lives in sects and societies. It is a relationship between soul and god. He explained that religion does not consist in erecting temples or building churches and attending public worship, also not available in the books or in words or in lectures or in organizations. Religion consists of realization. Religion does not consist in subscribing to a particular creed or faith but in spiritual realization. Therefore spiritual realization is a religion. To create a peaceful co-existence within global society, acceptance of true religion is essential.

The spirit of Swami Vivekananda's message may be brought out by quoting some of his memorable assertions. He wanted Indians to be strong; he did not believe that real religion could flourish on empty stomachs. It would do well to remember what he said: "Our young men must be strong; Religion will come afterwards. Be strong, my young friends, that is my advice to you. You will be nearer to Heaven through football than through the study of Gita. You will understand Gita better with your biceps, your muscles a little stronger. You will understand the mighty genius and the mighty strength of Krishna better with a little strong blood in you. You will understand the Upanishads better and the glory of the Atman when your body stands firm on your feet and you feel yourselves as men."

Swami Vivekananda pointed out the different people in the world approach spiritually in different ways. He asserted that man and his true nature is already divine. But that divinity is hidden. Therefore, the realization of that divinity is the purpose of life which is the essence of religion. To realize that religion, according to Vivekananda, man should have to practice four yogas. Those are the yoga of knowledge, control of mankind, selfless work and love of God. Therefore religion is the essence of human life and it has the great motivating power in one's life including his social, economic and political aspect.

This paper will analyze Swami Vivekananda's concept of universal religion, as a universal love or universal brotherhood. Vivekananda reflected on the necessity of the concept of universal religion for the society. He realized the nature of man, according to which mankind in the whole world has been trying to look beyond in the quest of his ultimate destiny or search for God. Therefore, whole of the world community is expecting a religion, which is acceptable to all.

Different social organizations are representing different needs of the man, and they endeavor to practice humaneness in society. Religions, on the other hand, represent the spiritual aspirations and struggles of mankind. The unpleasant reality is that various world religions have been indulging in mutual criticisms. Some religions in the world, claiming universal empire in the field of religion over all mankind, have engaged themselves in ruthless wars and bloodshed to achieve this end. Vivekananda has observed these two mutually opposing aspects of religion, which he explains in the following words:

"There is nothing that has brought to man more blessings than religion, yet at the same time, there is nothing that has brought more horror than religion. Nothing has made more for peace and love than religion; nothing has engendered fiercer hatred than religion. Nothing has made the brotherhood of man more tangible than religion; nothing has bred more bitter enmity between man and man than religion. Nothing has built more charitable institutions, more hospitals for men, and even for animals, than religion; nothing has deluged the world with more blood than religion."<sup>1</sup> Thus Vivekananda deeply felt the importance of religion, as well its crucial role in the human life. To improve this situation, some intellectuals and peace workers are searching a way to establish peace among the religions. Vivekananda said that "we must understand all of those religions have

proved their strength, their worth, and their necessity for mankind.”<sup>2</sup> Therefore, he underscored the equal status of all the religions in human society. Thus he brought out the weakness of conventional orthodox religion. He brought out this idea very picturesquely, when he adopted the simile of silkworms and said, “we make the thread out of our own substance and spin the cocoon and in course of time are imprisoned inside.”

Swami Vivekananda identified the need for universal religion and searched for the way to form that universal religion. He realized that the universal religion cannot be established with any one of the world religions, converting the followers of all other religions into it. Universal religion is possible only to the extent that there is a place for all religions suited to different types of humanity. Therefore, he gave due consideration to the phenomenon of diversity among the humanity in the world. Vivekananda continued:

“As human mind broadens, its spiritual steps broaden too. The time has already come when a man cannot thought without its reaching all corners of the earth; by merely physical means we have come into touch with the whole world; so the future religions of the world have to become as universal and as wide. The religious ideals of the future must embrace all that exists in the world and is good and great, and at the same time, have infinite scope for future development.”<sup>3</sup>

In this manner, Vivekananda’s point of view of Religion is both a means as well as end to human life.

Swami Vivekananda gives a thorough picture of the essentials of religions. He gives a very rational exposition of the necessity of religion and points out that ‘religion, as a science, as a study, is the greatest and healthiest exercise that the human mind can have.’ Religion is the greatest motive power for realizing that infinite energy which is the birthright and nature of every man. In building up character, in making for everything that is good and great, in bringing peace to others and peace to one’s own self, religion is the highest motive power.

This paper is meant to understand Vivekananda’s identification of the concept of universal religion and its application to the modern global world. During the past 150 years we have discussed the philosophical importance of the concept of universal religion. Now it is clear that we have to implement this concept in the world rather than discussing it. Following Swami Vivekananda we may conclude that we have only one solution for this multi-cultural and multi-religious world. It is the concept of one universal religion, the essence of Swami Vivekananda’s vision to the world. This universal ideal can be practiced not only by believers of different religions but equally by non-believers for it is founded on the ideal of oneness of humanity and it is geared for human self-realization which is not a monopoly of any particular religion. This truly global vision can form the foundation for peaceful co-existence of all in the globe.

## **Religious experience**

According to Vivekananda religious experience is the outcome of our deep realization of divinity in everything. He states “The nearer we approach to God, the more do we begin to see that all things abide to him, our heart will become a perennial fountain of love. Man is transformed in the presence of this light of love and realizes at least the beautiful and inspiring truth that love, lover and beloved one really one.” Religious experience, according to him is the feeling of oneness with all creatures. It is an attitude of oneness with all life and beyond that with the universe along with awareness of the unique entity of the self. The religious consciousness is closely related to the

experience of breaking down individual and feeling one with the all.

Vivekananda recognized the force of religious experience or spiritual development which states with the recognition of oneself as the source of potential divinity, such realization is the first mark to be religious man. To Vivekananda, religion is not mere metaphysical conversation. Its experience is spiritual, to break down avidya or maya. Religious experience is the feeling of oneness with every existence. When a man become truly religious, man transcends his individual existence and realized that the truth, that 'love' 'lover' and 'beloved' are really one. There is no barrier of space time in religious experience. Man becomes the part of the Absolute which is eternal. In religious experience we shall find that we are in the real, everything is real, and that reality is God, and this God is our own true nature. To quote Vivekananda, "He is always in us, and with us. Let us live in him and stand in him. It is the only joyful existence. Live on the plane of the spirit."

Religious experience is mystic kind of experience. This mystic kind of experience is the root of at least all major religions of the world. It is a direct experience of God and realization of presence of God in every sphere of the world. The mysticism has two tendencies. These are—first of all, within mysticism there is a negative tendency. Within mysticism we find revolt against the barriers of space and time. The second is positive tendency. The positive tendency is the tendency to rise up from the limitations imposed by space and time.

Swami Vivekananda like a mystic realized that man is bound by the order of space, time and causation. Though freedom is the very urge of every individual but his will is severely bound by the law of causation. Both the body and the will are bound by the laws of causality. His idea of freedom aspires to attain the highest, the absolute, which is permanent and unchangeable. Man struggles for freedom, and consequently man gains it in the Zenith of religious experience, when everyone becomes one with all other existence. In this state one feels everywhere the breath of God.

The concept of religious experience of Vivekananda is akin to the view of other neo-vedantin Dr. Sarvepalli Radhakrishnan. He states religious experience as God realization. He says, "It is the displacement of ignorance, avidya, unawareness by knowledge, vidya or awareness. This attainment of vidya, badhi, wisdom or enlightenment makes for power. It results in a complete of one's nature, which is assimilated to new inward dimension." Vivekananda says that, mysticism is not an accidental phase of religious development. In mysticism, there is reliance on constant intuition, meditation or concentration. He writes "you see the power of meditation, intensity of thought. These men churn up their own souls. Great truth come to the surface and become manifest. Therefore the practice of meditation is the great scientific method of knowledge."

Further he delivered that meditation is the highest state, when the mind is doubtful that is not its great state. Its great state is meditation. It looks upon things and see things, not identifying itself with anything else. Vivekananda opines that as long as we feel pain, we have identified our self with the body. But the high state is a balanced state when we look pleasure or pain as the same. He says that in perfect concentration the soul becomes indeed free from the bonds of the gross body. It knows itself. We suffer because we identify our self with mortal body. The free soul knows God and then becomes God. Nothing is impossible to such a free soul. There is no more birth and death for him. Such a soul is free forever. Such kind of religious experience "The great truth of spirituality regarding oneness of existence and the divinity of men find their unique expression in

the times of these three spiritual luminaries; Shri Ramakrishna, Holy mother and Vivekananda. From Sri Ramakrishna we learn that through great longing and renunciation we can have the direct experience of God. In Holy mother we see this realization of oneness manifests itself in all embracing impartial love for all beings. And from Swamiji we understand that by serving the divine dwelling within each and every person, we can attain to the same state of realization that the saint, immersed in meditation, attains through his spiritual practices.”

Vivekananda opines that all religious experiences are not mystic experience. There are varieties of religious experience. These are visionary experience; numinous experience and mystic experience etc. Visionary experience plays an important role in the same religion. For example vision of the virgin or Jesus is common in Christianity. Such visionary experience is found in Mahayana Buddhism too, where one can find visionary experiences of the Bodhisattvas. The second type of religious experience is numinous experience. It is overwhelmed by vital and active power. As a power numinous experience is so great that one is reduced to insignificance in its presence. In numinous experience one encounters unfathomable mystery. It is dreadful as well as fascinating. Numinous experiences are sometimes focused on a human being, sometimes on a sacred place, some natural object etc. Rudolf Otto in his book 'The Idea of Holy' has given a broad analysis of this numinous experience.

## **Religion and Reason**

In his philosophical expositions of religion Swami Vivekananda pays first reverence to Reason. In a statement, he asserts- 'Is religion to justify itself by the discoveries of reason, through which every other science justifies itself? Are the same methods of investigation, which we apply to sciences and knowledge outside, to be applied to the science of Religion? In my opinion this must be so, and I am also of opinion that the sooner it is done the better. If a religion is destroyed by such investigation, it was then all the time useless unworthy superstition; and the sooner it goes the better. I am thoroughly convinced that its destruction would be the best thing that could happen.' Depending on the results of such investigations he confidently adds, "All that is dross will be taken off, no doubt, but the essential parts of religion will emerge triumphant out of this investigation. Not only will it be made scientific-as scientific, at least, as any of the conclusions of physics or chemistry-but will have greater strength, because physics and chemistry has no internal mandate to vouch for its truth, which religion has." Thus it has been understood from the above lines of Vivekananda that he wanted religion to be based on reason. In his view if any religion fails to justify its validity through reason then it will be useless for us. Such a religion is unworthy superstition.

Regarding the question how exactly speaking religion satisfies reason, Vivekananda points out that the first principle of reasoning is that the particular is explained by the general until we come to the universal. A second explanation of knowledge is that the explanation of the thing comes from inside and not outside. Elucidating the second principle further he says, "...what is meant by science is that the explanations of things are in their own nature, and that no external beings or existences are required to explain his phenomenon. The chemist never requires demons, or ghosts, or anything of that sort to explain his phenomenon. The physicist never requires anyone of these to explain the things he knows, nor does any other scientist. ... Every science wants its explanation from inside."

In his opinion religion can satisfy both these essential principles of rationality- (1) the principle of generalization, and (2) the principle of immanent change. As to how the first principle is satisfied

he says that the generalization principle ought to be satisfied along with the principle of evolution. We have to come to an ultimate generalization. This ultimate generalization will not only be the most universal of the generalizations, but out of which everything else must come. It is Vivekananda's conviction that the Brahman of the Vedanta fulfills that condition, because Brahman is the last generalization to which we can come to. Brahman has no attributes but Existence, Knowledge and Bliss. "Existence", he explains, "... is the very ultimate generalization which the human mind can come to." What we mean by knowledge is what we see in the universe as the essential unity of things. This oneness is the one fact that is being proved by modern science. Thus Vedanta satisfied the first principle of generalization.

So far as the second principle is concerned, he says that Vedanta satisfied this principle also. According to him the explanation of a thing comes from within itself is completely satisfied by Vedanta. The Brahman of Vedanta has nothing outside of Himself; nothing at all. All this indeed is He. He is the whole universe or He is the universe Himself. Therefore all the change that is perceived by us in the universe is only immanent, that is manifestations of the Brahman.

Thus Vivekananda's concept of religion which is based on Vedanta satisfies completely the principles of reasoning so that it may be acceptable to all in the modern age. This concept is revolutionary in the sense that it meets all the challenges of modern science and principles of reasoning. It is certainly a revolutionary concept that religion itself is a science.

### **Conclusion (concept of Religion)**

From the above discussion it has been seen that according to Vivekananda religion is the manifestation of the divinity already in man. So it is his conviction that man is already divine. The essence of religion is to realize God in our heart and to realize the same god in others. We have to know that we all are children of God that we have come from God, and going back to God. It is significant to mention here that Vivekananda did not restrict this divinity to man only. From the lowest worm to the highest creature-man, all are expression of the same divine. But this divinity is not manifested equally in all. There is difference in manifestation, but this difference is not in kind, but in degree. Divinity is manifested more in the highest than to that of the lower creatures. So in man this divinity is manifested supremely, as man is the highest creature. But he asserted that this divinity is one unifying principle prevailing in the whole universe.

Thus in Vivekananda's philosophy religion is nothing except the manifestation of the divinity already within man. Therefore, it is not necessary to have doctrines or dogmas and intellectual argumentation. It is realization in the very heart of man. Religion is the realization of the truth that 'I am a spirit' in relation with the universal spirit and all its great manifestations. Plainly speaking, Vivekananda's way of understanding of religion is that man must realize God, feel God, see God, and talk to God. That is the religion. To him material prosperity and wealth is not an important thing. It is the wealth of the spiritual thought in brain that is more needed to the human progress. Religion has been a great healer as well as cruel killer. True religion has the capacity to heal evil thoughts in human mind. Similarly the false religion has the capacity to bring darkness in human mind and thus leads to the destruction of the human society. Vivekananda's message was that man must occupy the highest place. Hence, the welfare of man in the true sense of the term is his predominant impulse, and a true religion is the only agent for that purpose. He further said that the supreme reality is the only source of happiness and true religion teaches us that the goal of life has to be sought in Atman.

Vivekananda asserts that though man is already divine, this divinity is hidden. The purpose of religion is to make man realize his divinity. To realize that man should practice four yogas. Those are the yoga of knowledge, or control of mind, or of selfless work, or of love of God. Vivekananda had laid down also what religion is not. According to him religion is not dogmas, doctrines, rites, rituals and other externals. But, Vivekananda did not outright reject dogmas, doctrines etc. According to him, these externals are helpful at the initial stage of religion. But man must soon cross this stage and come to the higher stage when he realizes- 'spirit as spirit'. He has given us a religion which is monistic, spiritualistic, humanistic as well as pragmatic.

Another point has to be mentioned here that Vivekananda was not a religious preacher. Though he tried to give his own concept of religion, his intention was not to establish a new religion with a new sect. In his eyes all religions of the world have equal validity. To be one with God he prescribed for four Yogas. Every individual, no matter what his religion, caste, sex is, can follow the path. According to him, diversity of religions will remain. But we must realize that the different religions will co-exist as diverse ways of worship of the one infinite. The result is not a uniform pattern of religion for diverse people but the accordance of all religions as true by all.

The central theme of his religion is the divinity of man. It is Vivekananda's conviction that the knowledge of this divinity is the secret of man's development, secular as well as spiritual. This knowledge of divinity gives him infinite faith in himself and the awareness that he has infinite potentialities. He is thus invested with great strength which finds expression in creativeness of various types and dimensions enriching the society also.

Swami Vivekananda has introduced a universal form of worship. Since every human being has the same divinity in him, we can worship God by serving man. He says "You may build a temple in which to worship God, and that may be good, but a better one, already exists, the human body." This religion is new in the sense that it does not depend on persists, churches, temples, books, dogmas, ceremonials and rituals. It dispenses with all these auxiliaries prone to be misused.

At last we must mention that Vivekananda never tried to be a preacher of Hinduism or any other such religion. In our first chapter we have seen that the miserable condition of the Indian masses has given birth to the philosophy of Vivekananda. Vivekananda urged on the people of India to realize their own true self so that they could get self-confidence. He had another intention in his mind. He was convinced that if the higher class peoples, specially those belonged to the well-to-do and literate families, realized the presence of God in everyone, they would come forward to help the helpless. But this was not his selfish motive. He just preached what was the truth.

### **Swami Vivekananda: Three basic parts of religion**

Swami Vivekananda knew that religions of the world differ from each other. He has taken into consideration the three basic parts of religion. In every great religion there are three parts-. First, there is the philosophy which presents the whole scope of that religion; setting forth is basic principles, the goal, and the means of reaching it. The second part is mythology, which is philosophy made concrete. It consists of legends relating to the lives of men, or of supernatural beings, and so forth. It is the abstractions of philosophy concretized in the more or less imaginary lives of men and supernatural beings. The third part is the ritual. This is still more concrete, and is made up of forms and ceremonies, various physical attitudes, flowers and incense, and many other things that appeal to the senses. In these consists the ritual. All recognized religions have these three elements. Some lay more stress on one, some on another.

We now take into consideration these three parts one by one.

**(i) Philosophy-**

Vivekananda says that there is no universal philosophy. Philosophy of a certain religion is that which presents the whole scope of that religion, its basic principles, the goal as well as the means to realize the goal etc. Each religion brings out its own doctrines, and insists upon them as being the only true ones. And not only does it do that, but it thinks that he who does not believe in them must go to some horrible place. Some will even draw the sword to compel others to believe as they do. This is not through wickedness, but through a particular disease of the human brain called fanaticism.

**(ii) Mythology-**

Again according to Vivekananda there is no universal mythology accepted by all religions. All religions have their own mythology, only each of them says, 'My stories are not mere myths.' Vivekananda explains this point with example of different religions. The Christian believes that God took the shape of a dove, and came down to earth. To him this is history, and not mythology. The Hindu believes that God is manifested in the cow. Christians say that to believe so is mere mythology, and not history, that it is superstition. The Jews think that if an image be made in the form of a box, or a chest, with an angel on either side, then it may be placed in the Holy of Holies, but if the image be made in the form of a beautiful man or woman, they say 'This is a horrible idol; break it down!' Thus there is no universally accepted mythology. Each religion has its own cult-God, often jealous of other deities, and of prophets, incarnations etc., to whom their votaries are fanatically devoted. What certain religions claims as historical truth is only mythological, and in all world religions various combinations of mythology and history are treated as sacred literature, and dogmas are based on them.

**(iii) Rituals:**

Next comes the rituals. Every religious sect has its own rituals. One sect has one particular form of ritual, and thinks that is holy, while the rituals of another sect are simply arrant superstition. If one sect worships a peculiar sort of symbol, another sect denies it as horrible. Take for instance a general form of symbol. The phallus symbol is certainly a sexual symbol, but gradually that aspect of it has been forgotten, and it stands now as a symbol of the creator. Those nations which have this as their symbol never think of it as the phallus; it is just a symbol. But a man from another race or creed sees in it nothing but the phallus, and begins to condemn it; yet at the same time he may be doing something which to the so-called phallic worshipers appears most horrible. Vivekananda takes two points for illustration, the phallus symbol and the sacrament of the Christians. To the Christians the phallus is horrible, and to the Hindus the Christian sacrament is horrible. The Hindus say that the Christians sacrament, the killing of a man and eating of his flesh and the drinking of his blood to get the good qualities of that man is cannibalism. This is what some of the savage tribes do; if a man is brave, they kill him and eat his heart, because they think that it will give them the qualities of courage and bravery possessed by that man. Even such a devout Christians as Sir John Lubbock admits this, and says that the origin of this Christiansymbol is in this savage idea. The Christians, of course, do not admit this view of its origin; and what it may imply never comes to their mind. It stands for a holy thing, and that is all they want to know. So even in ritual there is no universal symbol, which can command general recognition and acceptance.

From the above discussion it has been understood that that according to Vivekananda there is no universally accepted philosophy, mythology or rituals. Every religion has its own philosophy,

mythology and rituals. There may be some similarities, but this philosophy, mythology and rituals are not universally accepted by the peoples of different religions of the world. So it is hard to find any universal features in regard to religion.

*"Rituals are the kindergarten of religion. They are absolutely necessary for the world as it is now; only we shall have to give people newer and fresh rituals. A party of thinkers must undertake to do this. Old rituals must be rejected and new ones substituted"*. — Swami Vivekananda in

## **Theory of Evolution**

Theories of evolution can broadly be classified into two different ways. Scientists discuss theory of evolution from a naturalistic point of view on the basis of wide observation of facts. In scientific framework evolution provides a rationale to explain the origin of different species, the physical environment, changes in nature etc. Biologists explain the various variations and the causes of annihilation of species. Social scientists also explain the evolution of social institutions, evolution of languages, political ideals, state etc. Philosophers on the contrary discuss evolution on the basis of some assumption, postulates of metaphysical speculations. Great thinkers like Hegel, Bergson, and Alexander have given different theories of evolution. Sri Aurobindo has also presented a metaphysical view of evolution. Each of these thinkers presume something as absolute in their scheme of explanation. Hegel takes spirit or Reason, Bergson takes Elan Vital (Vital impulse), Alexander considers space-Time and Sri Aurobindo conceives consciousness to be absolute being in order to account for a meaningful explanation of evolution. In case of scientific view of evolution we do not come across incompatible doctrines where in case of metaphysical theories we find mutually incompatible views as they are based on assumption and subjective postulates of the philosopher.

Sri Aurobindo is a metaphysical thinker and in the contemporary philosophical idiom can be characterized as a revisionary metaphysician. His metaphysical system presents a theory of evolution which is very significant in his scheme of thought. His metaphysics and theory of evolution as well is based on his notion of reality. Sri Aurobindo's position can be characterized as spiritualistic or in a technical sense intergalactic. He rejects materialism as a metaphysical doctrine. Materialism has been expressed in different ways but its essential assumption is that matter is the ultimate ontological reality which Sri Aurobindo denies. He does not accept any illusionistic account of the world nor does accept the unreality of matter. He takes Reality as Sacchidananda, Sat (existence), Chit (Consciousness), and Ananda (Bliss). He takes Reality as supremely spiritual just as the concept of Brahman is conceived in Vedanta philosophy. Brahman is infinity in the sense that it is not categorized by space and time. To be spatiotemporal means to be finite, but since the ultimate reality is not conditioned by space and time, it is infinite. Further reality is the cosmic consciousness not in the sense of being an attribute of anything but consciousness as such. It is something transcendental. It is construed as being the Divine Force. So also the reality is conceived as something blissful. Similarly, to the idea of theistic God, that is, omniscient, omnipotent and omnipresent, so too Sri Aurobindo conceives of the Ultimate Reality as infinite existence, infinite consciousness and infinite bliss. Keeping this metaphysical speculation of reality as envisaged by Sri Aurobindo, now we shall proceed to explain his theory of evolution. Sri Aurobindo's theory of evolution is spiritualistic for spirit or consciousness projects itself out of itself. Consciousness plays the most significant role in every step of evolution. Evolution is the manifestation of consciousness. Sri Aurobindo explains evolution with another presupposition which is called involution. He believes that there is evolution because prior to evolution there is some involution. Evolution and involution are reverse process. If evolution is considered to be a

state of ascent, then it can be understood by the idea of being adescent. Ascent is evolution and descent is involution. In the evolutionary process the unconscious matter is at the bottom. Evolution starts from matter and its goal is to reach the state of Life Divine that is at the top. The process of cosmic evolution begins with matter.

Matter evolves into life and life evolves into mind. Evolution is at present at the state of mental plane. In the process of creation there has been immanent movement of consciousness or the Absolute to successive lower ones and finally to the inconscient matter. If the matter evolves and gives rise to life and life evolves again and gives rise to mind that is because consciousness has descended to mind, then to life and finally to matter. Since there is an inherent presence of involution of consciousness down the life from the Absolute to the inconscient matter, there is evolution from matter in an upward direction. In the words of Sri Aurobindo evolution is the inverse action of involution. What is an ultimate and last derivation in involution is the first to appear in evolution. If Absolute consciousness is the primal existence which comes descending to the level of matter, then it is matter that starts evolving and its ultimate goal is to reach the state of absolute consciousness.

This grand speculation of evolution involution has been further substantiated with many descriptions in minor details. He takes evolution to be a triple process of widening, heightening and integration. Before the emergence of a higher conscious principle the lower one must become receptive, adaptive and sublime to change to the higher. For example, before emergence of life from matter, matter must undergo a qualitative change of self-differentiation. It must be receptive to take a leap to the higher condition. Similarly evolution is not only a process of widening it is also a process of heightening. Evolution of a higher principle of complexity takes place when the conscious force becomes explicit and fully manifests.

Apart from these two processes of widening and heightening, integration is another feature of evolution. In evolution when a higher principle manifests from the lower the higher principle also changes the lower one. In every ascent all the lower get transformed and turned to the new ones. With the emergence of life, matter does not cease to evolve, rather it is transformed to cope with the new situation. So too when mind emerges matter and life also become transformed, matter becoming more sensitive and life more creative in human being. With the emergence of higher principle or consciousness, all the lower principle get transformed and turned to the system. This is the integral ascent in Sri Aurobindo's vision of evolution. Sri Aurobindo maintains that cosmic evolution at present is at the mental plane. But beyond the mental plane there are higher grades of consciousness which have not yet been evolved. In the past there might be some stray cases where some men attained a height of higher consciousness. The saints, Yogis, seers, by spiritual contemplation might have ascended to a state of higher conscious plane but that vanish with the death of the individual.

The spiritual consciousness has not become an integral part or permanent with man. But Sri Aurobindo intends to take evolution ahead of the present condition and make it permanent. Sri Aurobindo speculates that beyond the mental level there are higher goods of consciousness leading to the apex height of supramental consciousness. He further imagines that there are transcendental states between the mental consciousness and supramental consciousness. So the ascent of man from mental consciousness to supramental consciousness will not happen all on a sudden, but by different grades of existence. In his model the mental consciousness will be transformed to a psychic state. With the outcome of the psychic transformation self-discipline

begins from within so that a craving is created for the realization of all that is true and noble. In this state mind becomes repulsive to what is false, obscure and undivine.

After the psychic transformation, there will be a higher state that would change the psychic personality to a spiritual personality. In this state the individual will be more elevated towards spiritual consciousness. But his state is not the final state in the evolutionary ladder. This will be followed by a supramental transformation, the apex state in the process of evolution. With the emergence of the supramental being the physical, vital and mental existence will not be annihilated but they will undergo an important change so as to cope with higher level of existence. Sri Aurobindo speculates that in case of any higher emergence, the lower is not rejected, but there happens an integral ascent and they are harmoniously turned together. The realization of supramental consciousness similarly will establish a perfect harmony in all the states of a being. The physical, vital, mental, psychic and spiritual states will harmoniously be turned together and would exhibit wider and fuller harmony than was open to them when they were living upon their own. There will be perfect adoption of all the beings and states in this spiritual evolution. The whole scheme of conceiving evolution as the reverse process of involution presents a hierarchical ascent and descent. The descent starts from the Divine coming to the supramental, to spiritual, to psychical to mental, to vital and lastly to physical.

This is Sri Aurobindo's notion of creation coming from the Divine to the physical. So evolution starts from the physical and ascending the ladder would reach the Divine through the intermediary stages. The process of creation is a Divine act or lila and evolution is the spirit's return unto itself. Sri Aurobindo's model of explaining a theory of evolution is metaphysical as it has nothing to do with empirical facts. But within a metaphysical framework it is neither mechanical nor cyclical. In mechanical evolution, evolution proceeds without any purpose or design. In a mechanical evolution the future is neither predictable nor designed. In cyclical theory of evolution, evolution and dissolution are cyclic processes one following the other. The Sankhya theory of evolution, though a metaphysical doctrine, is cyclic in nature.

Sri Aurobind's theory of evolution is teleological as he believes a divine life from man. Achievement of divine life is the creative fulfillment of man's life on earth. Again the highest achievement of this condition is not the individual fulfillment as conceived in liberation but is divinization of the collective humanity. Sri Aurobindo believes that the divinization of life would be a new birth for humanity as it can wipe out all evil from the world. Achievement of supramentalhood would establish identity among the individual selves. They will realize that they are the integral part of the universal spirit. This can be explained by an analogy. Just as one ocean embraces countless waves, so too the one universal spirit will embrace the plurality of finite individual selves. The sense of self-differentiation of the finite selves change into self-awareness of the many as eternally linked with the one spirit.

Thus Sri Aurobindo's contention is that man is not the highest reality nor is the mental consciousness the highest achievement of evolution. Beyond the mental state, there are higher planes of consciousness which can evolve and elevate manhood to supermanhood. Mind is the medium for the manifestation of the Divine. At this stage of evolution man is an imperfect image of the highest Being but man by achieving supermanhood can be the perfect image of the Divine. Further it must be pointed out that Sri Aurobindo's concept of superman is not to possess some extraordinary quality as some individuals in human history have achieved. There are some persons who had some extraordinary ability or some rare virtues which are not found in ordinary mortals.

Such person may be called superman but it has nothing to do with Sir Aurobindo's notion of superman. His notion of superman is a divinized being overpassing the level of mental consciousness. His whole assumption is that man is the last product of the evolutionary design of nature. Man will evolve to the state of superman and will go achieving higher levels of consciousness.

Again Sri Aurobindo assumes that the future evolution will be affected as a result of man's aspiration. Evolution from inorganic matter to his state has been the result of automatic operation of the nature. Sri Aurobindo holds that man's aspiration combined with the Divine grace can usher in the process of evolution. In the pre-human stage nature acted automatically for evolution of life and mind. But at this stage man's conscious endeavour would help transform his consciousness to the higher levels. Sri Aurobindo believes that mankind towards a new race. In the processes higher power of consciousness will be manifested progressively till evolution reaches its ultimate goal.

Thus Sri Aurobindo's theory of evolution as explained above is spiritual, teleological, integral and cosmic. But the entire approach is not grounded on any empirical finding. It is a metaphysical thesis based on many gross assumptions. Not only it is based on unfounded assumptions but also it contains many mystic elements. It also sounds very utopian and unrealistic. It is out and out speculative and non-naturalistic.

### **Mind and Supermind**

Sri Aurobindo provides us with a synopsis of the characteristics of mind in comparison with supermind: "Mental nature and mental thought are based on a consciousness of the finite; supramental nature is in its very grain a consciousness and power of the Infinite. Supramental nature sees everything from the standpoint of oneness and regards all things, even the greatest multiplicity and diversity, even what are to the mind the strongest contradictions, in the light of that oneness; its will, ideas, feelings, sense are made of the stuff of oneness, its actions proceed upon that basis. Mental nature, on the contrary, thinks, sees, wills, feels, senses with division as a starting-point and has only a constructed understanding of unity; even when it experiences oneness, it has to act from the oneness on a basis of limitation and difference. But the supramental, the divine life is a life of essential, spontaneous and inherent unity."

In terms of action, the mind tries to construct a set of rules or a framework of understanding which cannot possibly contain within it an understanding of the basis for action of the supramental consciousness. "supramental nature does not act by mental idea or rule or in subjection to any inferior impulse: each of its steps is dictated by an innate spiritual vision, a comprehensive and exact penetration into the truth of all and the truth of each thing; it acts always according to inherent reality, not by the mental idea, not according to an imposed law of conduct or a constructive thought or perceptive contrivance."

The supramental action, based in unity, and encompassing the entire universe of forms and multiplicity of energies, "arises naturally and inevitably out of a harmonic identity of the truth which is felt in the very substance of the conscious being, a spiritual substance which is universal and therefore intimately one with all that is included in its cognition of existence."

## **SRI AUROBINDO'S CONCEPT OF MIND AND ITS DIFFERENT STAGES**

### **The Higher Mind and its origin in over mind and Supermind:**

"Our first decisive step out of our human Intelligence, our normal mentality is an ascent into a higher Mind, a mind no longer of mingled light and obscurity or half-light, but a large clarity of the Spirit. Its basic substance is a unitarian sense of being with a powerful multiple dynamisation capable of the formation of a multitude of aspects of knowledge, ways of action, forms and significances of becoming, of all of which there is a spontaneous inherent knowledge. It is therefore a power that has proceeded from the over mind, -- but with the supermind as its ulterior origin, -- as all these greater powers have proceeded: but its special character, its activity of consciousness is dominated by Thought; it is a luminous thought-mind, a mind of Spirit-born conceptual knowledge."

### **Contrast between Higher Mind and Thinking Mind and Ordinary Intuition:**

"But here in this greater Thought there is no need of a seeking and self-critical ratiocination, no logical motion step by step towards a conclusion, no mechanism of express or implied deductions and inferences, no building or deliberate concatenation of idea with idea. In order to arrive at an ordered sum or outcome of knowledge: for this limping action of our reason is a movement of Ignorance searching for knowledge, obliged to safeguard its steps against error, to erect a selective mental structure for its temporary shelter and to base it on foundations already laid and carefully laid but never firm, because it is not supported on a soil of native awareness but imposed on an original soil of nescience. There is not here, either, that other way of our mind at its keenest and swiftest, a rapid hazardous divination and insight, a play of the searchlight of intelligence probing into the little known or the unknown."

### **The Higher Mind in its aspect of Cognition:**

"This higher consciousness is a Knowledge formulating itself on a basis of self-existent all-awareness and manifesting some part of its integrality, a harmony of its significances put into thought-form. It can freely express itself in single ideas, but its most characteristic movement is a mass ideation, a system or totality of truth-seeing at a single view; the relations of idea with idea, of truth with truth are not established by logic but pre-exist and emerge already self-seen in the integral whole. There is an initiation into forms of an everpresent but till now inactive knowledge, not a system of conclusions from premises or data; this thought is a self-revelation of eternal Wisdom, not an acquired knowledge. In the end there is a great totality of truth known and experienced but still a totality capable of infinite enlargement because there is no end to the aspects of knowledge, *nastyanto vistarasyame*."

### **The Higher Mind in its aspect Will:**

"This is the Higher Mind in its aspect of cognition; but there is also the aspect of will, of dynamic effectuation of the Truth: here we find that this greater more brilliant Mind works always on the rest of the being, the mental will, the heart and its feelings, the life, the body, through the power of thought, through the idea force. It seeks to purify through knowledge, to deliver through knowledge, to create by the innate power of knowledge. The idea is put into the heart or the life as a force to be accepted and worked out; the heart and life become conscious of the idea and respond to its dynamisms and their substance begins to modify itself in that sense, so that the feelings and actions become the vibrations of this higher wisdom, are informed with it, filled with the emotion and the sense of it: the will and the life impulses are similarly charged with its power and its urge of self-effectuation; even in the body the idea works so that, for example, the potent thought and

will of health replaces its faith in illness and its consent to illness, or the idea of strength calls in the substance, power, motion, vibration of strength; the idea generates the force and form proper to the idea and imposes it on our substance of Mind, Life or Matter. It is in this way that the first working precedes; it charges the whole being with a new and superior consciousness, lays a foundation of change, prepares it for a superior truth of existence."

### **These higher forces are limited in the realm of Ignorance:**

"It has here to be emphasized, in order to obviate a natural misconception which can easily arise when the superior power of the higher forces is first perceived or experienced, because they can appear dizzying and give a vast sense of possibilities. But in the lower world the situation is not the same as in their own realm. Sri Aurobindo explains that these higher forces are not in their descent immediately all-powerful as they would naturally be in their own plane of action and in their own medium. In the evolution in Matter they have to enter into a foreign and inferior medium and work upon it; they encounter there the incapacities of our mind and life and body, meet with the unreceptiveness or blind refusal of the Ignorance, and experience the negation and obstruction of the Inconscience."

### **The Cognitive Mind resists the Illumination of the Higher Mind**

"Thus the higher Idea descending into the developed mental intelligence has even there to overcome the barrage of a mass or system of formed ideas which belong to the Knowledge-Ignorance and the will to persistence and self-realization of these ideas; for all ideas are forces and have a formative or self-effective faculty greater or less according to the conditions, - even reducible to nil in practice when they have to deal with inconscient Matter, but still potential. There is thus ready-formed a power of resistance which opposes or minimizes the effects of the descending Light, a resistance which may amount to a refusal, a rejection of the Light, or take the shape of an attempt to impair, subdue, ingeniously modify or adapt or perversely deform the light in order to suit it to the preconceived ideas of the Ignorance."

### **Resistance by the Vital and the Subconscious**

"In the lower levels of the being, in the heart and life and body, the same phenomenon recurs and on a more intense scale; for here it is not ideas that have to be met but emotions, desires, impulses, sensations, vital needs and habits of the lower Nature; these, since they are less conscious than ideas, are blinder in their response and are more obstinately self-assertive: all have the same or a greater power of resistance and recurrence, or take refuge in the circum-conscient universal Nature or in our own lower levels or in a seedstate in the sub-conscient and from there have the power of new invasion or resurgence. This power of persistence, recurrence, resistance of established things in Nature is always the great obstacle which the evolutionary Force has to meet, which it has indeed created in order to prevent a too rapid transmutation even when that transmutation is its own eventual intention in things."

### **Overcoming the resistance to the transformation:**

"This obstacle will be there, -- even though it may progressively diminish, -- at each stage of this greater ascent. In order to allow at all to the higher Light an adequate entry and force of working, it is necessary to acquire a power for quietude of the nature, to compose, tranquillize, impress a controlled passivity or even an entire silence on mind and heart, life and body: but even so a continued opposition, overt and felt in the Force of the universal Ignorance or subliminal and obscure in the substance-energy of the individual's make of mind, his form of Life, his body of Matter, an occult resistance or a revolt or reaffirmation of the controlled or suppressed energies of

the ignorant nature, is always possible and, if anything in the being consents to them, they can resume dominance. The power of the spiritual Higher Mind and its idea-force, modified and diminished as it must be by its entrance into our mentality, is not sufficient to sweep out all these obstacles and create the gnostic being, but it can make a first change, a modification that will capacitate a higher ascent and a more powerful descent and further prepare an Integration of the being in a greater Force of consciousness and knowledge.”

### **The Illumined Spiritual Mind:**

Sri Aurobindo says the power of the spiritual Higher Mind...prepare(s) an Integration of the being in a greater Force of consciousness and knowledge. “This greater Force is that of the Illumined Mind, a Mind no longer of higher Thought, but of spiritual light. Here the clarity of the spiritual intelligence, its tranquil daylight, gives place or subordinates itself to an intense luster, a splendor and illumination of the Spirit: a play of lightning of spiritual truth and power breaks from above into the consciousness and adds to the calm and wide enlightenment and the vast descent of peace which characterize or accompany the action of the larger conceptual-spiritual principle, a fiery ardor of realization and a rapturous ecstasy of knowledge.”

“The Illumined Mind does not work primarily by thought but by vision; thought is here only a subordinate movement expressive of sight. The human mind, which relies mainly on thought, conceives that to be the highest or the main process of knowledge, but in the spiritual order thought is a secondary and a not indispensable process. As the Higher Mind brings a greater consciousness into the being through the spiritual idea and its power of truth, so the Illumined Mind brings in a still greater consciousness through a Truth-sight and Truth-light and its seeing and seizing power. In the transformation by the Illumined Mind there would be a similar fulfillment for the seer, the illumined mystic, those in whom the soul lives in vision and in a direct sense and experience: for it is from these higher sources that they receive their light and to rise into that light and live there would be their ascension to their native empire.”

### **The Intuitive Spiritual Mind:**

This is region of higher consciousness, which would seem to pertain more to a very high stage of realization far beyond ordinary nonduality, rather than intuition in the ordinary sense of the term. There is the Non-dual Absolute and equivalent states of Realization, then the Higher and Illumined Mind, and then Intuition. It is described by Sri Aurobindo (in “The Life Divine”). Intuition is always an edge or ray or out leap of a superior light; it is in us a projecting blade, edge or point of a far-off supermind light entering into and modified by some intermediate truth-mind substance above us and, so modified, again entering into and very much minded by our ordinary or ignorant mind-substance; but on that higher level to which it is native its light is unmixed and therefore entirely and purely veridical, and its rays are not separated but connected or massed together in a play of waves of what might almost be called in the Sanskrit poetic figure a sea or mass of “stable lightnings”. “Intuition has a fourfold power.

A power of revelatory truth-seeing, a power of inspiration or truth-hearing, a power of truth-touch or immediate seizing of significance, which is akin to the ordinary nature of its intervention in our mental intelligence, a power of true and automatic discrimination of the orderly and exact relation of truth to truth, these are the fourfold potencies of Intuition. Intuition can therefore perform all the action of reason, -- including the function of logical intelligence, which is to work out the right relation of things and the right relation of idea with idea, -- but by its own superior process and with steps that do not fail or falter. The intuitive light and power may be hampered in

its task because it is the edge of a delegated and modified supermind, but does not bring in the whole mass or body of the identity-knowledge. The basis of Inconscience in our nature is too vast, deep and solid to be altogether penetrated, turned into light, and transformed by an inferior power of the Truth-nature.”

**Sri Aurobindo’s concept of Adhimanas (over mind):**

State of consciousness beyond individual mind, beyond even universal mind in ignorance; it carries in itself a first, direct, masterful cognition of cosmic truth. It is a creator of truth, not of illusions or falsehood. Over mind takes each aspect of power and gives to it an independent action. It is the protective Double, a delegate of the Supermind consciousness. It has not the integrality of the supramental truth but it is well aware of the essential truth of things. Thus, over mind gives to the Sachchidananda Brahman the character of a teeming infinite of possibilities which can be developed into worlds or one world. It is a sort of delegation from the Supermind (this is a metaphor only) which supports the present evolutionary universe in which we live here in matter. Over mind sees calmly, steadily, in great masses and large extensions of space and time and relation, globally; it creates and acts in the same way—it is the world of the great Gods, the divine Creators.

An Over mind that covers as with the wide wings of some creative Oversoul this whole lower hemisphere of Knowledge- Ignorance, links it with that greater Truth- Consciousness while yet at the same time with its brilliant golden Lid it veils the face of the greater Truth from our sight, intervening with its flood of infinite possibilities as at once an obstacle and a passage in our seeking of the spiritual low of our existence, its highest aim, its secret Reality. The integrity of the Supermind keeps always the essential truth of things, the total truth and the truth of its individual self-determinations clearly knit together; it maintains in them an inseparable unity and between them a close interpenetration and a free and full consciousness of each other: but in Over mind this integrality is no longer there. Over mind Energy proceeds through an illimitable capacity of separation and combination of the powers and aspects of the integral and indivisible all-comprehending Unity.

It takes each Aspect or Power and gives to it an independent action in which it acquires a full separate importance and is able to work out, we might say, its own world of creation. “In Over mind we have the origin of the cleavage, the trenchant distinction made by the philosophy of the Sankhyas in which they appear as two independent entities, Prakriti able to dominate Purusha and cloud its freedom and power reducing it to a witness and recipient of her forms and actions, Purusha able to return to its separate existence and abide in a free self- sovereignty by rejection of her original overclouding material principle. In Over mind the separateness is still founded on the basis of an implicit underlying unity; all possibilities of combination and relation between the separated powers and Aspects, all interchanges and mutualities of their energies are freely organized and their actuality always possible.”

Over mind gives to the One Existence-Consciousness- Bliss the character of a teeming of infinite possibilities which can be developed into a multitude of worlds or thrown together into one world in which the endlessly variable outcome of their play is the determinant of the creation, of its process, its course and its consequence.

“The Over mind is a principle of cosmic Truth and a vast and endless catholicity is its very spirit; its energy is an all- dynamism as well as a principle of separate dynamisms: it is a sort of inferior

Supermind,—although it is concerned predominantly not with absolutes, but with what might be called the dynamic potentials or pragmatic truths of Reality, or with absolutes mainly for their power of generating pragmatic or creative values, although, too, its comprehension of things is more global than integral, since its totality is built up of global wholes or constituted by separate independent realities uniting or coalescing together, and although the essential unity is grasped by it and felt to be basic of things and pervasive in their manifestation, but no longer as in the Supermind their intimate and ever-present secret, their dominating continent, the overt constant builder of the harmonic whole of their activity and nature.”

“A pure experience of truth, Knowledge, Delight, imperishable existence would here be itself a contradiction of the truth of things. The Non-Existence is a concealed Consciousness, the insensibility a masked and dormant Ananda, these secret realities must emerge; the hidden Overmind and Supermind too must in the end fulfill themselves in this apparently opposite organization from a dark Infinite.”

Supermind cannot manifest itself as the Creator Power in the universe from the beginning, for it did, the Ignorance and Inconscience would be impossible or else the slow evolution necessary would change into a rapid transformation scene. “Yet at every step of the material energy we can see the stamp of inevitability given by a supramental creator, in all the development of life and mind the play of the lines of possibility and their combination which is the stamp of overmind intervention. As Life and Mind have been released in Matter, so too must in their time these greater powers of the concealed Godhead emerge from the involution and their supreme Light descend into us from above.”

## **The Supermind**

Supermind in Sri Aurobindo's philosophy refers to the infinite unitary truth-consciousness or truth-idea simultaneously transcendent and immanent to planes of matter, life, and mind. Supermind is the dynamic form of Sachchidananda (being-consciousness-bliss), and the necessary conduit, mediator or linkage between Sachchidananda and the manifest Creation.

"The super mind, the Truth-consciousness, the RealIdea which knows itself and all that it becomes." The objective and final stage of integral yoga is to actualise the Supermind within one's being, this would constitute a divinisation of matter itself or a realisation of its inherent primordial propensity, and usher in a completely new, 'divine' way of existing. "The term above is the unitarian or indivisible consciousness of pure Sachchidananda in which there are no separating distinctions; the term below is the analytic or dividing consciousness of Mind which can only know by separation and distinction and has at the most a vague and secondary apprehension of unity and infinity,—for, though it can synthesize its divisions, it cannot arrive at a true totality. Between them is this comprehensive and creative consciousness, by its power of pervading and intimately comprehending knowledge the child of that self-awareness by identity which is the poise of the Brahman and by its power of projecting, confronting, apprehending knowledge parent of that awareness by distinction which is the process of the Mind".

"Above, the formula of the One eternally stable and immutable; below, the formula of the Many which, eternally mutable, seeks but hardly finds in the flux of things a firm and immutable standing-point; between, the seat of all trinities, of all that is being, of all that becomes Many-in-One and yet remains One-in-Many because it was originally One that is always potentially Many. And shall we not say that its very existence points back to something beyond our supreme perception of the

ineffable Unity, - - Something ineffable and mentally inconceivable not because of its unity and indivisibility, but because of its freedom from even these formulations of our mind, – Something beyond both unity and multiplicity? That would be the utter Absolute and Real which yet justifies to us both our knowledge of God and our knowledge of the world”.

## **Sri Aurobindo: Integral yoga**

### **Central purpose of the Integral Yoga**

Transformation of our superficial, narrow and fragmentary human way of thinking, seeing, feeling and being into a deep and wide spiritual consciousness and an integrated inner and outer existence and of our ordinary human living into the divine way of life.

### **Integral yoga**

This yoga accepts the value of cosmic existence and holds it to be a reality; its object is to enter into a higher Truth-Consciousness or Divine Supramental Consciousness in which action and creation are the expression not of ignorance and imperfection, but of the Truth, the Light, the Divine *Ananda (Bliss)*. But for that, the surrender of the mortal mind, life and body to the Higher Consciousness is indispensable, since it is too difficult for the mortal human being to pass by its own effort beyond mind to a Supramental Consciousness in which the dynamism is no longer mental but of quite another power. Only those who can accept the call to such a change should enter into this yoga.

### **Sâdhanâ of the Integral Yoga**

The *Sâdhanâ* [practice] of the Integral Yoga does not proceed through any set mental teaching or prescribed forms of meditation, mantras or others, but by aspiration, by a self-concentration inwards or upwards, by a self-opening to an Influence, to the Divine Power above us and its workings, to the Divine Presence in the heart and by the rejection of all that is foreign to these things. It is only by faith, aspiration and surrender that this self-opening can come.

### **Integral method**

The method we have to pursue is to put our whole conscious being into relation and contact with the Divine and to call Him in to transform our entire being into His, so that in a sense God Himself, the real Person in us, becomes the *sâdhaka* of the *sâdhana*\* as well as the Master of the Yoga by whom the lower personality is used as the centre of a divine transfiguration and the instrument of its own perfection. In effect, the pressure of the *Tapas*, the force of consciousness in us dwelling in the Idea of the divine Nature upon that which we are in our entirety, produces its own realisation. The divine and all-knowing and all-effecting descends upon the limited and obscure, progressively illumines and energises the whole lower nature and substitutes its own action for all the terms of the inferior human light and mortal activity.

\* *Sâdhana*, the practice by which perfection, *siddhi*, is attained; *Sâdhaka*, the Yogin who seeks by that practice the *siddhi*.

### **Aim of the Integral Yoga**

It is not merely to rise out of the ordinary ignorant world-consciousness into the divine consciousness, but to bring the supramental power of that divine consciousness down into the ignorance of mind, life and body, to transform them, to manifest the Divine here and create a divine

life in Matter.

## **Conditions of the Integral Yoga**

This yoga can only be done to the end by those who are in total earnest about it and ready to abolish their little human ego and its demands in order to find themselves in the Divine. It cannot be done in a spirit of levity or laxity; the work is too high and difficult, the adverse powers in the lower Nature too ready to take advantage of the least sanction or the smallest opening, the aspiration and *tapasyâ* (concentration of the will) needed too constant and intense.

## **Method in the Integral Yoga**

To concentrate, preferably in the heart and call the presence and power of the Mother to take up the being and by the workings of her force transform the consciousness. One can concentrate also in the head or between the eye-brows, but for many this is a too difficult opening. When the mind falls quiet and the concentration becomes strong and the aspiration intense, then there is the beginning of experience. The more the faith, the more rapid the result is likely to be. For the rest one must not depend on one's own efforts only, but succeed in establishing a contact with the Divine and a receptivity to the Mother's Power and Presence.

## **Key-methods**

### **The way to devotion and surrender.**

It is the psychic movement that brings the constant and pure devotion and the removal of the ego that makes it possible to surrender.

### **The way to knowledge**

Meditation in the head by which there comes the opening above, the quietude or silence of the mind and the descent of peace etc. of the higher consciousness generally till it envelops the being and fills the body and begins to take up all the movements.

### **Yoga by works**

Separation of the *Purusha* from the *Prakriti*, the inner silent being from the outer active one, so that one has two consciousness or a double consciousness, one behind watching and observing and finally controlling and changing the other which is active in front. The other way of beginning the yoga of works is by doing them for the Divine, for the Mother, and not for oneself, consecrating and dedicating them till one concretely feels the Divine Force taking up the activities and doing them for one.

### **Object of the Integral Yoga**

The object of the Integral Yoga is to enter into and be possessed by the Divine Presence and Consciousness, to love the Divine for the Divine's sake alone, to be tuned in our nature into the nature of the Divine, and in our will and works and life to be the instrument of the Divine.

### **Principle of the Integral Yoga**

The whole principle of Integral Yoga is to give oneself entirely to the Divine alone and to nobody else, and to bring down into ourselves by union with the Divine Mother all the transcendent light, power, wideness, peace, purity, truth- consciousness and Ananda of the Supramental Divine.

## Fundamental realisations of the Integral Yoga

The psychic change so that a complete devotion can be the main motive of the heart and the ruler of thought, life and action in constant union with the Mother and in her Presence. The descent of the Peace, Power, Light etc. of the Higher Consciousness through the head and heart into the whole being, occupying the very cells of the body. The perception of the One and Divine infinitely everywhere, the Mother everywhere and living in that infinite consciousness.

## Iqbal: Self

Iqbal's philosophy is often described as the philosophy of *Khudi*, or the 'Self'. For him, the fundamental fact of human life is the absolute and irrefutable consciousness of one's own being. For Iqbal, the advent of humanity on earth is a great and glorious event, not an event signifying human sinfulness and degradation. He points out that according to the Qur'an, the earth is humanity's '*dwelling-place*' and '*a source of profit*' to it. Iqbal does not think that having been created by God, human beings were placed in a super-sensual paradise from which they were expelled on account of an act of disobedience to God. Pointing out that the term 'Adam' functions as the symbol of self-conscious humanity rather than as the name of an individual in the Qur'an, Iqbal describes the 'Fall' as a transition from: '*a primitive state of instinctive appetite to the conscious possession of a free self, capable of doubt and disobedience*'.

For Iqbal, Adam's story is not the story of the 'First Man' but the ethical experience, in symbolic form, of every human being. Following the Qur'anic teaching that though human beings come from the earth, God's spirit has been breathed into them, Iqbal holds on the one hand that human beings are divinely created, and on the other hand that they have evolved from matter. Unlike dualists, Iqbal sees no impassable gulf between matter and spirit, nor does he see human beings as a mere episode or accident in the huge evolutionary process. On the contrary, the whole cosmos is there to serve as the basis and ground for the emergence and perfection of the '*Ego*'. Humanity's evolution has not come to an end, for the destiny of human beings lies '*beyond the stars*'.

The purpose of life is the development of the Self. In order that they may achieve the fullest possible development, it is essential for human beings to possess knowledge. Following the Qur'an, Iqbal maintains that there are two sources of knowledge: the inner consciousness of human beings and the outer world of nature. Starting with the intuition of the Self, human beings become aware of the '*Not-Self*', the confronting '*other*' which provides a constant challenge for them. Nature, however, does not confront God in the same way as it confronts humanity, since it is a phase of God's consciousness. God is immanent since God comprehends the whole universe, but also transcendent since God is not identical with the created world. All life is individual. There is a gradually rising scale of self-ness running from the almost inert to God, who is the Ultimate Ego. God is not immobile nor is the universe a fixed product; God is constantly creative and dynamic and the process of Creation still goes on. The Qur'anic saying, 'Toward God is your limit' (Surah 53: 42), gives Iqbal an infinite worldview, and he applies it to every aspect of the life of humanity and the universe.

Iqbal distinguishes between two aspects of the Self, the efficient and the appreciative. The efficient self is that which is concerned with, and is itself partially formed by, the physical world. It apprehends the succession of impressions and discloses itself as a series of specific, and consequently numerable states. The appreciative self is the deeper self, of which one becomes aware only in moments of profound meditation when the efficient self is in abeyance. The unity of the appreciative self is that in it, each experience permeates the whole. The multiplicity of its

elements is unlike that of the efficient self. There is change and movement, but this change and movement are indivisible; their elements interpenetrate and are wholly non-serial in character. Corresponding to the two aspects of the Self are the two levels of time, serial time and pure duration. Serial time is spatial or clock time, whereas pure duration is a ceaseless continuous flow in which all things live and move and have their being. As human beings perfect their ego-hood, they cast off the girdle of serial time and gain a measure of eternity.

Iqbal believes ardently that human beings are the makers of their own destiny and that the key to destiny lies in one's character. He constantly refers to the Qur'anic verse, '**Verily God will not change the condition of a people till they change what is in themselves**' (Surah 13: 12). Humanity's mission on earth is not only to win greater freedom but also to gain immortality, which according to Iqbal: *'is not ours by right; it is to be achieved by personal effort. Man is only a candidate for it'*.

Though humanity is the pivot around which Iqbal's philosophy revolves, yet as pointed out by Schimmel, Iqbal's '**revaluation of Man is not that of Man qua Man, but of Man in relation to God**' (Schimmel 1963: 382). Iqbal's '**ideal person**' is the servant of God. The relation between humanity and God is a personal one; hence the great importance of prayer in the thought of Iqbal. The belief in the one living God gives humanity freedom from all false deities and fortifies it against forces of disintegration. Iqbal sees his concept of the '**ideal person**' realised in the Prophet of Islam, whose life exemplifies all the principles dearest to Iqbal's heart. In his view art, religion and ethics must be judged from the standpoint of the '**Self**'. That which strengthens the '**Self**' is good and that which weakens it is bad. Iqbal does not admit the absolute existence of evil but regards it as being necessary for the actualization of moral purpose as vital activity in the world. His Iblis (or al-Shaytan, Satan) is the counterpart to his '**Ideal Person**'.

### **Iqbal's Conception of God**

Muhammad Iqbal's lifelong project can be summarised as follows:

"The task of restoring God to the public and the private spheres, not in the way it is visualized and enacted nowadays, but in the more subtle and time-tested manner of elucidating the essential relationship between the human and the Divine; reaching for the human heart through his wisdom poetry and, through the medium of his Urdu and English prose, removing obstacles which make it difficult or impossible for the mind to understand."

This is indeed the case. Even a cursory examination of Iqbal's poetic and prosaic works reveal the "center" of his thought, i.e., a pragmatic God. Understood as a reality touching the heart, God is the "life-blood" of his thinking.

Commenting on various definitions of religion, Professor H.J. Paton in his illuminating book *The Modern Predicament: A study in the Philosophy of Religion* (1955) asserts; "For any serious view of religion, it is always possible to find another equally serious, which seems to be its precise opposite".

The same goes for the plurality of views of The Divine. While the existence of a supernatural, sovereign Divine power is rarely called into question and challenged by adherents of various religious systems, their conceptions as to its nature are as obscure and indefinite as are the definitions of the phenomena religion itself. Of course there are many religions, and each will have its distinctive approach. For my part, I will focus exclusively on Muslim religious thought.

Mostly, we have directed insufficient attention to the conception of God in which we believe, and to the manner in which our thoughts and beliefs are influenced by the concept of God we sincerely hold. This is unfortunate, because, as Iqbal makes clear, God is the life-blood of our most intimate convictions. Let us turn to him.

Iqbal recognizes that, for us Muslims, belief in the Diving Being is the the edifice of life (deen). Our very character and conduct of life depend deeply on our convictions about God: how we understand God's nature, God's power, God's relationship to human beings, God's guidance, and how we understand our own place in a wider universe embraced by God. Accordingly, if we are Muslim theologians and philosophers, Iqbal encourages us to to ask following significant questions:

- Do our images of God, The Divine Self, encourage (what Iqbal describes as) a “higher humanity”? Or do they promote and generate sectarianism/fragmentation?
- Do our convictions in God promote planetary well-being or destruction?
- Do our beliefs about God encourage justice, equality, solidarity, freedom and dignity or do belief in God inspire hatred and ill will towards our fellow beings? Is God portrayed as a Creator who works through cohesive, unilateral power (leaving no room for creaturely agency) or through persuasion and mutual partnership?
- Finally yet importantly, does our concept of God create a humanistic focus or a ritualistic one? In order to reform the ossified theological thought in Islam, these questions need adequate and sufficient answers.

### **Turn, then, to how Iqbal himself answered these questions. The Ultimate Ego**

One of the important tasks of modern Islamic theology is to define an adequate concept of God and God's relation to the natural and the human world. Iqbal's aim is to form just such a theistic-naturalistic worldview.

To understand his approach, we can consider Iqbal's **The Reconstruction of Religious Thought in Islam**, which consists of various lectures delivered at different universities in British India. This book reflects Iqbal's intellectual and theological climax, in which he forms a comprehensive system by creative synthesis. Here Iqbal's interpretations of God's omnipotence (all-powerful), omniscience (all-knowing) and God-man relationship differ in a significant way from the orthodox, mystical understanding in Muslim history handed down from one generation to another.

According to Iqbal, God is the Ultimate Ego, the Ultimate Reality, the Perfect Self, the Supreme Ego, the Absolute Self, presented both as immanent and transcendent. God is immanent (in space-time) since God manifests God's very self in the visible domain of nature, as a creative impulse/push towards relative perfection. Says the Scripture (Qur`an): “Unto God belongs the East and the West. Wherever you go, whichever way you turn, there is God's Countenance”.

Yet, God transcends the spatio-temporal arena and exists externally as its ground.

Iqbal, in the third chapter of his *Reconstruction*, says: “The universe cannot be regarded as an independent reality standing in opposition to Him”. God is permanent in His essence, eternal (not infinity of temporal points but a scale of timelessness), yet in the natural world (serial time) every day a new aspect of His creativity and glory is demonstrated and presented to our view.

## God and Omniscience

In classical theology and theism, God is conceived as omniscient being. If omniscient (Divine knowledge) entails “a single indivisible act of perception which makes God immediately aware of the entire sweep of history, regarded as an order of specific events, in an eternal now, then, this, according to Dr. Iqbal, indicates a “closed universe, a fixed futurity, a predetermined, unalterable order of specific events which, like a superior faith, has once for all determined the directions of God’s creative activity”. If we accept the notion of the Divine Will as dependent on an order of specific predetermined events, would not then such a notion be antithetic to God’s living incessant creative activity? And, would not this idea undermine man’s power of free-will? Divine omniscience, according to Iqbal, does not imply a timeless vision of the futurity in its actuality (complete knowledge about what will happen in the future). On the contrary, God knows the actual (the existent) as actual, while the future exists as possibilities to be actualized. Iqbal asserts: “The future certainly pre-exists in the organic whole of God’s creative life, but it pre-exists as an open-possibility, not as a fixed order of events with definite outlines.” Engaged with the notion of Divine knowledge, Iqbal provides the reader (audience) with an illustration to help us in comprehending what he means. He goes on to say:

“... Suppose, as sometimes happens in the history of human thought, a fruitful idea with a great inner wealth of applications emerges into the light of your consciousness. You are immediately aware of the idea as a complex whole; but the intellectual working out of its numerous bearings is a matter of time. Intuitively all the possibilities of the idea are present in your mind. If a specific possibility, as such, is not intellectually known to you at a certain moment of time, it is not because your knowledge is defective, but because there is yet no possibility to become known...”

In other words: God does not know the future in its complete actuality. God does not fully know what the result of any specific event or encounter will be in its totality until it materialises and unfolds wholly in the future. The knowledge of the Divine evolves and “grows” in relationship to the ongoing evolution of the universe. Nevertheless, if a specific possibility or future-knowledge is not known by God at a definite moment of time, then, this does not signify God’s defective omniscient. Rather, it only means, according to Iqbal, that there is yet no future- knowledge to be known because the future events are still in becoming and not wholly settled series of actuality. Such a conception of omniscience does justice to the elements of spontaneity and novelty (freedom) inherent in the make-up of finite egos.

If the future were pre-determined at a higher cosmic level by God then novelty, creativity, human freedom and spontaneity of life would be oxymoronic. Humanity would have been reduced to a fully determined entity, machinelike. Is Iqbal suggesting that God voluntarily circumscribes this scope of foreknowledge of future encounters in order to let freedom exist? This, then, would tend to make omniscience a matter of possessing a quality or potential to know rather than having specific foreknowledge.

We note that Iqbal is sharply departing from the classical notion of God’s omniscience, which portrays the Divine Being both as knower of the visible as well as the invisible. And, since God surpasses the divisible time, to God there is only an “eternal now/present”. Hence, we, the planetary beings, only know what the future holds as the future becomes our present moment. Divine omniscience does not limit future free actions in any way because human beings are capable of utilizing their power of freedom to make decisions. God knows that I will do x or y tomorrow, but God will in no way choose for me when more than one course of action are open to

me.

## God and Omnipotence

Muhammad Iqbal's interpretation of Divine omnipotence is significantly different from the orthodox, traditional understanding. The conventional understanding of divine power states that "nothing happens apart from divine determination or permission, even that which appears to be contrary to God's will for humankind and the world". In other words, God is portrayed as the Ultimate Controlling Power (id est, God controls every single detail of the world's causal process). In the words of Iqbal, "omnipotence, abstractly conceived, is merely a blind, capricious power without limits."

Humankind learns definitions through lived/actual experience. The idea of God as a willful despot and as exercising unilateral power may have historical antecedents. Briefly stated, humanity's notion of God being a capricious and tyrannical power developed under the imperial form of government. Under the monarchic form of organization, the monarchs were mostly tyrannical, vagarious and repressive. The imperial rulers exhibited their capability of power and rule in a whimsical fashion, devoid of order, rhyme or reason. Their dominance over the masses was unilateral, which left no room for mutual partnership. A king could penalize his subjects with no reason other than demonstrating his absolute power and control -- and that, too, in an arbitrary way. Human beings brought up in such fortuitous and dreadful environments associated power, control, authority and sovereignty with tempestuousness, irresponsibility and whimsicality -- the basic properties of tyrants. If these rulers represented the absolute power in human capacity, then, what to say about God? Unfortunately, the masses also considered God as a hyperbolized and glorified king -- the ultimate representation of an absolute, irresponsible and unaccountable ruler destroying everything in its furious course.

Another central point in relation to God and God's omnipotence is the external, natural world. Could such a God provide any inducement for humans to pursue the task of understanding the world, its order and its fixed laws of cause and effect which governed the world's natural courses (scientific development)? Or, ethically speaking, could such a God give human beings the incentive to discover a universal humanism based on equality of the human race, justice, unity, freedom and self-affirmation? In one word, could such a God emancipate humanity rather than enslave it?

I cannot help but to quote a pregnant remark by Professor Alfred North Whitehead (1861-1947), a prominent British philosopher considered as the intellectual father of Christian process theology. Discussing the problematic idea of God as a controlling power, Whitehead writes: "... The church gave unto God the attributes which belonged to Caesar." This is equally true with traditional Islamic theology: the Muslim priests gave unto God the attributes that belonged to kings and monarchs, thus warped the Qur'anic God as a "law-abiding God". This understanding of God still lingers in the collective consciousness of the Muslim community.

Iqbal, as astute and perceptive he was, saw the paralyzing and tragic effects of the "dictator God" in human societies and saw the need to emancipate the Islamic concept of God from the fashioning of God in the image of tyrants and imperial rulers. Relying on the authority of the Qur'an, Iqbal views divine omnipotence not as a blind and unlimited force, but as "intimately related to Divine Wisdom (Hikmah)", and finds the infinite power of God "revealed, not in the arbitrary and the capricious, but in the recurrent, the regular, and the orderly." He goes on to say: "at the same time, the Qur'an conceives God as holding all goodness in His hands." In other words, the Divine Will

does not operate in isolation. Rather, it is an aspect of the Divine ego. God's will, an aspect of His personality, is not destructive and impersonal, but a Will of a God who is good, wise, benevolent and compassionate.

The point, then, is that Iqbal firmly and sincerely believes in our freedom of choice. Freedom of choice and will is not a mere hypothesis but a fact of human existence and consciousness. The psychological argument in favor of human autonomy says: "we intuitively perceive that we are free to choose and act."

In his fourth lecture in the **Reconstruction** (The human ego – his freedom and immortality), Iqbal asserts: "... The ego is a free personal causality". This signifies the finite ego's (human beings) partial self-determination. The human being is not a predetermined creature; determinism does not prevail in the sphere of finite egos, which reigns only in the natural world. For instance, in the natural world (al-khalq), all physical objects and beings are bounded by immutable, permanent natural laws (Kalimàt Ullah). We constantly witness the order, harmony, purpose and regularity exhibited in the natural world (afaq).

As an illustration, please direct your attention to our beautiful solar system: all of the celestial bodies are moving in their prescribed orbits. The planet Earth moves around the sun in its gravitational field. The planets revolve according to set calculations. They will never move and revolve in a haphazardly way. Says the Qur'an: "There is no changing in the Kalimàt of Allah" (10, 64). Turning back to our man, Muhammad Iqbal, he finds sufficient support for his belief in human freedom in the following Qur'anic verse: "If ye do well to your own behoof will ye do well; and if ye do evil against yourselves will ye do it" (17, 7).

As far as human beings are concerned, we are free to choose any course of action, based on his own free will. In other words, in the domain of human beings, the Divine Will ceases to function as a controlling force. Our actions are not determined by an external agency. Rather, we are free to choose between the numbers of possibilities open to him. On this point, an important question arises: If the Divine Will ceases to be a controlling agency in the sphere of humans, does it mean that God's omnipotence and His freedom is confined? Let Iqbal provide the answer. He puts it this way:

"No doubt, the emergence of egos endowed with the power of spontaneous and hence unforeseeable action is, in a sense, a limitation on the freedom of the all-inclusive Ego. But this limitation is not externally imposed. It is born out of His own creative freedom whereby He has chosen finite egos to be participators of His life, power, and freedom".

Put differently, God is not limited by any external ontologically independent being, confronting God as His "other". The only limitation that can be assigned to God is self-imposed limitation, in accordance with God's wisdom and goodness. This self-limitation is a permanent law born out of God's creative freedom.

Therefore, The Divine Self does not lose divine power and freedom by binding itself in divinely chosen laws. Such a God can be relied upon because the divinely chosen laws demonstrate order, permanence and reliability. Despite possessing unlimited power and freedom, God, through self-limitation, does not suspend or break these set calculations. The edifice of science and the predictions we make in the sphere of natural world is a direct result of the permanence and

inflexibility of God's natural laws. God, by these permanent laws, upholds and conserves the world in its being, which gives us control over our external environment and sufficient scope for self-development. Turning to the realm of humans, there are laws controlling the development or debasement of his ego (Khudi). However, man is gifted with freedom of will to either obey or disobey the laws (the law of requital/as you sow so shall you reap). The finite entity is an autonomous self, hence, in the words of Dr. Iqbal "capable of doubt and disobedience". As humans are equipped with freedom, which signifies "private initiative", "God cannot feel, judge and choose for me when more than one course of action are open to me". By this line of thought, Iqbal demolishes the conception of fatalism (determinism) altogether.

Another important question arises on this point: Humanity has partial self-determination, the Divine will does not control his actions. Fine. But, does this imply that human beings are left to fumble in darkness – without any Divine guidance? The deists of the 18th century held and preached such belief. In Iqbal, we find the answer to this important question. Discoursing on the two ways in which the creative activity of God manifests itself to us, he states: "... Khalq is creation and Amr is direction". As stated previously, khalq signifies creation (controlling power in the physical world). Amr, on the contrary, signifies God's directive agency in the domain of human agents. Stated differently, God's amr is His guidance. This guidance is provided in the Revelation, the Qur'an. Says the Scripture: "This is Allah's Amr which He has revealed unto you" (65, 5).

Several points are important to reiterate here. First, to conceive God as a Self/Ultimate Ego signifies that God is a personality and not a principle or abstraction. God is not an object but rather a subject; not a thing but rather a person. Second, God is immanent (in time), which is another way of stating the notion that nature is God's "creative self-expression". Expressed in Iqbalian terminology: "the revelation of the Great I Am". The physical world (in which determinism prevails) is Divine will – an aspect of God – involved in revealing the infinite creativity and riches of His being. Third, The Ultimate Ego also exists outside the spatio-temporal order as its ground. As Professor Mustansir Mir states in his book Iqbal (2008): ... "what is revealed in nature is the symbols, not the person, of God, who, therefore, can also be said to transcend nature since nature points to Him".

Here Iqbal's interpretation of God's omniscience differs from the conventional thinking, which affirms that God has unchanging knowledge (passive omniscience) of the universe and its process. God knows the entire history at a single glance or act of perception; an unchanging eternal "now". For Iqbal, the future preexists in the Divine life but not as a complete actuality (predetermined order of events) but rather as an open possibility.

Finally, Divine omnipotence is not a blind, capricious and unlimited power, but intimately connected with Divine Wisdom and goodness. God, by God's own creative freedom, has limited unlimited power in the domain of autonomous egos in order to let humans exercise their partial freedom of will. Says Prof. Mir in Iqbal (2008): "...The freedom of the human ego implies, equally, the ego's ability to choose good and evil..." Right actions (birr) generates enrichment of his Self, whereas harmful actions (sharr/ithm) hampers his creative self-actualization.

Divine unilateral control robs the finite ego's capability of freedom (rihun), and reduces him to the status of a mechanical object. Such a view is diametrically opposed to the Qur'anic notion of human autonomy, which involves also moral accountability as every calculated act (high degree of ego-involvement) affects his personality (according to set laws of cause and effect/Qanoon-E-

mukafat-E-amal). Hence, taqdeer is not to be understood in the sense of fatalism (necessity), which negates human freedom, morality and transformation, but the range of possibilities open to man which he is free to select between.

The concept of God presented by Iqbal radically departs from the one advanced by traditionalists in various historical socio-political contexts. In the beginning I used the term pragmatic to describe Iqbal's reformed God. The use of the term entails that the Qur'an fixes its gaze on the concrete realities of human life and not on mere universals or intellectualism. Put differently, the Qur'anic God is not a God "in the heavens" or the abstract God of the philosophers' mental activity.

Iqbal remarks: "... A mere intellectual belief in God does not count for much in Islam." Rather, says Dr. Iqbal, "... The wisdom of Islam consists in exploiting the idea of God in the interest of Man ..."

In his **Reconstruction of Modern Religious Thought**, Iqbal adds details to this idea by pointing out that "... tawhid is only a practical means of making this principle a living factor in the intellectual and emotional life of mankind." It also demands "... loyalty to God, not to thrones." Loyalty to God implies adherence to the Revelation of God (the Qur'an), which is a book (al-kitab) comprising "basic principles of a universal import directing the evolution of human society on a spiritual basis."

### **Iqbal, God and Reformation**

The Muslim peoples in the Western world are on a daily basis confronted with questions concerning the ability of Islam in meeting out the exigencies of the constantly changing environments of human life, and if Islam is compatible with the spirit of democracy and human rights.

Regarding the issue of Islam and reform, Iqbal boldly affirms the belief in the capacity of Islamic Law to evolve with altering conditions of life. This affirmative reply is grounded on his conception of God, which paved the way for the "principle of movement in the structure of Islam". The principle he is referring to is *ijtihad*, translated as "the hermeneutical principle of creative, independent reasoning", an indispensable tool in the system of Islamic socio-political economic life. God, the Ultimate Reality, is "the spiritual basis for all life," He has a permanent aspect (His essence) and a changeable aspect revealed in the universe. Iqbal goes on to say in his *Reconstruction*:

"a society based on such a conception of Reality must reconcile, in its life, the categories of permanence and change. It must possess eternal principles to regulate its collective life, for the eternal gives us a foothold in the world of perpetual change. But eternal principles when they are understood to exclude all possibilities of change which, according to the Qur'an, is one of the greatest "signs" of God tend to immobilize what is essentially mobile in its nature."

Stated differently, the democratic activity is integral in the Islamic collective life. However, in order for that democratic, *ijtihadic* activity to play its essential role, we need to understand the nature of Sharia. Sharia, far from being a divinely formulated body of Islamic law, inflexible and changeless, is only a human construction in understanding the Divine Will enshrined in the Holy Scripture. There is nothing divine about Shariah. The dysfunctionality of the Islamic Law is due to the exclusion of the category of "change" and a blind adherence to bygone historical scriptural interpretations. Hence the ossified religious thought and behavior of Muslim peoples, incapable of growth and creative transformation.

An attentive reading of Dr. Iqbal's book **The Reconstruction of Religious Thought in Islam**, his wisdom poetry, letters, masterly written articles and statements on various topics, reveal his highly humanistic and democratic view of Islam as a God-centered and creature-centered living, firmly grounded in the Holy Scripture, the prime source of his life-enhancing voice. The aim of Islam as a living principle is the perfection of humanity as a whole by joining God in His process of creative transformation.

Muhammad Iqbal played his active part in the life of his Maker. He challenged the detrimental and highly entrenched religious conservatism, the deleterious socio-political and economic structures of his times by propagating the Qur'anic message of interconnectedness of all life and an Islamic humanism based on man's innate dignity. Iqbal made it crystal clear that humans are the shapers of their own destiny; that God is the God of the progressive human beings. It is up to us now to carry on, despite hostile forces, the torch of human dignity, freedom and creative unfolding within time.

### **Iqbal's concept of man**

In *Payam-I-Mashriq*, Iqbal draws a fine picture of man's creation in a famous poem "Taskin-Fitrat" (Conquest of nature). The first section of poem is titled "Milad-I-Adam" (The birth of Adam), he points that the creation of man generated excitement and commotion in the universe. Man made of clay is, in fact a centre of creativity and dynamism and gifted with forces of action, appreciation and intelligence. The glory of man, Iqbal lies in fresh activities while as other creation of the universe are busy in routine activities. In Iqbal's philosophical order, man becomes perfect or immortal when he knows his innate potentialities by taking the initiative to bring about changes in nature as well as in the social and moral world around him. In the *Javid Nama*, the voice of God addresses man thus:

Life is both mortal immortal.  
It is all creativity and eagerness.  
Man of truth! Be sharp and incisive.  
And become the destiny of their own world.

Iqbal evaluates the idea that the sincere endeavor of man is to see the truth face to face, through introspection to contemplate ultimate reality including the world and even beyond. The utility and vitality of man, Iqbal lies in his strength and power, *ya Qavi* (the most powerful) is itself God's Attribute. According to Iqbal, the human ego, in its development towards perfection, has to pass through three stages:

1. Obedience to the law.
2. Self control i.e. the highest form of self consciousness.
3. Divine vicegerency.

Obedience to the law and self-control, according to Iqbal, play a great role in the development and fortification of the human ego, but he preferred to regard them as representing mile stone on the upwards march towards the goal of attaining the state of perfect man, or superman. Obedience to the law, along with other favourable, tends, to train the ego for the second evolutionary phase where it attains perfect self-control, in its turn prepares the ego for the third and last stage of human development i.e. divine vicegerency.

According to Iqbal the third stage in the development of the self is *Niyabat-I-Ilahi* (the vicegerency

of God). Although man already possesses the germ of vicegerency (Quran 2:28) “not man as he is now, but man purified through obedience, self dominion and detachment, can reach the high station of divine vicegerency”.

Iqbal describes the perfect man in superlative, he is the completest ego, the goal of humanity, of the life, both in mind and body; in him the discord of our mental life becomes a harmony. This highest power is united in him with the highest knowledge. In his life, thought and action, instinct and reason, become one. He is the last fruit of the tree of humanity, and all the trials of a painful evolution are justified because he is to come at the end. He is the real ruler of mankind; his kingdom of God on earth.

Nature must undergo long and painful travels to bring to birth the perfect man. The vicegerent is a creator and interpreter of values he is “the goal of life’s Caravan” the ruler of all things that God created. Man is the deputy of God on earth. And over the elements his rule is fixed.

Iqbal’s perfect man, then though a co-worker with God, is not a breaker of divine law. He is the master of all things but a slave to God.

According to Iqbal, the moral and religious ideal of man is not self annihilation but self-realization. He can attain this ideal by becoming more and more individual, more and more unique. Prophet Muhammad (SAW) said, “Takhallaqu Bi-akhlaq Allah” create in yours self the attributes of God. Thus man becomes unique by becoming more and more like the most unique individual i.e. God. To him, physically and spiritually man is as self-contained center, but he is not yet a complete individual. The greater his distance from God, the smaller his individuality. He who comes nearest to God is the completes person but he is not finally absorbed in God. On the contrary, he absorbs God into himself. The perfect man not only absorbs the world of matter, rather, by mastering it, only absorbs the God himself into his ego.

Iqbal believes that the strength of a perfect man is paramount and supernatural. He draws a fresh vigor and vitality from his faith, and God’s will and might are on his side. Mountains cannot block his path, nor can oceans offer a hindrance. Describing the perfect man, Iqbal says:

A perfect man’s hand is the hand of God,  
Dominant, creative resourceful, efficient,  
Human but angel like in disposition, servant with the masters attributes.  
His carefree heart is  
in different to the riches of either world.

He is reasons last goal; he is the harvest of love. In the wide world, he sets all spirits ablaze. In Iqbal’s view, man can transfer both his being and his surroundings according to his own desires and inspirations. In fact, he makes improvements upon God’s creation. For instance, God created night, man made the lamp, God created clay, and out of it he made the cup. God created deserts, mountains and forests, and he made parks, flower gardens and groves. Its man, who turned stone into a mirror and it, is he who turned poison into an antidote. God creates the world, but man made it more beautiful. To Iqbal, the perfect man is ultimate goal of the evolutionary process of the world, and he is to develop out of his present stuff (self) just as the full moon is developed out of the crescent. Iqbal’s Mardi-Momen (The perfect man) possesses immense power and strength, and can change the destiny of people so, in a challenging mood, he asked and exclaimed:

Who can imagine the strength of his arm (perfect man)  
Destines are changed at the mere glance of a perfect man.

Again he says God intoxicated Duwamish is neither of the East nor of the West. His home is neither Delhi, nor Isfahan nor Samarqand. Unlike Plato, Iqbal's Man is not a man of the world of ideas. His perfect man belongs to this world of reality. He was not satisfied with merely converting kings into philosophers and philosophers into king; rather, his goal was to turn every man into perfect man, who may establish the kingdom of God on earth. Iqbal's Mard-I-Kamil (perfect man) is much more than Plato's philosopher and king combined together. For, while Plato's philosopher king was a representative at a state and belonged to an aristocrat class, Iqbal's Mard-I-Kamil was a Divine vicegerent of God on earth and a true representative of man kind. Iqbal man is superior to Plato's philosopher – king, as he is the real representative of socialism and humanism. As Iqbal was interested in the reconstruction of society, so he believed that an ideal man (perfect man) is also must in the formation of an ideal society or world community. Iqbal's Mard-i-Kamil (perfect man) is a man of this world, and belonged to all man kind and lived in all time and clime, as he is an impartial being. He is a true representative or viceregent of God on earth.

Iqbal's wisdom visualizes a new man of future society, a comprehensive all round develop personality. His future man is indeed Mard-i-Mumin (man of faith), God fearing with aesthetic tastes and the ability to create of a just social order. This personality for Iqbal is Sawar-I-Ashab (white rider horse of time) and deadeye Imkan Biya (splendid eye of future) where emergence from innumerable deserts is the message of glorious future. Allama Iqbal enhances this perfection in the finality of prophet of Islam P.U.H.

Its flames burned a hundred Abrahams:  
That the lamp of one Muhammad (SAW) might be lighted.

### **NIETZSCHE, IQBAL AND POST-MODERNISM: Concept of superman**

German thinker and writer, Nietzsche, was a multi-faceted genius who initiated the idea of ontological post-modernism. His conception of Superman is a declaration of a post-modern age and the end of the era of Man. His theory of "will to power" influenced philosophers and writers such as Heidegger, Jasper, Jean-Paul Sartre and the poet Rilke. He was not only influential in Western culture; his impact is visible on Eastern culture as well.

Allama Iqbal was basically an Eastern poet-philosopher but he was inspired by the idea of Superman presented by Nietzsche. According to him, man is not the ultimate goal of history and his value cannot be determined without the meaning of Superman. Superman is a guiding star of the entire world. The centrality of Man was challenged by him and the highest achievement is Superman.

Iqbal's conception of the perfect man was an idea of history and culture. He was inspired by Rumi and Nietzsche, and presented his idea of the perfect man. Iqbal was not satisfied by the status of Man. He was moving towards the idea of Superman and his idea was extremely limited. The transcendental element is absent from Nietzsche's idea of Superman. Iqbal admires Nietzsche and his powerful Superman, but he adds spirituality to the idea.

In his famous book *Thus Spake Zarathustra*, Nietzsche says "Be faithful to Earth". But Iqbal's view

is the unification of Eastern and Western values. In the East, Man's spirituality is as important as his material being and Superman is Man plus the spiritual and transcendental elements. His Superman goes beyond the earthly bounds and touches the highest peak of perfection that is known as *Insan-i-Kamil*. Iqbal's famous line is as under:

اے سوارِ اشہبِ دورانِ بیا  
اے نروغِ دیدہ امکاں بیا

Iqbal's Superman is the realization of the highest possibility of being, and the spiritual elements make him the crown of the universe.

This very conception of Superman inspired Derrida, Heidegger and Foucault. The post-modern era is basically the era of the Superman. The centrality of Man was challenged by post-modernists and they presented a philosophy of the new cultural phenomena, Literature, anthropology, aesthetics and all other important disciplines deviated from the idea of Man. Post-modern's include other topics such as legendary figures, myth and other areas of imagination.

*Insan-i-Kamil* or perfect man is basically a concept of the Muslim thinker, Al-Jili, According to him, the perfect man revealed himself in prophetic grace and Iqbal's view of Superman was a combination of Nietzsche and Al-Jili, and according to Iqbal, the Prophet of Islam (Peace be upon him) was a complete and perfect being who inspired history, culture and the entire humanity. He is an exemplary perfect man for the entire humanity, as he writes:

آدمی یا جوہرے اندر وجود  
آن کہ آزد گاہے گاہے در وجود

Apart from his Islamic view of Man, Iqbal's Superman is the conqueror of time and space. The rider on the horse of time and the light of possibility who makes Iqbal conscious of his absolute necessity for the evolution of history and Man. It is omega point for the spiritual evolution of Man.

Post-modern thinkers such as Derrida and Foucault believe in the superiority of coming Man or post-modern Man, as he is the ultimate goal of history and culture, and post-modern culture is basically a culture of Superman. Iqbal's thought is partly post-modern, but he does not agree with the post-modernists who deny the spiritual element and transcendental reality as the guiding star for humanity.

According to post-modern philosophers, the idea of Man presented by the Renaissance thinkers cannot be a model for historical development and the cultural evolutionary process. Man was their basic concern, and not the entire universe, including all beings. Iqbal and his philosophical message of selfhood or *khudi* is not limited to Man and his mode of existence. *Khudi* is universal and all the beings are moving towards perfect *khudi*, according to their different status of being, as Iqbal says:

خودی کی زد میں ہے ساری خدائی

Iqbal's post-modernism is basically spiritual, ontological and contains an idealistic element. The objectives of *khudi* are not limited. They are as infinite as the ideal Man who never realizes and does not take the objective form, but moving towards the infinity or the absolute being, as Iqbal says:

خودی کا سر زہاں ال الہ بالابلا  
خودی ہے نیرغ نساں ال الہ

According to Iqbal, the birth of *Khudi* is the first ontological event and this ontological process in the universe makes all things move. And this process does not terminate in the being of Man, but moves on and on. Life and death are just passing phases, and not the objectives of *Khudi*.

حیات و موت زہوں البذات کے النور  
نہیظ خودی ہے خودی کی نگاہ کا مقصود

Idealism of the self is the shining star of the creation and is a permanent incentive to human imagination. The literary and creative process is inspired by his ideal of *Khudi*, and human imagination realizes the essence hidden in human imagination.

**Note:** This assertion, often encountered in the facile writings in Iqbal Studies, can hardly stand the test of verification through Iqbal's works and a deeper study of Nietzsche's own ideas. Facing a similar objection, Iqbal himself dismissed the possibility by pointing out to the critic that he had not read Nietzsche when he wrote the verses that are usually interpreted as harbouring a concept of man that, apparently, resembled Nietzsche's idea of the superman.

## Intellect And Intuition According To Iqbal

*Move beyond the Intellect, as this Light,  
Merely illumines the path, but is not the destination*

*Aql* or Intellect, a faculty which has amazed man from his first realization of being in possession of it, has been the source and cause of much debate amongst Muslim philosophers for the past 13 centuries or so. The Neoplatonic philosophers called it NOUS, the first thing emanating from the First Cause, i.e God. Muslim Philosophers took the ideas of the Greek philosophers to a new level by scrutinizing it in light of the Quran and hadith and attuning it accordingly.

According to a hadith of the Prophet (SAW) of Islam, the first thing created by God was the Pen. Muslim Scholars are generally in agreement that the Pen here is synonymous with the Intellect, thus collaborating with the Greek/Neoplatonic belief of the Intellect as the first thing created.

The word *Aql* comes from the root *ql* which means to bind. The intellect or *Aql* actually serves to bind an individual to God by furnishing him with true knowledge, a knowledge of reality, and endowing him with the ability to distinguish between Reality and Falsehood. The Stoics called it "Natural Light," by which one can distinguish between the good and the bad, while Muslim scientists like Ibn Sina and Al Farabi were of the opinion that *Aql* must lead to praiseworthy conduct, therefore an individual of bad character, no matter how sagacious, is not an *Aqil*, *Aql* here pertaining to wisdom, hence *Aql* has also been referred to as *fitrah* and *tabiah*, an inherent, integral part of the soul.

Generally, when we refer to *Aql* or Intellect we appear to be referring to a rational means of attaining knowledge. There is, however, a more direct and immediate method for acquisition of knowledge which surpasses reason, a faculty generally known as intuition and referred to in

Muslim philosophy as *hads, basirah, nazar, fouad*, etc. The seat of intuition is purely the heart or *qalb*, where it receives direct participation in Divine knowledge or *ilm* without the aid of rationality.

However, intellect and intuition must not be seen as two different faculties but as sub-faculties of *aql*, being two different modes of knowledge procurement. Islam, being a proponent of Unity in all faculties, has never seen dichotomy between the intellect and intuition, but sees both as part of a hierarchy of methods used in the acquisition of knowledge.

While Intellect or rational thought may be seen as that rational part of consciousness that assists us in our practical life – all cognitive processes include and comprise thought, Intuition goes a step further. It provides thought with the flight it needs to discover the Ultimate Truth – instead of remaining caged up within mechanical mental processes.

Iqbal in his works has dwelled incessantly upon the topic of the intellect and intuition in Islam and the meaning and importance it holds in the life of an individual. Iqbal defines knowledge as “sense-perception elaborated by understanding.” According to him, there are two modes of acquiring this knowledge, one is by creating a connection with the external Reality through sense perception, through the sensual and the rational; while the other is through direct association with Reality as it reveals itself at an internal level, within the heart of the individual.

Intellect... in the words of the great mystic poet of Islam, “only waylays the living heart of man and robs it of the invisible wealth of life that lies within.” (Reconstruction, Lecture 2)

In the interests of securing a complete vision of Reality, therefore, sense-perception must be supplemented by the perception of what the Qur’an describes as *Fu’ād* or *Qalb*, i.e. heart.

The “heart” is a kind of inner intuition or insight which, in the beautiful words of Rūmī, feeds on the rays of the sun and brings us into contact with aspects of Reality other than those open to sense-perception. It is, according to the Qur’an, something which “sees”, and its reports, if properly interpreted, are never false. (Reconstruction, Lecture 2)

Throughout his works, especially his poetical works, Iqbal describes an ongoing struggle and tussle between Intellect and Intuition, the former referred to as *Aql*, while the latter as it emanates directly from the heart, referred to as *Ishq* not only by Iqbal but in most Sufi literature as well, including Rumi. Love, heart and intuition have been used interchangeably in Sufi Islamic poetry, just as we see it throughout Iqbal’s works.

The perpetual struggle between *Aql* and *Ishq* is due to the fact that reason and intuition oftentimes tend to lead a person in opposite directions, both in their colliding interests, reason putting fetters on the individual and his thought, while intuition bestows upon thought the wings to fly, turning it into Imagination. Sometimes, according to Iqbal, true knowledge is not possible without that leap of faith which one can take only under the guidance and assistance of intuition and love, compelled by the heart.

*Love is the first guide for the Intellect, Heart and Vision,  
In the absence of love religion and dogma are mere idols of illusion!*

In his Persian work *The New Garden of Mystery*, Iqbal asks nine fundamental questions about life

and existence, the first being about Thought, which encompasses both rational thought and intuition.

*What Light there is within the heart of Man,  
A light that is manifest in spite of its invisibility.  
I saw it in the constancy of change,  
I saw it both as light and fire.  
Sometimes its fire is nourished by argumentation and reasoning,  
Sometimes its light is derived from the breath of Gabriel*

Hence, for Iqbal both Intellect and Intuition apparently belong to the single faculty of thought, which when taking in ground realities appears as rational thought and when lifted by the wings of imagination turns into intuition.

Nor is there any reason to suppose that thought and intuition are essentially opposed to each other. They spring up from the same root and complement each other. The one grasps Reality piecemeal, the other grasps it in its wholeness... In fact, intuition, as Bergson rightly says, is only a higher kind of intellect. (Reconstruction, Lecture 1)

Islam and Islamic thought essentially focuses on unity of phenomena, and therefore sees rational thought and Intuition both as a continuation of thought, merely different modes of knowledge procurement, or apprehending Reality, which form a hierarchy, much like a ladder – as the individual ascends the steps, he or she utilises increasingly superior modes of knowledge acquisition.

*One leap of faith ended this pothole,  
I had imagined the cosmos to be boundless!*

It is in fact, Modern science that has created a dichotomy between Intellect and Intuition, seeing a wide chasm between the two. Attributing all mental and cognitive processes to the brain and thus as the organ from which thought arises, modern science has completely negated the role of the heart which has been referred to as the seat of “wisdom” and “intuition” by the Quran and all mystic and Sufi literature.

Very interestingly, however, neuroscientists have quite recently discovered the heart to possess its very own nervous system, quite independent of the brain, and capable of not only making its own decisions but also of “influencing” the decisions made by the brain. So there we have it – “intuition” not only assisting, but actually influencing “thought.” This discovery may serve to reaffirm the role assigned by the Quran to the heart as the seat of true knowledge, wisdom, intuition and love.

### **Tagore: Religion of man**

Tagore sets forth a new religion, which he calls the "Religion of Man." The Religion of Man differs radically from most organized religions, in the way it defines God; in its views on the origins of man and the cosmos, on revelation, and on authority; and in its commandments.

God is defined as the Universal Spirit, the Spirit of Life, the Eternal Spirit of human unity beyond our direct knowledge, the Super Soul that permeates all moving things, the Supreme Person, Man the

Eternal. This God dwells not in the heavens but in the heart of every human being.

The creation myth of this religion is the story of evolution. The first stage of Life's evolution was the physiological process, which seems to have reached its finality in man. The second stage of evolution, the spiritual process, is continuing. The evolutionary process has as its ultimate goal, not the attainment of Heaven or of nirvana or satori, but the release of each individual's consciousness from the illusory bond of the separate self and the realization of the spiritual unity of all human beings.

Truth in the Religion of Man is not that which was revealed only to a chosen few in the distant past. It is not reached through the analytical process of reasoning. It does not depend for proof on some corroboration of outward facts or the prevalent faith and practice of a group of people. Rather, the truth is revealed to every person every day, if we but listen. Truth comes like an inspiration and brings with it an assurance that it has been sent from an inner source of divine wisdom. This truth comes through an illumination, almost like a communication of the universal self to the personal self.

Every human being is capable of experiencing such illumination (the mystical experience). Although some people are more successful at actualizing this potentiality than others, most people have had at one time or another at least a partial vision of the universal unity. Furthermore, we can each increase our power of realization through "disciplined striving"--through our participation in nature, literature, arts, legends, symbols, and ceremonials, and through the remembrance of heroic souls who have personified this truth in their lives.

The truth, Tagore says, is inside us, like a song which has only to be mastered and sung. It is like the morning which has only to be welcomed by raising the screens and opening the doors.

Tagore calls Zarathustra the first prophet of the Religion of Man. Zarathustra, who spiritualized the meaning of sacrifice, was the first to address his words to all humanity, regardless of distance of space or time. He emancipated religion from the exclusive narrowness of the tribal God, the God of a chosen people, and offered it to the Universal Man.

The only commandment in the Religion of Man is that the individual who has realized the Divine Truth accept his or her responsibility to communicate this truth in word and deed to others.

Tagore stresses that his understanding of the Religion of Man came to him through his personal experience of the holy, not from knowledge gathered or through any process of philosophical reasoning. However, he acknowledges that certain factors enabled him to be receptive to these visions. One was the feeling of intimacy with Nature that he had from early childhood. Another formative experience was the songs he heard from wandering village singers, belonging to a popular sect of Bengal, called Bauls. The Bauls, who have no images, temples, scriptures, or ceremonials, express in their songs an intense yearning of the heart for the divine which is in Man. In addition, from childhood, he was immersed in the philosophy of the Upanishad, which holds that the world is pervaded by one supreme unity and that true enjoyment can be found only through the surrender of our individual self to the Universal Self.

Tagore believed that the task of the poet and artist is to direct our attention to the Infinite and to remind us that it ever dwells within each of us.

## **Rabindranath Tagore on education**

As one of the earliest educators to think in terms of the global village, Rabindranath Tagore's educational model has a unique sensitivity and aptness for education within multi-racial, multi-lingual and multi-cultural situations, amidst conditions of acknowledged economic discrepancy and political imbalance. Kathleen M. O'Connell explores Rabindranath Tagore's contribution.

**Rabindranath Tagore (1861-1941)**, Asia's first Nobel Laureate, was born into a prominent Calcutta family known for its socio-religious and cultural innovations during the 19th Bengal Renaissance. The profound social and cultural involvement of his family would later play a strong role in the formulation of Rabindranath's educational priorities. His grandfather Dwarkanath was involved in supporting medical facilities, educational institutions and the arts, and he fought for religious and social reform and the establishment of a free press. His father was also a leader in social and religious reform, who encouraged a multi-cultural exchange in the family mansion Jorasanko. Within the joint family, Rabindranath's thirteen brothers and sisters were mathematicians, journalists, novelists, musicians, artists. His cousins, who shared the family mansion, were leaders in theatre, science and a new art movement.

The tremendous excitement and cultural richness of his extended family permitted young Rabindranath to absorb and learn subconsciously at his own pace, giving him a dynamic open model of education, which he later tried to recreate in his school at Santiniketan. Not surprisingly, he found his outside formal schooling to be inferior and boring and, after a brief exposure to several schools, he refused to attend school. The only degrees he ever received were honorary ones bestowed late in life.

His experiences at Jorasanko provided him with a lifelong conviction concerning the importance of freedom in education. He also realized in a profound manner the importance of the arts for developing empathy and sensitivity, and the necessity for an intimate relationship with one's cultural and natural environment. In participating in the cosmopolitan activities of the family, he came to reject narrowness in general, and in particular, any form of narrowness that separated human being from human being. He saw education as a vehicle for appreciating the richest aspects of other cultures, while maintaining one's own cultural specificity. As he wrote:

I was brought up in an atmosphere of aspiration, aspiration for the expansion of the human spirit. We in our home sought freedom of power in our language, freedom of imagination in our literature, freedom of soul in our religious creeds and that of mind in our social environment. Such an opportunity has given me confidence in the power of education which is one with life and only which can give us real freedom, the highest that is claimed for man, his freedom of moral communion in the human world.... I try to assert in my words and works that education has its only meaning and object in freedom—freedom from ignorance about the laws of the universe, and freedom from passion and prejudice in our communication with the human world. In my institution I have attempted to create an atmosphere of naturalness in our relationship with strangers, and the spirit of hospitality which is the first virtue in men that made civilization possible. I invited thinkers and scholars from foreign lands to let our boys know how easy it is to realise our common fellowship, when we deal with those who are great, and that it is the puny who with their petty vanities set up barriers between man and man.

As well as growing up in a household that was the meeting place for leading artists and intellectuals from India and the West, Rabindranath had a further experience which was unusual for someone of his upbringing. In the 1890s, he was put in charge of the family's rural properties in East Bengal.

His first experiments in adult education were carried out there as he gradually became aware of the acute material and cultural poverty that permeated the villages, as well as the great divide between the uneducated rural areas and the city elites. His experiences made him determined to do something about rural uplift, and later at Santiniketan, students and teachers were involved with literacy training and social work and the promotion of cooperative schemes. As an alternative to the existing forms of education, he started a small school at Santiniketan in 1901 that developed into a university and rural reconstruction centre, where he tried to develop an alternative model of education that stemmed from his own learning experiences.

Rabindranath composed his first poem at age eight, and by the end of his life, had written over twenty-five volumes of poetry, fifteen plays, ninety short stories, eleven novels, thirteen volumes of essays, initiated and edited various journals, prepared Bengali textbooks, kept up a correspondence involving thousands of letters, composed over two thousand songs; and – after the age of seventy – created more than two thousand pictures and sketches. He dedicated forty years of his life to his educational institution at Santiniketan, West Bengal. Rabindranath's school contained a children's school as well as a university known as Visva-Bharati and a rural education Centre known as Sriniketan.

## **Key ideas**

Rabindranath did not write a central educational treatise, and his ideas must be gleaned through his various writings and educational experiments at Santiniketan. In general, he envisioned an education that was deeply rooted in one's immediate surroundings but connected to the cultures of the wider world, predicated upon pleasurable learning and individualized to the personality of the child. He felt that a curriculum should revolve organically around nature with classes held in the open air under the trees to provide for a spontaneous appreciation of the fluidity of the plant and animal kingdoms, and seasonal changes. Children sat on hand-woven mats beneath the trees, which they were allowed to climb and run beneath between classes. Nature walks and excursions were a part of the curriculum and students were encouraged to follow the life cycles of insects, birds and plants. Class schedules were made flexible to allow for shifts in the weather or special attention to natural phenomena, and seasonal festivals were created for the children by Tagore. In an essay entitled "A Poet's School," he emphasizes the importance of an empathetic sense of interconnectedness with the surrounding world:

We have come to this world to accept it, not merely to know it. We may become powerful by knowledge, but we attain fullness by sympathy. The highest education is that which does not merely give us information but makes our life in harmony with all existence. But we find that this education of sympathy is not only systematically ignored in schools, but it is severely repressed. From our very childhood habits are formed and knowledge is imparted in such a manner that our life is weaned away from nature and our mind and the world are set in opposition from the beginning of our days. Thus the greatest of educations for which we came prepared is neglected, and we are made to lose our world to find a bagful of information instead. We rob the child of his

earth to teach him geography, of language to teach him grammar. His hunger is for the Epic, but he is supplied with chronicles of facts and dates...Child-nature protests against such calamity with all its power of suffering, subdued at last into silence by punishment. (Rabindranath Tagore, *Personality*, 1917: 116-17)

In Tagore's philosophy of education, the aesthetic development of the senses was as important as the intellectual—if not more so—and music, literature, art, dance and drama were given great prominence in the daily life of the school. This was particularly so after the first decade of the school. Drawing on his home life at Jorasanko, Rabindranath tried to create an atmosphere in which the arts would become instinctive. One of the first areas to be emphasized was music. Rabindranath writes that in his adolescence, a 'cascade of musical emotion' gushed forth day after day at Jorasanko. 'We felt we would try to test everything,' he writes, 'and no achievement seemed impossible...We wrote, we sang, we acted, we poured ourselves out on every side.' (Rabindranath Tagore, *My Reminiscences* 1917: 141)

In keeping with his theory of subconscious learning, Rabindranath never talked or wrote down to the students, but rather involved them with whatever he was writing or composing. The students were allowed access to the room where he read his new writings to teachers and critics, and they were encouraged to read out their own writings in special literary evenings. In teaching also he believed in presenting difficult levels of literature, which the students might not fully grasp, but which would stimulate them. The writing and publishing of periodicals had always been an important aspect of Jorasanko life, and students at Santiniketan were encouraged to create their own publications and put out several illustrated magazines. The children were encouraged to follow their ideas in painting and drawing and to draw inspiration from the many visiting artists and writers.

Most of Rabindranath's dramas were written at Santiniketan and the students took part in both the performing and production sides. He writes how well the students were able to enter into the spirit of the dramas and perform their roles, which required subtle understanding and sympathy without special training.

As Rabindranath began conceiving of Visva-Bharati as a national centre for the arts, he encouraged artists such as Nandalal Bose to take up residence at Santiniketan and to devote themselves full-time to promoting a national form of art. Without music and the fine arts, he wrote, a nation lacks its highest means of national self-expression and the people remain inarticulate. Tagore was one of the first to support and bring together different forms of Indian dance. He helped revive folk dances and introduced dance forms from other parts of India, such as Manipuri, Kathak and Kathakali. He also supported modern dance and was one of the first to recognize the talents of Uday Sankar, who was invited to perform at Santiniketan.

The meeting-ground of cultures, as Rabindranath envisioned it at Visva-Bharati, should be a learning centre where conflicting interests are minimized, where individuals work together in a common pursuit of truth and realise 'that artists in all parts of the world have created forms of beauty, scientists discovered secrets of the universe, philosophers solved the problems of existence, saints made the truth of the spiritual world organic in their own lives, not merely for some particular race to which they belonged, but for all mankind.' (Tagore 1922:171-2) To encourage mutuality, Rabindranath invited artists and scholars from other parts of India and the world to live together at Santiniketan on a daily basis to share their cultures with Visva-Bharati. The Constitution designated Visva-Bharati as an Indian, Eastern and Global cultural centre whose goals

were:

1. To study the mind of Man in its realisation of different aspects of truth from diverse points of view.
2. To bring into more intimate relation with one another through patient study and research, the different cultures of the East on the basis of their underlying unity.
3. To approach the West from the standpoint of such a unity of the life and thought of Asia.
4. To seek to realise in a common fellowship of study the meeting of East and West and thus ultimately to strengthen the fundamental conditions of world peace through the free communication of ideas between the two hemispheres.
5. And with such Ideals in view to provide at Santiniketan a centre of culture where research into the study of the religion, literature, history, science and art of Hindu, Buddhist, Jain, Zoroastrian, Islamic, Sikh, Christian and other civilizations may be pursued along with the culture of the West, with that simplicity of externals which is necessary for true spiritual realisation, in amity, good-fellowship and co-operation between the thinkers and scholars of both Eastern and Western countries, free from all antagonisms of race, nationality, creed or caste and in the name of the One Supreme Being who is Shantam, Shivam, Advaitam.

In terms of curriculum, he advocated a different emphasis in teaching. Rather than studying national cultures for the wars won and cultural dominance imposed, he advocated a teaching system that analysed history and culture for the progress that had been made in breaking down social and religious barriers. Such an approach emphasized the innovations that had been made in integrating individuals of diverse backgrounds into a larger framework, and in devising the economic policies which emphasized social justice and narrowed the gap between rich and poor. Art would be studied for its role in furthering the aesthetic imagination and expressing universal themes.

It should be noted that Rabindranath in his own person was a living icon of the type of mutuality and creative exchange that he advocated. His vision of culture was not a static one, but one that advocated new cultural fusions, and he fought for a world where multiple voices were encouraged to interact with one another and to reconcile differences within an overriding commitment to peace and mutual interconnectedness. His generous personality and his striving to break down barriers of all sorts gives us a model for the way multiculturalism can exist within a single human personality, and the type of individual which the educational process should be aspiring towards.

Tagore's educational efforts were ground-breaking in many areas. He was one of the first in India to argue for a humane educational system that was in touch with the environment and aimed at overall development of the personality.

Santiniketan became a model for vernacular instruction and the development of Bengali textbooks; as well, it offered one of the earliest coeducational programs in South Asia. The establishment of Visva-Bharati and Sriniketan led to pioneering efforts in many directions, including models for distinctively Indian higher education and mass education, as well as pan-Asian and global cultural exchange. One characteristic that sets Rabindranath's educational theory apart is his approach to education as a poet. At Santiniketan, he stated, his goal was to create a poem 'in a medium other than words.' It was this poetic vision that enabled him to fashion a scheme of education which was

all inclusive, and to devise a unique program for education in nature and creative self-expression in a learning climate congenial to global cultural exchange.

## **Rabindranath Tagore: Nation and Nationalism**

Before we examine Tagore's idea of nationalism, it would be prudent to first comprehend as what he intended by the very notion of nation. Nation according to Tagore was not defined by ethnicity, geography, language or any other external factor, as many of us would believe, but by a shared tradition, purpose and commonality of being (Chaudhuri 2017). There should be no ambiguity that he discarded the idea of a nation where the nation becomes more influential and greater against the people who created it. This idea of nation was often endorsed by the colonizer countries that saw the nation above its citizens. The European nationalism always placed the nation above people and therefore, nation not the people of the nation were at the helm of day to day affairs. Thus, national security, national pride, economy, power subsumed the interests of ordinary people such as their living conditions, health, education, etc. (Patnaik 2016). He saw the birth of nationalism in the various European countries as the result of technological advancement and modern science. He demonstrated various negative fallouts of the nationalism which took birth in Europe and impacted internally and at the international arena. In his legendary lecture on Nationalism which he delivered in 1916, he said that west's success in the field of science and technology has led to dehumanization and increasing greed for power.

Nationalism instilled unbridled lust for power and money within the society which resulted in continuous degradation of moral values, dignity and severe condition of the labor class. This race for power and money encouraged colonizers to move beyond their territory and search for colonies where they can exploit the resources to accomplish their unending lust for wealth (Chakrabarty 2009).

In a letter dated 1909-1910, he said, "And what is the harvest of your civilization? You do not see from the outside. You do not realize what a terrible menace you have become to man. We are afraid of you. And everywhere people are suspicious of each other. All the great countries of the west are preparing for war, for some great work of desolation that will spread poison all over the world. And this poison is within our own selves. They try and try to find some solution, but they do not succeed, because they have lost faith in personality of man" (Tagore, *The English Writings of Rabindranath Tagore: A Miscellany* 1994).

In the Indian context, Tagore was convinced that there was no word like 'nation' in the Indian languages. Nationalism in India like in Europe was an urban phenomenon in the 19th century. He was fundamentally against any such attempt made in the name of nationalism, for nation or patriotism, to mobilize people for the so-called national cause. In a letter to his friend A.M Bose, he said, "Patriotism cannot be our final spiritual shelter. I will not buy glass for the price of diamonds and I will never allow patriotism to triumph over humanity as long as I live." (*Selected Letters of Rabindranath Tagore* 1997).

For him the fight that India was taking against the British rule was not the fight to take the nation back and decolonize the political authority; it was rather a spiritual fight, which aimed liberation of individuals from meshes of national pride, chauvinism, and national egoism. He gave more importance to freedom and wanted the realization of freedom to start flowing from the individual to community and then from community to universe, ultimately it will reach from the universe to infinity (Urwin 1968).

He opined that the very idea of nationalism is non-Indian or anti-Indian. He saw the seed of nationalism in India as an onslaught against Indian civilization which was religiously and culturally plural in nature. The story of 'Ghare Baire' demonstrates how nationalism led to disruption and decay of community life (Nandy 2006). He resolutely believed that this country had a unique personality which ought to be preserved. In his celebrated lecture 'Swadeshi Samaj' he contended that in the west it is the state which takes the central responsibility of welfare. People in the west are heavily dependent on the state. In contrast to this society in India is diverse, here the source of strength radiates from the society and the state. Things like health, education, and trade are primarily done in accordance with the 'dharma', which is acknowledged by the people and is not subject to the charity or benevolence of the ruler or king.

Consequently, it was the society and not the state that got priority and Tagore further elaborated the very nature of Indian society which was organic in nature. He said that if we look at the historical journey of different civilizations, it was the political and not social system which was predominant. However, in the case of India and China, the society took the dominant position and political system was subservient to it. Both these two countries flourished through the collective role of society (Gupta 2005). He emphasized the fact that it should be the society and not lust for power, resources, and colony that a nation should aspire for. Here Tagore noticeably indicates that India should restore its spiritual genius and should not run madly after the material things (Mehata 2015). Tagore acknowledged the fact that west has mastered the material realm very successfully, however, in the process of doing this west has also shattered the spiritual harmony resulting in the menace of imperialism everywhere.

Nationalism in the west created a chain of war and conflict and failed to establish a spiritual bonhomie. He wanted west to learn spirituality from the east because the menace of industrialization and imperialism has eroded the spiritual element from the western societies. He was of the opinion that west has succeeded materially but is living under acute spiritual poverty. However, it is because of values such as freedom, equality, and fraternity that despite being very critical about nationalism that took birth in the west and subsequently took the form of colonialism and imperialism, Tagore was very appreciative of what he calls the 'spirit of the west'.

He championed the idea of east-west dialogue instead of confrontation where both can learn from each other. In his different essays, Nationalism in Japan, Nationalism in the west and Nationalism in India, he marked a categorical distinction between 'spirit of West' and 'Nations of the West'. He saw an evident difference between western civilization and western nations. The 'extremist nationalists'<sup>2</sup> in India who were to an extent, inspired by the western nationalism could not impress him for the method and cause they were planning to embark on a struggle against the British authority to set this country free. When the split in Congress party occurred in 1907 in Surat Session, Tagore distanced himself from the extremist league. He found that extremist nationalists had no concerns for the real problems such as illiteracy; malnourishment and education in India (Mohanty 2015). What is important to note here that Tagore was in no way less patriotic to anyone, however, his patriotism was about the realization of potential by the country and not hatred for others.

"I am willing to serve my country, but my worship I reserve for right which is far greater than country. To worship my country as a God is to bring curse upon it," Tagore said in his famous novel 'The Home and the World' (Tagore, The Home and The World 1919).

One has to look for the reasons very carefully as to why the man, who penned down the National Anthem of this country, was against the prevailing conception of nationalism in India. Was he really opposed to any form of Nationalism? If we look at factors that worried most to Tagore and often found its place in the popular idea of nationalism, these were the exclusionary and self-aggrandizing features of which he was not at ease.

He was certainly against the militant and aggressive nationalism. Narrowly defined idea of nationalism and patriotism was not acceptable to Tagore. In his illustrious work, 'the Imagined communities' Anderson says that identity plays a very critical role in the consolidation of a group of people who in effect constitute a nation. Such identities are formed on the basis of language, territory, culture, and religion. When we talk of such things, we inherently create a space of we vs. they, our culture vs. their culture, our language vs. their language and likewise.

This exclusionary element in the whole project of nationalism made Tagore uncomfortable.

First, we create an atmosphere of we vs. they and then try to establish ourselves superior in every possible manner. Thus, the very project of nationalism got entangled with things like aggression, chauvinism, hate culture and animosity.

Doing this we often create an enemy to fulfill such things. The poet perceived such elements in nationalism abysmally poor and abhorred nationalism that is formed on the basis of such things.

Therefore, what we find is that Tagore was not against nationalism as long as it does not entail things like aggressive posturing, self-aggrandizement, feeling of hatreds and creating 'enemy within and outside.' He lamented Indian nationalism because, for many Indian nationalists and countrymen, nationalism was about driving British authority out of the country and have rule by Indian people over different institutions. Despite addressing Gandhi as a nationalist here, it should be noted here very categorically that Gandhi's idea of freedom was not merely to kick out British rule from India. Gandhi in his classical conception of 'Swaraj'<sup>3</sup> which includes Swaraj in economic, Political Individual- level have a very different idea of freedom which is not restricted to driving out British authority only, instead, he emphasized on things like self-restraint, duty over right and likewise.

If the nationalism was about boycotting foreign products and rule just because they were not Indian, Tagore certainly did not subscribe to such agenda. He had no quandary even if the British authority continues to rule in India. The only condition was that people from the lower strata of society and those who were marginalized, their condition should be alleviated. He saw that under British rule India had ceased to be creative in the cultural domain. He never championed the cause to oppose the British rule just because the English people were not Indian and that they were standing in the way of political freedom of India. Moderately he saw foreign rule good for the Indian people particularly to the lower caste people because the Englishmen started attempts to eradicate untouchability and accommodating in jobs and services. He was conscious of the fact that anti-west tendency which was very widespread in any Indian movement against the British authority would prove as an obstacle for India's cooperation with the rest of the international community. He as a result, discredited, Noncooperation movement launched by Mahatma Gandhi in 1920s.

Tagore found that this movement was full of blind national smugness and anti-west outlook. He was very much concerned and apprehensive about this anti-west propensity which was gaining currency day by day in India. For him if this happened and the country chooses the path of isolation, then India would be unable to find the prospect to be integrated with the mainstream of international transactions (Chakrabarti 2015). When Gandhi gave a call for Boycott of foreign goods and launched mass movements such as non-cooperation, civil disobedience to drive the British rule out of India, Tagore saw it as Gandhi and other leaders falling prey in the agenda of nationalism whose ultimate aim was merely to throw the foreigners out of the country.

His antipathy to this noncooperation movement was broadly due to four main reasons. First, as we already discussed he was not pleased with the idea of boycott of the government school in the absence of any other educational institution. Second, he was not impressed with the idea of burning of the foreign clothes and production of Khadi through spinning wheel. Thirdly, he was skeptical about the nature this movement was taking. He believed that this movement was being more and more focused on the sins of the British rule thus encouraging this spirit of isolation which according to him was not good for the broader view of humanity (Gupta 2005, 43). He has criticized three social groups who according to him had no love for this country and were merely serving the interest of their foreign masters. These three groups were western-educated political leaders, intellectuals and western-oriented rulers; mostly Zamindars. He found that Zamindars had accumulated wealth by exploiting the poor in India and were serving the interests of Englishmen. He was very critical about the leaders who were involved in the sycophancy of Britishers and crossed the limit. Instead of doing that, Tagore wanted them to establish a direct relationship with the mass. He tried to offer a new life to India through his efforts such as education and rural reconstruction.

The foundation of 'Visva Bharti' was led to the conviction that it would provide an alternative to the colonial education system and will facilitate people to realize the self. It was precisely this reason that when boycott movement was on its peak and political leaders gave a call for boycotting of government schools, Tagore abhorred this decision because there were no other alternative schools for education and boycotting the government schools tantamount to depriving the young children of education. In a letter to C.F Andrews he expressed his opinion as to why he does not consider the boycott of government-sponsored school is a good idea. He said by boycotting government schools, our students, 'are bringing their offering of sacrifice to what? Not to a fuller education but to a no education.'

"I remember the day, during the Swadeshi (freedom) movement in Bengal, when a crowd of young students came in the first floor hall of our Vichitra House. They said to me that if I would order them to leave their schools and colleges they would instantly obey. I was emphatic in my refusal to do so... the reason of my refusing to advise those students to leave their school was because the anarchy of mere emptiness never tempts me... I could not lightly take upon myself the tremendous responsibility of a mere negative programme which would uproot their life from its soil, however thin and poor that soil might be" (Bhattacharay 1997).

Nevertheless, Mahatma was convinced and justified the boycott movement and said government schools and colleges 'rendered us helpless and godless' because of the training imparted there in government schools and colleges. He worked on multiple fronts such as education, eradication of caste system, rural reconstruction. If someone is geared up to do such things in the name of nationalism, Tagore would merrily be part of that nationalist club. He was very much critical about

the western education. Not only that, but he was also against everything being derivative of the British fashion. According to him everything coming from the west is not good for this country and therefore the country must preserve its identity. He wanted India to adopt things from the west which were of pressing demands and suits this country.

Thus, what we find is an unprejudiced approach coming from Tagore regarding East-West debate. In his well-known satirical essay 'Kot and Chapakan' he called for national identity and wearing dress was part of that national identity. He also criticized all those Indians who were cheerfully wearing western dresses but not allowing their wives to do the same thing. At the time when Rammohan Roy was championing the cause of English as the language of instruction, Tagore asserted and supported the Bengali language as a medium of instruction. In an article titled as 'Engraj O Bharat Basi' expressed his dissatisfaction against the English rule on the ground that British has failed to make India their home, British people did not learn the language of this country. He was aggrieved by the kind of treatment British authority handed over to the Indians.

When Gandhi asked Tagore's opinion regarding use of Hindi as national language, he replied that Hindi was the 'only possible national language at the inter – provincial level subject to a period of preparation to 'pave the way towards its general use by constant practices as a voluntary acceptance of a national obligation' As a result, despite having much serious difference between them, both revered each other. Mahatma called him 'Gurudeva' and Tagore was the first to call Gandhi 'Mahatma'. Gandhi wrote a letter to Tagore and asked his message on the 'national struggle' in early April 1919. In reply, to this letter Tagore addressed Gandhi as 'Mahatma' and 'great leader of men'.

In his reply Tagore reaffirmed his faith and said that 'India will win freedom when she can prove that morally she is superior to the people who rule her by right of conquest'. What is interesting to note here is that fact that both Mahatma and the poet- philosopher collectively believed that nationalism was the offshoot of the western nation- state system. He himself was a modernist and therefore when Mahatma gave the call for use of Charkha (Spinning Wheel), Tagore questioned this proposal. He asked how long this country can afford to remain in isolation and kept away from world trade. In the light of this, Mahatma responded to Tagore's critique of his Charkha Program and said Tagore has rejected his excess of Charkha Program.

All he knows (Tagore), about this movement (Swadeshi Movement) is what he picked up from table talk. Further, poets have the 'poetic license' of exaggeration and consequently, his words should be taken literally. This exaggeration constituted the misunderstood notion that Gandhi was calling to use Charkha all the time. On the other hand, contrary to this, what Mahatma truly intended was the use of Charkha half an hour a day by those (employed and unemployed) who can afford other means of livelihood and not depend entirely on Charkha (Bhattacharay 1997).

Correspondingly on the issue of Indian Nationalism both Gandhi and Tagore differed with each other. Gandhi was of the view that to achieve internationalism one must go through nationalism first, in a similar way, war is indispensable before someone reaches to peace. Gandhi reiterated his firm faith that non- cooperation is simply a refusal to cooperate with British authority on their terms. "We say to them, come and co-operate with us on our terms, and it will be for us, for you and the world.' We must refuse to be lifted off our feet. A drowning man cannot save others. In order to be fit to save others, we must try to save ourselves. Indian nationalism is not exclusive, nor aggressive, nor destructive. It is health giving, religious and therefore humanitarian" (Gandhi 1921).

"It was love of foreign clothe that ousted the wheel from its position of dignity. Therefore, I consider it a sin to wear foreign cloth. I must confessthat I do not draw a sharp or any distinction between economics and ethics" (Pakhare 2015).

Additionally, Gandhi's call to use of Charkha should not be seen as isolation because Gandhi was not appealing for mere use of Charkha alone instead Charkhawas seen by Gandhi as an instrument that can lead to the path of rural cooperation and self-sufficiency. It was also seen by Gandhi as an instrument to restore dignity of individuals and strengthen their might against foreign system that crushed this indigenous wheel and those who operated it. Tagore was questioned by many who were enthusiastically involved in the national movement, on his views on Internationalism, when this nation itself was under the foreign yoke, how could someone talk about internationalism? However, suchcriticisms could not deter him of his views on Internationalism which was imagined for humanity at large and not for any particular country.

### **Concluding Remarks**

Tagore a person blessed with poetic, philosophical, and original thinking stood firmly against the mighty wind of nationalism blowing in the 19th century.

Regardless of having some fundamental differences with Mahatma, a towering figure in Indian national movements with a strong support base, Tagore never compromised what he believed about things like nation, Indian nationalism, idea of India, and methods that most political leaders were taking, and therefore he never desisted speaking against Gandhi and other political leaders. He was no lesspatriotic to anyone else; however, mere political freedom was never in his priority list. Wellbeing of the humanity (including east and west) was the paramount concern for him. His ideas and teachings are so profound that it still has all- inclusive global appeal. In the 21th century when the world is facing many grave humanitarian crises including forced migration, racial discrimination, genocides and ignorance to the cause of marginalized, it is high time for us to revisit what Tagore had to say. He fought till his last breath to shield the cause of suppressed and downtrodden. And hence, discarded the formation of any state whose agenda merely is to build up state power at the cost and ignorance of its citizens.

In India where despite many developmental and social efforts we are still witnessing unprecedented widening of the gap between rich and poor, discrimination based on caste, gender, and color, abysmal performance in health,education, and livelihood, this compelled us to think the Tagore's idea of India.

When the country is again debating on different aspects of nationalism at the costof ignorance of things previously mentioned, it is high time that we should march on the path guided by Tagore and bring back people to the center again. This is however not to say that India as the nation has botched completely. Without a doubt India has come a long way from where she was 70 years before; the only purpose to bring the idea of Tagore is to guide how as a nation we have to march forward. Things like hyper- nationalism about which Tagore had warned us is again tightening its grip all across, resulting in ethnic cleansing, degradation of human dignity, poor livelihood, and ignorance to the common cause. And therefore, not only in India, Tagore's messages are pertinent to the whole worldbecause for him, in the center, it is the concern for humanity at large.

## **The real idea of swaraj**

ON the day of India's Independence in August 1947, Mahatma Gandhi refused to join the nationwide festivities and remained in the riot-torn district of Noakhali in East Bengal to restore peace between Hindus and Muslims.

ON the day of India's Independence in August 1947, Mahatma Gandhi refused to join the nationwide festivities and remained in the riot-torn district of Noakhali in East Bengal to restore peace between Hindus and Muslims. That dark shadow of despair still haunts every time we think we need to celebrate our 'independence'. It was characteristic of Gandhi that he questioned the authenticity of independence in the aftermath of the Partition violence. But more importantly, he began to feel that colonisation had made deep inroads into the Indian mind and needed to be undone urgently.

He had written Hind Swaraj in 1909 as his manifesto for ideological independence when the attainment of swaraj was the immediate task facing colonial India.

Gandhi draws a subtle distinction between swaraj as self-rule and swaraj as self-government or home rule. Swaraj as self-rule is the rule of the self by the self or more precisely, the rule of the mind over itself and its passions. As swaraj is something that is capable of being experienced within oneself, the inner experience of self-rule enables the citizens to reinforce their political ethics by their conduct, in harmony with their native genius.

Gandhi was suspicious of the modern West primarily because of its obsessively materialistic world view. To him a culture, which did not have a theory of transcendence, could not be morally or cognitively acceptable. The legitimisation of the modern West as a superior culture came from an ideology, which viewed oriental societies as inferior to the occidental ones. With the acceptance of this ideology, the superiority of the West became an objective criterion of evaluation of other cultures. Even a liberal like JS Mill endorsed this civilisational partition of the world and used the very doctrine of liberty to justify the imperial rule over the world.

Gandhi felt that it was necessary to revitalise tradition to protect autonomy of the individual. Living through the era of British imperialism, and when the most insidious effects of colonialism were showing in India, he was anxious to teach the Indians that 'modern civilisation' posed a greater threat to them than did colonialism and that in any case colonialism itself was a product of modern civilisation. At the heart of Western modernity is the faith that reason alone will lead inevitably to a progressively better future. Gandhi held that the great weakness of modern civilisation was its failure to understand the nature and limits of reason. In his view modernity displaces other modes of thinking and moral points of reference, such as those found in religion and tradition which speak to the moral and cooperative nature of man and challenges the self-interests that are lodged in a person and in a society. Tradition was a resource, a source of valuable insights into the human condition, and part of a common human heritage. He therefore became a resolute critic of modernity.

Gandhi valorises traditional India for as much as it was able to maintain a certain openness of cultural boundaries, a permeability that allows new influences to flow in and be integrated as a new set of age-old traditions. These two processes of inflow and outflow, rather than a rigidly defined set of practices, determine Indian culture at a given point of time. Since Gandhi's Hinduism reaffirmed the non-canonical and the folk, his was a defence not of a religion or theology but of an

open-ended way of life on the assumption that, with such a base, Indians would cope better with modernity. His distrust of modernity has found echoes among many political and environmental movements around the world.

To be sure, there is nothing wrong in embracing elements of another culture, no matter how different it is from one's own. The point is that neither Western modernity nor indigenous tradition must be blindly accepted or rejected. Gandhi, one of the most original minds of the 20th century, did not want his house to be 'walled in on all sides and his windows to be stuffed'. He wanted the culture of all lands to be blown about his house as freely as possible but refused 'to be blown off' his feet by any.

In October 1931 the philosopher KC Bhattacharya delivered a lecture called 'Swaraj in Ideas', which echoed Gandhi's Hind Swaraj and warned against 'the so-called universalism of reason or religion' which, being the result of a rootless education, stood more than anything else in the way of 'swaraj in ideas'. He talks about 'cultural subjection' vitiating the very springs of our intellectual and moral life, which persists even today. According to Bhattacharya, 'there is cultural subjection only when one's traditional cast of ideas and sentiments is superseded without comparison or competition by a new cast representing an alien culture which possesses one like a ghost'. His lecture exhorts Indians to shake themselves free from it.

Bhattacharya concludes his lecture thus, 'we condemn the caste system of our country, but we ignore the fact that we who have received Western education constitute a caste more exclusive and intolerant than any of the traditional castes. Let us resolutely break down the barriers of this new caste, let us come back to the cultural stratum of the real Indian people and evolve a culture along with them suited to the time and to our native genius. That would be to achieve swaraj in ideas'. How the words ring true after seven decades of our Independence!

## **Concept of Philosophy**

K.C. Bhattacharyya's concept of philosophy cannot be understood by the accepted philosophical methods. There can be an approximate definition of his philosophy. In his philosophy, Bhattacharyya deals with pure self-subsistent object which has no spatio-temporal existence. For him, philosophy elaborates the concept of the self-subsistent object. In philosophy, the object has necessary reference to the subject which is not found in the case of science. For K.C. Bhattacharyya, philosophy is theoretic thinking. It does not deal with objects as fact but as self-subsistent realities. It is not related with facts like science.

Philosophy does not study facts or properties of object which are knowable or usable. Thus, for Bhattacharyya, the contents of philosophy are not literally thinkable. Philosophical thoughts are symbolic. Philosophy is the expression of theoretic consciousness or thoughts. Thus philosophical concepts are transcendental concepts which come from consciousness reflective attitude.

In his philosophy, Bhattacharyya distinguishes between grades of thoughts on which on the one hand, science or empirical thought and on the other hand, philosophy are located. Then he makes a distinction between grades of philosophic thoughts. They are –

- (a) empirical thought that involves reference to an object. Here content is distinct from the thought;
- (b) pure thought that has reference of content not distinguishable from it;
- (c) Philosophical concepts are transcendental concepts which emanates from consciousness's

reflective attitude.

Here content is not understood except the fact that it is spoken. So speakability is the necessary trait of philosophic thought.

Thus, Bhattacharyya confines contents of philosophy in to those which are speakable. In a real judgment, the predicate explicates the meaning of the believed subject. But in philosophical judgment, the subject is believed to be the self-evident elaboration of the predicate which is already believed as self-evident. So "philosophical judgments are self-evident elaboration of the self-evident which is spoken, not spoken of."

The central idea of K.C. Bhattacharyya seems to be that as we speak of everything including the Absolute, so everything is speakable. The speakable is of two kinds, the symbolically speakable and the literally speakable. The literally speakable comprises what is spoken of for information and symbolically speakable is what is only spoken, but not spoken of. What is only spoken is either as symbolized or as meant. Truth is only symbolically spoken, reality is literally spoken as symbolized, and self-subsistent is literally spoken as meant. None of these is spoken as information, while fact is spoken as information.

Thus K.C. Bhattacharyya takes, Truth, Reality, self-subsistent and fact as the four kinds of objects of speech. The difference between Truth and Reality is that while the latter is enjoyed, the former is not. Truth is believed as independent of speaking, as self-revealing. Truth is that in which there is nothing to be distinguished from, and is absolute in this sense. The absolute may be truth; it may also be freedom and value. Bhattacharyya's realization of freedom is a process of dissociation. For him, freedom is freedom from both 'being' and 'negation'.

Freedom is a process of dissociation of consciousness from the objective mode to the transcendental one. K.C. Bhattacharyya supports the philosophy of Abstract Monism. He does not attempt to interpret or expound Samkara's doctrine; but tries to defend its truth by a new approach through the philosophy of Immanuel Kant. He is not satisfied with the agnosticism of Kant with regard to the ideas of Reason. According to Kant, none of the categories of understanding are applicable to the things in themselves and they are, therefore, unknowable. At this point, Bhattacharyya joins issue with Kant and follows the Upanisads which declare Brahman to be beyond speech and thought and yet not unknowable.

## **Concept of Freedom**

The concept freedom examined by K.C. Bhattacharyya is highly original. His concept of freedom has some resemblance with that of Advaita Vedanta and Kant. His style of description of the concept freedom expresses his creative thinking. His approach to freedom is not primarily social and ethical. It may be considered as ontological and epistemological. He describes gradual revelation of freedom in the world, in our relation to world of objects, within the contexts of psychological and psychical subjectivity and beyond them. He is in search of freedom as reality. K.C. Bhattacharyya does not consider physical and other aspects of freedom as unreal, but only as transitional, facilitative of real freedom.

Theory of the Subject In K.C. Bhattacharyya's philosophy the subject occupies an important place as he considers the subject as freedom. To make people clear about his concept of freedom, Bhattacharyya gives a very detailed and clear explanation of the subject as distinct from the

object. Like Advaita Vedanta, the subject or the self is conceived as consciousness and interpreted as free function or freedom. The subject is only known in itself and felt to be free from the object.

Bhattacharyya says, "The subject is said to be distinct and therefore distinguishable from all objects."<sup>2</sup> The subject has a being of its own, which from the ultimate standpoint has no relation with the object. He considers subject as an entity but not a meant entity like the object. The subject is the source of all « meanings. He translated 'meaning' in two different ways- one is that which refersto some object and the other is self-contained, which does not refer to any object other than itself. So it can be said that the subject's consciousness of the object is in a relative sense, free from the causal compulsion of the objective world. The subject is only known in itself and felt to be free or dissociated from the object.

This indicates that the subject can disengage itself from the objects of the causal world including other subjects.

So it is seen that in the philosophy of K.C. Bhattacharyya, the subject is taken to be distinct from the object. The subject is known in itself, but the object is known in relation to the subject. The object is not known with the same certainty as that of the subject. The subject appears as a known fact, only as it is spoken of through a personal pronoun. The subject is free from the object as it is known by itself. The subject is not related to the object either in the way of identity or distinction. In this regard, we can mention the name of Immanuel Kant who draws a distinction between "thinkable transcendental subject and the knowable empirical subject."<sup>3</sup> But Kant makes this distinction from the empirical standpoint. K.C. Bhattacharyya holds, "the subject is known though neither thought nor intuited."<sup>4</sup> For him, subject is known as we have some awareness of the subject. The subject is known by itself. It is not known as related to objects. So it is different from the subjects that understand. The subject knows itself as T without being meant by it. T indicates the depth of the subject. When the speaker expresses itself in T, it indicates freedom of the subject as it dissociates from the object. A subject as a self-expression of itself is a self evident fact. This subject is not found in introspection. The introspective awareness of the subject is not a subject as itself. Subject in introspection, being free, but not freedom itself as it is still the object of the process of introspection. Thus subject's expressing of itself as T is indicative of freedom of the subject. Subject symbolizing its freedom in 'I'. It is freedom which has no being, but not expressible as negation of being. It is absolute freedom. This subject is absolutely unobjective or freedom itself. The subject is definitely positive.

Spiritual freedom means the realization of the subject as free. The cultivation of such freedom is in the subject's being itself. The subjective function of knowing which is not known as a fact has to be known as a self evidencing reality of the subject itself. This involves modes of freedom from the object.

The stages of freedom or different grades of subjectivity are-

- (1) the bodily subjectivity
- (2) psychical and
- (3) spiritual subjectivity.

## **Bodily Subjectivity**

For K.C.Bhattacharyya, freedom is attained not in a spontaneous manner, but through gradual stages. There is no freedom in the subject so long it remains identified with the external body. There are three stages within the subject when identified with the body. Firstly, the subject remains identified with the physical body. Secondly, the subject gets identified with the internally felt body. Thirdly, the subject remains one without identification with its body.

In the first stage, the body as observed and felt is the subject in relation to the environment. One's own body has a unique singularity even as a member of the objective world. Objectivity of other perceived objects are constituted by their position relative to the percipient's body; the percipient's own body cannot be taken to be so constituted. One's own body is uniquely different from other perceived object. If the subject is taken as one's own perceived body, it involves knowledge of something that cannot be explained in terms of materialistic principle. He says, "It implies the mystic awareness of dissociation from the object in which bodily subjectivity consists."

One's own body is not only perceived from outside. One can sensuously be aware of it also from within in the feeling of the body. In body feeling, we are not aware of it as distinguished from the perceived body. In felt body, freedom or subject's dissociation from object is more manifest than in the level of the perceived body. There is more freedom in the level of the felt body than on the level of perceived body. The felt body is not a completely non-perceptual psychic fact. The felt body is a perceived body with some indefiniteness. Because, felt body cannot be conceived as occupying a definite position. The distinction between the perceived body and felt body can be compared to the distinction between perceived object and its presentation in some nonperceptual knowledge. In introspection of the psychic fact, the felt body begins to resolve into bodiless psychic feeling. The feeling of detachment from the object is the feeling of freedom and the first hint of this freedom is reached in the feeling of the body.

K.C.Bhattacharyya states, "The realization of freedom from the felt body is the pre-condition of all distinctive spiritual activity." K.C.Bhattacharyya also considers knowledge of absence as a present fact. Generally, objective facts are considered as present or absent. The objects that are present are present in a spatio-temporal situation. Those that are not present in spatio-temporal contexts are considered as absent. Bhattacharyya considers absence as present. So for Bhattacharyya, an object may even be 'present as absence'. Absence is present in a spatio-temporal context. Absence is known by conscious non-perception. Like the feeling of the body, there is also a feeling of detachment here. The direct knowledge of the present absence of an object is a detachment both from the perceived object and the perceived body but not from the felt body. The cognition of absence by the sense is not ordinary perception and is yet non-dissociated from it. There are two cases of direct cognition of absence in a locus- one, of the absence of an object in a locus, and the other, of an object being absent in a locus. In the one, perceived locus of absence is imagined in the very perception of it as without the absence, and the absence is thus felt to be dissociated from the locus. Absence is considered as being nowhere though it is believed to be an objective fact. Here there is no actual imagination of the position-less objective fact but only the feeling of detachment or absence from objective space. This sort of perception of absence may be called imaginative perception. In the other case, the knowledge of an object being absent is present with conscious imagination of the object as found distinct from it as absent.

## **Psychic Subjectivity**

At the second stage of subjectivity, the subject is quite detached from the body but remains identified with the image or thought. The image is the first stage in the realization of the subjective point of view or subjectivity. The image appears is presented as something substantive distinct from the perceptible object. Though image is a fact, it is not in the sense of an object. The image has no spatio-temporal position. Image is known to be without position. The image involves in the perception of object, in the perception of one's own body and in imaginative perception of absence is not felt to be dissociated from the percept. The image potentially dissociated from object is realized in thought. Introspective viewing of the image is understood as functional and substantive as Bhattacharyya points out, "Image is functional and yet does not cease to be substantive."<sup>7</sup> It is functional as the subject's distinguishing from the object remains identified with image. As image emerging from object, it negatively refers to object. From a subjective standpoint, image is to be understood as dissociated from object. The next psychic stage is thought. The idea of an object that cannot be defined or imagined is thought. Bhattacharyya states, "Thought is the awareness of the unimaginability of its specific content."<sup>8</sup> It involves complete dissociation from objectivity though it is about the object. He says, "Thought is still about the object but it is of something about the object that is definitely unobjective."<sup>9</sup> The content of thought is independent of space-time context. The thought possesses meaning, as thought cannot be unmeant. Meaning is within thought. It is definite in itself and is fixed in the mind by the images which strike the mind. It is not the pictorial thought which lies between the definite form and definite intelligence.

Object of thought is definitely presented as unpicturable meaning. Still it is something about the object and is called lower grade of thought. The thought involves a belief in its possible objectivity. It implies that thought has to make some reference to object. The term 'reference' is not to be taken as external or independent object. But Bhattacharyya has pointed out that objectivity of thought is to be understood, in terms of 'dissociation', not of reference. When thought is 'unobjective' and involves a complete detachment from objectivity, it is called higher grade of thought. Thought in its higher grade is detained in the mind by the word, not by its figurative representation. It is complete as dissociated altogether from time and is in this sense, eternal.

In this psychical stage, the subject may remain identified with the image or thought at the beginning and gradually this subject will try to achieve freedom from them. This identification with the image is the lowest stage of psychical existence of the subject. The subject takes itself to be an image or thought and then gradually realizes freedom from cognitive experiences. The subject dissociates itself from thought at a higher stage and realizes considerable freedom.

When the subject gets detached from its images and pictorial idea, then it identifies with non-pictorial ideas. The subject then attains a higher stage of freedom. At this stage, the subject remains identified with pure ideas. When the subject dissociates itself from ideas, it achieves a high degree of detachment and begins to have spiritual status.

## **Spiritual Subjectivity**

When the subject dissociates itself from ideas or concepts, then it reaches the third stage. This is the spiritual stage of subjectivity. The highest realization of the subject is achieved at this stage. Spiritual progress means realization of the subject as free. For K.C. Bhattacharyya, "To spiritual subjectivity, the psychical is objective and so to psychic subjectivity, the bodily and to bodily subjectivity the extra-organic is objective." There are three spiritual stages. At the first stage, the subject identifies with its feeling. Feeling is explicitly unobjective like thought, as there is no

objective reference here. Bhattacharyya says, unlike thought, it is "positive as subjective fact without any reference to objective fact." Thus feeling follows from the process of dissociation. It is introspective awareness of meaning. It is not however merely negative but positive as a subjective fact without any reference to objective fact. It is purely subjective in the sense that there is no conscious reference to object even in the sense of dissociation from it. So the content of feeling is not distinct from it, it is not known. Feeling is the positive consciousness of detachment from meaning. It is the awareness of content as unmeant. In introspection of feeling, the distinction of feeling from its presentative content is not definitely known but only felt and symbolized. Feeling as detached from meaning may be taken as implicitly introspective. Again unlike thought, feeling is never outside introspection as it has no content outside it.

There are two stages of feeling-

- lower stage and
- upper stage.

In the lower stage, there is the freedom from actual thought and in the higher stage there is the freedom from possible thought. The lower grade is the feeling of self-being and the higher grade is one of self-negation, here self is absent in a way. Possible thought is linked with actual thought. The feeling of self-negation is itself a feeling. Feeling may be its own content. It can be characterized as the feeling of feeling. There are forms of feeling beyond the range of thought. Through feeling, the subject may explore and attain another feeling of a deeper kind.

In the second stage subject identifies with introspection. Introspection is essentially possible detachment from all distinct being and is conscious identity without being of the self. Here the self is the first person 'I', the speaker who is not an object of introspection; it is simply the function of speaking. The word 'I' is neither meanable nor unmeanable. The word T has a meaning-function but not a meaning. It is the expression of introspection or the I-function. The word T has no meaning either to the speaker or to the hearer and yet it stands like any other word for the same thing to both. It indicates a grade of self-consciousness higher than our actual introspection. Actual introspection is unrealized knowledge because it is actually only self-evidencing to another and not self-evident to itself. This stage is one of the subject's identification with introspection. No mental states apart from subject exist here. The introspective subject is free from being or possible objectivity and is thus freedom itself.

In the last stage, the subject identifies with the stage beyond introspection. It is a stage in which self is realized not as self-evidencing to another but self-evident to itself. Here the self is intuited by oneself. The possibility of self enjoying T is intelligible when one is free from all subjective states. The absolute intuitable self is understood in a non-being state. For this, a spiritual discipline is necessary.

Then, the subject begins to have a spiritual status in which it transcends the level of spiritual introspection. Here subject realizes it as itself. When the subject dissociates itself from the stages beyond introspection, it is a stage of eternal freedom.

## **Subject as Freedom**

Thus, it is observed that 'freedom is subject as itself. The subject is understood as freedom that is real and is characterisable by no objective category, not even by the category of distinctness. To know the subject as actually itself is freedom. The awareness of the subject as absolutely

unobjective or freedom itself is not the awareness of mere negation or of an indefinite. In the stage of complete freedom, the experience of freedom also lapses or disappears. The subject is expressed as 'I' by the speaker. But K.C.Bhattacharyya's interpretation of the word T is very difficult to grasp. He tries to point out that T as a word is self-expressive. But it is not in the case of T's meaning. Because for Bhattacharyya, what 'I' means is not the word 'I', but 'I' as the subject, as self-expression, as the source of meanings.

He makes a distinction between the linguistic 'I' and the ontological 'I'. He says that the meaning of 'I' as understood by the speaker is different from the meaning of 'I' as understood by the hearer. When the speaker says 'I' it indicates something which is not understood by the hearer. But the hearer can grasp though incompletely, what the speaker means by 'I'. The subject 'I' cannot be identified with the object. Though 'I' is individualized in the body, 'I' is not introspectively aware of it. K.C.Bhattacharyya tries to show the basic character of the subject in another way. Subject is known in itself, whereas object is known as distinguished from subject. Object is linked with the subject. Without subject, object has no meaning. But the subject is not linked with the object in the same way. Subject may be known by introspection, by inwardizing consciousness. This involves abstraction from object. But this abstraction is not total and therefore introspective self-knowledge remains in a way object-linked. K.C.Bhattacharyya says, "The reality of the subject is known in the direct understanding of the word T as used by a speaker, which is neither the understanding of its meaning nor a mystic intuition of an unspeakable content." No meanable truth is self-evidencing. It implies that meanable truth which cannot be denied to be truth has to be realized as self-evidencing by the spiritual cultivation of subjective attitude.

K.C. Bhattacharyya tries to realize subject as free reality not only by the spiritual cultivation of subjective attitude but also by different grades of nonperceptual knowledge, different modes of representation. He says that our bodily 'I' may be known from within and that knowledge need not be perceptual. The internally felt body is not an object of the observable world. Yet it is believed as observed body in the sense of its character of internality. Secondly, what our self is may be immediately apprehended from its absence. This cannot be said to be known by external perception at least in the ordinary sense but is known from its present absence in the spatio-temporal context. Thirdly, memory also enables us to grasp in a way what self or 'I' is. Fourthly, productive imagination can also help us to realize T, the subject proper. The subject in the productive imagination is not really concrete, but is available in the forms of glimpses only. Finally, there is the possibility of the inferential knowledge of the self or T. Inference is belief in the perceptible object as possessing unperceivable character of necessity. The path to freedom lies in and through transcendence of the perceptual modes of cognitive consciousness.

The Vedanta and K.C.Bhattacharyya do not accept the dualism between nature and freedom. Both the Vedanta and K.C.Bhattacharyya seek to overcome the perceptual dualism between nature and freedom. Although their approaches are different, they have some kind of an alliance in their basic positions. Vedanta takes external world as illusory not as real but K.C. Bhattacharyya does not consider external as illusory only tries to dissociate subject from the objective world. In Vedanta the distinction between the empirical and the transcendental is only apparent and is true so long as the empirical self is subject to Avidya. When the empirical self realizes the transcendental self, this distinction disappears. From this standpoint, the highest form of self-realization is not achievable by will, not even by rational will. Because the action that follows from these different kinds of will will generate some dispositions and propensities [vasanas, vrttis, samskaras, etc.] in us, due to which it is difficult for us to be free. For Advaita Vedanta, 'moksa' is not an ethical end. It

is like knowing the known.

K.C.Bhattacharyya has taken the distinction between the illusory, the empirical and the transcendental in his own way. He draws important distinction between what he calls objective fact, psychic fact and spiritual fact. The highest spiritual truth lends itself to be grasped on different, alternative but 'absolute' modes (anekanta) as truth, as rasa (aesthetic feeling), as objectless subjective spirituality or freedom. In short, he tries to show that object (nature) is an appearance to subject (psyche). K.C.Bhattacharyya does not accept subject-object duality of Kant and also the subject-object unity of Hegel. In his words, "The duality between subject and object is symbolic of their felt dissociation. Their unity is an intellectual revelation of their deep underlying identity." It implies that the duality between subject and object is the result of the felt dissociation of the subject from the object.

K.C.Bhattacharyya considers highest form of freedom as reality. In this, he disagrees with the phenomenologist. For the phenomenologist, the highest form of reality is knowledge in its essence. K.C.Bhattacharyya holds that like other objects, self's own body is open as a possible object of knowledge both from within and without. It is already mentioned that all human bodies possess a uniqueness which cannot be ignored. Due to stimulation from without, when one looks at one's own body, one feels a sense of uniqueness attached to it. But, it is true that the clear sense of uniqueness is the possession of one's own subjectivity and is not found in one's apprehension of other's subjectivity. The uniqueness of one's own is present even amidst other human beings of our own or of different cultures. Due to this self-identity we can gradually free ourselves from an alien sense of objectivity, and slowly acquire a sense of freedom as subjectivity in our own being.

K.C.Bhattacharyya holds freedom as disengagement. This disengagement will be possible if it is understood that there is no intimate relation between the subject and the objective world. To differentiate perceptual body from other objects, K.C.Bhattacharyya holds that although perceptual body is like other objects, it has a singularity, unique dissociatedness of its own. The individual's awareness of its singularity and dissociation is somehow mystical and it informs mystically of the underlying subjectivity. In understanding subject as freedom, K.C.Bhattacharyya makes a subtle distinction between perceptual and sensuous. In all cases, the sensuous need not be perceptual like in the case of body consciousness. Felt body is like a presentation which does not refer to any perceptual object. One's feeling of one's own body can thus be said to be nonperceptual. The difference between object and its representation is remarkable.

Another thing K.C.Bhattacharyya says in this connection is that felt body is to be distinguished not only from the objective representative fact, but also one feels a sense of uniqueness attached to it. But, it is true that the clear sense of uniqueness is the possession of one's own subjectivity and is not found in one's apprehension of other's subjectivity. The uniqueness of one's own is present even amidst other human beings of our own or of different cultures. Due to this self-identity we can gradually free ourselves from an alien sense of objectivity, and slowly acquire a sense of freedom as subjectivity in our own being.

K.C.Bhattacharyya holds freedom as disengagement. This disengagement will be possible if it is understood that there is no intimate relation between the subject and the objective world. To differentiate perceptual body from other objects, K.C.Bhattacharyya holds that although perceptual body is like other objects, it has a singularity, unique dissociatedness of its own. The individual's awareness of its singularity and dissociation is somehow mystical and it informs mystically of the

underlying subjectivity. In understanding subject as freedom, K.C.Bhattacharyya makes a subtle distinction between perceptual and sensuous. In all cases, the sensuous need not be perceptual like in the case of body consciousness. Felt body is like a presentation which does not refer to any perceptual object. One's feeling of one's own body can thus be said to be nonperceptual. The difference between object and its representation is remarkable. Another thing K.C.Bhattacharyya says in this connection is that felt body is to be distinguished not only from the objective representative fact, but also from the psychic fact. It implies that disengagemental forms of consciousness are attainable. In introspection, our body feeling starts getting resolved into psychic feeling. The feeling of detachment or disengagement from the body provides us 'first' or a preliminary taste of freedom.

K.C.Bhattacharyya states, "The highest and enlarged forms of freedom are analogous to, and an outcome of, further deepened exploration of freedom from the felt body, from the level of sub-psychic consciousness."

In his attempt to realize the concept of freedom, K.C.Bhattacharyya has made a very subtle analysis of the subjective states. In this process, he makes a distinction between freedom at the level of thought and freedom at the level of image.

Although image is the creation of the mind, it has an intimate relation to objects. But thought has no direct relation to objects. Its relation to object is mediated by both image and sense percepts. All images, productive or creative are often found to be abstract. Even then, the objective reference to this type of image cannot be denied. But Bhattacharyya argues that unlike image, thought is self-contained in a strict sense. It has no place in the space-time position. Thought is meaningful as it is self-presentative and not representative of this or that fact.

The relation between imagination and thought is described in the Vedanta philosophy. It indicates gradual disengagement or detachment of the self-consciousness from its objective situation. Vedanta philosophy holds that sense-perception leaves behind them traces (samskara) to be found in our consciousness. With the passage of time, these traces tend to fade away. The vedantin holds that meditation and contemplation are more effective ways of removing these samskaras. This whole process of epistemic freedom implies that consciousness can disengage itself step by step from the material corporeality of the objective world. This process of disengagement leads to the attainment of the higher levels of consciousness of freedom.

Regarding thought, K.C.Bhattacharyya says that thought is not empty. It is fulfilled meaning. Thought is about the object and as such it should be called presentation. Beyond it is the region of spiritual subjectivity. It is marked by the absence of object or what is meant. But this subjectivity is not meaningless per se. It has meaning of its own which is quite different from objective meaning. Thought is eternal and spatial and temporal objectivity are distinguished from it. Despite its eternity, thought cannot be called pure subjective activity. Because, compared to the awareness of 'I', thought is objective. Bhattacharyya tries to differentiate T from the body. He states, when I say, 'I feel myself I do not stand for my body. Rather, T is different from my body. But T is not meaningless. It has a meaning of its own. Because, without giving any meaning to the word T, the derivative expression 'my bod/' cannot be given any meaning at all. Otherwise my identity, position, my relations with other subjects could not be determined. This indicates that the word T does have meaning. But the meaning of 'I' is unobjective or subjective. 'I' or subject is known in itself not as related to the object. This is the realization of freedom.

In his attempt to realize the subject as it is and in itself, K.C.Bhattacharyya tries to make the subject free from other minute subjective states. He says introspective awareness reveals that subjective fact is distinct in itself and at a level lower than feeling. It brings out the dissociations of the knowledge of the subjective fact from the object. At the level of feeling, one becomes conscious of this dissociation. Pure subjectivity is conscious absence and unmeant. In K.C.Bhattacharyya's word, "Introspection is a subjectivity that is detached both from being and from negation, being positive as freedom."<sup>15</sup> The unreality of the subject is inconceivable. In feeling, in the psychic fact, the distinction between 'I' and its felt body is present in a vague manner but not nullified. However, the possibility of complete detachment starts at this psychic level.

In this regard, K.C.Bhattacharyya tries to show the difference between Kant's approach to self and his own. For Kant, the self is the thinking function, thinking of a thought or 'accomplished meaning'. But for Bhattacharyya, the speaking or meaning function is more fundamental than thinking. The introspective self is not only detached from thinking and feeling, but also undeniably self-knowing. Another difference between Kant and K.C.Bhattacharyya is in their mode of denial of the objectivity of the self as first person T. Kant's denial of the self as object is total because, according to him, it is in the self that the very possibility or constitution of object is grounded. But when K.C.Bhattacharyya states that T is not unmeanable nor is it meant, it should be understood as - It is 'not meanable', in the way different objects and different bodies are meant. It is 'not unmeanable', i.e. meanable as it is self-expressive. Like Bhattacharyya, if meaning is taken as the 'thinnest presentation of object', then introspective self can be said to be meanable. For example, when as a speaker one calls oneself T, this word T is understood through the word, not through its meaning. The word here has a meaning function or 'I-function' but not a meaning as such.

In Kant's philosophy, T as thinking 'I' is said to be capable of thinking itself. But Bhattacharyya maintains, 'I' as an expression of linguistic use has nothing, not even negatively, to do with thought. In actual introspection as unrealized knowledge self is only self-evidencing to another and not self-evident to itself. This self-evident character of the self is indicative of the necessity of a spiritual effort for higher or the highest possible self-realization. Here self's self-evident character is not found. But it is possible for the self to grasp this higher level character of self-consciousness. In this process, the introspective self becomes conscious to know itself as subject, and cognitively goes up nullifying step by step its distinction from the bodily self, the psychic self and different grades obtained within them. This introspective awareness of the subject, essentially subjective in nature is neither thought nor meant, neither feeling nor is absence. It is not even to be taken as distinct as the subject, to which it reveals itself. It is not in the nature of negation, nor is it the awareness of an indefinite. As definite and positive, it cannot be said to be not known in the ordinary sense. As actually not dissociated from object, it cannot be claimed to be known either. Here, according to K.C.Bhattacharyya, "Only the awareness of dissociation provides glimpses of T, 'the subject' as the realm of possible freedom."

Again, K.C.Bhattacharyya points out that in the state of spiritual subjectivity beyond introspection, the self is self-evident to itself. It indicates the necessity of a spiritual stage for higher or highest possible self-realization. It is possible when the self dissociates itself from its content, a subjective self. Here, the self is as it is without any content; only the self's self-identity is here. In self's self-identity, the distinction between self and a subjective fact is unknown. This self-identity, when actually intuited is self-evident. But until and unless this intuited self-identity is attained, a faint distinction between self and its content is present in the self-revealing self. When one can overcome this distinction, then one can understand the conception of absolute self as freedom.

From all these explanation it can be said that Bhattacharyya's concept of subject as freedom has some resemblance with Husserl's concept of transcendental self. Husserl proposes phenomenology as the science of pure consciousness. For Husserl, transcendental self is not to be grasped from the standpoint of empirical psychology.

### **The Doctrine of Maya**

The world is regarded as maya in the Advaita System. The worldly objects undergo change and therefore are not real. Brahman alone is real. Samkara says: 'What is eternal cannot have a beginning, and whatever has a beginning is not eternal.' What is the relationship between the Brahman and the world? He is of the opinion that the question itself is not legitimate and therefore impossible to answer. When one has realized the absolute Brahman the question of relation of Brahman to the worldly objects does no more remain valid. Even logically, if Brahman alone exists, the question of relating Brahman to the world does not arise. A relation can be established only when two distincts exists, but the Advaita says nothing exists in the world except the Brahman. Explaining this Dr. S. Radhakrishnan says: 'Brahman and the world are non-different, so the question of the relation between the two is an admissible one. The world has its basis in Brahman. But the Brahman is and is not identical with the world. It is, because the world is not apart from Brahman; it is not because Brahman is not subject to mutations of the world.' The mind perceives the world as reality, but as soon as the reality of the Brahman is realized the world fades away.

Samkara holds that it is impossible to logically explain the relation between Brahman and the world. He examines different views and finds that all are unsatisfactory. To hold that infinite Brahman is the cause of the finite world and creates it, amounts to accepting that the infinite is subject to limitations of time. Cause and effect imply succession. If we say that Brahman is the cause and the world is the effect, it will tantamount to acceptance of two identities namely Brahman and the world. Moreover, how can the infinite unconditioned be the cause of the finite world? How can we ascribe action to the infinite? For him both are identical and it is a case of eternal co-existence in temporal sense. 'The effect is the manifested world beginning with akasa; the cause is the highest Brahman.

With this cause, in the sense of the highest reality, the effect is identical, having no existence beyond it. (Samkara Bhasya on Brahma Sutra, ii.1.14) The world seems to be so because of lack of insight.

Samkara does not hold the view that Brahman, either in whole or in part, changes into the world. If the whole changes, the Brahman is before our eyes and therefore there is nothing to seek. If it is the part only, then being capable of partition, it is not eternal. Scriptures hold that the Brahman is devoid of parts.

When either partially or totally it changes into the world, it becomes a different substance and therefore no longer independent. The absolute cannot be relative.

Samkara says that there are two types of causality. One is vivartopadana where the cause without undergoing any change produces effect. The other is parinamopadana where the cause itself is transformed in producing the effect. Vivarta means perversion. He brings out that the phenomenal world is the translation of the absolute Brahman at the plane of time and space. Silver appears to be present in the shell, though in fact it is not. Integrity of the the cause is not disturbed in this illustration. In the same manner the Brahman appears as the world of mutiplicity though it remains

unchanged.

Any effort to connect the Brahman with the phenomenal world is bound to end in failure. No system could logically establish the connection between the two.

Samkara says: ' To show how and why the universe is, so that finite existence belongs to it, is utterly impossible. That would imply understanding of the whole not practicable for a mere part.' Maya, thus, points out a gap in our knowledge.

### **Radhakrishnan: Intellect and intuition**

Sarvepalli Radhakrishnan was in his time the most renowned interpreter of Indian philosophy to an international audience. In *An Idealist View of Life*, based on the Hibbert lectures he delivered at the universities of London and Manchester in 1929–30, he presents his thesis on the nature and meaning of life.

The book weaves a spiritual approach through its metaphysical argument, also adopting a scientific attitude, to produce a bold view of creative thinking.

Radhakrishnan exposes the inadequacy of existing religions and contrasts them with science, which “demands induction from facts and not deduction from dogmas”. Speaking amid the gathering storm of the impending war in Europe, he is disappointed by the moral inadequacy and destructive political consequences of established faiths, and states that “nothing is as hostile to religions as other religions”. If religion is ineffective, the new gods of atheism, agnosticism and authoritarianism are equally without worth, and he describes the modish sceptic as someone for whom nothing is serious and who “drifts along confusedly, hoping for the best, expecting little and believing in nothing very much”. This is not an inaccurate description of many scientists today, for whom the deeper meaning of science remains elusive in an ever-changing yet constant world.

According to Radhakrishnan, there are two forms of knowledge: intellectual and intuitive. Intellectual knowledge lies at the core of Western systems of philosophy and is based on critical analysis and logic. If all knowledge were purely intellectual, reason alone would suffice, eventually leading to hard-core reductionism. However, Eastern systems of philosophy, particularly Hinduism, believe in a higher form of knowledge built on intuition. Intuition is essentially synthesis, which in turn follows naturally from Hindu ideas of monism. According to Advaitic (non-dualistic) doctrine, one who knows the Absolute becomes the Absolute. Accordingly, ignorance of this knowledge is the root of all trouble.

It is understandable thus far. But Radhakrishnan then claims that the true test of knowledge is certainty, which is a characteristic of intuitive thinking, rather than communicability, which characterizes intellectual knowledge. He then argues that intuition does not oppose intellect but rather lies beyond it. In other words, intuitive knowledge, although it does not contradict the necessity of reason, questions the sufficiency of reason. Intuition is not illogical but super-logical. In summary, both intellect and intuition must be synergized in the quest for the nature of ultimate reality.

Addressing scientific issues, Radhakrishnan argues that “great scientific discoveries are due to the inventive genius of creative thinkers”, intuitive thinking being as relevant to science as it is to the arts. Consider, for example, Faraday's discoveries, Mendeleev's periodic table, Kekulé's postulation

of the cyclic structure for benzene, or the way in which Crick and Watson unravelled the double-helix structure of DNA.

Several hypotheses in Radhakrishnan's book are worthy of close attention from scientists. First, he says that great intuition arises from a bedrock of rationality. Next, when the big discovery is made, there is enough room for the readjustment and reinterpretation of partial and incomplete concepts and data that preceded the discovery. This readjustment is so simple, says Radhakrishnan, that when full scientific insight is obtained it escapes notice, allowing one to imagine that the process of discovery arose entirely from intellectual thinking. Finally, instinctive thinking is not easily communicable – so when the discovery is discussed, it appears to have arisen from rational thought. The lines between discovery and proof are now blurred, resulting in an erroneous simplification of the deeper movements of thought.

There is much to commend this approach to scientists today, given the increasing complexity inherent in contemporary scientific problems. The coming century will see an intensive study of emergent phenomena such as the prediction of crystal structures, protein folding, fractals and monsoon forecasting. The answers to these difficult questions may not be found in a single model of complexity, such as cellular automata. Eventually, we would even like to examine the differences between life and non-life in, say, chemical terms. Subjects such as physics and chemistry are already redefining their goals to study more complex biological phenomena, with modern chemical biology being a pertinent example of this trend.

As the natural sciences move towards the social sciences and less precise forms of knowledge, there is a real need for inspired intuition, not as a substitute for thought but as a challenge to intelligence. An intuitive and holistic grasp of the situation is required. What we need is not faster computers, but faster minds.

The final section of the book seamlessly synthesizes the role of intuition in the cognitive, aesthetic and ethical endeavours of humankind. Recognizing these efforts as varied facets of human expression, Radhakrishnan opines that only religion based on spiritual values can completely encapsulate the human spirit. At a time when religious fundamentalism threatens the stability of the world, there is an urgent need for intuitive and inquiring scientists to contemplate the eternity between the atom and the Absolute. As Radhakrishnan says: "Real heroes are religious in a true sense in that they have broken down the barriers between the individual and the universal."

## **Idealist View of Life**

*An Idealist View of Life* has a marked mystical foundation in the theory of knowledge. In this regard, it may be said to express the main Hindu tradition in philosophy. This is one reason for its importance. The other is the author's familiarity with Western philosophy and science. Though his general standpoint guides him, there is no turning away from crucial problems.

## **Radhakrishnan's Idealism**

Sarvepalli Radhakrishnan recognizes that the term "idealism" needs definition. It is clear that he is not a subjective idealist of the mode of the early George Berkeley. Nor does he much concern himself with Hegelian rationalistic Idealism. Rather, his emphasis is on the relation of value to reality. The truly real is replete with value. The alignment is with the Upanishads in India and the outlook of the Platonists, especially that of Plotinus, the father of the Western tradition of mysticism.

The book reflects the meeting of the East and the West. The broad sweep of Radhakrishnan's thought brings together Hindu classic thinkers with the Greek philosophers Plato and Aristotle, and with the Anglo-American idealists Francis Herbert Bradley and Josiah Royce. Less attention is paid to Western naturalism and realism. That is both the strength and the weakness of the book. It stands out as an excellent example of its perspective, and it has both scope and verve.

Radhakrishnan's general argument is that the ideal world, which alone is real, lies beyond the phenomenal one of appearance yet is tied in with it and dominates it. Spirit is working in matter that matter may serve spirit. In a sense, matter is an abstraction and not a concrete reality, such as spirit. That is why materialism can be absorbed and transcended. It is doubtful whether Western materialists would accept this thesis, but it goes quite logically with the author's outlook. For him, the center of the universe is the transcendent, the Absolute, Brahma, that which has *aseity*, being. However, despite this assurance—rather, because of it—he is sympathetic with other points of view because they have their partial truth.

### **Religion and Mysticism**

The first of the eight lectures concerns itself with the modern challenge to the religious outlook on the universe as a result of scientific and social thought. Here the author confronts psychology specialists Sigmund Freud, John B. Watson, and Émile Durkheim. The second lecture notes contemporary movements such as humanism, naturalism, and logical positivism. These are tied in with science. In all this, the author is frank and well informed. He is not trying to defend specific orthodoxies. Like the Buddhist, he has no tradition of particular doctrines in geology and biology. Science is to be accepted but has its limits.

It is in the third lecture that Radhakrishnan states the basic claims of the religious consciousness, especially at the mystical level. He introduces *intuition* as a way of knowledge alternative to that of sense perception or discursive conception. He puts forward the claim for an integral apprehension of ultimate reality. It is a knowledge by identity that transcends the distinction between subject and object. Here, of course, is where dispute arises. Those who do not have the mystical vision are likely to deny its significance.

In the fourth lecture, Radhakrishnan develops the idea that scientific certainty is not the only kind of certainty available to us. A query may, of course, be raised as to the scientific claim that is usually more modestly put as an affair of working hypotheses. However, the author is ready to admit that, in the mystical revelation, we must distinguish between the kernel of it and the interpretation given, which is historically conditioned. Thus Hindu, Muslim, and Christian mystics have different accounts of the meanings of their experiences.

### **PHILOSOPHY OF RADHAKRISHNAN IN GENERAL:**

Radhakrishnan is one of the greatest figures of the Indian Renaissance. He has a place of eminence amongst the most important thinkers of the contemporary world of philosophy and creative thought. Contemporary Indian Philosophy is greatly indebted to him for his contribution of immense scholarly works in the field of religious philosophy. He has contributed powerfully to the synthesis of the two hemispheres – East and the West. A man of very rare intellectual endowments, his fame rests securely on the contribution as the creative interpreter of the comprehensive religious and philosophical traditions of India and the West. His early education made him familiar with the knowledge of the East – particularly of India, and his own scholarly

adventure acquainted him with the wisdom of the West. But his fundamental convictions are deeply rooted in Indian traditions. His philosophy was grounded in Advaita Vedānta reinterpreting this tradition for a contemporary understanding. He defended Hinduism against 'uninformed Western criticism' contributing to the formation of contemporary Hindu identity. He has consistently defended Hinduism against all criticisms which tend to describe it as non historical and negative. He has been influential in shaping the understanding of Hinduism, in both India and the West, and earned a reputation as a bridge-builder between India and the West. But he has a knack of presenting all ideas into idioms and models of Western thought. He seems to be presenting old and traditional ideas in a refreshingly novel manner. Among Contemporary thinkers he has done a great deal to shape what may be described as a 'world philosophy,' by bringing Eastern and Western thought closer together.

C.E.M Joad, the famous interpreter of Radhakrishnan, has described him as the liaison officer between the East and the West. Joad in his Counter attacks from the East describes Radhakrishnan's metaphysical position thus, " the function, the unique function which Radhakrishnan fulfils today is that of a liaison officer. He seeks to build a bridge between the traditional wisdom of the east and the new knowledge and energy of the west." This statement does contain some elements of truth, and that is apparent from the fact that Radhakrishnan makes persistent efforts to bring about an eastwest synthesis.

It is generally accepted that Radhakrishnan is one of the greatest modern exponents of Hindu thought possessing the true hospitality of the Hindu mind and defending successfully not only the essentials of Hinduism but the spirit which lies behind all religions. His work is important not merely because he gives an attractive description of a "mysteriously profound way of thinking," but also because of his conscious attempt to construct a system of thought in which there is a place for the insights of other thinkers, both philosophers and scientists of the modern world.

There are some scholars who strongly maintain that the metaphysics of Radhakrishnan is a real fusion of the East and West, particularly because he attempts to answer responsibly the problem which has haunted philosophers and theologians of all time, namely the relation between the Absolute of philosophy and the God of religious experience. In his attempt to work out a solution to this problem, he is rightly described as not merely the distinguished exponent of a lofty spiritual philosophy, but as the initiator of a new synthesis. The basic philosophical position of Radhakrishnan is an outcome of synthesis between the Eastern and Western traditions. He synthesises Advaita Vedānta especially of Śaṅkara and Absolute Idealism of the West. The spirit of Radhakrishnan's philosophy consists fundamentally in the attitude of synthesis or the concept of organic unity. As Charles A. Moore observed, "His basic approach to philosophy is the recognition of and demand for organic unity of the universe and its many aspects of the many sides of the nature of man, of man and universe, of the finite and the infinite, the human and the Divine."

Thus Radhakrishnan provides an interpretation of the philosophy which does justice to intuition and reason, philosophy and religion and this world and the other world. So it is clear that he provides inevitably a synthesis of the old and the new and of the east and the west in order to construct a philosophy of religion based on Absolute Idealism of Indian origin. The philosophical thinking of Radhakrishnan is influenced by a number of factors of which Indian religious tradition, Advaita Vedānta philosophy and Hegelian Absolute Idealism are the most important. He does not advocate any philosophical system. As a neo- Vedāntin he reinterprets, reconstructs, purifies and

extends the philosophical doctrines of the Upanishads and the Advaita Vedānta of Śaṅkara in the light of modern science and technology. Radhakrishnan goes through the philosophical doctrines of the Vedas, the Upanishads and the Bhagavad Gitā, the basic texts of the orthodox and heterodox schools and the commentaries of Śaṅkara and Rāmānuja. Radhakrishnan himself says about the influences on him which lead him to develop philosophical views. He asserts, "I studied the classics of Hinduism, the Upanishads, the Bhagavad Gitā, and the commentaries on Brahmasutra by the chief Acharyas, Śaṅkara, Rāmānuja, Madhva and Nimbārka and others, the dialogues of Buddha as well as the scholastic works of Buddhism and Jainism. Among the western thinkers, the writings of Plato, Plotinus and Kant and those of Bradley and Bergson influence me a great deal. My relation with my great Indian contemporaries, Tagore and Gandhi were most friendly for nearly thirty years, and I realise the tremendous significance they had for me."<sup>3</sup> Thus Radhakrishnan has two ancestral lines in theology, one in India and the other in the West from which he develops his idea of religion. His philosophy contains a deep spiritual awareness. Radhakrishnan's system of philosophy is constructed around the spirit of the Vedas, although he differs from some of the ancient teachers. The three fundamental principles on which his philosophy was built are spirit, intuition and religion. Radhakrishnan has propounded spiritualism and dynamic idealism. Idea of spirit is the root concept of his philosophy. But he differs from Hegelianism and other Indian Idealism. He assumes the spirit not as substance but as life.

According to Radhakrishnan, "Spirit is life, not thing, energy, not immobility, something real in itself and by itself, and cannot be compared to any substance subjective or objective." For him humanity and reason should be explained in the light of spirit. Radhakrishnan considers self, God and Absolute as the different names of the Universal Spirit which represents his philosophy of idealism.

Radhakrishnan is a philosopher of comparative religion. The centre of his philosophical investigation is religion. He gives a modern interpretation of Ethics, Metaphysics, Politics, Aesthetics and Education on the basis of religion. He attempts to reconcile the teachings of different world religions. By religion or dharma Radhakrishnan did not mean any particular religion. Indeed he tried to glorify Hinduism which is clearly evident in his Hindu View of Life, but he seems to be more in favour of advocating a universal religion. According to Radhakrishnan religions may differ in their nomenclatures, rituals, ceremonies, however their essence is the same. He distinguishes between historical and universal religions.

Historical religions are many – Christianity, Hinduism, Islam, Buddhism, Jainism etc. He felt that they are the different dimensions of one universal religion, because the spirit of these historical religions is the same.

By Universal religion, Radhakrishnan does not mean a new religion over and above historical religions. He did not want to dispense with historical religions and create a new one. He is also aware of the fact that the historical religions cannot be removed overnight. He wanted that the historical religions should be understood through universal religion by grasping the essence of religions or the religion of the spirit.

Radhakrishnan speaks of the ultimate religion that is religion as conceived in the most general way. The universal character of the Bhagavad Gitā as expressed by Radhakrishnan can be applied to his view of religion also. According to Radhakrishnan, "The Bhagavad Gitā represents not any sect of Hinduism, but Hinduism as a whole, not merely Hinduism but religion as such in its universality

without limits of time and space, embracing within its synthesis the whole gamut of the human spirit.”<sup>5</sup> Since religion is such a universal phenomenon it becomes the subject of metaphysical enquiry in as much as metaphysics is concerned with the ultimate or universal reality. Radhakrishnan therefore points out that religion can be treated as a fit subject for metaphysical investigation.

Radhakrishnan, by analysing and interpreting different religious concepts like the nature of the Absolute, relation of God and Absolute, the theory of Karma, and rebirth, the nature of the self, and the means to its salvation, removed many doubts and confusions that trouble a philosophic mind. For example, in explaining the relation of the law of karma and the idea of the freedom of the human will, Radhakrishnan writes, “The cards in the game are given to us. We do not select them. They are traced to past Karma, but we are free to make any call as we think fit and lead any suit, only we are limited by the rules of the game.”<sup>6</sup> Thus as we play we gain or lose.

Radhakrishnan’s conception of religion has a spiritual background. Spirit constitutes the centrality of his philosophy. His views on human being, world and God reflect this point. While discussing the nature of human being Radhakrishnan distinguishes between finite and infinite man and observes that the mind-body complex of human being is his finite nature. It is apparent and undergoes change and modifications. However, there is some permanent element in human.

Radhakrishnan calls it the spirit in man. He said that the spirit in man cannot be ruled out on the ground that it cannot be perceived with the naked eye. So also Radhakrishnan discusses the significance of spirit in the evolution of the world. He believes in different phases or levels of evolution of the world. They are matter, life, mind and spirit. Though Radhakrishnan considers spirit as the highest stage of evolution, he said that matter, life and mind are necessary for the realisation of the spirit. Radhakrishnan considers God as the spirit. It is the universal spirit existing in man and the world.

Thus we find that spirit occupies a significant place in Radhakrishnan’s conception of man, world and God. He extends this philosophy to his understanding of religion. He considers the different religions are the manifestations of the same spirit. On this ground he pleads for fellowship of religions. He wants different religions should prevail and must develop understanding, tolerance and brotherhood by realising the underlying spirit among them. Radhakrishnan repeatedly emphasised that we have to live in religion. Our religious temper and commitment must find expression in our day to day actions. Religion can become the most powerful means of improvement of an individual and human society if our faith in God is total, if our acts conform to our ideals, and if there is no difference between our belief and behaviour. In the words of Radhakrishnan, “There is nothing special in loving those who love us or who are themselves lovable. Jesus asks us to love our enemies in the hope of reawakening their humanness, their potential capacity for love. We are called upon to remove from enemy’s heart the fear of our own hateful intentions. How far do we carry out these instructions to be good even to those who hate us?”<sup>7</sup> Religion is the expression of human effort towards spiritual perfections. All religions are only varied historical expressions of one truth. The fundamental doctrine of Radhakrishnan’s philosophy is that there is an absolute spirit lying behind and involved in the whole world process. He says, “Spirit is the reality of the cosmic process.”<sup>8</sup> The acceptance of a spiritual reality is different from the physical that naturally leads to philosophical difficulties. A question arise here-how do we know the reality of the spirit? If our knowledge is confined to sense experience and thinking only, as many philosophers since the time of Hume maintain, then we have no ground to

believe in the spirit. This will be considered as a metaphysical assertion and hence non- sense. Radhakrishnan is aware of these criticisms. The whole range of his writing is an answer to these and in support of his claim that Ultimate Reality is spiritual. Radhakrishnan considers the different experiences of knowledge and accepts three ways of knowing namely sense experience, discursive reasoning and intuitive apprehension.

The first two are generally accepted by all, while the last namely intuition is accepted only by few. Radhakrishnan is aware of the fact that the basic concept of his philosophy on the reality of spirit cannot be justified without accepting intuition as a means of knowing. Radhakrishnan regarded intuition as a non- sensuous immediate apprehension which the Hindus call aparoksha. It arises from a close relation between mind and reality. It is the kind of knowledge acquired by being and not through senses or through symbols. In other words intuition is the most direct knowledge that man is capable. The main point which Radhakrishnan wants to emphasise is the directness and certainty of intuition. So what is intuited carries with it certainty. From this Radhakrishnan argues for the spirituality of reality and the spiritual basis of the universe.

## **RELIGION ACCORDING TO RADHAKRISHNAN**

The salient features of Radhakrishnan's philosophy comprise universal outlook, synthesis of the east and west in religion and philosophy, the spiritualism and humanism and openness to the influences of science, art and values. Naturally he combined the two traditions with perfect ease and is able to evolve a philosophy of synthesis. The philosophical thinking of Radhakrishnan is influenced by a number of factors of which Indian religious tradition, Advaita Vedānta philosophy, and Hegelian absolute idealism are the most important.

Radhakrishnan goes through the philosophical doctrines of the Vedas, the Upanishads and the Bhagavad Gītā, the basic texts of the orthodox and the heterodox schools and the commentaries of Śaṅkara and Rāmānuja. His philosophy contains a deep spiritual awareness. Religious philosophy of Radhakrishnan is a land mark in the history of religion since he has given a panorama of central core of religion, apart from giving an authoritarian as well as institutional interpretation of religion. Radhakrishnan was deeply religious in his thinking. In his many lectures and writings he explained what he meant by religion. Radhakrishnan conceives the meaning of religion with a new orientation. According to Radhakrishnan, "Religion is not a creed or a code but an insight in to reality."

Religion implies a discipline, which transforms man's nature and he develops an insight in to his own true nature or his essence. Religion also implies firm faith in the existence of God, the soul of man and absolute spiritual values.

Radhakrishnan stated that religion must contribute in the process of man's evolution in his divine stature. Religion has to develop the spirit of love, tolerance and universal brotherhood. Thus a religion, which breeds narrowness, dogmatism, selfishness and communalism, must be abandoned. Radhakrishnan stands for that religion which is ethically sound and quite relevant to human needs and social environment. Instead of isolation and resignation, true religion teaches courage and adventure. It also cultivates inner life, and the apprehension of the life beyond life. In his concept of religion, Radhakrishnan discussed all these things.

According to Radhakrishnan, "Religion is spiritual change, an inward transformation. It is a transition from darkness to light, from unregenerate to a regenerate condition. It is an awakening;

rebornness.....Religion is an experience which affects our entire being, ends our disquiet and anguish, the sense of aimlessness of our fragile and fugitive existence.”

Radhakrishnan's concept of religion is dynamic. It is an authentic religion which makes an individual free from fear and fanaticism and brings about a change in society at the conscious level for the attainment of wholeness. Radhakrishnan's religion of spirit serves as an inspiration in life. Religion is the awareness of our real nature in God. Religion is also defined by Radhakrishnan as strenuous endeavour to apprehend truth. Radhakrishnan admitted that a true religion is a perennial wisdom; it is eternal aspect behind all religions. It is 'Sanātana Dharma', or a timeless tradition of human race. According to Radhakrishnan religion is spiritual insight. Radhakrishnan holds that religion is, "in essence, experience or of living contact with ultimate reality."

It is an autonomous form of experience. Essentially, religion is concerned with the inner life of human being. True religion is an expression of the true nature of the self. Its root lies in the spirit of which is deeper than feeling, will or intellect. Our deepest soul experiences divine nature which is spontaneous, autonomous and unique. It is genius and exceptional. He says, "Religious experience is exceptional only in the sense that all genius is exceptional."<sup>16</sup> Religion therefore touches the inner essence of human being. It aims at the attainment of salvation of life and makes man able to transcend his narrow egoism to spiritual pride. Religion makes spiritual change, inward transformation. Religion is a power of conservation of the whole world by awakening spirituality in man. It makes man free from the delusion of caste, creed, wealth and power. Religion aims at peace and truth.

Radhakrishnan says, "Religion is a search for truth and peace, not power and plenty." The true meaning of religion is therefore found within and inside us. Man's religion is his own. It is not imposed by any external principles or authority or code. Radhakrishnan says, "A man's religion must be his own and not simply accepted or trust or imposed by authority. While trust and authority may put him on the way, it is his own independent search that will take him to the goal."<sup>18</sup> Of course trust or authority may guide him to lead a right path. So, religious experience is quite personal where the self makes communion with the divine being. It is so intensive and inward as its root lies in the very depth of being. More we dive in to the experience more we get an intense feeling of indubitable. It is "flight of the alone to the Alone."<sup>19</sup> For Radhakrishnan, religion is more than revelation. It attempts to manifest what lies deep in our being as also an effort to have a contact with that. The deepest layers of man's being are spiritual and religion being a spiritual attempt can trace out these layers. To have a notion of God is not enough for religion. It attempts to transform our material experience into spiritual one in which we are acquainted with the deepest layers. The deepest layers refer to ultimate reality. Radhakrishnan was a worldwide acknowledged idealistic philosopher who specially brought our certain influential development regarding the understanding and interpretation of religion. According to him it is not easy to find out an exact definition of religion. Basically he emphasises the universal aspect of religion. He speaks of the ultimate religion that is religion as conceived in the most general way.

According to Radhakrishnan, "Religion is an independent functioning of the human mind, something unique, possessing an autonomous character. It is something inward and personal, which unifies all values and organises all experiences. It is the reaction of the whole of man to the whole of reality. It may be called spiritual life, as distinct from a merely intellectual or moral or aesthetic activity or a combination of them." Religion is essentially a discipline of the soul. It effects the transformation, integration and purification of the entire human personality. It is a transforming

experience. Religion is not the result of intellectual analysis. It is the art of selfdiscovery. Radhakrishnan is of the opinion that religion is not so much theological learning or dialectical skill as spiritual insight. It is the conviction that man is not mere intellect or senses or the mind but spirit, which while including all these far transcends them, and is different from them. Radhakrishnan holds that religion has the aim of fellow feeling in the entire mankind and this can be accomplished by the spiritual insight or the awareness that man is spirit and not intellect. Radhakrishnan rejects the false conceptions of religion such as the ideal of the satisfaction of pleasures in heaven. Religion unites time and eternity in one eternal bond of friendship and harmony. According to Radhakrishnan religion must be lived and experienced. In fact it is life experienced in its depth. Religion aims at spiritual fulfilment but it cannot be realised if man sticks to mere outer forms of religion without religious experience. Radhakrishnan repeatedly emphasised that we have to live in religion.

Our religious temper and commitment must find expression in our day –to – day actions. If a person only professes religion but cannot practice it then that person deceives himself and others. Again if our faith in God is complete, if our actions conform to our ideals and if there is no difference between our belief and behaviour then religion can become the most powerful means of improvement of an individual and human society. Radhakrishnan is of the opinion that, "There is nothing special in loving those who love us or who are themselves lovable. Jesus asks us to love our enemies in the hope of reawakening their humanness, their potential capacity for love. We are called upon to remove from the enemy's heart the fear of our own hateful intentions. How far do we carry out these instructions to be good even to those who hate us?"<sup>21</sup> Radhakrishnan often uses the terms religion and spirituality as interchangeable. When he distinguishes the two he relates religion to dogma and creed and spirituality to the experience of the true or Real Being. To him, "Genuine religion is indistinguishable from and coeval with spirituality."

Radhakrishnan asserts that Hinduism emphasises 'spiritual experience' rather than doctrine or creed, for which Hinduism is as 'eternal religion' (Sanātana Dharma) as it encompasses all the other religions with an open mind. Religious experience is spiritual experience which is integral in nature. Religion cannot be identified with the phenomenal accounts of 'pure experience'. While phenomenologists attempt to restore the pre-reflective experience of unity that accompanies all cognition, Radhakrishnan is concerned with reinstating the uniqueness and autonomy of religious experience. In his analysis, wholeness and self-sufficiency emerge as hall marks of spiritual experience."

In the course of history of thought religion has been identified with feeling, emotion, and sentiment or with instinct, cult and ritual or with perception, belief and faith. According to Radhakrishnan, religion contains all those elements in some form or the other. Religion is a synthesis of all these. The conflicts of different religions are due to the emphasis on one aspect of religion in utter disregard to other aspects. These conflicts do not touch the essence of religion. The essence of all religions is one and the same. Religion is an insight into the nature of Reality. It is a direct experience of Reality. This insight reveals that the ultimate reality is somehow immanent in man. Religion is a living creative power. It is the self- manifestation of the ultimate reality in man. Religion is not a way out of life but way unto life.

Religion is the awareness of our real nature of the divine. It is also a way of response to the ultimate reality. Religion implies a faith in the ultimate spiritual values and a way of life to realise them. This faith involves an awareness of the beyond. It also involves a conviction that such

awareness is possible.

Radhakrishnan believes that the true meaning of religion lies in the development of the individuality of human being. It is a way of living which disciplines body, mind and thought. True religion therefore summons man to change his individualist selfish nature and to let the divine nature in him. Religion is therefore, not a rigid ethical code but a universal guideline which teaches man to fight against the evil and to strive for the truths of the spirit.

According to Radhakrishnan, true religion is the most efficient instrument of social regeneration. In almost all his speeches and writings, he has put forth the ideal of the Religion of the Spirit. The function of religion is to foster humanist ideals and world unity. It must harmonize the claims of the mind, heart and spirit. Religion is the response of the total nature of man. Religion is not a mere faith, it is conduct also. It helps us to transform our life and give us a new outlook.

Radhakrishnan believes that at the core of all religions there is a wide field of agreement. This field of agreement he calls the Religion of Spirit. Radhakrishnan conceives the meaning of religion neither as 'mere consciousness of value' as Kant says nor as a 'form of knowledge' as Hegel says. Like the ancient Indian thinkers he says, "There is in it a mystical element, an apprehension of the real and an enjoyment of it for its own sake which is absent in the moral consciousness."

For Radhakrishnan, religion is direct apprehension of the Supreme Reality.<sup>26</sup> It is the attainment of a state of illumination. The Reality is omnipresent and therefore man is able to comprehend it directly within his own inmost being. This truth is enunciated in the Upanishadic maxim, 'tat tvam asi,' (that thou art).

Radhakrishnan says that, God is true according to all religions. Religion is a way of life which has for its end a profound spiritual transformation. Religion is not a theory or a sentiment, but a vital experience. Ethics cannot be divorced from religion as the essence of religion is the vision of the good. All religions are of a value in so far as they are exercises and discipline of the spirit.

According to Radhakrishnan, any religion which asks us to hate other human beings cannot be regarded as true religion. Unless religion asks us to love one another, since God is love, it is not true religion. Religion is a means for fostering the integration of personality, social equality and also respect for all living faiths. A truly religious is devoid of any sense of egoism, any passions, hatred, ill will etc. Religion is direct encounter with the Supreme Reality and insight into the mastery of things, in to the meaning of existence. Religion reflects our common spiritual struggle and aspiration. Religion is not theology, but practice and discipline. The main purpose of religion is to restore the lost relationship between the individual and the eternal.

A particular religion, may, however be a defective one as it cannot generally get rid of prejudices and superstitions and dogmas. But an ideal religion is without defects and through Vedānta Radhakrishnan is seeking for such a religion. He is interested in a Universal Religion based on Vedāntic principles. His religion speaks of the city of God, a divine city where theological differences are absent. When man reaches this city through religion, he will find divine grace, and attain thereby salvation. He therefore, attempts at reconciliation of theological differences and claims of science and theology as well. Religion is a matter of personal experience; it is not a matter of mere dogmas or faiths; it is a kind of personal experience. Man must be transformed, in that he has to become a different human being altogether as a result of his religious conversion.

Without such spiritual conversion, man is not truly religious.

'Religion', Radhakrishnan says, "is not a thing which one can be bought or got from visiting temple or churches or other places of worship. It is a thing which one can practice only by waging incessant war on the baser instincts which have so much command over human nature."

For Radhakrishnan religion is not the mere search for individual salvation. It is not a mere belief, it is behaviour. It is a quest for values. Religion is the most potent instrument for individual salvation and social regeneration. It is a force and not a mere form. Through religion we can integrate ourselves with external nature, with fellow man and with one's own life. Radhakrishnan stands for a religion that is rational, scientific, humanistic and that which makes for world unity and fosters peace. For him religion is in essence a mystic experience- a firsthand encounter with God. It is a life transforming experience carrying a certitude all its own.

Religion as a transforming experience makes man realise his true nature. Man does not understand his true dimension as long as he lives at the superficial level of the senses. The function of religion is the evaluation of man into his divine stature, develop awareness and intensity of understanding and bring about a better, deeper and more enduring adjustment in life. Religion commands man to make the change in his own nature and let the divine in him manifest itself. According to Radhakrishnan the purpose of life is not the enjoyment of the world but the education of the soul. Like many modern thinkers Radhakrishnan's approach to religion has also a very strong social aspect.

According to him religion has a very vital role in moulding the society and conserves the order of the society. Radhakrishnan maintains that religion is an integral element of a society and it represents the whole aspect of human being. According to him there is no sharp distinction between religion and social life.

Religion has two sides, the individual and the social. Both the sides are interdependent and complementary to each other and without the one the other is ineffectual. Religion must lay emphasis on individual culture and transformation of the inner world of man. Unless the individual is pure and perfect the ideals of religion cannot be realised on earth. But religion is not merely individual perfection. Religion is not solitary life. Radhakrishnan says, it is sarvamukti or the emancipation of the entire mankind that the truly religious man tirelessly works. The religious man sees all existence in his own self. True religion is universally valid and it encourages 'fresh truth' and awakens 'social passion'. Religion encourages man to become more and more integrated. It aims at creating harmony among people of different religions and demonstrates how to live together striving to attain perfection.

According to Radhakrishnan the individual and social aspects of religion are interlinked and inseparable. The personal and social dimensions of religion derive from both the autonomous and heterogeneous nature of man. Religion has been one of the most important preoccupations of mankind throughout the course of human civilisation. Radhakrishnan is of the opinion that most of the social inequalities and injustices pervading all over can be easily affected by harmonious relations based on spiritual consciousness and this sense of wholeness may be furnished by religious ideologies. Religion is a great socialising and civilising agency which intends to call for a fresh and new turn of mind and heart that guides us towards fellowship and co-operation.

Radhakrishnan holds religion as a social factor, a binding force upon the social relations with moral awareness. He believes in the authenticity of experience and its insight penetrates into the things. Radhakrishnan like Gandhi also believes that religion should be treated as an inward integration which each one has freedom to achieve for oneself, without interference from others. It is as well as a call to establish an equitable social order. Religion is in its essence, reintegration of human personality and redemption of human society. Radhakrishnan asserts that a religion which does not give importance to social reform and international justice has no appeal to the modern mind. Radhakrishnan believes that religion should have great touch with human behaviours and his works. There should have profound consistency between inner and outer life which modern man lacks.

Radhakrishnan writes, "The inadequacy of religion is evident from the disparity between outward allegiance and inward betrayal." Apart from its practical aspect religion is by itself is an abstraction. The true meaning of religion lies in man's utmost and intense faith in the Supreme. True religion is the aspiration of the soul. Radhakrishnan prescribes to observe different modes of religious rites like worship, prayer to increase our faith in the Supreme. Religion is not a study of God. It is an endeavour to regain the lost unity between the individual and the Absolute. It is a binding force which enriches our fellow feelings. It is generally observed that at the dawn of civilization religion, science, art, morality was found intermingled together.

According to Radhakrishnan, it is untrue to believe that there is an opposition between science and religion. Talking about the relevance of religion in our own age of science, Radhakrishnan said, "The controversy between science and religion is out of date, for the science which challenged religion is as dead as the religions which it challenged. The problem today relates not to the incredible dogmas of religion, but to the place of the spiritual in a universe which cannot be explained altogether by science. The kingdom of spirit is always within each of us."

He holds that the creed of religion is as real as the theories of sciences. Philosophy is to lean on religion heavily with a view to possessing a spiritual flavour. While science enriches philosophy with material data, religion provides it with spiritual data. Philosophy has to work on both of them. For the progress of man both civilization and culture are necessary. Science contributes to the advancement of civilization while religion contributes to the advancement of culture. While culture is connected with man's spiritual experience, civilization is disconnected with his material behaviour. Both are necessary for over all progress of man. Religion, for Radhakrishnan, was the supreme value of human life, which must lend its own colour and complexion to everything that concerns human life. The distinctive feature of Indian religious thought is that there is no dividing line between religious and secular.

Radhakrishnan exhibits an integral viewpoint in his systematic approach to religion. He has pointed out the contribution of each great religion to humanity and emphasised their fundamental unity. According to Radhakrishnan, religious truth depends upon the intuitive experience of the individual who reveals it to the world in human language as far as possible.

Radhakrishnan also stated that the religion, which springs from the radical insufficiency of human nature, is an instinct with us which surely we cannot shake off. In fact there is nothing else but religion which transfigures the whole personality of man, his thought, feeling and action. Religion is the ultimate attitude of thought, feeling and will to God or the ultimate reality. It is by religion that man is able to create harmony in him and produce harmony in the universe and establish

harmonious relationship with his fellowmen. Radhakrishnan assures that religion can give us the highest bliss; it can maintain our intimate contact with creativity. Religion has the capacity to meet challenges that come in course of time in the society. He emphasised very clearly that the growth of society is intimately related to the growth of religion. Religion gives security to value and meaning to life. Symbolism plays an important role in religion. We adore the Supreme in the form of images or symbols. Symbolism is the vision of infinite, in the finite.

According to Radhakrishnan, religion requires an observation of strict ethical discipline. It transforms our being and makes us capable to grasp the Reality by widening the narrow region of our being. Radhakrishnan holds that the Hindu concept of Dharma is accepted as the rule of life. The Hindu ethical and social duties make our life disciplined. They are the ways to achieve the goal of life.

Religion also requires an absolute purity of the mind. Inward purity is the complete mastery of the being over all other faculties. Purity of mind makes capable to realize divine being that within us. Meditation is the way of making contact with the Reality. It is the means of establishing direct relation with our inner being. It is the art of living in tune with the eternal. It increases our self-awareness. In true religion an inter-subjective relation between divine being and individual self is established. It manifests one's inward achievements. It is an aspiration of the self. In the words of Radhakrishnan, "True religion is not what we get from outside, from books and teachers. It is the aspiration of the human soul, that which unfolds within oneself, that which is built by one's life blood."

Radhakrishnan's interpretation of religion is unique in the field of philosophy. He has prescribed a religion which is both scientific and humanistic. Radhakrishnan is of the opinion that we cannot rest religion on dogmatic supernaturalism. He affirms that the idea of God is an interpretation of experience. It follows here that religious experiences are for Radhakrishnan context relative.

However religious experiences have value for Radhakrishnan, in so far as they offer the possibility of heightening one's religious consciousness and bringing one to ever closer proximity to 'religious intuition'. In his conception of religion Radhakrishnan affirms religion as a life or experience. It is an insight into the nature of reality or experience of reality. The significance of Radhakrishnan's philosophy is that he has attempted to restate certain aspects of Vedānta and recapture the eternal meaning of religion for modern man. He has related the imperishable truths of religion to modern enquiry. Radhakrishnan has discovered the ultimate truth of philosophy and of religion in the history of Indian Philosophy. Radhakrishnan is of the opinion that religion can be equated with perennial philosophy under the circumstances that, religion must be purely spiritual, cleansed of all accidental accretions and it must be spiritual. Moreover Radhakrishnan seeks to show that religion has the qualifications to be treated as a fit subject for metaphysical investigation. He makes a sustained effort to vindicate religious experience as the plane where the realm of essence and existence meet. Radhakrishnan's constructive endeavour is directed towards delineating metaphysics of religious experience.

Radhakrishnan was a profoundly religious man. The most important contribution which Radhakrishnan has made is that of the religion of the spirit that must according to him be the future religion of the world. Radhakrishnan says that no religion is perfect, because religion is a movement or growth in which the new rests on the old. The different religions, Radhakrishnan felt, were like comrades in a joint enterprise for facing the common problems of peaceful co-existence,

international welfare and justice, social equality and political independence. He used this as the basis for the development of human culture. He also asserted that religion which has not given importance to social reforms and international justice has no appeal to the modern mind.

## **Hindu view of life**

Radhakrishnan starts off by confronting the classic question of what Hinduism actually is. This, he does not answer directly, for a very good reason: Hinduism isn't an internally recognized word, but a name given to the sub-continent of India by outsiders. Later, it was recognized by Hindus as being a practicable working name. This was because India, despite being diverse, had a common history, literature and civilization.

The backbone of Hindu culture and beliefs is the Vedas. Faith is the vision of the soul where the spiritual part of the world is apprehended, just as the material world is apprehended via the physical senses. The mind has two powers, reason and intuition. Reason correlates with the physical senses, intuition with faith. The Vedas are a collection of the intuitions of the soul, which became the spiritual intuitions which founded the cohesive Hinduism we now know. These intuitions have a perennial value because "the truths revealed in the Vedas are capable of being re-experienced on compliance with ascertained conditions".

Hindus believe that there are different paths to God, and each individual has their own path. This is one of the reasons why there are many different books to learn from, not just the Vedas, but the Puranas, Ramayana, Mahabharata, to name a few. The reason why it is thought that each person has their own path to God is that religious experience cannot be made objective. Instead, our path to God is crafted from how we are disposed to experience God, therefore we all have a different experience of what God is, and a different path to God.

We understand God by asking what God is not. Through negation, we get closer to the answer. Essentially, a Hindu Guru would take our idea of what we believe God to be and chip away until we have an experience of nothingness. This is because the exact nature of God alludes thought, language and symbolism. God is understood in palpable terms by being divided into personalities: Cognition (Brahman), Emotion (Visnu) and Will (Siva).

The questions of our individual experience of God and our experience of reality go hand in hand. "The seers of the Upanisads were impressed by the unreality of the world, its fleeting and transitory character, and sought for the infinite real [sat]" (p. 13). The character of the world which is illusory is known as Maya, Buddha taught that we can escape from it through the dharma. The absolute nature of reality is known as Brahman, the relation of that to us (our experience of it) is Bhagavan. Our Bhagavan causes us to experience not only the world differently, but also God, hence why some people experience God through Visnu, Rama, Buddha, and so forth. The Hindu attitude is that there is no right or wrong God, merely our experience of God.

The mystics, he says, are all one family. When one chooses to experience God removed from dogma, there is no difference between Christianity, Islam, Hinduism, and so forth. "When the love of God is reached, divergences become impossible, for the soul has passed beyond the sphere of the manifold and is immersed in the one reality". As such, Hinduism welcomes Gods and figures from all religions.

He paints Hinduism's progression as being culturally democratic. They are well known to have kept

religious figures and ideologies from even the earliest known cultural traditions, and kept them on equal levels to their most modern gods. "To despise other people's Gods is to despise other people, for they and their Gods are adapted to each other" (p. 26). To the outsider, we can understand the people through their Gods, and the Gods by the people.

A great example of this is Krishna. He is so well known and loved that since Bhagavad Gita has become so culturally prominent, Krishna has too. Before the popularization of Bhagavad Gita, Krishna was a minor figure. Differences such as name become immaterial for the Hindu, since every name, at its best, connotes the same metaphysical and moral perfections.

Religion should be found in righteous living rather than correct belief. "What counts is not creed but conduct". By putting creed and doctrine before our personal faith, we lose ourselves to the religious group. "We start by claiming that Christianity is the only true religion and then affirm that Protestantism is the only true sect of Christianity, Episcopalianism the only true Protestant Christian religion...". Hinduism instead 'saps the roots instead of cutting the growths'.

Next we will discuss the concept of Maya. A majority of Hindus do not advocate fully the idea of Maya (the belief that the world is an illusion). However, it is held by Samkara who is often seen as holding the 'standard' type of Hindu thought. He had several reasons for advocating the doctrine of Maya including:

1. The manifold of experience is incomplete, and we are unable to unify it.
2. Time and space cannot be rounded into one whole.
3. That which is real must be exempt from change, and nothing empirical seems to be exempt from change.

The curtain of illusion may drop, but another drama will commence, continuing the illusion. This is why we must seek the eternal. "The state of perfection is a condition of absolute stillness". He warns us against merging waking state and dreams, and of merging illusions of reality with reality. "Moksa [release from belief in illusion] of an individual does not bring about the destruction of the world but the displacement of a false outlook by a true one".

He emphasized that the world was independent of Brahman, but not completely. Logically, we cannot rationalize the relationship of God and the world, so he says we should hold on to both. Agnosticism is the only logical conclusion.

Karma has been terribly misunderstood by westerners and by Hindus. Karma is an immutable natural law of the universe, and the universe is lawful to the core.

Karma is recognized to affect not only in the universe, but in minds and society too. It is "the embodiment of the mind and will of God... and justice is the karmic attribute of God". Karma is in fact a God-manifested law of justice which is immutable and intrinsic to nature.

Karma is the cause of the life and context in which we are born, and is conditioned by our right and wrong deeds in the world. We have a level of understanding of the karma an individual generates by their habits. What we mean by this is the kind and array of behavior to which they have propensity. Good karma is generated when people act highly in or above this range of habit. However, it is worth noting that bad and good do not level out, both will manifest in the next life.

Now on to what Dharma is. Dharma can roughly be translated as 'truth'. To have good dharma is to behave in the truest way. We all have an array of desires. "The Hindu code of practice links up the realm of desires with the perspective of the eternal. It binds together the kingdoms of earth and heaven".

Artha is that which deals with economic and political pursuits of man. Prosperity is the medium through which we express and move. Artha, Radhakrishnan notes, is good when, and only when, it is disciplined and ethical.

Moksa is 'spiritual realization'. It means 'release', and is our self-made spiritual emancipation from samsara (perpetual rebirth). There are three ways of attaining moksa-

1. Wisdom
2. Devotion
3. Servitude

Devotion is the most popular way as it is the most accessible way. It is also known as bhakti, and is explained in depth in Bhagavad Gita.

A wheel of Samsara, the process of continual reincarnation.

In a Hindu's life, there are four stages to move through. These stages are called Brahmacharya. The first stage is about training the body and mind. "The student is required to live for a fixed period in the house of his teacher".

The second stage is the prominent part of most Hindu's lives, and constitutes the level which most

Hindus are at. It is known as the householder stage. In this stage, Hindus get married. Marriage is considered highly sacred. The first reason is because sexual repression is believed to be unhealthy, and therefore a husband and wife should be sexually active.

Marriage is also important because it is a platform through which people can develop their personalities, and develop further spiritually. Marriage is successful when a partner becomes a lifetime companion. True love demands sacrifices, "byrestraint and endurance, we raise love to the likeness of the divine". Perfect relationships are created, not found.

The third stage comes about only when the second is perfected. "When one's bodily powers wane, it is time to depart to the forest and prepare oneself for the true life of the spirit. This is the stage when meditation is most important. Once the Hindu has been a benefactor to the world, they turn to their soul.

The final stage is that of the Samnyasin. At this stage, one seeks to attain complete spiritual freedom. This is done by intense practice, meditation and renunciation. The samnyasin does not attach to the world bodily or emotionally, their quest is a far more spiritual one.

Caste issues cause a lot of suffering and oppression in India. This is not the way it should have been. The caste system emerged as a way of creating a cohesive cultural synthesis, due largely to the fact that India had become highly multi cultured in a short space of time.

Multi culturalism in India, from an early point, encompassed "dark aboriginal tribes, the sturdy Dravidians, the yellow-skinned Mongols and the blithe, forceful Aryans... The Persians, Greeks and the Scythians...". Hindus wished for harmony between races. "those who tried to bring together different races in India are worshipped as the makers of Hindu society". When each race was welcomed into Hindu society, they were not seen as one nation, they believed that each race and community had a uniqueness, which was to be preserved.

He says that each caste has its own purpose and function, but that these can be categorized into four classes, called Varnas. These are-

1. These are granted freedom from labor, to develop spiritual insight, and to govern the state.
2. These are warriors. Whilst violence is never an ideal, it is sometimes thought of as a necessary evil in the world.
3. These people are responsible for wealth, they work with the movement of money. (Radhakrishnan says that "Hinduism has no sympathy with the view that 'to mix religion and business is to spoil two good things'. We ought not to banish spiritual values from life".
4. These are the unskilled workers.

These, respectively, are "men of thought, men of action, men of feeling, and others in whom none of these is highly developed". He wishes to reinforce, that there is no competition. No one caste is superior to another, they have equal value in the world.

He admits that there is in fact a lot of conflict between the castes. He puts this down to uneven wages and functioning of money in the world. He believes that artists and statesmen should receive less money than manual workers because their reward is in the love of their job, and therefore has a higher spiritual reward. He concludes that "A just organization of society will be

based of spiritual liberty, political equality and economic fraternity”.

### **J. Krishnamurti: 'Thought and Consciousness'**

All things were withdrawing into themselves. The trees were enclosing themselves in their own being; the birds were folding their wings to brood over their day's wanderings; the river had lost its glow, and the waters were no longer dancing but quiet and closed. The mountains were distant and unapproachable, and man had withdrawn into his house. Night had come, and there was the stillness of isolation. There was no communion; each thing had closed itself, set itself apart. The flower, the sound, the talk - everything was unexposed, invulnerable. There was laughter, but it was isolated and distant; the talk was muffled and from within. Only the stars were inviting, open and communicating; but they too were very far away.

Thought is always an outward response, it can never respond deeply. Thought is always the outer; thought is always an effect, and thinking is the reconciliation of effects. Thought is always superficial, though it may place itself at different levels. Thought can never penetrate the profound, the implicit. Thought cannot go beyond itself, and every attempt to do so is its own frustration. "What do you mean by thought?"

Thought is response to any challenge; thought is not action, doing. Thought is an outcome, the result of a result; it is the result of memory. Memory is thought, and thought is the verbalization of memory. Memory is experience. The thinking process is the conscious process, the hidden as well as the open. This whole thinking process is consciousness; the waking and the sleeping, the upper and the deeper levels are all part of memory, experience. Thought is not independent.

There is no independent thinking; "independent thinking" is a contradiction in terms. Thought, being a result, opposes or agrees, compares or adjusts, condemns or justifies, and therefore it can never be free. A result can never be free; it can twist about, manipulate, wander, go a certain distance, but it cannot be free from its own mooring. Thought is anchored to memory, and it can never be free to discover the truth of any problem.

"Do you mean to say that thought has no value at all?"

It has value in the reconciliation of effects, but it has no value in itself as a means to action. Action is revolution, not the reconciliation of effects. Action freed from thought, idea, belief, is never within a pattern. There can be activity within the pattern, and that activity is either violent, bloody, or the opposite; but it is not action. The opposite is not action, it is a modified continuation of activity. The opposite is still within the field of result, and in pursuing the opposite, thought is caught within the net of its own responses. Action is not the result of thought; action has no relation to thought. Thought, the result, can never create the new; the new is from moment to moment, and thought is always the old, the past, the conditioned. It has value but no freedom. All value is limitation, it binds. Thought is binding, for it is cherished.

"What relationship is there between consciousness and thought?"

Are they not the same? Is there any difference between thinking and being conscious? Thinking is a response; and is being conscious not also a response? When one is conscious of that chair, it is a response to a stimulus; and is not thought the response of memory to a challenge? It is this response that we call experience. Experiencing is challenge and response; and this experiencing,

together with the naming or recording of it - this total process, at different levels, is consciousness, is it not? Experience is the result, the outcome of experiencing. The result is given a term; the term itself is a conclusion, one of the many conclusions which constitute memory. This concluding process is consciousness. The conclusion, the result, is self-consciousness. The self is memory, the many conclusions; and thought is the response of memory. Thought is always a conclusion; thinking is concluding, and therefore it can never be free.

Thought is always the superficial, the conclusion. Consciousness is the recording of the superficial. The superficial separates itself as the outer and the inner, but this separation does not make thought any the less superficial. "But is there not something which is beyond thought, beyond time, something that is not created by the mind?"

Either you have been told about that state, have read about it, or there is the experiencing of it. The experiencing of it can never be an experience, a result; it cannot be thought about - and if it is, it is a remembrance and not experiencing. You can repeat what you have read or heard, but the word is not the thing; and the word, the very repetition, prevents the state of experiencing. That state of experiencing cannot be as long as there is thinking; thought, the result, the effect, can never know the state of experiencing.

"Then how is thought to come to an end?"

See the truth that thought, the outcome of the known, can never be in the state of experiencing. Experiencing is always the new; thinking is always of the old. See the truth of this, and truth brings freedom - freedom from thought, the result, Then there is that which is beyond consciousness, which is neither sleeping nor waking, which is nameless: it is

### **'Ending Thought'**

Questioner: I wonder what you really mean by ending thought. I talked to a friend about it and he said it is some kind of oriental nonsense. To him thought is the highest form of intelligence and action, the very salt of life, indispensable. It has created civilization, and all relationship is based on it. All of us accept this, from the greatest thinker to the humblest labourer. When we don't think we sleep, vegetate or daydream; we are vacant, dull and unproductive, whereas when we are awake we are thinking, doing, living, quarrelling: these are the only two states we know. You say, be beyond both - beyond thought and vacant inactivity. What do you mean by this?

Krishnamurti: Very simply put, thought is the response of memory, the past. The past is an infinity or a second ago. When thought acts it is this past which is acting as memory, as experience, as knowledge, as opportunity. All will is desire based on this past and directed towards pleasure or the avoidance of pain. When thought is functioning it is the past, therefore there is no new living at all; it is the past living in the present, modifying itself and the present. So there is nothing new in life that way, and when something new is to be found there must be the absence of the past, the mind must not be cluttered up with thought, fear, pleasure, and everything else. Only when the mind is uncluttered can the new come into being, and for this reason we say that thought must be still, operating only when it has to - objectively, efficiently. All continuity is thought; when there is continuity there is nothing new. Do you see how important this is? It's really a question of life itself. Either you live in the past, or you live totally differently: that is the whole point.

Questioner: I think I do see what you mean, but how in the world is one to end this thought? When I

listen to the blackbird there is thought telling me instantly it is the blackbird; when I walk down the street thought tells me I am walking down the street and tells me all I recognise and see; when I play with the notion of not thinking it is again thought that plays this game. All meaning and understanding and communication are thought. Even when I am not communicating with someone else I am doing so with myself. When I am awake, I think, when I am asleep I think. The whole structure of my being is thought. Its roots lie far deeper than I know. All I think and do and all I am is thought, thought creating pleasure and pain, appetites, longings, resolutions, conclusions, hopes, fears and questions. Thought commits murder and thought forgives. So how can one go beyond it? Isn't it thought again which seeks to go beyond it?

Krishnamurti: We both said, when thought is still, something new can be. We both saw that point clearly and to understand it clearly is the ending of thought.

Questioner: But that understanding is also thought.

Krishnamurti: Is it? You assume that it is thought, but is it, actually?

Questioner: It is a mental movement with meaning, a communication to oneself.

Krishnamurti: If it is a communication to oneself it is thought. But is understanding a mental movement with meaning?

Questioner: Yes it is.

Krishnamurti: The meaning of the word and the understanding of that meaning is thought. That is necessary in life. There thought must function efficiently. It is a technological matter. But you are not asking that. You are asking how thought, which is the very movement of life as you know it, can come to an end. Can it only end when you die? That is really your question, isn't it?

Questioner: Yes.

Krishnamurti: That is the right question. Die! Die to the past, to tradition. Questioner: But how?

Krishnamurti: The brain is the source of thought. The brain is matter and thought is matter. Can the brain - with all its reactions and its immediate responses to every challenge and demand - can that brain be very still? It is not a question of ending thought, but of whether the brain can be completely still. Can it act with full capacity when necessary and otherwise be still? This stillness is not physical death. See what happens when the brain is completely still. See what happens.

Questioner: In that space there was a blackbird, the green tree, the blue sky, the man hammering next door, the sound of the wind in the trees and my own heartbeat, the total quietness of the body. That is all.

Krishnamurti: If there was recognition of the blackbird singing, then the brain was active, was interpreting. It was not still. This really demands tremendous alertness and discipline, the watching that brings its own discipline, not imposed or brought about by your unconscious desire to achieve a result or a pleasurable new experience. Therefore during the day thought must operate effectively, sanely, and also watch itself.

Questioner: That is easy, but what about going beyond it?

Krishnamurti: Who is asking this question? Is it the desire to experience something new or is it the enquiry? If it is the enquiry, then you must enquire and investigate the whole business of thinking and be completely familiar with it, know all its tricks and subtleties. If you have done this you will know that the question of going beyond thought is an empty one. Going beyond thought is knowing what thought is.

**Questioner:** I wonder what you really mean by ending thought. I talked to a friend about it and he said it is some kind of oriental nonsense. To him thought is the highest form of intelligence and action, the very salt of life, indispensable. It has created civilization, and all relationship is based on it. All of us accept this, from the greatest thinker to the humblest labourer. When we don't think we sleep, vegetate or daydream; we are vacant, dull and unproductive, whereas when we are awake we are thinking, doing, living, quarrelling: these are the only two states we know. You say, be beyond both - beyond thought and vacant inactivity. What do you mean by this?

Krishnamurti: Very simply put, thought is the response of memory, the past. The past is an infinity or a second ago. When thought acts it is this past which is acting as memory, as experience, as knowledge, as opportunity. All will is desire based on this past and directed towards pleasure or the avoidance of pain. If you have done this you will know that the question of going beyond thought is an empty one. Going beyond thought is knowing what thought is.

## **Freedom From the Known**

Man has throughout the ages been seeking something beyond himself, beyond material welfare - something we call truth or God or reality, a timeless state - something that cannot be disturbed by circumstances, by thought or by human corruption.

Man has always asked the question: what is it all about? Has life any meaning at all? He sees the enormous confusion of life, the brutalities, the revolt, the wars, the endless divisions of religion, ideology and nationality, and with a sense of deep abiding frustration he asks, what is one to do, what is this thing we call living, is there anything beyond it?

And not finding this nameless thing of a thousand names which he has always sought, he has cultivated faith - faith in a saviour or an ideal - and faith invariably breeds violence.

In this constant battle which we call living, we try to set a code of conduct according to the society in which we are brought up, whether it be a Communist society or a so-called free society; we accept a standard of behaviour as part of our tradition as Hindus or Muslims or Christians or whatever we happen to be.

We look to someone to tell us what is right or wrong behaviour, what is right or wrong thought, and in following this pattern our conduct and our thinking become mechanical, our responses automatic. We can observe this very easily in ourselves.

For centuries we have been spoon-fed by our teachers, by our authorities, by our books, our saints. We say, 'Tell me all about it - what lies beyond the hills and the mountains and the earth?' and we are satisfied with their descriptions, which means that we live on words and our life is shallow and empty. We are secondhand people. We have lived on what we have been told, either guided by our inclinations, our tendencies, or compelled to accept by circumstances and environment. We are the result of all kinds of influences and there is nothing new in us, nothing that we have discovered for ourselves; nothing original, pristine, clear.

Throughout theological history we have been assured by religious leaders that if we perform certain rituals, repeat certain prayers or mantras, conform to certain patterns, suppress our desires, control our thoughts, sublimate our passions, limit our appetites and refrain from sexual indulgence, we shall, after sufficient torture of the mind and body, find something beyond this little life. And that is what millions of so-called religious people have done through the ages, either in isolation, going off into the desert or into the mountains or a cave or wandering from village to village with a begging bowl, or, in a group, joining a monastery, forcing their minds to conform to an established pattern. But a tortured mind, a broken mind, a mind which wants to escape from all turmoil, which has denied the outer world and been made dull through discipline and conformity - such a mind, however long it seeks, will find only according to its own distortion.

So to discover whether there actually is or is not something beyond this anxious, guilty, fearful, competitive existence, it seems to me that one must have a completely different approach altogether. The traditional approach is from the periphery inwards, and through time, practice and renunciation, gradually to come upon that inner flower, that inner beauty and love - in fact to do everything to make oneself narrow, petty and shoddy; peel off little by little; take time; tomorrow will do, next life will do - and when at last one comes to the centre one finds there is nothing there, because one's mind has been made incapable, dull and insensitive.

Having observed this process, one asks oneself, is there not a different approach altogether - that is, is it not possible to explode from the centre?

The world accepts and follows the traditional approach. The primary cause of disorder in ourselves is the seeking of reality promised by another; we mechanically follow somebody who will assure us a comfortable spiritual life. It is a most extraordinary thing that although most of us are opposed to political tyranny and dictatorship, we inwardly accept the authority, the tyranny, of another to twist our minds and our way of life. So if we completely reject, not intellectually but actually, all so-called spiritual authority, all ceremonies, rituals and dogmas, it means that we stand alone and are

already in conflict with society; we cease to be respectable human beings. A respectable human being cannot possibly come near to that infinite, immeasurable, reality.

You have now started by denying something absolutely false - the traditional approach - but if you deny it as a reaction you will have created another pattern in which you will be trapped; if you tell yourself intellectually that this denial is a very good idea but do nothing about it, you cannot go any further. If you deny it however, because you understand the stupidity and immaturity of it, if you reject it with tremendous intelligence, because you are free and not frightened, you will create a great disturbance in yourself and around you but you will step out of the trap of respectability. Then you will find that you are no longer seeking. That is the first thing to learn - not to seek. When you seek you are really only window-shopping.

The question of whether or not there is a God or truth or reality, or whatever you like to call it, can never be answered by books, by priests, philosophers or saviours. Nobody and nothing can answer the question but you yourself and that is why you must know yourself. Immaturity lies only in total ignorance of self. To understand yourself is the beginning of wisdom.

And what is yourself, the individual you? I think there is a difference between the human being and the individual. The individual is a local entity, living in a particular country, belonging to a particular culture, particular society, particular religion. The human being is not a local entity. He is everywhere. If the individual merely acts in a particular corner of the vast field of life, then his action is totally unrelated to the whole. So one has to bear in mind that we are talking of the whole not the part, because in the greater the lesser is, but in the lesser the greater is not. The individual is the little conditioned, miserable, frustrated entity, satisfied with his little gods and his little traditions, whereas a human being is concerned with the total welfare, the total misery and total confusion of the world.

We human beings are what we have been for millions of years - -colossally greedy, envious, aggressive, jealous, anxious and despairing, with occasional flashes of joy and affection. We are a strange mixture of hate, fear and gentleness; we are both violence and peace. There has been outward progress from the bullock cart to the jet plane but psychologically the individual has not changed at all, and the structure of society throughout the world has been created by individuals. The outward social structure is the result of the inward psychological structure of our human relationships, for the individual is the result of the total experience, knowledge and conduct of man. Each one of us is the storehouse of all the past. The individual is the human who is all mankind. The whole history of man is written in ourselves.

Do observe what is actually taking place within yourself and outside yourself in the competitive culture in which you live with its desire for power, position, prestige, name, success and all the rest of it - observe the achievements of which you are so proud, this whole field you call living in which there is conflict in every form of relationship, breeding hatred, antagonism, brutality and endless wars.

This field, this life, is all we know, and being unable to understand the enormous battle of existence we are naturally afraid of it and find escape from it in all sorts of subtle ways. And we are frightened also of the unknown - frightened of death, frightened of what lies beyond tomorrow. So we are afraid of the known and afraid of the unknown. That is our daily life and in that there is no hope, and therefore every form of philosophy, every form of theological concept, is merely an

escape from the actual reality of what is.

All outward forms of change brought about by wars, revolutions, reformations, laws and ideologies have failed completely to change the basic nature of man and therefore of society. As human beings living in this monstrously ugly world, let us ask ourselves, can this society, based on competition, brutality and fear, come to an end? Not as an intellectual conception, not as a hope, but as an actual fact, so that the mind is made fresh, new and innocent and can bring about a different world altogether? It can only happen, I think, if each one of us recognises the central fact that we, as individuals, as human beings, in whatever part of the world we happen to live or whatever culture we happen to belong to, are totally responsible for the whole state of the world. We are each one of us responsible for every war because of the aggressiveness of our own lives, because of our nationalism, our selfishness, our gods, our prejudices, our ideals, all of which divide us. And only when we realize, not intellectually but actually, as actually as we would recognise that we are hungry or in pain, that you and I are responsible for all this existing chaos, for all the misery throughout the entire world because we have contributed to it in our daily lives and are part of this monstrous society with its wars, divisions, its ugliness, brutality and greed - only then will we act.

But what can a human being do - what can you and I do - to create a completely different society? We are asking ourselves a very serious question. Is there anything to be done at all? What can we do? Will somebody tell us? People have told us. The so-called spiritual leaders, who are supposed to understand these things better than we do, have told us by trying to twist and mould us into a new pattern, and that hasn't led us very far; sophisticated and learned men have told us and that has led us no further. We have been told that all paths lead to truth - you have your path as a Hindu and someone else has his path as a Christian and another as a Muslim, and they all meet at the same door - which is, when you look at it, so obviously absurd. Truth has no path, and that is the beauty of truth, it is living. A dead thing has a path to it because it is static, but when you see that truth is something living, moving, which has no resting place, which is in no temple, mosque or church, which no religion, no teacher, no philosopher, nobody can lead you to - then you will also see that this living thing is what you actually are - your anger, your brutality, your violence, your despair, the agony and sorrow you live in. In the understanding of all this is the truth, and you can understand it only if you know how to look at those things in your life. And you cannot look through an ideology, through a screen of words, through hopes and fears.

So you see that you cannot depend upon anybody. There is no guide, no teacher, no authority. There is only you - your relationship with others and with the world - there is nothing else. When you realize this, it either brings great despair, from which comes cynicism and bitterness, or, in facing the fact that you and nobody else is responsible for the world and for yourself, for what you think, what you feel, how you act, all self-pity goes. Normally we thrive on blaming others, which is a form of self-pity.

Can you and I, then, bring about in ourselves without any outside influence, without any persuasion, without any fear of punishment - can we bring about in the very essence of our being a total revolution, a psychological mutation, so that we are no longer brutal, violent, competitive, anxious, fearful, greedy, envious and all the rest of the manifestations of our nature which have built up the rotten society in which we live our daily lives?

It is important to understand from the very beginning that I am not formulating any philosophy or any theological structure of ideas or theological concepts. It seems to me that all ideologies are

utterly idiotic. What is important is not a philosophy of life but to observe what is actually taking place in our daily life, inwardly and outwardly. If you observe very closely what is taking place and examine it, you will see that it is based on an intellectual conception, and the intellect is not the whole field of existence; it is a fragment, and a fragment, however cleverly put together, however ancient and traditional, is still a small part of existence whereas we have to deal with the totality of life. And when we look at what is taking place in the world we begin to understand that there is no outer and inner process; there is only one unitary process, it is a whole, total movement, the inner movement expressing itself as the outer and the outer reacting again on the inner. To be able to look at this seems to me all that is needed, because if we know how to look, then the whole thing becomes very clear, and to look needs no philosophy, no teacher. Nobody need tell you how to look. You just look.

Can you then, seeing this whole picture, seeing it not verbally but actually, can you easily, spontaneously, transform yourself? That is the real issue. Is it possible to bring about a complete revolution in the psyche?

I wonder what your reaction is to such a question? You may say, 'I don't want to change', and most people don't, especially those who are fairly secure socially and economically or who hold dogmatic beliefs and are content to accept themselves and things as they are or in a slightly modified form. With those people we are not concerned. Or you may say more subtly, 'Well, it's too difficult, it's not for me', in which case you will have already blocked yourself, you will have ceased to enquire and it will be no use going any further. Or else you may say, 'I see the necessity for a fundamental inward change in myself but how am I to bring it about? Please show me the way, help me towards it.' If you say that, then what you are concerned with is not change itself; you are not really interested in a fundamental revolution: you are merely searching for a method, a system, to bring about change. If I were foolish enough to give you a system and if you were foolish enough to follow it, you would merely be copying, imitating, conforming, accepting, and when you do that you have set up in yourself the authority of another and hence there is conflict between you and that authority. You feel you must do such and such a thing because you have been told to do it and yet you are incapable of doing it. You have your own particular inclinations, tendencies and pressures which conflict with the system you think you ought to follow and therefore there is a contradiction. So you will lead a double life between the ideology of the system and the actuality of your daily existence. In trying to conform to the ideology, you suppress yourself - whereas what is actually true is not the ideology but what you are. If you try to study yourself according to another you will always remain a secondhand human being.

A man who says, 'I want to change, tell me how to', seems very earnest, very serious, but he is not. He wants an authority whom he hopes will bring about order in himself. But can authority ever bring about inward order? Order imposed from without must always breed disorder. You may see the truth of this intellectually but can you actually apply it so that your mind no longer projects any authority, the authority of a book, a teacher, a wife or husband, a parent, a friend or of society? Because we have always functioned within the pattern of a formula, the formula becomes the ideology and the authority; but the moment you really see that the question, 'How can I change?' sets up a new authority, you have finished with authority for ever.

Let us state it again clearly: I see that I must change completely from the roots of my being; I can no longer depend on any tradition because tradition has brought about this colossal laziness, acceptance and obedience; I cannot possibly look to another to help me to change, not to any

teacher, any God, any belief, any system, any outside pressure or influence. What then takes place?

First of all, can you reject all authority? If you can it means that you are no longer afraid. Then what happens? When you reject something false which you have been carrying about with you for generations, when you throw off a burden of any kind, what takes place? You have more energy, haven't you? You have more capacity, more drive, greater intensity and vitality. If you do not feel this, then you have not thrown off the burden, you have not discarded the dead weight of authority. But when you have thrown it off and have this energy in which there is no fear at all - no fear of making a mistake, no fear of doing right or wrong - then is not that energy itself the mutation? We need a tremendous amount of energy and we dissipate it through fear but when there is this energy which comes from throwing off every form of fear, that energy itself produces the radical inward revolution. You do not have to do a thing about it.

So you are left with yourself, and that is the actual state for a man to be who is very serious about all this; and as you are no longer looking to anybody or anything for help, you are already free to discover. And when there is freedom, there is energy; and when there is freedom it can never do anything wrong.

Freedom is entirely different from revolt. There is no such thing as doing right or wrong when there is freedom. You are free and from that centre you act. And hence there is no fear, and a mind that has no fear is capable of great love. And when there is love it can do what it will.

What we are now going to do, therefore, is to learn about ourselves, not according to me or to some analyst or philosopher - because if we learn about ourselves according to someone else, we learn about them, not ourselves - we are going to learn what we actually are.

Having realized that we can depend on no outside authority in bringing about a total revolution within the structure of our own psyche, there is the immensely greater difficulty of rejecting our own inward authority, the authority of our own particular little experiences and accumulated opinions, knowledge, ideas and ideals. You had an experience yesterday which taught you something and what it taught you becomes a new authority - and that authority of yesterday is as destructive as the authority of a thousand years. To understand ourselves needs no authority either of yesterday or of a thousand years because we are living things, always moving, flowing, never resting. When we look at ourselves with the dead authority of yesterday, we will fail to understand the living movement and the beauty and quality of that movement.

To be free of all authority, of your own and that of another, is to die to everything of yesterday, so that your mind is always fresh, always young, innocent, full of vigour and passion. It is only in that state that one learns and observes. And for this a great deal of awareness is required, actual awareness of what is going on inside yourself, without correcting it or telling it what it should or should not be, because the moment you correct it you have established another authority, a censor.

So now we are going to investigate ourselves together - not one person explaining while you read, agreeing or disagreeing with him as you follow the words on the page, but taking a journey together, a journey of discovery into the most secret corners of our minds. And to take such a journey we must travel light; we cannot be burdened with opinions, prejudices and conclusions - all that old furniture we have collected for the last two thousand years and more. Forget all you know

about yourself; forget all you have ever thought about yourself; we are going to start as if we knew nothing.

It rained last night heavily, and now the skies are beginning to clear; it is a new fresh day. Let us meet that fresh day as if it were the only day. Let us start on our journey together with all the remembrance of yesterday left behind - and begin to understand ourselves for the first time.

### **Freedom from the Self**

Freedom from the self, and therefore the search of reality, the discovery and the coming into being of reality, is the true function of man. Religions play with it in their rituals and rigmarole – you know, the whole business of it. But if one becomes aware of this whole process, then there is a possibility for the newly awakened intelligence to function. In that, there is not self-release, not self-fulfilment, but creativeness. It is this creativeness of reality, which is not of time, that sets one free from all the business of the collective and the individual. Then one is really in a position to help create the new.

### **It is only the free mind that is creative**

Why does the mind accumulate knowledge or acquire virtue? Why does the mind constantly strive to become something, to perfect itself? In the process of acquisition and accumulation, the mind is burdened. All accumulation in self-knowledge is a hindrance to the further discovery of the self. Now, is it possible to discover and not be acquisitive, so that the discovery does not leave an experience which will condition further discovery?

This is really the freedom from the self, so that there is no accumulative entity, and therefore there is creative being. Accumulation is not creativeness. A mind which is constantly acquiring can obviously never be creative. It is only the free mind that is creative. There can be no freedom if every experience is stored up, because that which is accumulated becomes the centre of the “me”, of the “I”.

### **The process of the self**

By the self, I mean the idea, the memory, the conclusion, the experience, the various forms of nameable and unnameable intentions, the conscious endeavour to be or not to be, competition, the accumulated memory of the unconscious, the racial, the group, the individual, the clan, the whole of it, whether projected outwardly in action or projected spiritually as virtue. The whole process of that is the self; and we know actually when we are faced with it that it is an evil thing. I am using the word *evil* intentionally, because the self is dividing; it is self-enclosing; its activities, however noble, are separative and isolating. We know all this. We also know those extraordinary moments when the self is not there, in which there is no sense of endeavour, of effort, and which happens when there is love.

### **Is it possible for the mind to be quite still, in a state of non-recognition or non-experiencing?**

All the various forms of discipline, belief and knowledge only strengthen the self. Can we find an element which will dissolve the self? Or is that a wrong question? That is what we want basically. We want to find something which will dissolve the “me”. We think there are various means, namely identification, belief, etc., but all of them are at the same level; one is not superior to the other because all of them are equally powerful in strengthening the self, the “me”. So can I see the “me” wherever it functions and see its destructive forces and energy? Whatever name I may give to it, it is an isolating force, it is a destructive force, and I want to find a way of dissolving it. You must

have asked this yourself. I see the "I" functioning all the time and bringing anxiety, fear, frustration, despair, misery, not only to myself but to all around me. Is it possible for that self to be dissolved, not partially but completely? Can we go to the root of it and destroy it? That is the only way of truly functioning, is it not? I do not want to be partially intelligent but intelligent in an integrated manner. Most of us are intelligent in layers: you probably in one way and I in some other way. People are intelligent in different ways but we are not integrally intelligent. To be integrally intelligent means to be without the self. Is it possible?

Is it possible for the self to be completely absent now? What are the necessary ingredients or requirements? What is the element that brings it about? Can I find it? When I put that question 'Can I find it?' I am convinced that it is possible and so I have already created an experience in which the self is going to be strengthened. Understanding of the self requires a great deal of intelligence, a great deal of watchfulness, alertness, watching ceaselessly so that it does not slip away. I, who am very earnest, want to dissolve the self. When I say that, I know it is possible to dissolve the self. The moment I say, 'I want to dissolve this,' in that there is still the experiencing of the self, and so the self is strengthened.

One can see that the state of creation is not at all the experience of the self. Creation is when the self is not there, because creation is not intellectual, is not of the mind, is not self-projected, is something beyond all experiencing. So is it possible for the mind to be quite still, in a state of non-recognition or non-experiencing, to be in a state in which creation can take place, which means when the self is not there, when the self is absent? Any movement of the mind, positive or negative, is an experience which actually strengthens the "me". Is it possible for the mind not to recognize? That can only take place when there is complete silence, but not the silence which is an experience of the self and which therefore strengthens the self.

Is there an entity apart from the self which looks at the self and dissolves the self? Is there a spiritual entity which supersedes the self and destroys it, which puts it aside? Most religious people think there is such an element. The materialist says, 'It is impossible for the self to be destroyed; it can only be conditioned and restrained – politically, economically and socially; we can hold it firmly within a certain pattern and we can break it; and therefore it can be made to lead a high life, a moral life, and not to interfere with anything but to follow the social pattern and to function merely as a machine.' That we know. There are other people, the so-called religious ones – they are not really religious, though we call them so – who say, 'Fundamentally there is such an element; if we can get in touch with it, it will dissolve the self.' Is there such an element to dissolve the self? Please see what we are doing. We are forcing the self into a corner. If you allow yourself to be forced into the corner, you will see what will happen. We should like there to be an element which is timeless, which is not of the self, which we hope will come and intercede and destroy the self, and which we call God. Now is there such a thing which the mind can conceive? There may be or there may not be; that is not the point.

**If you and I as individuals can see the whole working of the self, then we shall know what love is.** When the mind seeks a timeless spiritual state which will go into action in order to destroy the self, is that not another form of experience which is strengthening the "me"? When you believe, is that not what is actually taking place? When you believe that there is truth, God, the timeless state, immortality, is that not the process of strengthening the self? The self has projected that thing which you feel and believe will come and destroy the self. So, having projected this idea of continuance in a timeless state as a spiritual entity, you have an experience. Such an experience only

strengthens the self, and therefore what have you done? You have not really destroyed the self but only given it a different name, a different quality. The self is still there, because you have experienced it. Thus our action from the beginning to the end is the same action, only we think it is evolving, growing, becoming more and more beautiful. But it is the same action going on, the same "me" functioning at different levels with different labels, different names.

When you see the whole process, the cunning, extraordinary inventions, the intelligence of the self, how it covers itself up through identification, through virtue, through experience, through belief, through knowledge; when you see that the mind is moving in a circle, in a cage of its own making, what happens? When you are aware of it, fully cognizant of it, then are you not extraordinarily quiet? Not through compulsion, not through any reward, not through any fear, when you recognize that every movement of the mind is merely a form of strengthening the self, when you observe it, see it, when you are completely aware of it in action, when you come to that point, not ideologically or verbally, not through projected experiencing, but when you are actually in that state, then you will see that the mind, being utterly still, has no power of creating. Whatever the mind creates is in a circle, within the field of the self. When the mind is non-creating there is creation, which is not a recognizable process.

Reality, truth, is not to be recognized. For truth to come, belief, knowledge, experiencing, the pursuit of virtue, all this must go. The virtuous person who is conscious of pursuing virtue can never find reality. He may be a very decent person but that is entirely different from being a man of truth, a man who understands. To the man of truth, truth has come into being. A virtuous man is a righteous man, and a righteous man can never understand what is truth because virtue to him is the covering of the self, the strengthening of the self because he is pursuing virtue. When he says, 'I must be without greed,' the state of non-greed which he experiences only strengthens the self. That is why it is so important to be poor, not only in the things of the world but also in belief and in knowledge. A man with worldly riches or a man rich in knowledge and belief will never know anything but darkness, and will be the centre of all mischief and misery. But if you and I as individuals can see the whole working of the self, then we shall know what love is. I assure you that is the only reformation which can possibly change

the world. Love is not of the self. Self cannot recognize love. You say, 'I love,' but in the very saying of it, in the very experiencing of it, love is not. But when you know love, self is not. When there is love, self is not.

## **Self-knowing**

Intelligence is possible only when there is real freedom from the self, from the "me", that is, when the mind is no longer the centre of the demand for the "more", no longer caught up in the desire for greater, wider, more expansive experience. Intelligence is freedom from the pressure of time, because the "more" implies time, and as long as the mind is the centre of the demand for the "more", it is the result of time. So the cultivation of the "more" is not intelligence. The understanding of this whole process is self-knowledge. When one knows oneself as one is, without an accumulating centre, out of that self-knowing comes the intelligence which can meet life; and that intelligence is creative.

I and my mind are the same, there is no division between myself and my mind. The self that is envious or ambitious is exactly the same as the mind that says, 'I must not be envious, I must be noble,' only the mind has divided itself. Now, when I see that, what am I to do? If the mind is the

product of environment, of envy, greed and conditioning, then what is it to do? Surely any movement it makes to free itself is still part of that conditioning. Any movement on the part of the mind to free itself from conditioning is an action of the self which wants to be free in order to be more happy, more at peace, nearer the right hand of God. So I see the whole of this, the ways and trickeries of the mind. Therefore the mind is quiet, it is completely still, there is no movement; and it is in that silence, in that stillness, that there is freedom from the self, from the mind itself. Surely the self exists only in the movement of the mind to gain something or to avoid something.

If there is no movement of gaining or avoiding, the mind is completely quiet. Then only is there a possibility of being free from the totality of consciousness. *Krishnamurti*

### **The totality of the self**

I do not know if you have noticed the constant effort that one is consciously or unconsciously making to express oneself, to be something, either socially, morally, or economically. This entails a great deal of striving; our whole life is based on the everlasting struggle to arrive, to achieve, to become. The more we struggle, the more significant and exaggerated the self becomes, with all its limitations, fears, ambitions, frustrations. There must have been times when each one has asked themselves whether it is not possible to be totally without the self.

### **Can we live in this world without any identification at all?**

After all, we do have rare moments when the sense of the self is not. I am not talking of the transmutation of the self to a higher level, but of the simple cessation of the "me" with its anxieties, worries, fears – the absence of the self. One realises that such a thing is possible, and then one sets about deliberately, consciously, to eliminate the self. That is what organised religions try to do, to help each worshipper or believer to lose themselves in something greater, and thereby perhaps to experience some higher state. If you are not a so-called religious person, then you identify yourself with the State, with the country, and try to lose yourself in that identification, which gives you the feeling of greatness, of being something much larger than the petty little self. Or if we do not do that, we try to lose ourselves in social work of some kind, again with the same intention. We think that if we can forget ourselves, deny ourselves, put ourselves out of the way by dedicating our lives to something greater and more vital than ourselves, we shall perhaps experience bliss or happiness. And if we do none of these things, we hope to stop thinking about ourselves through the cultivation of virtue, through discipline, through control or through constant practice.

All this implies a ceaseless effort to be or to become something. Perhaps in listening to what is being said, we can together go into this whole process and discover for ourselves whether it is possible to wipe away the sense of the "me" without this fearful, restricting discipline, without this enormous effort to deny ourselves, this constant struggle to renounce our wants, our ambitions, in order to be something or to achieve some reality. I think in this lies the real issue. All effort implies motive. I make an effort to forget myself in something, in a ritual or ideology, because in thinking about myself I am unhappy. When I think about something else, I am more relaxed, my mind is quieter, I seem to feel better, I look at things differently. So I make an effort to forget myself. But behind my effort there is a motive, which is to escape from myself because I suffer; and that motive is essentially a part of the self. When I renounce this world and become a monk, or a very devout religious person, the motive is that I want to achieve something better; but that is still the process of the self. I may give up my name and just be a number in a religious order, but the motive is still there.

Is it possible to forget oneself without any motive? We can see very well that any motive has within it the seed of the self, with its anxiety, ambition, frustration, its fear of not being, and the immense urge to be secure. Can all that fall away easily, without any effort? Which means, really, can you and I, as individuals, live in this world without being identified with anything? I identify myself with my country, with my religion, with my family, with my name, because without identification I am nothing. Without a position, without power, without prestige of one kind or another, I feel lost; and so I identify myself with my name, with my family, with my religion, I join some organisation or become a monk – we all know the various types of identification that the mind clings to. But can we live in this world without any identification at all?

If we can think about this, if we can listen to what is being said, and at the same time be aware of our own intimations regarding the implications of identification, then I think we shall discover, if we are at all serious, that it is possible to live in this world without the nightmare of identification and the ceaseless struggle to achieve a result. Then I think knowledge has quite a different significance. At present we identify ourselves with our knowledge and use it as a means of self-expansion, just as we do with the nation, with a religion, or with some activity.

Identification with the knowledge we have gained is another way of furthering the self. Through knowledge the 'me' continues its struggle to be something, and thereby perpetuates misery, pain.

**“Self-knowledge means going very deeply into oneself without assuming anything.”**

If we can very humbly and simply see the implications of all this, be aware, without assuming anything, of how our minds operate and what our thinking is based on, then I think we shall realise the extraordinary contradiction that exists in this whole process of identification. After all, it is because I feel empty, lonely, miserable, that I identify myself with my country, and this identification gives me a sense of wellbeing, a feeling of power. Or for the same reason I identify myself with a hero or with a saint. But if I can go into this process of identification very deeply, I will see that the whole movement of my thinking and my activity, however noble, is essentially based on the continuance of myself in one form or another.

Now, if I once see that, if I realise it, feel it with my whole being, then religion has quite a different meaning. Then religion is no longer a process of identifying myself with God, but rather the coming into being of a state in which there is only that reality, and not the “me”. But this cannot be a mere verbal assertion, it is not just a phrase to be repeated.

That is why it is very important to have self-knowledge, which means going very deeply into oneself without assuming anything, so that the mind has no deceptions, no illusions, so that it does not trick itself into visions and false states.

Then perhaps it is possible for the enclosing process of the self to come to an end – but not through any form of compulsion or discipline, because the more you discipline the self, the stronger the self becomes. What is important is to go into all this very deeply and patiently, without taking anything for granted, so that one begins to understand the ways, the purposes, the motives and directions of the mind. Then the mind comes to a state in which there is no identification at all, and therefore no effort to be something; then there is the cessation of the self, and that is the real. Although we may swiftly, fleetingly experience this state, the difficulty for most of us is that the mind clings to the experience and wants more of it; and the very wanting of more is again the beginning of the self. That is why it is very important, for those of us who are really serious in these

matters, to be inwardly aware of the process of our own thinking, to silently observe our motives, our emotional reactions, and not merely say, 'I know myself very well' – for actually one does not. You may know your reactions and motives superficially, at the conscious level, but the self, the "me", is a very complex affair, and to go into the totality of the self needs persistent and continuous inquiry without a motive, without an end in view. Such inquiry is surely a form of meditation.

That immense reality cannot be found through any organisation, through any church, through any book, through any person or teacher. One has to find it for oneself – which means that one has to be completely alone, uninfluenced. But we are all the result of so many influences, so many pressures, known and unknown; and that is why it is very important to understand these many pressures, influences, and be dissociated from them all, so that the mind becomes extraordinarily simple, clear. Then perhaps it will be possible to experience that which cannot be put into words.

## **Choiceless**

The concept of choiceless observation or awareness is the crux of J.Krishnamurti's philosophy of life. Awareness is only one word that can explain what he has been saying for the last fifty years to large audiences both in the east and the west. A state called choiceless awareness where the notion of choice collapses and we give up taking sides. This state of mind is similar to a state of awareness that collapses into a choiceless state where there are no likes or dislikes from the observer's point of view. It is also a state where total attention is given without the observer, the observer is the self, the past, who is conditioned. Therefore, to observe choicelessly is not to divide the observer and the observed and since the observer is the past, it's the past that observes. The division between the observer and the observed is the source of conflict, the source of psychological conditioning. The conflict between desire and necessity is rooted in the state of mind where there is a constant battle between the demands of one's ego and the true self. J.Krishnamurti was the first person to have used the term choiceless awareness, he asserts:

Choiceless awareness is to be aware both externally and inwardly, without any choice. Just to be aware of the trees, the mountains, nature, just to be aware. Not choose, saying, –I like this!, –I don't like that!, or –I want this!, –I don't want that!. It is to observe without the observer. The observer is the past, which is conditioned, always looking from that conditioned point of view, therefore there is like and dislike and so on. To be choicelessly aware implies observing the whole environment around you, the mountains, the trees, also the ugly world and the towns; just to be aware, observe and in that observation there is no decision, no will, no choice.

A deeper understanding of this notion of choiceless awareness reveals that it is not about giving up anything or taking sides, but rather a state of mind where the ego, the conditioned mind or the shadow is transcended, not by the act of will but by inquiring and allowing them to flower. According to J.Krishnamurti, choiceless awareness means to be completely free of lower senses like self, ego, I, sense of self, anger, hatred etc. It is in fact developing of a completely pure mind. It is totally passive in nature, if there is made a choice there is a center, the ego, wanting to have a result, to avoid something, to fulfill something. The ego is always wishing, wanting, the best for itself. Ego is making the greatest choice, by making a choice, and there is contradiction, with what ego is experiencing, which is not pleasant. Choiceless observation is the only way, the direct and intelligent way of understanding the truth of 'what is'. It alone can transform the fact, the actuality by revealing its true nature. It is only through choiceless observation, that consciousness can be emptied of its content. He maintains that excepting choiceless awareness, there is no other way of regenerating the human mind and the world irreversibly and instantly.

Choiceless observation is the observation of 'what is', the fact or the actuality without the movement of thought which is knowledge or past. It is the observation devoid of the observer, the centre, the censor, the 'me' or the thinker which is thought. It is the awareness without the division as the observer and the observed. It is a holistic observation in which the observer is the observed.

As J.Krishnamurti says:

In it there is no reaction, resistance, justification and condemnation. It is a pure observation sans remembrance, recollection, recognition and naming. It is free from ideas, ideals and opinions. It is observation without prejudice likes and dislikes. It is without a motive and an end in view.

According to J.Krishnamurti, choiceless awareness is an understanding in which the previous experience is totally absent. It is experiencing 'what is' without the experiences. It is a 'negative' approach to the fact. It is an awareness in which the psychological past is totally negated. It is the denial of knowledge in understanding. It is a 'passive' awareness without effort. It is a 'silent' observation without the activity of thought. It is 'silence' with which thought does not interfere in any form. According to J.Krishnamurti, the negative and the passive approach is the most active and positive one. It alone leads to the absolute certainty which is truth. Skepticism is the basis of true spirituality. Choiceless awareness does not understand the fact from a particular point of view. It is not moulding according to a preconceived conclusion. It is not fitting 'what is' into the framework of a system. It does not involve intellectualization, interpretation, explanation or theorization. Nor does it warrant analysis or introspection. Choiceless awareness perceives the fact without translating it to knowledge. J.Krishnamurti avers:

This awareness is not evolutionary. It is not a 'progressive' or a gradual understanding of 'what is' by accumulating knowledge about it. It is not movement from the past to the future, but it is 'seeing' the fact without distorting and dividing it. It is 'remaining with' 'what is' without moving away from it. It is the complete attention of holding the totality of 'what is', like a vessel holding water. Total attention generates the holistic energy that regenerate 'what is'

According to J.Krishnamurti, it is an experimental approach of allowing 'what is' to reveal itself as it exactly and essentially is. It is an unpremeditated art of looking at 'what is' directly and wholly. It is a non-verbal and non-conceptual understanding. It is an a causal and a timeless insight into 'what is' Insight is the comprehension of the truth of 'what is', in a 'flash'. According to J.Krishnamurti, —the insight is not analysis, time, remembrance, all that. It is the immediate perception of something. 4 It is an absolute observation of allowing the 'what is' to 'flower' freely and fully. The spontaneous and total flowering of the 'what is' is the ending of its bondage. J.Krishnamurti says, —Truth is when there is the realization that the observer is the observed. Then, in that realization, which is truth, the conditioning disappears.

**AWARENESS:** According to J.Krishnamurti, the effortless action springs from choiceless awareness. Mind that is caught in problems, in fear, in despair, in the desire to fulfill itself, is always creating illusion and is therefore in a state of neurosis. That is the first thing to realize. So when the mind is highly sensitive and free of all choice and illusion, out of that choicelessness and sensitivity there is intelligence, and only then can the mind be completely and effortlessly quiet. That state of complete and effortless quietness is the beginning of meditation and in that state of mind there arise action which are completely effortless. So, first there is awareness, a choiceless

observation of all your thoughts and feelings, of everything that you do. Out of that there comes a state of attention which has no frontier, but in which the mind can concentrate, and from this state of attention there is quietness of the mind. And when the mind is completely quiet, without any illusion, without any kind of self-hypnosis, there is the coming into being of something which is not put together by the mind.

According to J.Krishnamurti, we know only the action of will which consists in the formulation of a goal and the struggle for achieving it, which is effort. Action of will involves choice which breeds resistance to the undesirable and the overcoming of this resistance is the effort involved in the endeavor to achieve the desired end in view. So action of will involves choice, resistance and effort. But why do we choose at all? Because we are confused, we don't know ourselves; we don't see 'what is,' because we want something else; and so, to choose is to deny, to ignore 'what is' To the discerning eye there is no choice, there is only one truth which does not admit of any choice. To have no choice is to be free from effort. Effort is not action, effort is mere activity. Choice implies confusion and conflict, the resistance of the self which is violence, the violation of the law of love, the state of no duality. In other words, the effort to be what one is not, what one should be, is to escape from what is, is to be unaware of oneself. As J.Krishnamurti points out:

Effortless is a distraction from 'what is.' Sirs, if I may suggest, think it over and you will see the moment I accept 'what is' there is no struggle. Any form of struggle or strife is an indication of distraction and distraction which is effort must exist as long as psychologically I wish to transform 'what is' into something it is not.

It is notable that J.Krishnamurti, is not referring to the changes that we want to bring about at the physical level; he is talking of change at the psychological level. For, psychologically, if the action is born of the desire to change 'what is,' that desire is either the projection of the mind or a reaction of the mind; and so the action will take place in the field of the mind, in the field of becoming; and there will be no categorical change. This interpretation is illustrated by the following extract from his talk at Ommen, 1937.

The mind finds that it does not pay to hate, for it has discovered that there is too much suffering involved in it, and so it makes an effort to discipline itself, to overcome hate by love, to subdue violence and fear by peace. All this indicates the fundamental desire merely to escape from suffering; that is, to guard itself in those virtues and qualities that will not give it pain, that will not cause disturbance.

Thus, we are reminded once again, that effort of will is effective in the field of becoming, but as far as the psychological revolution is concerned, effort is a distraction. Effort indicates overcoming of resistance, struggle and strife, but not action. Effort implies dissipation of energy, division in the consciousness and distraction in the flow of attention. Therefore, effort is involved in the activity of mind which is self-perpetuities, self-expansive, fragmentary and contradictory.

Total action, action free of distraction, free of division in consciousness cannot come through effort; it has to be effortless, spontaneous. In other words, silence of mind cannot be brought about by the action of will, since it implies effort resistance, conflict, duality, fragmentation of consciousness and self-perpetuation.

According to J.Krishnamurti, the action of will is based on idea, on a projection or a reaction of

mind. So there should be action without idea, without projecting oneself, without a blue print.

## **Gandhi: Truth**

The word satya (Truth) is derived from Sat which means 'being.' Nothing is or exists in reality except Truth. That is why Sat or Truth is perhaps the most important name of God, In fact it is more correct to say that Truth is God than to say God is truth. On deeper thinking, however it will be realized that Sat or Satya is the only correct and fully significant name for God.

And where there is Truth, there is also knowledge which is true. Where there is no Truth, there also is knowledge which is true. Where there is no Truth, there can be no true knowledge. That is why the word Chit or knowledge is associated with the name of God. And where there is true knowledge, there is always bliss (Ananda). There sorrow has no place. And even as Truth is eternal, so is the bliss derived from it. Hence we know God as Sat-Chit-Ananda, one who combines in Himself Truth, Knowledge and Bliss.

Devotion to this Truth is the sole justification for our existence. All our activities should be centered in Truth. Truth should be the very breath of our life. When once this stage in the pilgrim's progress is reached, all other rules of correct living will come without effort, and obedience to them will be instinctive. But without Truth it is impossible to observe any principles or rules in life.

But how is one to realize this Truth, which may be likened to the philosopher's stone or the cow of plenty? By single minded devotion (abhyasa) and indifference to all other interests in life (vairagya) replies the Bhagavad Gita.

In spite, however of such devotion, what may appear as Truth to one person will often appear as untruth to another person. But that need not worry the seeker. Where there is honest effort, it will be realized that what appear to be different truths are like the countless and apparently different leaves of the same tree.

Does not God himself appear to different individuals in different aspects? Yet we know that He is one. But Truth is the right designation of God. Hence there is nothing wrong in every man following Truth according to his lights. Indeed it is his duty to do so. Then if there is a mistake on the part of any one so following Truth it will be automatically set right.

In such selfless search for Truth nobody can lose his bearings for long. Directly he takes to the wrong path he stumbles, and is thus redirected to the right path. Therefore the pursuit of Truth is true bhakti (devotion). It is the path that leads to God.

## **Nonviolence**

With Gandhi, the notion of nonviolence attained a special status. He not only theorized on it, he adopted nonviolence as a philosophy and an ideal way of life. He made us understand that the philosophy of nonviolence is not a weapon of the weak; it is a weapon, which can be tried by all.

Nonviolence was not Gandhi's invention. He is however called the father of nonviolence because according to Mark Shepard, "He raised nonviolent action to a level never before achieved." Krishna Kripalani again asserts "Gandhi was the first in Human history to extend the principle of nonviolence from the individual to social and political plane."<sup>2</sup> While scholars were talking about an idea without a name or a movement, Gandhi is the person who came up with the name and brought

together different related ideas under one concept: Satyagraha.

## **Gandhi's View of Violence / Nonviolence**

Gandhi saw violence pejoratively and also identified two forms of violence; Passive and Physical, as we saw earlier. The practice of passive violence is a daily affair, consciously and unconsciously. It is again the fuel that ignites the fire of physical violence. Gandhi understands violence from its Sanskrit root, "*himsa*", meaning injury. In the midst of hyper violence, Gandhi teaches that the one who possesses nonviolence is blessed. Blessed is the man who can perceive the law of *ahimsa* (*nonviolence*) in the midst of the raging fire of *himsa* all around him. We bow in reverence to such a man by his example. The more adverse the circumstances around him, the more intense grows his longing for deliverance from the bondage of flesh which is a vehicle of *himsa*...<sup>3</sup> Gandhi objects to violence because it perpetuates hatred. When it appears to do 'good', the good is only temporary and cannot do any good in the long run. A true nonviolence activist accepts violence on himself without inflicting it on another. This is heroism, and will be discussed in another section. When Gandhi says that in the course of fighting for human rights, one should accept violence and self-suffering, he does not applaud cowardice. Cowardice for him is "the greatest violence, certainly, far greater than bloodshed and the like that generally go under the name of violence."<sup>4</sup> For Gandhi, perpetrators of violence (whom he referred to as criminals), are products of social disintegration. Gandhi feels that violence is not a natural tendency of humans. It is a learned experience. There is need for a perfect weapon to combat violence and this is nonviolence. Gandhi understood nonviolence from its Sanskrit root "*Ahimsa*". *Ahimsa* is just translated to mean nonviolence in English, but it implies more than just avoidance of physical violence. *Ahimsa* implies total nonviolence, no physical violence, and no passive violence. Gandhi translates *Ahimsa* as love. This is explained by Arun Gandhi in an interview thus; "He (Gandhi) said *ahimsa* means love. Because if you have love towards somebody, and you respect that person, then you are not going to do any harm to that person."<sup>5</sup> For Gandhi, nonviolence is the greatest force at the disposal of mankind. It is mightier than any weapon of mass destruction. It is superior to brute force. It is a living force of power and no one has been or will ever be able to measure its limits or its extent. Gandhi's nonviolence is the search for truth. Truth is the most fundamental aspect in Gandhi's Philosophy of nonviolence. His whole life has been "experiments of truth". It was in this course of his pursuit of truth that Gandhi discovered nonviolence, which he further explained in his Autobiography thus "Ahimsa is the basis of the search for truth. I am realizing that this search is vain, unless it is founded on *ahimsa* as the basis."<sup>6</sup> Truth and nonviolence are as old as the hills. For nonviolence to be strong and effective, it must begin with the mind, without which it will be nonviolence of the weak and cowardly. A coward is a person who lacks courage when facing a dangerous and unpleasant situation and tries to avoid it. A man cannot practice *ahimsa* and at the same time be a coward. True nonviolence is dissociated from fear. Gandhi feels that possession of arms is not only cowardice but also lack of fearlessness or courage. Gandhi stressed this when he says; "I can imagine a fully armed man to be at heart a coward. Possession of arms implies an element of fear, if not cowardice but true nonviolence is impossible without the possession of unadulterated fearlessness."<sup>7</sup> In the face of violence and injustice, Gandhi considers violent resistance preferable to cowardly submission. There is hope that a violent man may someday be nonviolent, but there is no room for a coward to develop fearlessness.

As the world's pioneer in nonviolent theory and practice, Gandhi unequivocally stated that nonviolence contained a universal applicability. In his letter to Daniel Oliver in Hammana Lebanon on the 11<sup>th</sup> of 1937 Gandhi used these words: " I have no message to give except this that there is no deliverance for any people on this earth or for all the people of this earth except through truth

and nonviolence in every walk of life without any exceptions."<sup>8</sup> In this passage, Gandhi promises "deliverance" through nonviolence for oppressed peoples without exception.

Speaking primarily with regards to nonviolence as a liberatory philosophy in this passage, Gandhi emphasizes the power of nonviolence to emancipate spiritually and physically. It is a science and of its own can lead one to pure democracy.

## **Satyagraha**

Satyagraha (pronounced sat-YAH-graha) is a compound of two Sanskrit nouns *satya*, meaning truth (from 'sat'- 'being' with a suffix 'ya'), and *agraha*, meaning, "firm grasping" (a noun made from the *agra*, which has its root '*grah*'- 'seize', 'grasp', with the verbal prefix 'a' - 'to' 'towards'). Thus Satyagraha literally means devotion to truth, remaining firm on the truth and resisting untruth actively but nonviolently. Since the only way for Gandhi getting to the truth is by nonviolence (love), it follows that Satyagraha implies an unwavering search for the truth using nonviolence. Satyagraha according to Michael Nagler literally means 'clinging to truth,' and that was exactly how Gandhi understood it: "clinging to the truth that we are all one under the skin, that there is no such thing as a 'win/lose' confrontation because all our important interests are really the same, that consciously or not every single person wants unity and peace with every other"<sup>9</sup> Put succinctly, Satyagraha means 'truth force', 'soul force' or as Martin Luther Jr would call it 'love in action.' Satyagraha has often been defined as the philosophy of nonviolent resistance most famously employed by Mahatma Gandhi, in forcing an end to the British domination. Gene Sharp did not hesitate to define Satyagraha simply as "Gandhian Nonviolence."

Today as Nagler would say, when we use the word Satyagraha we sometimes mean that general principle, the fact that love is stronger than hate (and we can learn to use it to overcome hate), and sometimes we mean more specifically active resistance by a repressed group; sometimes, even more specifically, we apply the term to a given movement like Salt Satyagraha etc. It is worthwhile looking at the way Gandhi uses Satyagraha.

## **Gandhi View of Satyagraha**

Satyagraha was not a preconceived plan for Gandhi. Event in his life culminating in his "Bramacharya vow", prepared him for it. He therefore underlined:

Events were so shaping themselves in Johannesburg as to make this self-purification on my part a preliminary as it were to Satyagraha. I can now see that all the principal events of my life, culminating in the vow of Bramacharya were secretly preparing me for it.

Satyagraha is a moral weapon and the stress is on soul force over physical force. It aims at winning the enemy through love and patient suffering. It aims at winning over an unjust law, not at crushing, punishing, or taking revenge against the authority, but to convert and heal it. Though it started as a struggle for political rights, Satyagraha became in the long run a struggle for individual salvation, which could be achieved through love and self-sacrifice. Satyagraha is meant to overcome all methods of violence. Gandhi explained in a letter to Lord Hunter that Satyagraha is a movement based entirely upon truth. It replaces every form of violence, direct and indirect, veiled and unveiled and whether in thought, word or deed.

Satyagraha is for the strong in spirit. A doubter or a timid person cannot do it. Satyagraha teaches the art of living well as well as dying. It is love and unshakeable firmness that comes from it. Its

training is meant for all, irrespective of age and sex. The most important training is mental not physical. It has some basic precepts treated below.

## **The Basic Precepts of Satyagraha**

There are three basic precepts essential to Satyagraha: Truth, Nonviolence and self-suffering. These are called the pillars of Satyagraha. Failure to grasp them is a handicap to the understanding of Gandhi's non-violence. These three fundamentals correspond to Sanskrit terms:

- *Sat/Satya* - Truth implying openness, honesty and fairness
- *Ahimsa/Nonviolence* - refusal to inflict injury upon others.
- *Tapasya* - willingness to self-sacrifice.

These fundamental concepts are elaborated below.

### **1. Satya/Truth:**

Satyagraha as stated before literally means truth force. Truth is relative. Man is not capable of knowing the absolute truth. Satyagraha implies working steadily towards a discovery of the absolute truth and converting the opponent into a trend in the working process. What a person sees as truth may just as clearly be untrue for another. Gandhi made his life a numerous experiments with truth. Inholding to the truth, he claims to be making a ceaseless effort to find it. Gandhi's conception of truth is deeply rooted in Hinduism. The emphasis of Satya-truth is paramount in the writings of the Indian philosophers. "*Satyannasti Parodharmati (Satyan Nasti Paro Dharma Ti)* - there is no religion or duty greater than truth", holds a prominent place in Hinduism. Reaching pure and absolute truth is attaining moksha. Gandhi holds that truth is God, and maintains that it is an integral part of Satyagraha. He explains it thus:

The world rests upon the bedrock of satya or truth; asatya meaning untruth also means "nonexistent" and satya or truth, means that which is of untruth does not so much exist. Its victory is out of the question. And truth being "that which is" can never be destroyed. This is the doctrine of Satyagraha in a nutshell.<sup>13</sup>

### **2. Ahimsa:**

In Gandhi's Satyagraha, truth is inseparable from Ahimsa. Ahimsa expresses as ancient Hindu, Jain and Buddhist ethical precept. The negative prefix 'a' plus himsa meaning injury make up the world normally translated 'nonviolence'. The term Ahimsa appears in Hindu teachings as early as the Chandoya Upanishad. The Jain Religion constitutes Ahimsa as the first vow. It is a cardinal virtue in Buddhism. Despite its being rooted in these Religions, the special contribution of Gandhi was:

To make the concept of Ahimsa meaningful in the social and political spheres by moulding tools for nonviolent action to use as a positive force in the search for social and political truths. Gandhi formed Ahimsa into the active social technique, which was to challenge political authorities and religious orthodoxy.<sup>14</sup>

It is worth noting that this 'active social technique which was to challenge political authorities', used by Gandhi is none other than Satyagraha. Truly enough, the Indian milieu was already infused with notions of Ahimsa. Nevertheless, Gandhi acknowledged that it was an essential part of his experiments with the truth whose technique of action he called Satyagraha.

At the root of Satya and Ahimsa is love. While making discourses on the Bhagavad-Gita, an author says:

Truth, peace, righteousness and nonviolence, *Satya, Shanti,*

*Dharma* and *Ahimsa*, do not exist separately. They are all essentially dependent on love. When love enters the thoughts it becomes truth. When it manifests itself in the form of action it becomes truth. When Love manifests itself in the form of action it becomes *Dharma* or righteousness. When your feelings become saturated with love you become peace itself. The very meaning of the word peace is love. When you fill your understanding with love it is *Ahimsa*. Practicing love is *Dharma*, thinking of love is *Satya*, feeling love is *Shanti*, and understanding love is *Ahimsa*. For all these values it is love which flows as the undercurrent.<sup>15</sup>

### **3. Tapasya (Self-Suffering):**

It remains a truism that the classical yogic laws of self-restraint and self-discipline are familiar elements in Indian culture. Self-suffering in Satyagraha is a test of love. It is detected first of all towards the much persuasion of one whom is undertaken. Gandhi distinguished self-suffering from cowardice. Gandhi's choice of self-suffering does not mean that he valued life low. It is rather a sign of voluntary help and it is noble and morally enriching. He himself says; It is not because I value life so I can countenance with joy Thousands voluntarily losing their lives for Satyagraha, but because I know that it results in the long run in the least loss of life, and what is more, it ennoble those who lose their lives and morally enriches the world for their sacrifice.<sup>16</sup>

Satyagraha is at its best when preached and practiced by those who would use arms but decided instead to invite suffering upon them.

It is not easy for a western mind or nonoriental philosopher to understand this issue of self-suffering. In fact, in Satyagraha, the element of self-suffering is perhaps the least acceptable to a western mind. Yet such sacrifice may well provide the ultimate means of realizing that characteristic so eminent in Christian religion and western moral philosophy: The dignity of the individual.

The three elements: Satya, Ahimsa, Tapasya must move together for the success of any Satyagraha campaign. It follows that Ahimsa - which implies love, leads in turn to social service. Truth leads to an ethical humanism. Self-suffering not for its own sake, but for the demonstration of sincerity flowing from refusal to injure the opponent while at the same time holding to the truth, implies sacrifice and preparation for sacrifice even to death.

### **Satyagraha in Action**

For Satyagraha to be valid, it has to be tested. When the principles are applied to specific political and social action, the tools of civil disobedience, noncooperation, nonviolent strike, and constructive action are cherished. South Africa and India were 'laboratories' where Gandhi tested his new technique. Satyagraha was a necessary weapon for Gandhi to work in South Africa and India. Louis Fischer attests that: "Gandhi could never have achieved what he did in South Africa and India but for a weapon peculiarly his own. It was unprecedented indeed; it was so unique he could not find a name for it until he finally hit upon Satyagraha."<sup>17</sup>

South Africa is the acclaimed birthplace of Satyagraha. Here Satyagraha was employed to fight for

the civil rights of Indians in South Africa. In India, Gandhi applied Satyagraha in his socio-political milieu and carried out several acts of civil disobedience culminating in the Salt March.

Another wonderful way of seeing Satyagraha in action is through the fasting of Mahatma Gandhi. Fasting was part and parcel of his philosophy of truth and nonviolence. Mahatma Gandhi was an activist - a moral and spiritual activist. And fasting was "one of his strategies of activism, in many ways his most powerful."<sup>18</sup>

### **Qualities of a Satyagrahi (Nonviolence Activist)**

Gandhi was quite aware that there was need to train people who could carry on with his Satyagraha campaigns. He trained them in his "Satyagraha Ashrams".

Here are some of the basic qualities of expected of a Satyagrahi.

- A Satyagraha should have a living faith in God for he is his only Rock.
- One must believe in truth and nonviolence as one's creed and therefore have faith in the inherent goodness of human nature.
- One must live a chaste life and be ready and willing for the sake of one's cause to give up his life and his possessions.
- One must be free from the use any intoxicant, in order that his reason may be undivided and his mind constant.
- One must carry out with a willing heart all the rules of discipline as maybe laid down from time to time.
- One should carry out the jail rules unless they are especially dense to hurt his self-respect.
- A satyagrahi must accept to suffer in order to correct a situation.

In a nutshell, Satyagraha is itself a movement intended to fight social and promote ethical values. It is a whole philosophy of nonviolence. It is undertaken only after all the other peaceful means have proven ineffective. At its heart is nonviolence. An attempt is made to convert, persuade or win over the opponent. It involves applying the forces of both reason and conscience simultaneously, while holding aloft the indisputable truth of his/her position. The Satyagrahi also engages in acts of voluntary suffering. Any violence inflicted by the opponent is accepted without retaliation. The opponent can only become morally bankrupt if violence continues to be inflicted indefinitely.

Several methods can be applied in a Satyagraha campaign. Stephen Murphy gives primacy to "noncooperation and fasting". Bertrand Russell has this to say about Gandhi's method:

The essence of this method which he (Gandhi) gradually brought to greater and greater perfection consisted in refusal to do things, which the authorities wished to have done, while abstaining from any positive action of an aggressive sort...The method always had in Gandhi's mind a religious aspect... As a rule, this method depended upon moral force for its success. <sup>19</sup>

Murphy and Russell do not accept Gandhi's doctrine totally. Michael Nagler insists that they ignore Constructive Programme, which Gandhi considered paramount. A better understanding of Gandhi's nonviolence will be seen in the next chapter.

## **Swaraj**

*Mahatma Gandhi introduced the concept of 'Swaraj' during the British regime. His ideology of 'Swaraj' was to empower people and give them the real meaning of self-rule. 'Swaraj' is a bigger term. In political terms it talks about the implementation of democracy in its true form right from the grass-root level where at every level there is a public representative, moreover, it is also about the overall development of the nation where every section of the society irrespective of religion, caste, race, sex or economic condition are treated equally* Gandhi's idea of 'Swaraj', in the colonial period was prominently to empower and liberate people and teach them to rule themselves and establish self-control, self-respect and capacities for self-realisation. By teaching people about liberation, Gandhi intended to reject and wholly uproot the British rule in India. But, through the course of time, post-independence, the meaning of 'Swaraj' modified to implement better governance in a democratic political structure and promote equality and overall development.

To implement this ideology for making India a true democracy at the grass-root level, the 73rd and 74th Constitutional Amendments were passed. As a result, from gram panchayat to the union government there is always a public representative at every level of governance. The 73rd and 74th Constitutional Amendments passed by the Parliament in 1992 laid the foundation of local government system in India. The Indian political structure saw a major change after the amendments came into existence. The amendments not only described the local governing bodies as basic units of democracy but also put forth a provision that all seats must be filled by direct voting and one-third of total number of seats be reserved for women and one-third for SCs and STs, hence, providing equal opportunities to every section of society and promoting equality factor of Gandhian ideology as well.

## **Gandhi on 'Swadeshi and Gram Swaraj'**

One of the Mahatma's major concerns was to make villages self-sustaining and self-contained units. To fulfil this, Gandhi put forth the ideology of 'Swadeshi and Gram Swaraj'. One of the similar movements we have seen recently taken up the Patanjali Ayurveda – a company creating, promoting and selling indigenously manufactured products – Gandhi in his time promoted the idea saying, "It is your duty and mine to find out neighbors who can supply our wants and teach them to supply them where they do not know how to proceed, assuming that there are neighbors who are in want of healthy occupation. Then every village of India will almost be self-supporting and self-contained unit, exchanging only such necessary commodities with other villages as are not locally produced."

## **'Swaraj' at present**

Gandhi's definition of Swaraj also focused on regenerating reference points, systems, and structures that enable individuals and collective self-development. Researchers studying Gandhi's ideology and promoting his views define 'Swaraj' as not merely a political structure but an ideology which promotes overall development of a nation. Citizens make the nation and therefore development of each and every individual leads to the development of the nation. Looking at the economically weaker sections of the society today, it can be seen that there are loopholes in the system which restricts the development of poor people on various aspects like skill development, education, hygiene, healthcare, or other aspects.

The Gandhian philosophy has always been the guiding light for the governments to implement the democracy in India and world-wide in an effective manner.

Although there are certain loopholes in implementation, the Gandhian ideology, in recent years, has been given prominence and made the very basis of many government schemes and policies launched like Swachh Bharat Mission, Swachhta se Swachhagraha and more. India is taking baby steps towards creating a nation where people can enjoy Swaraj in its true essence.

## **GANDHI'S CRITIQUE OF MODERN CIVILISATION**

All of you, who have seen Gandhi, in pictures obviously, agree that in his dress and appearance he belonged to the Indian ascetic tradition. As a mass leader and iron hearted campaigner against the British imperialism, he consciously chose such an image. His philosophy too contained symbols and words which were, in look and meaning, essentially Eastern in general and Hindu in particular. He used these words and symbols as weapons not only against the British colonisers, but also against the modern civilisation they represented, and in a sense, against modernity itself.

Khadi, about which we will discuss more in the course of this chapter has been one such symbol and Ram Rajya, Sanatan Dharma, Satyagraha, Swaraj are some more in the long list. In a sense most of the words and symbols Gandhi invented and used in his long political and philosophical struggle against the British and the Western materialism were symbols of Indian tradition on the one hand and a critique of modern Western civilisation on the other. These words and symbols have more than one meaning. They also present multiple messages and the most important among them was a critique of modernity. These essentially Indian words and symbols were used by Gandhi as critiques of and counter to the three important concepts of nationalism, industrialism and western education, which form the very core of modernity in India. All these suggest that Gandhi declined to accept "modern civilisation" which he designates and describes as "Western civilisation" and most of the values it stood for. He actively countered them with words, symbols, concepts, traditions, values and in all, the very philosophy which is essentially Indian.

### **Aims and Objectives After studying this Unit, you will be able to understand:**

- Gandhi's ideas and perspectives on modern western and Indian civilisations.
- His perception of modern civilisation as a bane for India.
- His use of Indian symbols like Khadi to counter modern civilisation.
- His ideas of education that best suited India

## **GANDHI'S IDEA OF CIVILISATION**

Gandhi explains in detail his ideas and concepts of civilisation, positive and negative features of Western civilisation i.e., modern civilisation, and comparison and contrast between Indian and Western civilisations in many speeches and writings especially in Hind Swaraj which he wrote in Gujarati in 1909 on his return voyage from London to South Africa. It was serialised in two installments in the same year in the Gujarati edition of Indian Opinion, the weekly published by Gandhi in South Africa. It was issued as a booklet in Gujarati in 1910 and was banned by the British authorities on the charges of seditious content. Undaunted by this move of the imperial authorities, Gandhi later developed the ideas he expressed in Hind Swaraj further and enriched them by new contributions throughout his life.

When we try to assess Gandhi's view on the then existing civilisation, we must take a note of these in the context of the impact of his work on his total philosophy. His views emanated mainly from his reaction to events and his attempt to give a lead to many social reforms and political

movements. However, the existence of a uniformity underlying his thoughts will make our task of connecting, understanding and analysing them relatively easy. This uniformity in Gandhian thoughts arose from a moral approach and a desire to lead active and creative life not for the sake of himself but for the sake of his countrymen. Gandhi regarded violence un-Indian, something alien to Indian civilisation and he makes his opinions amply clear in Hind Swaraj.

In a sense, the aim of Hind Swaraj was to confront the anarchist and violence-prone Indian nationalism with an alternative to violence derived from Gandhi's earliest experiments with Satyagraha. Gandhi mentioned that Hind Swaraj was written in order to show that his countrymen were following a suicidal policy of violence, and that if they but revert to their own glorious civilisation, either the English would adopt the latter and become Indianised or find their occupation in India gone. Furthermore, in Hind Swaraj Gandhi depicted "the dichotomy between the spiritual, moral superiority of Indian society, and the violent, politically corrupt nature of European states" even more dramatically than any of his predecessors.

While condemning the 'brute force' of Western power, Gandhi distances himself from the militant nationalists for their support to violence which he considered a suicidal strategy as it would provoke 'an organised violence' by the ruling authority. Hind Swaraj was a detailed commentary on Western civilisation that thrived on material power. According to Gandhi, modern Western civilisation is characterised by the many negative features like greed, aggression, colonialism, imperialism, war technology, inequity, exploitation, poverty, extravagance and luxury, bodily comforts, unbridled individualism and vulgar materialism, immorality, valueless and commercial education, alienation and so on.

These are thoroughly criticised by Gandhi. Before explaining these features in detail and their impact on social, economic, political and moral aspects of modern human life, and Gandhi's overall critique of Western civilisation scattered throughout his extensive works, it is better to know what Gandhi meant by civilisation -both Western and Indian- by quoting himself elaborately. According to Gandhi, "Civilisation is that mode of conduct which points out to man the path of duty. Performance of duty and observance of morality are convertible terms.

To observe morality is to attain mastery over our mind and our passions. So doing, we know ourselves".

In the chapter titled "Civilisation" in Hind Swaraj, he provides an elaborate explanation about his ideas on modern (western) civilisation: First consider what state of things is described by the word "civilisation". Its true test lies in the fact that people living in it make bodily welfare the object of life... The people of Europe today live in better-build houses than they did a hundred years ago. This is considered an emblem of civilisation, and this is also a matter to promote bodily happiness. Formerly, they wore skins, and used spears as their weapons. Now, they wear long trousers, and, for embellishing their bodies, they wear a variety of clothing, and, instead of spears, they carry with them revolvers containing five or more chambers. If people of a certain country, who have hitherto not been in the habit of wearing much clothing, boots, etc., adopt European clothing, they are supposed to have become civilized out of savagery.

Formerly, in Europe, people ploughed their lands mainly by manual labour.

Now, one man can plough a vast tract by means of steam engines and can thus amass great

wealth. This is called a sign of civilisation. Formerly, only a few men wrote valuable books. Now, anybody writes and prints anything he likes and poisons people's minds. Formerly, men traveled in wagons. Now, they fly through the air, in trains at the rate of four hundred and more miles per day. This is considered the height of civilisation. It has been stated that, as men progress, they shall be able to travel in airship and reach any part, of the world in a few hours. Men will not need the use of their hands and feet. They will press a button, and they will have their clothing by their side. They will press another button, and they will have their newspaper.

A third, and a motor-car will be in waiting for them. They will have a variety of delicately dished up food. Everything will be done by machinery. Formerly, when people wanted to fight with one another, they measured between them their bodily strength; now it is possible to take away thousands of lives by one man working behind a gun from a hill. This is civilisation. Formerly, men worked in the open air only as much as they liked. Now thousands of workmen meet together and for the sake of maintenance work in factories or mines. Their condition is worse than that of beasts. They are obliged to work, at the risk of their lives, at most dangerous occupations, for the sake of millionaires. Formerly, men were made slaves under physical compulsion. Now they are enslaved by temptation of money and of the luxuries that money can buy. There are now diseases of which people never dreamt before, and an army of doctors is engaged in finding out their cures, and so hospitals have increased. This is a test of civilisation. Formerly, special messengers were required and much expense was incurred in order to send letters; today, anyone can abuse his fellow by means of a letter for one penny. True, at the same cost, one can send one's thanks also. Formerly, people had two or three meals consisting of home-made bread and vegetables; now, they require something to eat every two hours so that they have hardly leisure for anything else. This civilisation takes note neither of morality nor of religion... Civilisation seeks to increase bodily comforts, and it fails miserably even in doing so... This civilisation is irreligion, and it has taken such a hold on the people in Europe that those who are in it appear to be half mad.

This civilisation is such that one has only to be patient and it will be self-destroyed. According to the teaching of Mohammed this would be considered a Satanic Civilisation. Hinduism calls it a Black Age.

Gandhi reasoned why western writers were not critical of the civilisations they lived in: We rarely find people arguing against themselves. Those who are intoxicated by modern civilisation are not likely to write against it. Their care will be to find out facts and arguments in support of it, and this they do unconsciously, believing it to be true. A man whilst he is dreaming, believes in his dream. He is undeceived only when he is awakened from his sleep. A man laboring under the bane of civilisation is like a dreaming man. What we usually read are the works of defenders of modern civilisation, which undoubtedly claims among its votaries very brilliant and even some very good men. Their writings hypnotize us. And so, one by one, we are drawn into the vortex.

Get an idea of his opinion on Indian civilisation. In this regard, he wrote: I believe that the civilisation India has evolved is not to be beaten in the world. Nothing can equal the seeds sown by our ancestors. Rome went, Greece shared the same fate; the might of the Pharaohs was broken; Japan has become Westernized; of China nothing can be said; but India is still, somehow or other, sound at the foundation. The people of Europe learn their lessons from the writings of the men of Greece or Rome, which exist no longer in their former glory... In the midst of all this India remains immovable and that is her glory. It is a charge against India that her people are so uncivilized, ignorant and stolid that it is not possible to induce them to adopt any changes. It is a charge really

against our merit. What we have tested and found true on the anvil of experience, we dare not change. Many thrust their advice upon India, and she remains steady. This is her beauty: it is the sheet-anchor of our hope.

We have retained the same kind of cottages that we had in former times and our indigenous education remains the same as before. We have had no system of life-corroding competition. Each followed his own occupation or trade and charged a regulation wage. It was not that we did not know how to invent machinery, but our forefathers knew that, if we set our hearts after such things, we would become slaves and lose our moral fiber. They therefore, after due deliberation decided that we should only do what we could with our hands and feet. They saw that our real happiness and health consisted in a proper use of our hands and feet... They saw that kings and their swords were inferior to the sword of ethics, and they, therefore, held the sovereigns of the earth to be inferior to the Rishis and the Fakirs. A nation with a constitution like this is fitter to teach others than to learn from others.

While admiring the Indian civilisation, Gandhi was not unaware of the fact that India of his days was not exactly like he described it. He was quite aware of the darker side—child marriage, child widows, teenaged mothers and housewives, women practising polyandry, existence of the practice of Niyoga, where, girls dedicate themselves to prostitution in the name of religion, goats and sheep killed in the name of religion. He candidly regarded those defects as defects. He declared that nobody mistook evils of Indian civilisation for ancient civilisation. He recognised the attempts that have always been made in the past to remove those evils and believed that such attempts would be made to remove them in future too. He said: We may utilize the new spirit that is born in us for purging ourselves of these evils. But what I have described to you as emblems of modern civilisation are accepted as such by its votaries. The Indian civilisation, as described by me, has been so described by its votaries. In no part of the world, and under no civilisation, have all men attained perfection. The tendency of the Indian civilisation is to elevate the moral being, that of the Western civilisation is to propagate immorality. The latter is godless, the former is based on a belief in God. So understanding and so believing, it behoves every lover of India to cling to the Indian civilisation even as a child clings to the mother's breast.

Gandhi declared that "India is unique. Its strength is immeasurable." He also draws our attention to the historical fact that when other civilisations succumbed, the Indian civilisation has survived many a shock.

### **Ambedkar: Annihilation of caste**

B.R. Ambedkar's passion for the abolition of untouchability and the eradication of caste is as relevant today as it was 75 years ago.

THE Jat Pat Todak Mandal, a social reformist organisation of Lahore, had, in 1936, invited Dr B.R. Ambedkar to deliver the presidential address of its annual conference on the topic of the caste system in India. Ambedkar sent the manuscript of his speech titled *The Annihilation of Caste*. However, the organising committee found some of his views, particularly his critique of the Vedas and his inclination to leave the Hindu fold, unacceptable.

It, therefore, suggested to Ambedkar that he delete these views, to which he replied that he would not change a comma. The speech thus remained undelivered. Ambedkar subsequently published it in May 1936.

Among the numerous writings and speeches of Ambedkar that run into thousands of pages, *The Annihilation of Caste* is indeed his magnum opus. Judged by any criterion such as content, logic, argument, language, diction, exposition, urge and, above all, the force, it is a manifesto of social emancipation, and occupies a place similar to what *The Communist Manifesto* once did in the world communist movement.

Since the book is polemical in nature, Ambedkar did not elaborate much on the agonies, indignities, humiliation and overall sufferings of the Sudras, and particularly the untouchables. He only gave illustrations of how they were deprived of education and freedom of occupation and were subjected to stigmatised manual labour, all resulting in their virtual economic slavery, how they were segregated and deprived of basic rights such as drinking water even from public wells, and above all how they were made victims of social persecutions.

But, according to Ambedkar, worse and unparalleled, the Hindu Dharmashastras gave legitimacy to the doctrine of Chaturvanya and the caste system. The infamous Manusmriti dehumanised the Sudras and untouchables, ruled the Hindu psyche for centuries and created the greatest obstacle to any serious attempt at eradicating the caste system. This made Ambedkar publically burn the Manusmriti on the occasion of his historical Mahad Satyagraha in 1927 for establishing the right of untouchables to drink the water of the Chawdar tank in Mahad town in Maharashtra.

In *The Annihilation of Caste*, Ambedkar, probably for the first time, raised many profound questions with respect to caste. First, he rejected the defence of caste on the basis of division of labour and argued that it was not merely a division of labour but a division of labourers. The former was voluntary and depended upon one's choice and aptitude and, therefore, rewarded efficiency. The latter was involuntary, forced, killed initiative and resulted in job aversion and inefficiency. He argued that caste could not be defended on the basis of purity of blood, though pollution is a hallmark of the caste system.

He quoted from D.R. Bhandarkar's paper *Foreign Elements in the Hindu Population* that there is hardly any class or caste in India which has not a foreign strain in it, (and that) there is an admixture of alien blood not only among the warrior classes the Rajputs and the Marathas but also among the Brahmins who are under the happy delusion that they are free from all foreign elements.

Ambedkar thus argued that caste had no scientific basis. He painfully maintained that Hindu society was a collection of castes, fixed in watertight compartments with graded hierarchy that made an associated corporate life virtually impossible.

But most importantly, according to Ambedkar, caste destroyed the concept of ethics and morality. To quote him: The effect of caste on the ethics of the Hindus is simply deplorable. Caste has killed public spirit. Caste has destroyed the sense of public charity. Caste has made public opinion impossible. A Hindu's public is his caste. His responsibility is to his caste. His loyalty is restricted only to his caste.

Virtue has become caste-ridden, and morality has become caste-bound.

Ambedkar ultimately suggested that inter-caste marriage is the only remedy to destroy caste. In *The Annihilation of Caste*, Ambedkar's critique of the Hindu social order was so strong that

Mahatma Gandhi, in Harijan, described Ambedkar as a challenge to Hinduism. Ambedkar replied to Gandhi in his usual uncompromising manner.

Ambedkar did not spare the socialists or the communists either. He vehemently attacked the communists for their doctrinaire approach to caste in treating it as the superstructure and argued that unless they dealt with caste as a basic structural problem, no worthwhile social change, let alone a socialist revolution, was possible.

From the beginning Ambedkar was convinced that political empowerment was key to the socio-economic development of the untouchables. Therefore, he vehemently demanded a separate electorate for untouchables in the Second Round Table Conference in 1932.

When the British conceded his demand, Gandhi started his historic fast unto death in the Yerawada jail. Pressure from all corners mounted on Ambedkar to forgo the demand for a separate electorate as the Mahatma's life was at stake. Reluctantly Ambedkar agreed to the formula of a Joint Electorate with reserved seats in legislatures for untouchables.

What is the situation today with respect to Ambedkar's mission of annihilation of caste and, in view of that, the relevance of his manifesto of social emancipation?

First, the state's reservation policy for the Scheduled Castes (S.Cs) and Scheduled Tribes (S.Ts) has made a positive impact on their socio-economic condition.

Though the gap between them and the rest of society persists, and they lag behind the others with respect to many indicators of development, the overall situation has improved. A small strata in all areas of national importance education, professions, governance, politics, art, literature and so on has emerged in these communities. This upward occupational mobility has been accompanied by some social prestige, which was unthinkable earlier. The spread of literacy and higher and professional education, the pace of urbanisation, the development of means of communication and transport, and so on have been instrumental in loosening somewhat the rigidity and hangover of the caste system, particularly in the urban areas.

Second, and contrary to this positive development, caste has come to be used blatantly and indiscriminately for political ends. This has sharpened caste and sub-caste identities and resulted in caste alliances of different types in different regions for the sole purpose of wielding political power.

Thus, while the dominant castes, either in numerical strength or in terms of economic clout, struggle to retain their monopoly over power, the marginal castes, operating on the periphery of the power structure, have aroused their caste consciousness for political mobilisation.

### **POTENT INSTRUMENT**

Third, since caste is considered a potent instrument for socio-economic and political empowerment, caste and sub-caste organisations have proliferated. There is growing demand by some castes, keeping their caste arrogance intact, to get included in the Other Backward Classes (OBC) category, and by some OBCs to be considered as S.Ts (for instance, Jats in Haryana and Rajasthan). This is indeed a trend in reverse. Fourth, the entire trade union movement ignored issues relating to caste owing to total apathy and lack of concern or because of the fear of a rift in

the rank and file over the contentious issue of reservation. As a result, there is a growing tendency on the part of the S.Cs and S.Ts in several organisations to form their own associations to fight for their demands.

Fifth, Ambedkar suggested inter-caste marriage as the remedy to destroy caste. Today, marriages are preferred not only within castes, but also within sub-castes. In Haryana and Rajasthan, for instance, the khap (caste council) gives orders to kill young lovers for marrying outside their caste. Such inhuman killings are glorified as honour killings.

Lastly, atrocities on the S.Cs and S.Ts continue unabated in different parts of the country. They are on two counts: first, owing to the practice of untouchability, resulting in the violation of human and civil rights of these groups, particularly in the rural areas; second, for economic and political reasons. Thus, according to the National Crime Records Bureau of the Union Home Ministry, between 2001 and 2005, the total number of crimes against the S.Cs alone were 1,56,274, of which 3,406 were of murder and 6,163 were of rape.

Various legislative measures such as the Protection of Civil Rights Act, 1955, and the Scheduled Caste and Scheduled Tribe (Prevention of Atrocities) Act, 1989, have proved to be virtually worthless because of the lack of political will to implement them.

Ambedkar thought the abolition of untouchability and the eradication of caste would make India an emotionally strong and unified country. His thought and passion are as relevant today as they were 75 years ago.

Dr Balachandra Mungekar is a former member of the Planning Commission and former Vice-Chancellor of the University of Mumbai.

## **Philosophy of Hinduism**

Dr. Bhimrao Ambedkar (1891-1956), or Babasaheb Ambedkar, was a scholar, social reformer, powerful advocate of the rights of Dalits and women, chairman of the Constituent Assembly of India, and the country's first law minister.

In 1976, the Government of Maharashtra set up the Dr. Babasaheb Ambedkar Source Material Publication Committee to compile Dr. Ambedkar's complete works. The Committee consisted of the state's then education minister and noted scholars and writers. In 1978, when Vasant Moon (Dalit activist, author and Officer on Special Duty) joined the Committee it decided to procure and publish Dr. Ambedkar's unpublished writings too.

The state's Education Department started to publish a 22-volume series titled *Dr. Babasaheb Ambedkar: Writings and Speeches* in 1979, and it brought out this third volume (consisting of five parts) in 1987. The series was re-printed by the Dr. Ambedkar Foundation, an autonomous body under the Ministry of Social Justice and Empowerment, in January 2014.

This volume is significant as it contains of Dr. Ambedkar's unpublished books and essays (parts I-IV). Part V contains the outlines of books that Dr. Ambedkar had planned; the chapters he was able to finish have been included in this volume.

## **Part I: Philosophy of Hinduism**

In this essay, Dr. Ambedkar investigates the 'Hindu scheme of divine governance', which, he says, is enshrined in the *Manu Smriti*. He examines the place of religion in 'savage' and 'civilised' societies; the latter, he says, can be further divided into antique and modern societies. According to Dr. Ambedkar, the concept of right or wrong in antique societies was based on 'social utility', while in modern societies, it was based on 'individual justice', that is, equality, liberty and fraternity.

Dr. Ambedkar says that central to the social organisation of Hinduism is a system "in which different castes are placed in a vertical series one above the other." Inequality, for him, is the soul of Hinduism, and the religion supports and sustains the rights of a class of 'supermen' – the Brahmins. The caste system, he adds, divides labourers, dissociates work from interest, disconnects intelligence from manual labour, prevents a person from cultivating interests, and prevents societal mobilisation. Thus, in Dr. Ambedkar's view, Hinduism fails the test of social utility and individual justice.

## **Part II: India and the Pre-Requisites of Communism**

In Dr. Ambedkar's papers, the Committee found three chapters from the unfinished book *India and Communism*, which are included in this part of the volume.

The first chapter – 'Hindu Social Order—Its Essential Principles' – discusses whether the Hindu social order is free. According to Dr. Ambedkar, a free social order is based on equality, liberty and fraternity, while Hindu society, because of the caste system, is inherently unequal and cannot accommodate these ideals. Among its tenets are 'graded inequality' (castes existing in an order of precedence), the fixity of occupations and the fixation of people within their class. He concludes that the Hindu social order is based on classes, not individuals.

The second chapter lists the Hindu social order's unique features. Among them is the worship of a class of 'supermen' (the Brahmins), the denial of the right to rebel due to restrictions on the 'oppressed castes', and that the order is divinely ordained and inviolate.

The incomplete third chapter discusses various historical descriptions of caste provided by foreign travellers like Megasthenes (350–290 BC) and Alberuni (973-1050 AD). Dr. Ambedkar says that while caste has changed over time, it is still highly organised with rigid groups that have involuntary membership, and individuals are completely subordinated to their castes.

## **Part III: Revolution and Counter-Revolution**

This part has 13 incomplete chapters from Dr. Ambedkar's proposed treatise titled *Revolution and Counter-Revolution in Ancient India*, which, too, was unfinished. Dr. Ambedkar considers the rise of Buddhism as a revolution, and the 'counter revolution', pioneered by the Brahmins, as the cause for its decline.

In a chapter titled 'The Triumph of Brahmanism: Regicide or the birth of Counter-Revolution', Dr. Ambedkar says that Buddhism brought about a change in the status of Shudras and women – they had social mobility and freedom – as compared as to the Vedic Regime under which they had 'a very low position'. In Brahmanism's subsequent triumph over Buddhism, the former brought about 'a complete demolition' of the high status that the latter had accorded to Shudras and women. Dr. Ambedkar contends that graded inequality, whereby castes benefit differentially due to inequity, is the reason there has been no revolution against Brahmanism.

In 'The Woman and the Counter-Revolution', Dr. Ambedkar discusses the rights of women in the Manu and pre-Manu eras. For Manu, women should not have the right to property, divorce or education. In fact, Manu's scheme of enforced widowhood or Sati and early marriage for girls was a way to establish endogamy within caste groups.

### **Ambedkar, Buddhism and Neo Buddhism**

Ambedkar is the symbol of Dalit's freedom from the jaws of upper cast oriented system of India. He was the man who raised his voice against the discriminations being practiced with the so called lower cast and untouchable people in India and finally became successful, at large extent, in making them get rid of this system.

He was born in the 1891 in a family of Mahāra caste which was considered as untouchable during that time. Born as a part of Hindu society, he felt that there was no right or freedom to study, live with the common society, to participate in the social function to the lower caste people and especially untouchables were being treated very cruelly by the upper caste people. He, having got the higher education somehow, tried to improve the condition of suppressed class within the Hindu society and in this context; he had the conflict with the Hindu freedomfighter leaders like Gandhi Ji also on several occasions. But the status of Dalits could not be upgraded barring a few incidental successes.

Finally, he decided to renounce the Hindu religion in 1935 saying: *"Although I am born as a Hindu because I had no control over it. But I will not die as a Hindu because I do have control over it"*. He had been studying about other religions for a long time and, now after, he began to do so with more commitments so that he could choose the appropriate religion for himself and his followers. He became greatly impressed by studying Tipitaka (Popularly known as Tripitaka), the collection of Buddha's words and he decided to convert towards Buddhism. In a lecture "Why I like Buddhism" he says: *"I prefer Buddhism because it gives three principles in combination which no other religion does. All other religions are bothering themselves with 'God' and 'soul' and 'life after death'. Buddhism teaches 'Prajñā' (understanding as against superstition and supernaturalism). It teaches 'Karuṇā' (love). It teaches 'Samatā' (equality). This is what man wants for a good and happy life on earth. These three principles of Buddhism make their appeal to me. These three principles should, also make an appeal to the world. Neither God nor soul can save society"*.

He, with the half of the million followers of him, took refuge under Buddhism on October 14th, 1956 and revived Buddhism in modern India, which was extant from India since 12th Century AD. The kind of Buddhism he adopted and propagated is known as Neo Buddhism in the history. Neo Buddhism does not give any importance to the spiritual part of original Buddhism. It does not accept that Buddha gave any sermon related to other world or to transcendental realization. It applies all the doctrines of the Buddha in the social context.

### **D.D. Upadhyaya: Integral Humanism**

**Integral humanism** is a doctrine developed by Deendayal Upadhyaya and adopted by the Jana Sangh in 1965 as its official doctrine. It is also the official philosophy of the Bharatiya Janata Party. It aims to appeal to broad sections of Indian society by presenting an indigenous economic model that puts the human being at center stage.

According to Upadhyaya, the primary concern in India must be to develop an indigenous economic

model that puts the human being at center stage.

## Features

- It is **opposed to both western capitalist individualism and Marxist socialism**, though welcoming to western science.
- It seeks a middle ground between capitalism and socialism, evaluating both systems on their respective merits, while being critical of their excesses and alienness.

## Four objectives of humankind

Humankind, according to Upadhyaya, had four hierarchically organized attributes of body, mind, intellect and soul which corresponded to four universal objectives,

- kama (desire or satisfaction),
- artha (wealth),
- dharma (moral duties),
- moksha (total liberation or 'salvation').

While none could be ignored, **dharma is the 'basic', and moksha the 'ultimate' objective** of humankind and society.

## Why did he reject other ideologies ?

He claimed that the problem with both capitalist and socialist ideologies is that they only consider the needs of body and mind, and were hence based on the materialist objectives of desire and wealth.

## Rejection of individualism

(First what is individualism .....Individualism is a social theory favouring freedom of action for individuals over collective or state control.)

- Upadhyaya rejected social systems in which individualism 'reigned supreme'.
- He also rejected communism in which individualism was 'crushed' as part of a 'large heartless machine'.
- *Society, according to Upadhyaya, rather than arising from a social contract between individuals, was fully born at its inception itself as a natural living organism with a definitive 'national soul' or 'ethos' and its needs of the social organism paralleled those of the individual.*

## Source of Integral Humanism Advaita Vedanta

- Upadhyaya claimed that Integral Humanism followed the tradition of advaita developed by Adi Sankara.
- Non-dualism represented the unifying principle of every object in the universe, and of which humankind was a part.
- This, claimed Upadhyaya, was the essence and contribution of Indian culture.

(In case u don't know what Non Dualism or Advaita is ? Advaita means nondual or "not two." This oneness is a fundamental quality of everything. Everything is a part of and made of one nondual

consciousness. Often the question arises, “If it is all one thing, why don’t I experience it that way?” This is confusing oneness for the appearance of sameness. Things can appear different without being separate. Just look at your hand for a moment. Your fingers are all different from each other, but are they separate? They all arise from the same hand. Similarly, the objects, animals, plants and people in the world are all definitely different in their appearance and functioning. But they are all connected at their source—they come from the same source. This one Being that is behind all life has an infinite number of different expressions that we experience as different objects. )

## **Integral Humanism and Gandhian Philosophy**

Integral humanism is almost an exact paraphrase of Gandhi’s vision of a future India.

- Both seek a distinctive path for India,
- both reject the materialism of socialism and capitalism alike,
- both reject the individualism of modern society in favor of a holistic, varna-dharma based community,
- both insist upon an infusion of religious and moral values in politics,
- both seek a culturally authentic mode of modernization that preserves Hindu values.

Integral humanism contains visions organized around two themes: **morality in politics and swadeshi**, and small-scale industrialization in economies, all Gandhian in their general thematic but distinctly Hindu nationalist. These notions revolve around the basic themes of harmony, primacy of cultural-national values, and discipline.

## **Narayana Guru**

**Shree Narayana Guru** (1856–1928), also known as Shree Narayana Guru Swami, was a Hindu saint & social reformer of India. The Guru was born into an Ezhava family, in an era when people from backward communities like the Ezhavas faced social injustice in the caste-ridden Kerala society. Gurudevan, as he was known among his followers, led Reform movement in Kerala, revolted against caste system and worked on propagating new values of freedom in spirituality and social equality which transformed the Kerala society.

Shree Narayana Guru is revered for his Vedic knowledge, poetic proficiency, openness to the views of others, non-violent philosophy, and unrelenting resolve to set aright social wrongs. Narayana Guru was instrumental in setting the spiritual foundations for social reform in Kerala and was one of the most successful social reformers to revolt against caste system in India. He demonstrated a path to social emancipation without invoking the dualism of the oppressed and the oppressor. The Guru stressed the need for spiritual growth and social upliftment of the downtrodden by the establishment of temples and educational institutions. In the process, he brushed aside the superstitions that clouded the fundamental Hindu religious convention of *Chaturvarna*.

## **Freedom in Spirituality**

*Not to be confused with Spiritualism.*

**Spirituality** can refer to an ultimate or immaterial reality; an inner path enabling a person to discover the essence of their being; or the “deepest values and meanings by which people live.” Spiritual practices, including meditation, prayer and contemplation, are intended to develop an individual's inner life; such practices often lead to an experience of connectedness with a larger reality, yielding

a more comprehensive self; with other individuals or the human community; with nature or the cosmos; or with the divine realm. Spirituality is often experienced as a source of inspiration or orientation in life. It can encompass belief in immaterial realities or experiences of the immanent or transcendent nature of the world.

Traditionally, religions have regarded spirituality as an integral aspect of religious experience. Many do still equate spirituality *with* religion, but declining membership of organized religions and the growth of secularism in the western world has given rise to a broader view of spirituality.

Secular spirituality carries connotations of an individual having a spiritual outlook which is more personalized, less structured, more open to new ideas/influences, and more pluralistic than that of the doctrinal faiths of organized religions. At one end of the spectrum, even some atheists are spiritual. While atheism tends to lean towards skepticism regarding supernatural claims and the existence of an actual "spirit", some atheists define "spiritual" as nurturing thoughts, emotions, words and actions that are in harmony with a belief that the entire universe is, in some way, connected; even if only by the mysterious flow of cause and effect at every scale.

In contrast, those of a more 'New-Age' disposition see spirituality as the active connection to some force/power/energy/spirit, facilitating a sense of a deep self. For some, spirituality includes introspection, and the development of an individual's inner life through practices such as meditation, prayer and contemplation. Some modern religions also see spirituality in everything: see pantheism and neo-Pantheism. In a similar vein, Religious Naturalism has a spiritual attitude towards the awe, majesty and mystery it sees in the natural world.

## **Spiritual path**

Spirituality, in a wide variety of cultural and religious concepts, is itself often seen as incorporating a spiritual path, along which one advances to achieve a given objective, such as a higher state of awareness, outreach wisdom or communion with God or with creation. Plato's Allegory of the Cave, which appears in book VII of *The Republic*, is a description of such a journey, as are the writings of Teresa of Avila. The spiritual journey is a path that has a dimension primarily subjective and individual. For a spiritual path may be considered a path of short duration, directed at a specific target, or a lifetime. Every event of life is part of this journey, but in particular one can introduce some significant moments or milestones, such as the practice of various spiritual disciplines (including meditation, prayer, fasting), the comparison with a person believed with deep spiritual experience (called a teacher, assistant or spiritual preceptor, guru or otherwise, depending on the cultural context), the personal approach to sacred texts, etc. If the spiritual path is the same in whole or in part, with an initiatory path, there may be real evidence to overcome. Such tests usually before a social significance, are a "test" for the individual of his reaching a certain level. Spirituality is also described as a process in two phases: the first on inner growth, and the second on the manifestation of this result daily in the world.

## **Religion**

Whilst the terms *spirituality* and *religion* can both refer to the search for the Absolute or God, an increasing number of people have come to see the two as separate entities, religion being just one way in which humans can experience spirituality. Cultural historian and yogi William Irwin Thompson states, "Religion is not identical with spirituality; rather religion is the form spirituality takes in civilization."

Those who speak of spirituality outside of religion often define themselves as SBNR or "spiritual but not religious" and generally believe in the existence of many different "spiritual paths" - emphasizing the importance of finding one's own individual path to spirituality. According to one poll, some 24±4% of the United States population identifies itself as spiritual but not religious. One might say then, that a key difference is that religion is a type of formal external search, while spirituality is defined as a search within oneself.

The experience of 'spirituality'; the human emotions of awe, wonder and reverence, are also the province of the secular/scientific, in response to their highest values, *vague* or when observing or studying nature, or the universe.

## **NARAYANA GURU'S CONCEPTION OF ONE CASTE, ONE RELIGION AND ONE GOD**

There is a call for globalisation in the present era. It aims at a kind of unity, harmony, co-operation and worldwide able communication. Economical globalisation has a currency. In this background, it aims at international market, international economy, international interaction. But stillly we are not matured enough for contemplating spiritual globalisation and world Government.

Sri Narayana Guru has thought of spiritual globalisation and a kind of world Government long ago, that is during 19th century itself. Rishis and Yogis are all time thinkers, since they are great visionaries. They can visualise past, present and future. When the upanishad says 'Vasudaiva Kutumbakam' which refers to one family system on the entire existence. This refers to spiritual globalisation; spirit or consciousness is one but forms are many.

Another upanishad says : 'Neha Nanasti Kinchana', that means^ there is no multiplicity what so ever. Such a unitary existence was being visualised by the Rishis. Narayana Guru, following such as Rishi-tradition. has therefore envisaged the concept of one caste, one religion and one God in the entire universe. It is because the entire universe is created by God and He is present everywhere.

Guru quotes an upanishadic statement "Tatsristva Tadevanu Pravishat" which means^ God has not only created the universe but also he himself entered into it. If God has himself enters it\* and pervades whole of existence, where is Brahmin and paraiah (untouchables)? Where is Brahmin and Sudra? Where is varna and avarna? All these differentiations are but the creation of fools says Narayana Guru. Hence he has advocated one caste, one religion and one God. This means the fundamental unity of blood of the human species, the uniformity of the truths of all the religions and the common goal of all human kind.

Narayana Guru says : there is no difference between one man to another man and man to woman at all. All differences are created by lunatics and fanatics. There is a basic unity among the human beings both physically as well as scientifically. In a plant there are roots, trunks, branches, leaves, flowers and fruits etc. Apparently there seems to be difference but the sap in it is flowing all through the entire tree. It is only sap which makes the tree united and one; so also among the human beings colour may be different, name, height, etc. may be different but the Pure Consciousness is same and common to all. Philosophically there is one caste of human beings and no more. Even scientifically our body is made up of five mahabhutas (Earth, Water, Air, Fire and Akasha). There is another system brain, heart, so on and so forth, they are all common factors which all human beings are sharing. The blood is same in all ; we cannot find kerosene in some bodies instead of blood. Hence, even scientifically there is unity among the human beings and

therefore humanity as such belongs to only one caste.

Narayana Guru has admitted in his institution/ ashrama all people irrespective of caste, creed and sect, since, he was great committed humanist. All the students used to live together dine together and study together. They never thought of anycaste or creed. Like Plato, commune theory formed a universal group and brought out new social revolution under the leadership of the great Guru Narayan.

Sri Narayana Guru was not a religious fanatic, but believed that every religion seeks human happiness. Established in different countries at different times religions appeared to be different, but the goal of them is the same. All religions attempt to uplift souls. For ^uru, the non-violence of Buddhism, Brotherhood of Islam, and Universal love of Christianity are equally important and inter-related. According to guru^ Hinduism is the unity of a number of religious sects like Vaidika, Puranic, Sakta, Saiva, Samkhya, Yoga, Vaisesika and Vedanta etc.

Sectarian differences are common to all religions, he points out that, in the course of time the wise used to select different doctrines from the teaching of their predecessors and combined them. Thus, a new religion comes into existence and named after the man who started it. Then, by this argument Narayana Guru says that all these religions are one because their goal is the same, that is the welfare of the world. Narayana Guru says:

Religions are in essence one; as blind men dispute about the elephant« the ignorant with Varying arguments stray Behold and stray not, be at peace'

In fact, religion is the art of living through right action; we have to live our daily life in harmony within ourselves and with others and to lead a life of peace and happiness. It means, a way of life that which supports the entire universe and it is the supreme means of providing eternal bliss of man.

Yajñavalkya smṛiti says: " Ahimsa Satyamasteyam Soucha mindriyanigraha Danam da^odaya ksanti \*7 Sarvesha dharma sadhanah"

Means : Non-violence, truth, non control of mind and sense charity, compas//\*\* etc are the basic principles of Dharma or religion. The Guru from his theological interpretation of one God and one religion, further asserted that there is one caste. It has been recorded that his dictum was : "Ask not, speak not, think not of caste. "Narayana Guru argued vehemently for the establishment of niversal brotherhood, Men . immersed in ignorance tt&t thinking that there are different religions and castes. Just as, there is only one jati or universal cowhood in all cows, similarly in all men there is only one jati or universal humanity. A man can bom any where and can produce human beings^ so they all belong to one species. As cowhood is one jati or rkg universal in all cows, humanity is the one jati or universal in all human beings. When this truth is rightly grasped, race and caste differences based on untruth^ are destroyed and will develop a universal friendliness and one^ness. Sri Narayana Guru says that differences among men are due to language, dress etc.;but not due to race and caste. Therefore, intermarriage and inter- dining may be voluntarily done among men. In his own words: "whatever may be the difference in man's creeds, dress, language etc. because all of them belong to the same kind of creation, there is no harm at all in their dining together or having marital relations with one another.

Hindu religions and the chief theologians or interpreters of them have employed static laws on the basis of myths and superstitions and made the individual enslaved to them. They deceive themselves, their fellow men and ordinary people by their myth-making and keep society in closed morality. Narayana Guru gave a revolutionary interpretation and a new orientation to the vedantic tradition and integrated its teaching with the social needs and requirements. Guru developed a theoretical understanding of the ancient wisdom and derived the practical implication of them and thereby advocated practical and religious ideas that unite all mankind. He says : Acts that one performs for one's own sake should also aim the good of othermen.

A casual incident in a train on the way to Madras throws light on his attitude. A young Indian in European dress was sitting in the compartment. He asked the Guru seriously,

"What is your name?'Narayana'

'Of what caste are you?' 'What do you think? Guess!'

'I cannot make out from your appearance'

'If you do not know by sight, how can you through hearing'

On hearing a report of this from Guru at Madras a young firebrand blurted out that the so called sacred thread of the twice born should be burnt. The Guru commented 'If there are half a dozen youth of such enthusiasm, the curse of caste can be exercised. No special proof is needed to believe that all human beings belong to the same jati'. A dog, on seeing another, recognizes it as one of its own kin. Every animal has this instinct except man. Only he has doubts. He is inferior to beasts.

The Guru was totally against the system of segregating people on the basis of their hereditary profession. In fact, he was against the very idea of making a profession hereditary. Should the son of a thief become a thief? Making a profession hereditary is fundamentally the denial of a man's freedom of choice. If a priest's son likes and wants to become a priest, let him become one. It does not need to be branded as hereditary and restricted to a framework of caste. The problem comes when he does not want to become a priest. If his right to choose a profession is taken away and he is compelled to do something which he does not like, he will degenerate into a slavish imitator. The goal of all religions is same. Religion has the role of creating in the human soul the trend to ascend. Once the trend is set, they themselves will seek and find the ultimate truth. Religions are only the guides to help one seek rightly. To those who have attained the supreme, religion is not at all authority, they themselves are authority to religion. Did Lord Buddha preach the path to Nirvana after studying Buddhism? He sought and found the way to salvation and then preached. It subsequently became Buddhism. Did Buddhism do any good to Lord Buddha. That only means a realised soul is above religion and it is only from such a soul religion emerges. Hence all religions emerged out of such a realised soul and therefore Sri Narayana Guru says the principle underlying all religions, eternal values are of equal significance and all religions are representing one or the other such eternal truth. Depending upon time and circumstances one may become more important and other truth may become less important. Hence to bring peace and harmony on earthy Narayana Guru has prescribed the study of all religions with open mind and equal attention.

Narayana Guru a God-intoxicant saint advocates that 'God is all, God alone is The one who has realised the God can see the presence of God everywhere.' Some time Guru used to say one's own potential is one's own 'God, ^ours God is your- self. This is true if and only if we explore the divine within us the kingdom of God is definitely within us. The knowledge or Arivu according to Guru is

God itself Brahavidya means this God realisation or attainment of advaitic knowledge.

Attainment of 73 awareness or knowledge is the realisation of the knowledge^ fime dualism of the self gud the supreme; the Atman and the Brahman. When such a realisation downs upon one;self he will embrace all, see the unity of life, this is what Narayana Guru says the essence of existence. Thus^ such God is the protector, benefactor, supporter, leader and guide all in one. He is the creator, the creation and the instrument of creation. He is eternal omniscient ^omnipresent and omnipotent. He is reality and illusion. He is the creator and destroyer of illusion, illusion itself, exponent of reality and reality itself. He is all inall. Just like water can Giot separated from the v\_ r wave, God cannot be separated from life.

Narayana Guru has not separated God from life. For him life is God, God is life andman himself is God fife Guru M(s great humanist, he could identifier God with man. If he says God is somewhere who transcends, man and nature hiding inc) ?M&no one would have accepted his views. If there is a God, He must be one andmust be present every where. If there were more than one God there would havebeen fight among themselves, which is not God at all. Hence there must be one and only one God. If that one God is staying in one particular place He will not be considered as supreme, he will be limited being like us. Hence he must be existingevery where as ais essence. As Gita puts Sutremani Ganaa era a common thread which is immanent principle in many pearls.

Narayana Guru a saint-philosopher and prophet has maintained all through theconception of one caste, one religion and one God in order to bring harmony, peace and global understanding in the human kind. He was a great humanist, secular saint and socio-religious reformer.

### Social Reforms

Sri Narayana Guru was a prophet, sage and Hindu saint and also a social reformer of India. He was born in the family of Ezhavas, in a period when people from backward communities, like, the Ezhavas faced much social injustices in the caste-ridden Kerala society. Gurudevan, as he was fondly known to his followers, revolted against casteism and worked on propagating new values of freedom in spirituality and of social equality, thereby transforming the Kerala society and as such he is adored as a prophet. India as a whole may have produced its Gandhi, but Keralites are inclined to take more pride in their own great spiritual and social leader, the contemporary of Gandhi, the low-caste sage Sri Narayana Guru, with his tireless preaching of the doctrine of 'One Caste, One Religion, One God.' He preached for moral and religious universalism.

### Tiruvallur: Tirukkural

**Tirukkural**, (Tamil: "Sacred Couplets")also spelled **Tirukural** or **Thirukkural**, also called **Kural**, the most celebrated of the *Patiren- kirkkanakku* ("Eighteen Ethical Works") in Tamil literature and a work that has hadan immense influence on Tamil culture and life. It is usually attributed to the poet Tiruvalluvar, who is thought to have lived in India in the 6th century, thoughsome scholars assign an earlier date (1st century BC). In its practical concerns, aphoristic insights into daily life, and universal and timeless approach, the *Tirukkural* has been compared to the great books of the

world's major religions.

An all-inclusive ethical guide, the *Tirukkural* has as its foremost moral imperative the avoidance of killing and the avoidance of falsehood. It also commends to the reader a feeling of compassion for all individuals, regardless of caste or creed. Its 133 sections of 10 couplets each are divided into three books: *aram* (virtue), *porul* (government and society), and *kamam* (love). The first section opens with praise of God, rain, renunciation, and a life of virtue. It then presents a world-affirming vision, the wisdom of human sympathy that expands from one's family and friends to one's clan, village, and country. The *porul* section projects a vision of an ideal state and relates good citizenship to virtuous private life. The *kamam* section addresses both "secret love" and married love; the section on married love is written as a dialogue between husband and wife.

### **Jyotiba Phule: Critical understanding of Caste-system**

It is a well-known fact that at the time of India's national movement, there was another movement known as the movement of social engineering or social revolution, led by Mahatma Phule, who had pioneered the foundation of a social revolution in India. Although contemporary thinkers like Ram Mohan Roy, Justice

M.G. Ranade and G.G. Agarkar were quite active in social reforms at that time, Mahatma Phule was different from them as he was the first non-Brahmin social revolutionary in India.

Phule believed that radical ideology must be complemented by radical practices, which was in striking contrast to the upper caste elite thinkers and social reformers of his time. He criticized the literature of *Vedas* and *Puranas* and Hindu mythological stories woven around deities that facilitated special privileges to Brahmins in every sphere of life. Brahmins always had the upper hand and authoritative power of decision-making, particularly in religious affairs. The significance of his movement was that it not only aimed to eradicate caste-hierarchy from the society but also protested against gender inequity. He advocated the progress of backward caste communities while emphasizing the importance of imparting education to women in the family. In other words, he insisted on gender equality in the field of education, property, jobs, and of course, in the family. During the nineteenth century, contemporaries of Phule who belonged to the upper strata of society tried to enlighten the masses on critical and sensitive issues like the caste-based patriarchal practices of Sati, and child-marriage, while also building up a favourable public opinion towards widow re-marriage and women's education. Nevertheless, the approach of these thinkers was within the framework of caste hierarchy and based on the principles and practices of Vedic-Brahmanic Dharmashastras.

Mahatma Phule was against this approach and argued for the emancipation of women from these socio-religious shackles, and eradication of caste hierarchy. In this way, Phule's anti-caste outlook was more sensitive to gender equality than other social reformers of his time. He included women of all castes and communities in his notion of the 'oppressed', which shows his consideration for those women who were victims of Brahmanical culture and power in common with other low caste people and untouchables.

While Karl Marx was propagating the theory of Class Struggle in Europe, Mahatma Phule in India was not merely advocating but was practically involved in mobilizing the lower castes and women to organize against Brahmanical exploitations. To quote G.P. Deshpande, "Phule was the first to identify and theorize the bipolar (*dvaivarnik*) structure of Indian Society, marked by the

dichotomous relationship between the oppressors (the Brahmans) and the oppressed (*Stri-Shudra-Atishudras*).[1]

It is to be noted here that Mahatma Phule used the term 'Stri-Shudra-Atishudras', thereby connecting all categories of women with Shudra-Atishudras, which includes middle castes, untouchables, tribes (Adivasis) and all other castes that are at the receiving end of the Brahmanical order. He also made an attempt to unify all Non-Brahmin castes by clubbing them into one category—Non-Aryans.

Mahatma Phule says that according to the Dharmashastras all women, irrespective of their castes, are inferior creatures and hence invariably in the same group as Shudras and Dasas.

He realised that since women were the biological reproducers of caste-patriarchy, the regulation, and control of their sexuality was crucial to retain and preserve the 'pure' roots of caste and lineage. The notions of purity and impurity are extremely complex and vary greatly among different castes. For example, high castes are always associated with purity whereas lower castes are equated with impurity as mentioned in Dharmashastras, which also say that an impurity means '*varnasankara*' (mixing of caste). Therefore Phule, denounced the *chaturvarna* system, attacked the notions of purity and impurity in his writings, and examined the motives and objects of the cruel and inhuman laws framed by the Brahmins.

Brahmanical hegemonic culture represents a specific view of the world, based on caste-bound social order and patriarchal oppression. However, there are other dimensions to this, which are class and caste. In this regard, Phule was not definite about the role of endogamy in caste patriarchy and the control of women, but he was well aware of the fact that there was a power structure between men and women. According to him, in the Brahmanical social order 'Stri-Shudra-Atishudras' were not allowed to enter the field of knowledge and education since it was a monopoly of the Brahmins. This caused 'Stri-Shudra-Atishudras' to remain in slavery. Phule realized the significance of Knowledge as a key to their emancipation and as a tool for breaking the monopoly of Brahmins in the society. His pedagogy clearly mentions the magnitude of the relation between 'Knowledge' and 'Power'.

To recall Professor Deshpande's argument, Phule spoke of the relationship between Knowledge and Power much before Foucault did. To quote him, "In fact, Foucault's post-modernist analysis came at a time when Europe was literally seeing an 'End of History', whereas Phule's efforts were to change the world

/Society with the weapon of Knowledge." Therefore, Phule was right in his writings when he says that the Third Eye (*Tritiya Netra*) is Knowledge, as it can mentally and materially emancipate human beings. He describes three types of Knowledge:

- (1) Knowledge of self, which means to realize one's own consciousness and come out of the pseudo understanding of caste, class, race and gender.
- (2) The collective knowledge, which means a social cluster that introduces itself or an individual according to class, caste, race and gender, and makes aware of the dynamism of Knowledge.
- (3) Practical, technical and scientific knowledge, that helps human beings in materialistic progress as well as emancipation.

As far as the issue of gender is concerned, it can be observed that most of the social reformers at that time with elitist backgrounds, had an agenda for the improvement of women's social status, whereas Mahatma Phule believed in equal status for women and wanted equal and common human rights for women at par with men. His was the first attempt in modern Indian history to correlate the slavery of women with oppressed castes in Indian society. His critique of history is based on the references to patriarchal conditions on women, caste-based slavery, untouchables within and outside of the village boundaries, and peasants and artisans included in the caste hierarchy.

In the Brahmanical system, though poor farmers were exploited, he brought to notice that the peasant women were most exploited. He says in his *Akhandas* that in caste hierarchy, unlike Brahmin women, the peasant women engaged both in household and agricultural work, thus doing far more physical labour. To make a point here, Mahatma Phule could imagine the stratification of labour and exploitation of women in India much before Karl Marx could visualize the exploitation of labour merely for men. His conscious mind quantified the division of labour based on caste and gender, which is why he explains how in a peasant/artisan's family, immediately after marriage, women engaged themselves in domestic labour as well as artisan labour, based on caste patriarchy.

Phule also criticized the nature of exploitation by oppressed classes and castes of women in their own families. This was a genuine concern for women since these women were more vulnerable to getting exploited by men who were themselves victims of a caste-ridden society. In the words of Professor Gail Omvedt, "His depth of pro-feminist feeling was great enough that he was ready to attack one of his co-workers, Krishnarao Bhalekar. Bhalekar, it seems, had written a severe criticism of a book published by one Tarabai Shinde, comparing men and women (*Stri-Purusha Tulana*). Phule replied in 1885 with an attack that was ferocious and in some ways more bitter than his attack on Brahmins."

He also put forward an alternative framework of gender equality based on social, cultural and religious structures. While doing so, Mahatma Phule gives special attention to the fact that all religious scriptures were written by men, and none were written by women. According to him, this showed that women were more peace-abiding and creative. Therefore, Phule in his *Sarvajanik Satyadharma* rejects the concepts of god, soul, re-birth, and theories of karma and rituals based on caste, class and gender. He accepted instead the philosophies of secular and humanistic religions, inspired by Buddhism, Jainism, Lokayata and Sant Kabir.

### **M.N.Roy: Radical Humanism**

Humanism is a philosophical stance that emphasizes the value and agency of human beings, individually and collectively. The concept of humanism refers primarily to a system of thought, which focuses on the autonomy of the individual. Humanism is a doctrine according to which man is point of departure and point of reference of human action. Humanism was a product of Renaissance and reformation in Europe and found its fullest expression in the American and French Revolutions.

### **Ancient India And Humanism**

Human-centered philosophy that rejected the supernatural may also be found circa 1500 BCE in the Lokayata system of Indian philosophy. Nasadiya Sukta, a passage in the Rig Veda, contains one of the first recorded assertions of agnosticism. In the 6th century BCE, Gautama

Buddha expressed, in Pali literature a skeptical attitude toward the supernatural.

Since neither soul, nor aught belonging to soul, can really and truly exist, the view which holds that this I who am **world**, who am **soul**, shall hereafter live permanent, persisting, unchanging, yea abide eternally: is not this utterly and entirely a foolish doctrine.

**Humanism is defined in the Oxford Dictionary as:**

*an outlook or system of thought concerned with human rather than divine or supernatural matters. A belief or outlook emphasizing common human needs and seeking solely rational ways of solving human problems and concerned with mankind as responsible and progressive intellectual beings.*

Humanism expresses that human being has great potentiality and if developed fully, one can reach to the greatest height, provided one gets proper opportunities to develop. Gandhi ji, Russel and Tolstoy were great humanists of the twentieth century.

In humanist thought, man becomes free in his private life. He was not only unique but also different and could not be reduced to the other. Man acquired inherent natural right to decide the rules of moral living. Man claimed freedom in the public domain and asserted the right to choose his political regime.

Human beings are in complete charge of themselves, they will decide their own values and they are materialists. Everyone wants to be a freeman. Everyone occupies a unique position, in communion with oneself, everyone is alone, and responsible for his actions. The final decision in all matters now rests with the individual. Since man has the capacity to decide true and false as he is endowed with reason, he has a right to choose his political regime. Democracy is the only legitimate form of government as it is based on the idea of willing subjects. Thus, humanism has links with the materialism, individualism and democratism.

**M.N. Roy's Radical Humanism In India**

M.N. Roy gave a clear expression to the idea of humanism. Manavendranath Roy whose original name was Narendranath Bhattacharya was born on 21st March, 1887 at Arbalia in Bengal. He was a revolutionary and a member of Juganther Party and went to other countries to secure arms. He came in touch with Marxism in the USA. He joined the Socialist Party of Mexico and he made it the Communist Party of Mexico and he became the founder of the first Communist Party outside Soviet Union. He became a prominent member of Communist International.

In his later life, he was well-known as a radical humanist. Radical Humanism was also known as scientific humanism. It undertook a scientific approach for understanding man and his place in the world. So it was called scientific humanism. It is known as materialism or monistic naturalism whose characteristics are naturalism, determinism and monism.

Naturalism asserts the existence of nature and holds that everything that exists including man is a part of nature. Determinism implies that the universe is governed by certain objective laws, that the process is orderly and that events do not take place without a cause. Nothing is left to chance. So it leads to the following conclusion. The universe works on a deterministic manner. This is called monism. Man is made of superior matter. He has a rational mind. He is gifted with reason.

Man is a part of nature. He lives in society. But, society does not possess consciousness. It does

not know what is good and bad. It is not a biological being. Man has all these characteristics. So between man and society, man is important. He is the measure of everything. Social development means development of all people living in the society. In other words, society, State, government, etc. exist for the welfare of man. He is the end and the society is the means. It exists to guarantee his freedom and to protect his liberty. In short, he asserts the sovereignty of man. Roy regarded man as central. He wrote:

**freedom is the supreme value because the urge for freedom is the essence of human existence.**

Roy accepted humanism because humanists had always approached life from the assumption of the sovereignty of man. It is man's unique capacity of knowing, as distinct from the common biological activity of being aware, which endows him with powers, not to rule over others, but to create freedom for the benefit of humanity. All citizens are equal members of the society.

Humanism believes that society consists of individuals, good and bad; those who can co-operate and those who cannot, and those who can inflict injury and those who cannot. All of them can coexist in a framework of plurality. The State should protect them all and should be so organized that the individual becomes an end in itself. The State, science, technology, etc. are all means of an end, namely, to enable individuals to flourish; they are not ends in themselves; they cannot be allowed to dominate human life.

## **Conclusion**

Submerged Humanism is a system of views based on respect for the dignity of man, concern for his welfare, his all round development and creation of favorable conditions for social life. The humanism that we have seen in thoughts of contemporary Indian philosophers is different from the western humanism.

Western humanism is mostly intellectual, economic and political in nature. But the Indian humanism is primarily spiritual. The Indian humanism does not take man to be material being but as one with spirit, mind, life and body. It aims at the fulfillment of the aspirations which are physical, vital, mental and spiritual in nature.

## **Roy's Materialism or Physical Realism**

M .N. Roy was a strong supporter of materialist philosophy. According to Roy, strictly speaking, materialism is "the only philosophy possible", because it represents the knowledge of nature as it really exists—knowledge acquired through the contemplation, observation and investigation of nature itself.

Roy points out that materialism is not the "monstrosity" it is generally supposed to be. It is not the cult of "eat, drink and be merry", as it has been depicted by its ignorant or malicious adversaries. It simply maintains that "the origin of everything that really exists is matter, that there does not exist anything but matter, all other appearances being transformations of matter, and these transformations are governed necessarily by laws inherent in nature." (Roy 1951)

Thus, broadly speaking, Roy's philosophy is in the tradition of materialism. However, there are some important differences between Roy's materialism and traditional materialism. In fact, Roy's "materialism" is a restatement of traditional materialism in the light of contemporary scientific knowledge. According to Roy, the substratum of the universe is not matter as traditionally

conceived, but it is “physical as against mental or spiritual”. It is, in other words, “a measurable entity”. Therefore, says Roy, to prevent prejudice, materialism could be renamed “physical realism”.

## **Roy’s Materialism and Traditional Materialism**

Roy was of the view that materialism must be dissociated from certain notions, which have been rendered untenable by the discoveries of science. His revision and restatement of materialism embraces both the basic tenets of materialism: the concept of matter as well as the doctrine of physical determinism.

### **i. Change in the Concept of “Matter”**

According to Roy, the discoveries of quantum physics have “made the classical notion of matter untenable”. Nevertheless, Roy insists that though the substratum of the universe is “not matter as traditionally conceived” it is “physical as against mental or spiritual. It is a measurable entity”.

The so-called “crisis” of materialism, according to Roy, involved the *conception* of matter, and not its *existence*. The “crisis” simply exposed the inadequacy of the old atomist theory. The substance of the “crisis” was, “that it appeared to reduce matter from mass to energy and radiation”. However, there cannot be any doubt about the fact that “atomic physics deals with material realities which exist objectively, outside the mind of the physicist.” Thus, in Roy’s physical realism “matter” is not made up of hard and massy stone-like atoms as in traditional “mechanical materialism”. The whole concept of “matter” has been revised in the light of new physics. In fact, Roy was even ready to discard the term “matter” provided a more appropriate new term could be coined. In *Science and Philosophy*, Roy describes “matter” as the “sole-existence.” According to Roy, it is not very important what name is attached to the “substratum of existence” – matter, energy, action, vibratory motion or field. However, he insists that it is a *physical reality*. What Roy means by calling it *physical* is that it *exists objectively* and that it is *measurable*. As we have seen, Roy has even renamed his revised version of materialism as “physical realism”.

### **ii. Revision of Physical Determinism**

Roy disagrees with the view of some thinkers that Heisenberg’s Principle of Uncertainty requires the rejection of the doctrine of determinism. According to Roy, only a modification in the traditional conception of causality is required.

Causality, in Roy’s view, is not an *a priori* form of thought or an axiomatic law; it is physical relation inherent in the constitution of the universe.

Roy, in fact, tries to temper a rigidly mechanical view of determinism by interpreting it in terms of probability. He admits plurality of possibilities and the element of contingency in the world, and tries to show that *determinism and probability are not mutually exclusive*. However, Roy insists that statistical methods presuppose determinism. The universe is a law-governed system, and the existence of law presupposes causality. He is emphatic that the element of *uncertainty* in the sub-atomic world is not to be equated with *indeterminacy*. Rejection of the idea that there are invariant relations in nature, maintains Roy, will blast the very foundation of science.

Roy also tries to reconcile “freedom of will” with determinism. According to him, human beings possess free will and can *choose* out of various alternatives in front of them. Roy, however, is not unique among materialists in recognizing free will. Epicurus, among ancient Greek materialists, and Hobbes, among modern materialists, tried to accommodate free will in their philosophies.

According to Roy, the vast world of biological evolution lies between the world of human beings and the world of inanimate matter, and, therefore, the world of human beings has its own specific laws, though these laws can be referred back to the general laws of the world of dead matter. Nevertheless, human will, says Roy, cannot be directly related to the laws of physical universe. Thus, Roy is not, to use the terminology of William James, a “hard” determinist like Holbach, but a “soft” determinist like Hobbes.

### **iii. Objective Reality of Ideas and the Autonomy of the Mental World**

Though Roy traces the origin of mental activities to the physical background of the living world, yet he also grants them an objective existence of their own. Mind and matter, according to Roy, can be reduced to a *common denominator*; as such, they are *two objective realities*. In Roy’s view, once formed, *ideas exist by themselves, governed by their own laws*. Thus, Roy grants much more objectivity and autonomy to the mental world than has been traditionally granted by materialists. Roy’s materialism is not an “extreme” materialism like that of the eighteenth century French materialist, Julien de la Mettrie, who regarded man to be a self-moving machine. According to Roy, on the other hand, “Man is not a living machine, but a thinking animal”.

### **iv. Emphasis on Ethics**

Roy has given a very important place to ethics in his philosophy. According to Roy, “the greatest defect of classical materialism was that its cosmology did not seem to have any connection with ethics”. Roy strongly asserts that if it is not shown that materialist philosophy can accommodate ethics, then, human spirit, thirsting for freedom, will spurn materialism. In Roy’s view materialist ethics is not only possible but also the noblest form of morality. Roy links morality with human being’s innate rationality. *Human beings are moral*, according to Roy, *because they are rational*. In Roy’s ethics *freedom*, which he links with the struggle of existence is the *highest value*. Search for truth is a corollary to the quest for freedom.

However, Roy is not unique among materialists in emphasizing the importance of ethics in his philosophy. Contrary to popular impression, ancient materialist Epicurus and modern materialist Holbach, for example, accorded an important place to ethics in their philosophies. However, the details of Roy’s ethics are somewhat different from these philosophers.

## **C. Roy’s Materialism and Marxian Materialism**

Before he formulated and expounded his own philosophy of New Humanism, Roy was an orthodox Marxist. In fact, Roy’s revision of materialism was carried out in the context of Marxism. Thus, Roy’s revision of materialism in general is also applicable to Marxian materialism to the extent Marxian materialism resembles traditional materialism.

Roy’s Physical Realism is, however, different from Marxian materialism in three important ways:

### **i. Delinking of Dialectics and Materialism**

Roy considers the Hegelian heritage a weak spot of Marxism. The simplicity and scientific soundness of materialism are marred by making its validity conditional upon dialectic. According to Roy, *materialism pure, and simple, can stand on its own legs*, and, therefore, he tries to de-link dialectics from materialism. The validity of materialism, maintains Roy, is in no way conditional on dialectics, as there is no logical connection between the two.

## **ii. Rejection of Historical Materialism**

Roy rejects historical materialism and advocates a *humanist* interpretation of history in which he gives an important place to human will as a determining factor in history, and he recognizes the autonomy of the mental world. He argues that human will cannot be directly related to the laws of physical universe. Ideas, too, have an objective existence, and are governed by their own laws. The economic interpretation of history is deduced from a wrong interpretation of materialism.

## **iii. Emphasis on Ethics**

Roy's materialism is sharply different from Marxian materialism in so far it recognizes the importance of ethics and gives a prominent place to it. According to Roy, Marxian materialism wrongly disowns the humanist tradition and thereby divorces materialism from ethics. The contention that "from the scientific point of view this appeal to morality and justice does not help us an inch farther" was based, according to Roy, upon a false notion of science.

## **Maulana Azad: Humanism**

India is considered as an emerging power on the international platform but there are number of problems still prevalent in the Indian society which prevents its progress ahead to be great nation. Great nation means having great people and resources which are self sustained peacefully and attract the world for its character of humanity, culture, stability, maintenance of natural resource in environmental friendly manner. India will take many decades or century to reach to that tag of greatness. It is not true that India was not great but over a period of time since Asoka, all those characteristics of greatness taken away by the selfish and inhuman individuals and groups. Today India is struggling with many problems. The uncontrolled growth of its population which has already touched 1.21 billion alongwith some social and health problems are major challenges for its progress. With these problems remaining unresolved, it is unlikely that India will be able to provide its citizens a respectable life. Unplanned population growth with total negligence towards proper human resource development puts a huge pressure on the existing resources which leads to poverty, poor quality of life of people. One third of Indian population is still living below poverty line. According to the new World Bank's estimates on poverty based on 2005 data, India has 456 million people, 41.6% of its population, living below the new international poverty line of \$1.25 (PPP) per day. The World Bank further estimates that 33% of the global poor now reside in India.<sup>1</sup> It is further augmented by uneven distribution of wealth, with the top 10% of income groups earning 33% of the income.<sup>2</sup> This inequity and unequal development leads to people in urban area enjoying better comforts than rural areas. Illiteracy makes people weaker and susceptible to not only exploitation but also to more prone to die of diseases. Other problems like malnutrition among pregnant women, children, and adolescent girls make them at risk of diseases throughout their lives. More than fifty percent of our mothers are anemic. There are 20% of all pregnancies are among teenage group. Lack of adequate sanitation in more than 60% of the total household in the country also leads to significant economic losses for the country apart from frequent diseases outbreaks. Gender discrimination remains the most distressing social evils in India. Issues like female feticide, infanticide, exploitation, illiteracy, maternal mortality and dowry deaths are throbbing discrimination women of India are subjected to. Unemployment remains a problem since with increasing price of necessary resources of life, unemployed people are unable to fetch themselves and their families. Other major problems like child labour, discrimination towards lower caste, religious conflict and civil war, widespread corruption, terrorism, naxalism and weak political-legislative implementation and social system- all these lead to a society with wide socioeconomic disparities and poor growth. All these problems are affecting human society and

violating human rights. To protect the Indian society from these problems, humanism needs to be protected and promoted and realized in true sense. According to *American Humanist Association*, **Humanism** is defined as a progressive life stance that, without supernaturalism, affirms our ability and responsibility to lead meaningful, ethical lives capable of adding to the greater good of humanity.<sup>3</sup> **Humanism** is a rational philosophy informed by science, inspired by art, and motivated by compassion.

Affirming the dignity of each human being, it supports the maximization of individual liberty and opportunity consonant with social and planetary responsibility. It advocates the extension of participatory democracy and the expansion of the open society, standing for human rights and social justice. It recognizes human beings as a part of nature and holds that values—be they religious, ethical, social, or political—have their source in human experience and culture. With humanism, all social barriers like discrimination, violence against women, gender bias, religion wars, casteism etc can be eliminated. It calls upon a participatory political system with equal distribution of resources thereby reducing wealth gap, promoting rational thinking and promoting human rights. For this reason humanism needs to be inculcated in every character of people of India on urgent basis.

As a public health professional I personally feel that humanism in public health is equally important in India. Public health is defined "the science and art of preventing disease, prolonging life and promoting health through the organized efforts and informed choices of society, organizations, public and private, communities and individuals."<sup>4,5</sup> The role of humanism is becoming more important when there is disparity of health care among people. According to the Constitution of India, state is responsible for health of its people, however, more than 80% of its population health is catered by Private or corporate bodies. Due to the nature of private and corporate bodies to earn profit the welfare of the people is sidelined. Hence exploitation of poor in private health sector is common. Poor doctor patient relationship is rampant. There are incidences where doctors and healthcare staff refused to give treatment to HIV patients, handling trauma or delivery of poor. Weaker sections of the society like scheduled castes, scheduled tribe, residents of rural areas, illiterate and women should also be given due attention and facilities which is given to other patients. To tackle these problems of healthcare delivery in India, there is urgent need of humanism in health sector. Health care workers should not treat patients as diseased bodies but treat them with human touch and values. They should not discriminate patients with HIV, tuberculosis and leprosy in care. All the doctors and paramedical staff should be trained in humanist values to interact with the people. Hospital environment should be such that to provide services to the patients in a human friendly manner and planning the services for patient welfare. At the same time, patients should also be taught about their role and support in providing such kind of services. They should take their responsibility in following the treatment and instructions of the doctor, keep faith in the doctor, be aware and spread awareness among fellow community members. With both doctor and patient working together with human values, health care services can be improved in future. Without the health of its people no nation can be great.

We are aware of many problems striking the nation which make us weak and poor. Because the problems are multifactorial in nature, our efforts should be multilayered at home, society, and country and within country in various sectors. Humanism should be practiced in following levels:

### ***Importance of Humanism in Home***

Family needs to deal with following problems in emotional, logical and effective manner:

Low value of girl child and women, female infanticide and feticide, women equalrights and respect, etc.

### ***Importance of Humanism in Society***

Society needs to deals with following problems in participatory, consultative, supportive and rational manner:

Casteism, inequalities, poor attitude towards rape and molestation, Child labor, mentally and physically challenges people, elderly population,

### ***Importance of Humanism in the Country***

Country through its parliament and political structure needs to deals with following problems in scientific, rational, parliamentary, and authoritativemanner:

Defective policies and program, poor implementation of laws, corruption, black money, divisive politics, etc.

### ***Importance of humanism in Medicine and public health***

Health sector needs to deal with following problems in ethical, rational, scientific,and responsible manners:

Exploitation of patients, maltreatment, discrimination with HIV/AIDS, tuberculosis, poor, destitute, poor doctor-patients relationship, quackery, unscientific system of medicine, etc. According to Gautama Buddha, six things are to be remembered in order to unite any community in harmony which are promoting human values in community:

- 1: Friendly Behaviour both in public & in private.
- 2: Friendly Speech both in public & in private.
- 3: Friendly Thought both in public & in private
- 4: Sharing of Gains even down to any single lump of food
- 5: Moral Agreement: All respect the same ethical rules
- 6: Same Views: All share the same general views & opinions

No human being can remain happy and progress if he/she is not in harmony and peace. When humanism prevailed people are happy and progressed. When you care for human beings you start looking in all those factors which are responsible for human health and happiness such as environmental health protection and preservation of animals and birds. It can only happen when you have platonic anduniversal humanism.

# MCQs

- (b) Object of effort.
- (c) Aim of life.
- (d) All of these.

236. Value is accompanied with

- (a) Beliefs.
- (b) Convictions,
- (c) Sacrifices.
- (d) All of these.

237. Value has been closely linked with interest. This statement has been given by

- (a) J.B. Perry.
- (b) J.S. Mackenzie,
- (c) J.S. Mill.
- (d) W. M. Urban.

238. According to psychologists, value is primarily concerned with:

- (a) Needs.
- (b) Sentiments,
- (c) Drives.

(d)All of these.

239. According to ethicists, values are concerned with

- (a)Morals.
- (b)Reasons,
- (c)Purposes.
- (d)All of these.

240. Axiological judgement shows the characteristics of

- (a)Inevitable.
- (b)Obligatory.
- (c)Based upon judgment.
- (d)All of these.

241. The materialists define value as

- (a)Material.
- (b)Mental.
- (c)Spiritual.
- (d)None of these.

242. The spiritualists define value as

- (a)Material.
- (b)Mental.
- (c)Spiritual.
- (d)None of these.

243. Values have been classified as

- (a)Intrinsic.
- (b)Extrinsic,
- (c)Both of them.
- (d)None of these.

244. Goodwill, according to Immanuel Kant, is

- (a)Extrinsic value.
- (b)Intrinsic value.
- (c)Instrumental value.
- (d)None of these.

245. The ultimate good includes

- (a)Extrinsic value.
- (b)Intrinsic value.
- (c)Instrumental value.
- (d)None of these.

246. The ultimate human values are of the nature of

- (a)Physical.
- (b)Intellectual,
- (c)Spiritual.

(d)None of these.

247. Values can be classified as

- (a)Permanent.
- (b)Temporary,
- (c)Both of them
- (d)None of these.

248. The theory of liberation has been rejected in Indian philosophy by the school known as

- (a)The Charvaka.
- (b)The Jaina.
- (c)The Buddhists,
- (d)The Vedanta.

249. Liberation, according to Charvaka, can be said to be

- (a)Possible.
- (b)Impossible,
- (c)Foolish.
- (d)None of these.

250. Liberation, according to Jain philosophy, is

- (a)Freedom of matter.
- (b)Freedom from life and death.
- (c)Freedom from Karma.
- (d)All of these.

251. Liberation, according to Jain philosophy can be classified as

- (a)Bhava moksha.
- (b)Dravya moksha.
- (c)Both of them.
- (d)None of these.

252. The state of Jivan mukti is included in

- (a)Bhava moksha.
- (b)Dravya moksha.
- (c)Both of them.
- (d)None of these.

253. Liberation, according to Jaina, can be achieved by

- (a)Penance.
- (b)Self-control,
- (c)Detachment.
- (d)All of these.

254. Liberation, according to Buddha, means

- (a)Extinction.
- (b)Freedom.
- (c)Detachment.

(d)None of these.

255. Liberation in Buddhist philosophy is known as

- (a)Nirvana.
- (b)Moksha.
- (c) Mukti.
- (d)None of these.

256. The most important means for achieving Nirvana, according to Buddha, is

- (a)Eight-fold path,
- (b)Penance,
- (c) Detachment.
- (d)Mortification.

257. Nirvana in Buddhist texts has been described as

- (a)State of peace.
- (b)Eternal health,
- (c) Perfect freedom,
- (d)All of these.

258. Nirvana cannot be described as

- (a)Eternalism.
- (b)Nihilism.
- (c)Both
- (d)None of these.

259. The famous preaching of Nirvana to King Milinda were given by

- (a)Gautam Buddha.
- (b)Nagarjuna.
- (c) Nagasena.
- (d)None of these

260. The important forms of Nirvana include

- (a)Sopadhi sesa.
- (b)Nirupadhi sesa
- (c)Both of them.
- (d)None of these.

261. The world as suffering has been postulated by

- (a)Buddhism.
- (b)Samkhya.
- (c) Jainas.
- (d)All of these.

262. The cause of suffering, according to Samkhya, philosophy is

- (a)Ignorance.
- (b)Attachment,
- (c)Fear.

(d)None of these.

263. Liberation, according to Samkhya, can be attained by:

- (a) Knowledge.
- (b) Penance,
- (c) Enjoyment.
- (d) None of these.

264. The self in Samkhya philosophy is known as

- (a) Jiva.
- (b) Purusa.
- (c) Atman.
- (d) None of these.

265. The chief characteristics of purusa in Samkhya philosophy is

- (a) Transcendent.
- (b) Ever liberated,
- (c) Non-attached.
- (d) All of these.

266. The liberation by living, according to Samkhya philosophy, can be termed as

- (a) Jivanmukti.
- (b) Videhamukti.
- (c) Both of them.
- (d) None of these.

267. Liberation after death, according to Samkhya philosophy, can be termed as

- (a) jivanmukti.
- (b) videhamukti.
- (c) Both of them.
- (d) None of these.

268. The final state of liberation, according to Samkhya philosophy, is

- (a) Jivanmukti.
- (b) Videhamukti.
- (c) Both of them.
- (d) None of these.

269. Liberation and bondage, according to Samkhya philosophy, are of the nature of

- (a) Ultimate reality,
- (b) Practical reality,
- (c) Like dream.
- (d) None of these.

270. The main objection against Samkhya concept of liberation is based upon

- (a) The Purusa as agent.
- (b) No happiness in liberation.
- (c) Fallacies of evolution.

(d)All of these.

271. The best theory of liberation in Indian philosophy has been advanced by

- (a)The Jainas.
- (b)The Buddhists.
- (c)The Samkhya.
- (d)Advaita Vedanta.

272. According to Advaita Vedanta, the nature of liberation can be explained as

- (a)Brahman.
- (b)Atman.
- (c)Transcendental reality.
- (d)All of these.

273. Advaita Vedanta theory of liberation is based upon

- (a)The Vedas.
- (b)The Upanishads.
- (c)Bhagwadgita.
- (d)Brahmasutra.

274. The liberation in Advaita Vedanta is known as:

- (a)Nirvana.
- (b)Apavargh.
- (c)Moksha.
- (d)None of these.

275. To contribute to India's national integration education should

- (a)Make children familiar with all aspects of national life.
- (b)Reach each and every child of the country.
- (c)Be free and compulsory.
- (d)Be of high quality.

276. Indian education can promote national consciousness by

- (a)Breaking down regional and linguistic barriers.
- (b)Establishing more and more all India institutions which will admit students from different parts of the country.
- (c)Understanding and re-evaluating of India's cultural heritage.
- (d)All of these.

277. Who was the founder of Shanti Niketan ?

- (a)Tagore
- (b)Vivekananda
- (c)Gandhi
- (d)Sri Aurobindo.

278. under whose leadership is founded the University at Pondicherry?

- (a)Tagore
- (b)Vivekananda

- (c) Gandhi
- (d) Sri Aurobindo.

279. On whose philosophy is based the current primary education in India?

- (a) Tagore
- (b) Vivekananda
- (c) Gandhi
- (d) Sri Aurobindo.

280. Material and spiritual knowledge is already present in man covered by a 'curtain of ignorance-who said this?

- (a) Tagore
- (b) Vivekananda
- (c) Gandhi
- (d) Plato.

281. Vivekananda included study of religion, philosophy, Upanishadas and Puranas" to achieve

- (a) Spiritual development of the child.
- (b) Development of intellect of the child.
- (c) Propagation of Indian culture.
- (d) Complete development of child's personality.

282. Which of the following was not suggested as a method of education by Vivekananda?

- (a) Lecture-cum-discussion
- (b) Yoga
- (c) Meditation
- (d) Guided readings.

283. Vivekananda's philosophy of life was derived from

- (a) Buddhist philosophy.
- (b) Vedanta philosophy.
- (c) Sankhya philosophy.
- (d) Plato's Idealism.

284. Which of the following types represents M.K. Gandhi's contribution to education?

- (a) Integral education
- (b) Basic Education
- (c) Education for man making
- (d) Education for international understanding.

285. Which of the following types represents Vivekananda's contribution to education?

- (a) Integral education
- (b) Basic education
- (c) Education for man making
- (d) Education for International understanding.

286. Which of the following types represents Aurobindo's contribution to education?

- (a) Integral Education
- (b) Basic education

- (c) Education for man making
- (d) Education for international understanding.

287. As an educationist, Gandhiji was

- (a) A naturalist
- (b) An Idealist
- (c) Naturalist, an Idealist and a Pragmatist all together
- (d) A Pragmatist.

288. The ultimate aim of education, according to Gandhiji, was to help the individuals to be

- (a) Gainfully employed in life.
- (b) Peaceful and happy in life.
- (c) Able to acquire as much as possible from the ocean of knowledge.
- (d) Able to grow into a divine human being by realizing Godliness.

289. What did Gandhiji's philosophy of education stress as aim of education?

- (a) Social aims
- (b) Individual aims
- (c) Cultural aims
- (d) A synthesis of individual and social aims.

290. Rabindra Nath Tagore was a Naturalist because he said about children that

- (a) They should be made to develop into complete human being.
- (b) They should be given full freedom to live in natural environment and learn by doing.
- (c) They should be acquainted with the ideals and values of national culture.
- (d) They should be educated for national integration.

291. Tagore was an Idealist because he emphasized

- (a) Religious education in a formal manner.
- (b) Moral and spiritual development of the child.
- (c) Vocational education.
- (d) Rigid control and discipline in schools.

292. In Democracy educational pattern is planned after the interests of the many because

- (a) Democracy is the government of the many, by the many and for the many.
- (b) There are always too many illiterates in a democracy.
- (c) The ultimate authority determining educational policy in democracy is imminent in man.
- (d) Democracy has tremendous faith in hermen and their powers.

293. Aims of education are determined by human being for the good of the

- (a) Individual.
- (b) Society.
- (c) The individual and the society both.
- (d) Neither the individual nor the society.

294. India's constitutional value of "equality of all" is founded on several assumptions. Which of the following is not among these?

- (a) Claim of human dignity

- (b) All men have intrinsic worth
- (c) All men are alike by nature
- (d) All men are created equal.

295. In India's constitutional values equality applied to education means
- (a) To equalize the external or material circumstances of obtaining education.
  - (b) To impart same kind of education to all.
  - (c) To impart education to all up to the same level.
  - (d) To have same kinds of institutions for all in the society.

**296.** Which of the following does not contribute to India's national integration?

- (a) National system of education
- (b) Teaching history compulsorily in the school
- (c) National language
- (d) National curriculum.

297. Which of the following is not a national objective to be achieved through education in India?

- (a) Increasing productivity
- (b) Achieving social and national integration
- (c) Increasing children's creative ability
- (d) Accelerating process of modernization.

298. Development of which of the following is not an aim of democratic education?

- (a) Vocational efficiency
- (b) Educational leadership
- (c) Scientific and technical education
- (d) Democratic citizenship.

299. The Vedas teach us that creation is

- (a) Without beginning.
- (b) Without an end.
- (c) Without beginning and without an end.
- (d) Has a definite beginning and also an end.

300. Who said, "Without caring for all that is believed, reason it all out and having found that it will do good to you and all believe it, live up to it and help others to live up to it"?

- (a) Swami Vivekananda
- (b) Buddha
- (c) Kapila
- (d) Vyas.

201. (a) 202. (a) 203. (b) 204. (c)  
 205. (a) 206. (a) 207. (d) 208. (a)  
 209. (a) 210. (b) 211. (c) 212. (d)  
 213. (b) 214. (d) 215. (b) 216. (d)  
 217. (c) 218. (b) 219. (a) 220. (b)  
 221. (a) 222. (b) 223. (a) 224. (a)

225. (b) 226. (b) 227. (b) 228. (d)  
229. (b) 230. (d) 231. (c) 232. (d)  
233. (b) 234. (b) 235. (d) 236. (d)  
237. (a) 238. (d) 239. (d) 240. (d)  
241. (a) 242. (c) 243. (c) 244. (b)  
245. (b) 246. (c) 247. (c) 248. (a)  
249. (d) 250. (d) 251. (c) 252. (a)  
253. (d) 254. (a) 255. (a) 256. (a)  
257. (d) 258. (c) 259. (c) 260. (c)  
261. (d) 262. (a) 263. (a) 264. (b)  
265. (d) 266. (c) 267. (b) 268. (b)  
269. (b) 270. (d) 271. (d) 272. (d)  
273. (d) 274. (c) 275. (a) 276. (d)  
277. (a) 278. (d) 279. (c) 280. (b)  
281. (a) 282. (d) 283. (b) 284. (b)  
285. (c) 286. (a) 287. (c) 288. (d)  
289. (d) 290. (b) 291. (b) 292. (b)  
293. (c) 294. (c) 295. (a) 296. (b)  
297. (c) 298. (c) 299. (c) 300. (b)

301. The Gujarati translation of the 'Unto this Last' is called:

- a. Harijan
- b. Sarvodya
- c. Navajeevan
- d. Swadesi

**Answer: c**

302. Gandhi said, "For me there can be no politics without "

- a. Service
- b. religion
- c. will
- d. none of these

**Answer: a**

303. Gandhi believed in the sovereignty of the people based on pure

- a. rational authority
- b. political wisdom.
- c. moral authority
- d. knowledge

**Answer: d**

304. Which of the following statements is not correct about Dr. Ambedkar?

- (a) Dr. Bhimrao got married at the age of 15 years with a nine-year-old girl "Ramabai".
- (b) The Reserve Bank of India (RBI) was based on the ideas of Ambedkar, which he recommended to the Hilton Young Commission.
- (c) He was the first Law and Justice Minister of independent India
- (d) He adopted Buddhism in 1965

**Answer: d**

**Explanation:** All options are correct except option d. Dr. Ambedkar adopted Buddhism in 1956.

305. When was Dr. Ambedkar given Bharat Ratna?

- (a) 1985
- (b) 1980
- (c) 1990
- (d) 1973

**Answer: c**

**Explanation:** Bharat Ratna was given to Dr. Ambedkar by the government of Vishwanath Pratap Singh in 1990.

306. What is the name of Dr. Ambedkar's memorial site?

- (a) Samta Sthal
- (b) Chaitya Bhoomi
- (c) Veer Bhumi
- (d) Buddhist Bhumi

**Answer: b**

**Explanation:** The name of Dr. Ambedkar's memorial site is Chaitya Bhoomi, which is in Mumbai, Maharashtra.

307. Which of the following political parties has not been formed by Dr. Ambedkar?

- (a) Indian Republican Party
- (b) Independent Labor Party
- (c) Scheduled Cast Federation
- (d) Dalit Shoshit Samaj Sangharsh Samiti

**Answer: d**

**Explanation:** A party called Dalit Shoshit Samaj Sangharsh Samiti was formed by Kanshi Ram not by Dr. Ambedkar.

308. Dr. Ambedkar was the chairman of which committee constituted to form the Indian Constitution?

- (a) Preamble Committee
- (b) Drafting Committee
- (c) Flag Committee
- (d) Union Constitution Committee

**Answer: b**

**Explanation:** Dr. Ambedkar was elected as the chairman of the drafting committee setup to form the Indian Constitution. A 7-member draft committee was formed for the framing of the constitution on 29 August 1947.

309. Which of the following books has not been written by Dr. Ambedkar?

- (a) Thoughts on Pakistan
- (b) Annihilation of caste
- (c) The problem of Rs: Origin and solution
- (d) Gandhi, Nehru, and Tagore

**Answer: d**

**Explanation:** Dr. Ambedkar has written all books except Gandhi, Nehru, and Tagore. Worth to mention, the problem of money: the origin and solution and the Annihilation of caste are among his

famous books.

310. Which of the following Indians participated in all three round table conferences?

- (a) Dr. Ambedkar
- (b) Mahatma Gandhi
- (c) Jawaharlal Nehru
- (d) Madan Mohan Malaviya

**Answer: a**

**Explanation:** Dr. Ambedkar participated in all the three Round Table Conferences. Gandhiji participated only in the Second Round Table Conference from the Congress side.

311. Who was the first and only Satyagrahi to perform "Satyagraha for drinking water"?

- (a) Mahatma Gandhi
- (b) Vallabhbhai Patel
- (c) Dr. Ambedkar
- (d) None of the above

**Answer: c**

**Explanation:** Dr. Ambedkar was the first and only Satyagrahi to conduct "Satyagraha for drinking water". On 20 March 1927, he also organized a satyagraha in the city of 'Mahad' to get the untouchable community the right to take water from the city's Chavdar pond.

312. Which of the following statements is not correct about Poona Pact?

- (a) Poona Pact was held on 24 September 1934
- (b) Poona Pact took place between Mahatma Gandhi and Dr. Ambedkar.
- (c) In Poona Pact, right to separate electorate and two votes for Dalits was abolished
- (d) After Poona Pact, the number of seats reserved for Dalits was increased from 71 in the Provincial Legislatures to 147 and 18% of the total seats in the Central Legislature.

**Answer: a**

**Explanation:** Poona Pact took place on 24 September 1932 between Mahatma Gandhi and Dr. Ambedkar. At this time Gandhiji was on a fast unto death in protest against the Communal Award at Yerwada Jail in Pune. It is said that Baba Saheb Bhimrao Ambedkar had signed the Poona Pact crying out of remorse.

313. Who was the author of the book "The Problem of the Rupee: Its Origin and Its Solution"?

- (a) Mahatma Gandhi
- (b) M.N Roy
- (c) B.R. Ambedkar
- (d) Sarojini Naidu

**Answer: c**

**Explanation:** The author of the book "The Problem of the Rupee" was Dr. Ambedkar. This book is one of his most popular books. Even today it is counted among the best selling books in India.

314. Who among the following established the 'Bahishkrit Hitakarini Sabha'?

- (a) Mahatma Phule
- (b) Dr. Ambedkar
- (c) Govind Ranade
- (d) Govind Vallabh Pant

**Answer: b**

**Explanation:** The 'Bahishkrit Hitakarini Sabha' was founded by Dr. Ambedkar in 1924 as an attempt to promote and uplift the education of untouchables.

315. Which of the following magazine was not launched by Dr. Ambedkar?

- (a) Mooknayak
- (b) Bahishkrit Bharat
- (c) Prabuddh Bharat
- (d) Saraswati

**Answer: d**

**Explanation:** In order to protect the rights of Dalits, Dr. Ambedkar had brought out five journals namely; Bahishkrit Bharat, Mooknayak, Samata, Prabuddh Bharat, and Janata.

316. What are trinity principles espoused by Dr. Ambedkar?

- a. Non-violence, Truth and Peace
- b. Non-Cooperation, Non-stealing and Non-equalization
- c. Revolution, Historical Materialism and Dialectical materialism
- d. Liberty, Equality and Fraternity

**Answer: (d)**

317. Which of the following, according to Gandhiji, is an essential principle of Satyagraha?

- a. Infinite capacity for suffering
- b. Non violence
- c. Truth
- d. All the three

**Ans: D**

**Explanation:** 'Satyagraha' is the most important weapon of Gandhiji. It emerged as a weapon of conflict resolution. Gandhiji applied satyagraha in the non-violent struggle against exploitation, injustice and dictatorship.

318. Gandhiji's "The Story of My Experiments with Truth" was originally written in Gujarati. Who translated it into English?

- a. Maganlal Gandhi
- b. Mahadev Desai
- c. Pyarelalji
- d. Sushila Nayyar

**Ans: B**

319. Indian Philosophy is

- a. Subjective in Nature
- b. Objective in nature
- c. Both
- d. None

**Ans: a**

320. Indian philosophy is

- a. Materialistic
- b. Spiritualistic
- c. Both

d. None

**Ans: b**

# **UNIT – 6**

Recent Western Philosophy

## **Applied Philosophy**

Applied philosophy is marked out from philosophy in general by its focus on matters of practical concern. It is often identified with applied ethics, but although this forms a large part of the area of applied philosophy, the broader term includes discussion of philosophical problems, some metaphysical, some epistemological, in fields such as law, education or art, that are not strictly or uniquely ethical. Applied ethics also includes the area of professional ethics; it examines the ethical dilemmas and challenges met with by workers in health-care, business and other areas where specific ethical issues such as confidentiality and truth-telling may arise.

## **The Proper Preoccupations of Philosophy**

Philosophy is often regarded as the most abstract of studies, so the term 'applied philosophy' needs some explanation. It represents the claim that it is possible to build bridges between theory and practice and, in particular, that philosophy is not only an internal movement in philosophy but that it can and should play a role in public debate. This should not be seen, though, as a bid to claim expertise on the part of philosophers but rather as a reassertion of the traditional conception of the philosopher, not as an expert, but as an honest and open seeker after truth. This search involves accepting the possibility of rational argument about normative directions. It does not mean, though, maintaining a posture of uninvolved neutrality. As philosophy, indeed, it involves a prior commitment to the values of rationality, impartiality and equality of respect for individuals, and these provide the foundation for the moral values and range of rights that are fundamental to applied ethics. Applied philosophy, then, is part of a whole view of the human condition and takes a broad view of ethical decision-making. It can therefore accept as part of its task the identification and discussion of values capable of securing widespread acceptance in the contemporary world. For philosophy has traditionally been concerned, not only with abstract reflection but also with questions about how we should live and how we should conduct our social life and political affairs.

Today's applied philosophy, then, marks a return to what have always been proper preoccupations of philosophers. Some of these preoccupations are old and could be said to have a perennial interest - intimate relationships and family life, for example, or global issues of peace and war. Others are the product of new technologies, revolutions in communication, new weapons of indiscriminate destruction, and an unprecedented increase in the impact of humans on their environment and support systems. Applied philosophy and especially applied ethics yields scope and space for discussion of these issues of public policy. To all these debates, it can bring clarity, openness, critical analysis, and respect for careful evaluation of arguments. At the same time, it represents a shift from the view that philosophy can only analyse and clarify problems but is not able to take on the task of seeking answers to them.

Applied philosophy differs in style and approach from some mainstream philosophy in other ways, too. It gives greater attention to context and to the detailed texture of complex situations and it is also more holistic in approach - that is to say, it is much more ready to include the insights of psychology, sociology and other relevant areas of knowledge in its deliberations, and to allow the facts it finds there to influence its conclusions. Its method of reasoning could be compared to that of a designer who starts with a blueprint, but has to adapt it to the materials to hand and to the situations in which it is required.

The origins and background of applied philosophy can be traced back to the first of the early Greek philosophers, Thales (c.585 BCE), who could well qualify as the first applied philosopher.

Having been scorned for his speculative and impractical interests - he was so preoccupied with studying the stars that he fell down a well!

- he decided, very successfully, to go into business and use those observations to make a fortune, thus demonstrating that philosophical abstraction had its uses, and even a potential cash-value.

Later schools of philosophy in ancient times - Pythagoreans, Epicureans, Stoics - offered their followers principles for living and guidance on life-style. Socrates (469-399 BCE.), too, while he avoided preaching any dogma, did offer in his own approach to life and also to death an example of a way of living appropriate to the pursuit of philosophy.

Plato (c.430-347 BCE), the chronicler of Socrates' discussions, described his own blueprint for the good society in his dialogue the Republic, which covered not only political arrangements, but also the way social life should be organised. He set out there his ideals for education, for sexual relations and reproduction, for art, literature and censorship.

In the modern period, too, many philosophers have applied their philosophical insights to practical issues. St. Thomas Aquinas (1225-74) treated such topics as marriage and the family in his *Summa Theologiae*. John Locke (1632-1704) wrote on toleration, and also on education; his political theory also provided the philosophical underpinning of the American Declaration of Independence. The principle of human dignity formulated by Immanuel Kant (1724-1804) is central to most modern conventions of human rights, and Kant also treated the subject of suicide, and the question of whether it is ever right to tell a lie from benevolent motives - questions which continue to be important for medical ethics. Utilitarians like Jeremy Bentham (1748-1832) and John Stuart Mill (1806-73) have a continued if not always acknowledged influence on public policy, while Karl Marx's (1818-83) political philosophy has played a dramatic role in the shaping of the modern world.

Applied philosophy, then, is not a new subject. Nevertheless, it suffered a period of neglect as the pendulum in philosophy swung from the speculative metaphysics of the nineteenth century to the materialistic scientism of the twentieth.

A number of factors contributed to the return to applied ethics, dating from approximately the mid-twentieth century. Perhaps the most important of these was the development of new kinds of medical technology, particularly those involving new methods of reproduction, and those affecting the end of life; another has been controversy about war and international relations. The publication of Peter Singer's *Animal Liberation* (1975) prompted increased academic debate about the relationship between humans and the animal world, and at the same time, there was a dawning public awareness of environmental threats on a global scale. Finally, interest in business and corporate ethics has grown, in reaction to scandals of public and business life. For all these reasons, then, and many others, applied philosophy has today entered a new, more self-conscious and better-defined phase of development.

## **PHILOSOPHY OF TECHNOLOGY**

The philosophy of technology brings logical, metaphysical, epistemological, ethical, and political philosophical questions to bear on the making and using of artifacts. The particular balance among these questions will differ within related regionalizations of philosophy, such as the philosophy of science or the philosophy of art. In the philosophy of technology, for instance, epistemology typically plays a lesser role than in the philosophy of science but a greater role than in the philosophy of art. Any philosophical assessment of technology is thus partially defined by its own in-

ner balance in relation to philosophy as a whole.

## Historical Emergence

Although limited discussions of techne and associated or derivative phenomena can be found in ancient, medieval, and early modern philosophy, it was not until the late nineteenth and early twentieth centuries that technology, as something distinct from technics or technique, became a subject for theoretical examination. Among the earliest contributing texts, the mechanical engineer Franz Reuleaux's *Theoretische Kinematik* (1875) developed an extended conceptual analysis of different types of tools and machines. More generally, Ernst Kapp's *Grundlinien einer Philosophie der Technik* (1877), in the first book to use "philosophy of technology" in its title, outlined a theory of culture grounded in technics understood as the extension and differentiation of human anatomy and physiology. The hammer, for instance, functions as an extension of the fist, the camera as an extension of the eye, and the railroad as an extension of the circulatory system; and vice versa, the fist can be said to be like a hammer, the eye like a camera, and rail lines like blood vessels. Elaborations of this view of technology as organ projection are representative of a school of what Carl Mitcham (1994) calls engineering philosophy of technology, an approach that was further developed in the work of thinkers as diverse as the Russian Peter Englemeier, the German Friedrich Dessauer, the Frenchman Gilbert Simondon, and the Spaniard Juan David García Bacca (all of whom have been largely ignored in Anglo American philosophy).

The research engineer Dessauer, for instance, developed a neo-Kantian critique of the transcendental possibility of technological invention that sees technology as bringing noumenal power into the world. Dessauer was also instrumental in promoting philosophical discussion within the *Verein Deutscher Ingenieure* (VDI; Society of German Engineers). The psychologist Simondon explored relations among parts, artifacts, and technical systems and the evolutionary manifestation of what he called technicity. The engineer Englemeier and the philosopher García Bacca both saw technological change engendering world-historical transformations that were at once humanizing and transcending of the merely organically human. Additional contributions to this school can be found in theoretical discussions about cybernetics and artificial intelligence. Also illustrative of achievements in engineering-oriented philosophy of technology are the scientific philosopher Mario Bunge's (1985) systematic metaphysics, epistemology, and ethics of technology and the engineer Billy Vaughn Koen's (2003) brief for engineering as the one right method for problem solving.

In its emergence, however, philosophy of technology was more commonly associated with what might be called a counterphilosophy that interprets technology not as extending but as encroaching on or narrowing the dimensions of human experience. Following Immanuel Kant's attempt "to deny [scientific] knowledge, in order to make room for faith," this humanities philosophy of technology has sought to limit technological thought and practice to make room for human culture in all its rich diversity. A case in point is the public intellectual Lewis Mumford's (1967) criticism of what he calls monotechnics, the technics of power, in contrast to poly- or biotechnics. The problem with monotechnics is that it promotes the pursuit of physical power and control at the expense of other aspects of human flourishing such as friendship and art. For Mumford the "myth of the machine" is to think that power is the source of all human benefit. In fact, it constitutes an unrealistic narrowing of human activity. Some version of this argument has been promoted especially by the continental European philosophical tradition in the works of José Ortega y Gasset (1939), Martin Heidegger (1954), and Jacques Ellul (1954). Indeed, even more broadly, the relation between technology and life—whether in the sense of *zoe* (organic existence) or *bios* (human flourishing)—has become one of the most crucial issues in both the metaphysics and ethics of

technology.

Until the latter half of the twentieth century, the argument for delimitation had the unintended side effect of relegating technology to marginal status in professional philosophy. Only as technology became more than an engineering interest or a social problem has it begun to be a mainstream topic in philosophy. One of the challenges in the twenty-first century will be to pursue the professional development of philosophical reflection on technology in ways that bridge the oppositions inherent in its bimodal historical origins without compromising their basic if divergent concerns.

## **Ethical and Political Issues**

Because of their prominence in public affairs, the philosophy of technology properly highlights ethical and political issues. Indeed, contemporary work in practical or applied ethics—as in nuclear, environmental, biomedical, and computer ethics—emphasizes the moral challenges of technology, although in ways that sometimes reduce the field to an aggregate of different ethics for different technologies. Such subspeciation can deprive ethics of possible synergistic strengths. Access equity issues, for instance, occur in both biomedicine and computers, and the concepts and principles for dealing with one might well inform or enhance the other. Speaking generally, then, one can identify at least six competing and overlapping interpretations of technology as an ethical or political problem. Three of these arose initially before World War II, although they have continued to cast a shadow of concern, often in new and distinctive forms.

First, there is a problem of the just distribution of technological products and powers—that is, technology as a political issue. Since the Industrial Revolution the social-justice question has found numerous expressions in authoritarian and democratic regimes, in developing and developed countries. Authoritarian regimes have often justified themselves as acting to promote access to technological benefits against entrenched special scientific, technical, or corporate interests or against those whose commitment to equality undermines the invention and production of goods and services. Democratic regimes have placed more emphasis on promoting equality by means of due process and regulatory agencies. One aspect of due process that has been given special philosophical attention concerns the legal protocols to promote free and informed consent, extending the concept from human experimentation to engineering at large (Martin and Schinzing 2005).

With the engineered design of new products and processes social justice issues have often taken special form in association with some otherwise morally neutral concepts. The advent of electronic computer and Internet communications, for instance, has helped impart ethical significance to questions of privacy and the so-called "digital divide." Additionally, according to Ulrich Beck (1992), concerns for the fair distribution of goods and services were, during the late twentieth century, superseded by those dealing with the fair distribution of dangers and risks, thus giving social justice debates a special twist. One of the strongest criticisms of some of the resulting twists and turns has been Kristin S. Shrader-Frechette's (1991) careful dissecting of the antidemocratic assumptions of much risk-cost-benefit analysis.

Second is the problem of the alienation of workers from their labor in the industrial means of production, which has been presented especially by Marxists as an economic and by some non-Marxist social scientists as a psychological issue. Langdon Winner's (1977) analysis of the theory of autonomous technology or the idea that technology as resistant to human control is a more general statement of the issue. Critical theory work by Herbert Marcuse (1964) and Andrew Feen-

berg (1991, 1999) extended the classic Marxist discussion into situations reconfigured by consumerist culture and globalization. Opposing Marcuse's pessimism about transformation, Feenberg (especially 1995) has been more optimistic about alternative possibilities. Environmentalists, however, have further argued that technology in general alienates human beings from nature.

Don Ihde's (1990) phenomenology of the techno-lifeworld offers another take on this issue through an analysis of human—technology—world relations. Two fundamental types of such engagements are instrumental relations, in which the technology is integrated into the human sensorium as its extension (the blind man's cane), and hermeneutic relations, in which the technology becomes part of the world to be interpreted (a thermometer). Both engagements manifest an invariant structure that amplifies some aspect of the world (exact metric of temperature) while simultaneously reducing others (general sense of climate). The former tends to bring humans closer to the world, the latter to distance (or alienate) them from it.

Third is the problem of the destruction or transformation of culture by modern science and technology—either directly through new weapons and forms of military conflict or indirectly through the impact of new means of transportation, communication, and media. The destruction of World War I, the most violent in human history, was a manifestation of technology that only became worse during World War II with the development of nuclear weapons. The long cold war practice of nuclear deterrence and the early twenty-first-century challenges of terrorism present special problems for learning to manage the destructive potential in technology.

Between the two world wars concern for the more indirect technological transformation of culture took on special salience, as variously illustrated by the cultural lag theory of the American sociologist William Fielding Ogburn, the elegiac ruminations of the Catholic theologian Romano Guardini, or the active nihilistic enthusiasms of Ernst Jünger. In the latter half of the twentieth century the issue found small-scale manifestation in personal efforts to come to terms with new choices (e.g., in diet, drugs, and consumer lifestyle options) and large-scale manifestation in debates about the dynamics of sociotechnical change (e.g., the role of technology in economic development and technological determinism versus social constructionism). Questions can also arise about the transformed character of cultural life under the influence of information and image technologies, from television to the Internet and virtual reality machines.

Since World War II three more issues have emerged to ethical and political prominence. One is that of democratic participation. An anticipatory version of this issue emerged in interwar proposals for technocracy. For some theorists (such as Thorstein Veblen) rule by technical elites offered a better alternative than rule by economic or political elites. However, in the postwar revival of democratic theory, and with recognition that technology (like law) is a creation that also influences the creators, it was argued that the principle of "no taxation without representation" should be extended to "no innovation without representation" (Goldman 1992). Winner, for instance, describes "technologies as forms of life" and calls for the abandonment of "technological somnambulism" (1986, p. 10) in favor of public debate about the design of technological projects as diverse as highway bridges, tomato harvesters, and nuclear power plants. Efforts to determine how such democratic participation should be structured both within communities of technical expertise and in the negotiations between technical experts and the nontechnical public have been the subject of ongoing debates.

Fifth is the industrial pollution of the natural environment, which has contributed to attempts to develop an appropriate environmental or ecological ethics. What is the difference between artifice and nature—and the moral status of wilderness or the nonhuman environment? As nature is hu-

manly transformed, to what extent should contemporary technological action take into account the welfare of future generations, whether human or nonhuman? What is the relation between values that are divided between the anthropocentric and ecocentric, extrinsic or instrumental and intrinsic?

Another morally relevant concept, closely related to issues of both participation and environmentalism, is that of unintended consequences. To what extent are scientists and engineers responsible for the unexpected and perhaps even unforeseeable results of their technological actions? Two attempts to deal with the plethora of environmental issues, especially in relation to the challenge of unintended consequences, are those associated with sustainable development and the precautionary principle—with competing interpretations of both becoming major themes of moral and political deliberations.

Finally, there is the issue of responsibility: How are humans to respond ethically to the power placed in their hands by modern technology? Such a question has personal, professional, and policy dimensions. At the personal level, quantitatively and qualitatively enhanced choices, with expanding knowledge production relevant to such choices (scientific research and consumer reports), place existential pressures on individuals to increase conscious reflection. The principle of free and informed consent appears to require not only that medical professionals inform the subjects of human experimentation about the risks and benefits of their participation but also that medical patients of all sorts become reflective participants in their own treatment—and that consumers of any technological goods or services weigh multiple costs and benefits as if they were engineers designing their lives. Are such demands both reasonable and possible?

At the professional level, scientists and engineers, falling under similar existential pressures to expand the conscious exercise of responsibility, have formulated codes of conduct for technical practices related to both research and design. In engineering ethics, for instance, the primacy of protecting public safety, health, and welfare is now a well-established general principle. In what sense, however, are engineers qualified to make such judgments? Does technical expertise provide any basis for determining appropriate levels of public safety, health, or welfare?

Finally, at the level of public policy, responsibility takes two closely related forms. Policy for science and technology seeks out the best ways to fund or regulate developments in science and technology. Science and technology for policy searches for the best ways to bring scientific knowledge to bear on political decision making while making technological power most effectively available for political action. Responding to and exemplifying these dual drives scientific and technological research agencies such as the U.S. National Science Foundation, the Human Genome Project, and the National Nanotechnology Initiative have created specific programs to promote ethical reflection on the creation and use of new scientific knowledge and technological products, processes, and systems.

Again speaking broadly, it is possible to identify two fundamental attitudes toward this spectrum of ethical and political issues. One attempts to explain modern technology as rooted in human nature and culture (engineering philosophy of technology), the other interprets modern technical methods and effects as deformations of human action, however preferable in particular instances to those of nature (humanities philosophy of technology). The engineering approach in its expansive confidence calls in one way or another for more and better technology, the humanities approach in its restrictive questioning for some relinquishment or delimitation of technology. The tensions between such alternative attitudes repeatedly come to the fore in analysis of such key concepts as privacy, risk, participation, and the environment, and in assessments of new opportu-

nities in virtual reality construction, biotechnological design, and nanotechnological research and development.

There is also a tendency for the engineering school to make alliances with the Anglo American analytic tradition in philosophy, and for the humanities school to find a convenient partner in the European phenomenological tradition. The former, viewing technology as a complex amalgam of artifacts, knowledge, activities, and volitions, each with diverse structural features scattered across historical epochs and societal contexts, prefers to deal on a case-by-case basis with one technology after another. The latter strives for bolder generalizations about technology as a whole, at least across each historical or societal context. From the phenomenological perspective, too great an emphasis on individual technological rocks can obscure the extent to which such geological specimens are constituents of mountains extended in both space and time.

## **Metaphysical Issues**

The attempt to speak of technology rather than technologies rests on an attempt to identify some inner or essential feature of diverse technologies. This hypothetical essential feature may be termed technicity. One can then immediately note that, before the modern period, technicity was at a minimum scattered throughout and heavily embedded within a diversity of human engagements, and indeed that philosophy took a stand against any separating of technicity from its embedding context. Plato's argument in the *Gorgias* is precisely an argument against disembedding *techne* from social or cultural contexts and traditions, not to mention ideas of the good. For Aristotle, *techne* is an intellectual virtue, and thus properly subordinate to the flourishing of human nature. What is distinctive about modern philosophy, by contrast, is the attempt, beginning with Galileo Galilei, Francis Bacon, and René Descartes to disembed technics from particular human activities, to study them in systematic ways, and thus to create technology.

John Stuart Mill in his *Logic* (1843) already assumes the success of this disembedding project when he explains the practical value of science. For Mill the rationality of any art is grounded in a corresponding science.

The art proposes to itself an end to be attained, defines the end, and hands it over to the science. The science receives it, considers it as a phenomenon or effect to be studied, and, having investigated its causes and conditions, sends it back to art with a theorem of the combinations of circumstances by which it could be produced. Art then examines these combinations or circumstances, and according as any of them are or are not in human power, pronounces the end attainable or not. (*logic*, book 6, ch. 12, section 2).

Remarkably, Mill's analysis does not recognize art (or traditional technics) as including any knowledge of means. Art is concerned solely with determining an end, to achieve which it deploys appropriate means as determined by science. It is the scientific study of means that constitutes what even during Mill's lifetime was coming to be called technology. Modern technicity may thus be defined as a systematic or scientific study of means that suspends examination of ends. Does such an approach have distinctive social and cultural implications, independent of any particular technologies and contexts?

Among the first philosophers to analyze such a disembedding of means from ends was Ortega. In the English translation of his *La rebelión de las masas* (1929), Ortega writes that "[t]hree principles have made possible [the] new world: liberal democracy, scientific experiment, and industrialism.

The two latter may be summed up in one word: technicism" (1939, p. 56). Ortega himself actually uses the word *técnica*, but the term technicism is significant, and this in fact constitutes one of its first English occurrences with this sense. (Before the 1930s, technicism simply meant excessive reliance on technical terminology. The previous decade Max Scheler used the cognate *Technizismus* to name the industrial ethos.)

As part of a further "Meditación de la técnica" (1939), Ortega outlined a historical movement from the chance inventions that characterize archaic societies, through the trial-and-error techniques of the artisan, to the scientific technologies of the engineer. According to Ortega, the difference between these three forms of making lies in the way they create the means to realize a human project—that is, in the kind of technicity involved. In the first epoch, technical discoveries are accidental; in the second, techniques emerge from intuitive skill. In both instances they are preserved and elaborated within the confines of myth and craft traditions. In the third, however, the engineer undertakes scientific studies of technics and, as a result, "prior to the possession of any [particular] technics, already possesses technics [itself]" (Obras, 5:369). It is this third type of technicity that constitutes modern technicism (and here Ortega himself uses the term *tecnicismo*).

But technicism, understood here as the science of how to generate all possible technical means, disembedded from any lived making and using, creates a unique challenge. Before the modern period human beings were commonly limited by circumstances, within which they inherited a way of life and the technical means to achieve it. Now, however, they are given in advance many possible ways to live and a plethora of technical means but little in the way of a substantive vision of human flourishing. "To be an engineer and only an engineer is to be everything possibly and nothing actually," all form and no content (Obras, 5:366). There is in the midst of modern technicism what Ortega describes as a hidden ethical challenge to imagination and choice. Insofar as people can be anything they want, why should they take the trouble to be any one thing at all? Will not some extranatural motivation (not to say fanaticism) not be needed to help Buridan's cyborgs select among (rejecting some) the equally liberal options that surround them?

According to Heidegger modern technology is a challenge not just to ethics but to ontology. For Heidegger (1954) scientific technics constitutes a new kind of truth: truth not as correspondence, not as coherence, and not as functional knowledge, but as disclosure or revelation. Technology discloses Being in a historically unique way: as *Bestand* or resource. A castle constructed with traditional technics on a cliff overlooking the Rhine makes more fully present than before the stone that invests the landscape with its particular contours, while it sets off the curve of the river against the backdrop of its walls and towers. It invites people to settle near and experience the particularities of this place. By contrast, a poured concrete, hydroelectric power station compels the river to become an energy resource and converts the landscape into, not a place of human habitation, but a machine for the generation of electricity. It encourages people to draw on its energy for multitasking business in production and travel. The distinctly modern technicity that manifests itself in the disclosure of nature as resource Heidegger names *Gestell* (enframing).

*Gestell* at first sight appears to be a human work, something human beings in the course of history have chosen to practice for their own benefit. It gives them power over nature. However, as it digitalizes nature physically (dimensioned vectors), geographically (longitude and latitude), chemically (molecules, atoms, and subatomic particles), and biologically (genetic mapping), it also transforms language (computer signal processing) and art (pixel imaging) so that impact outstrips original intentions. Hidden in the midst of *Gestell* is Being as event, that which lets this dominating transformation come to pass. *Gestell* is at once destiny and, precisely because it appears so clearly to be

the result of a human activity, an obscuring of the transhuman imparting of a destiny that is its ground.

In the same year that Heidegger's *Die Frage nach der Technik* appeared, Jacques Ellul published *La Technique*, later translated into English as *The Technological Society* (1954). For Ellul, too, what is happening is something transhuman, or at least transindividual, the emergence of a new social order in which people give themselves up to the systematic analysis of actions into constituent means that are then evaluated in terms of output/input metrics. The scientific analysis of techniques extends technoscientific methods into economics, politics, education, leisure, and elsewhere creating what he calls the technical milieu. After the milieus of nature and of society, technology is the third great epoch of human history. Ellul's characterology of this new reality—describing its rationality, artificiality, self-directedness, self-augmentation, indivisibility, universality, and autonomy—reveals the technical milieu as something more than simply human. Although more hospitable to human biological existence, it nevertheless also manifests certain inexorable laws of artifice (such as those of economics). Just as the natural milieu once provided a framework for human life, a differentiated but overriding order to which human beings adapted in a variety of ways, so now a much more homogeneous technical milieu presents itself, not simply as a realm of freedom that human beings have constructed, but as that which also constructs and constrains them even when they fail to recognize it.

### **From Metaphysics to Ethics**

Efforts to make phenomenological metaphysics fruitful for ethics can be found in the work of two German American philosophers, Hans Jonas and Albert Borgmann. Jonas's (1966) work begins with a fundamental inquiry into the phenomenon of life, arguing that in the organic world there emerges a new kind of being. For Jonas the key features of human inner life (introspection and subjectivity) are present in embryo in the most primitive organisms, and in metabolism there emerges the primordial form of freedom. In metabolism a detachment enters the world insofar as being becomes distinguished from physical identity. However, in the materialism of modern science this unique reality is easily overlooked. Adopting a teleological approach to ontology, Jonas argues that only from the perspective of the more fully realized freedom manifest in humans can the reality of the organic as a whole be recognized for what it is. On this ontological basis Jonas (1984) undertakes an extended philosophical scrutiny of the technological projects of nuclear weapons and biomedical health care. In the presence of technical powers to end or alter human life Jonas reformulates the Kantian categorical imperative as: "Act so that the effects of your action are compatible with the permanence of genuine human life" (p. 11). Such a reformulation of the fundamental deontological principle constitutes an attempt at the re-embedding of technology in moral philosophy.

More broadly and in sustained dialogue with a range of discussions about the place of technology in human affairs, Borgmann's (1984) work draws a fundamental distinction between two kinds of artifice and action. On the one side are technological devices that obscure their inner functions to deliver without engagement commodities for easy and effortless consumption. This constitutes what Borgmann calls the device paradigm, an ideal type at which the products and processes of modern technology aim. On the other are focal things and practices whose workings are more transparent and that demand of their users some reordering of interests if they are to be used. The model for the first is the central heating system that only needs its thermostat set, for the second the wood-fired hearth.

In a series of studies arguing the nondeterminist importance of material culture to ethics and politics, Borgmann (1992, 1999) calls on citizens in the high-tech world to reconsider their ways of life to develop a deeper sense for the possibilities of human flourishing in the midst of liberal options for self-determined self- fulfillment. For Borgmann the ideal is not a forced return to the past but a voluntary recovery of the commanding presence of things in the technological present. As he concludes in a volume devoted to the critical assessment of his thought:

Science makes reality ever more transparent, and technology makes it more and more controllable. But at the end of our inquiries and manipulations there is always something that reflects rather than yields to our searchlight and presents itself as given to us rather than constructed by us. It is intelligible not because we have seen through it or designed it but because it speaks to us [in the form of] an unforethinkable and uncontrollable reality. (Higgs, Lights, and Strong 2000, pp. 368–369)

It is such a reality to which human flourishing is ultimately in thrall even in the midst of its highest exercises of insight and mastery.

## **Epistemological Issues**

Epistemology has often been treated as a stepchild in the philosophy of technology family of philosophical interests. Technological forms of knowledge are commonly thought to be derivative of scientific knowledge, so that any attempt to bring the theory of knowledge to bear in the examination of technology has regularly been part of a discussion of the relation between technology and science. At the same time this common privileging of science has been philosophically criticized, although the criticism has taken different forms in the European phenomenological and in the Anglo American analytic philosophical traditions.

From a phenomenological perspective the argument has been that technology is not so much applied science as science is theoretical technology. In his historico- philosophical studies of the scientific and technological revolutions of the seventeenth century and after, for instance, Jonas (1974) argues that from its origins modern science was animated by a technological interest that gives it an inherently applicable or technological character. Related studies of the dependency of science on technological instrumentation, from Galileo's telescopes to particle accelerators and PCR (polymerase chain reaction) machines suggest that science might even be described as applied technology. This approach to the epistemology of technology has parallels with the pragmatic tradition of conceiving scientific knowledge in fundamentally instrumentist terms. The Venezuelan phenomenologist Ernesto Mayz Vallenilla (2004) likewise offers a more Husserlian-based but complementary effort to describe the unique epistemological features of what he calls meta-technical instruments.

From the analytic perspective there has been more of an effort to identify distinctive types of knowledge operative in technology. Summarizing the results from such an approach, Mitcham (1994) draws attention to at least four types of distinctly technological knowledge: sensorimotor skills, technical maxims (including rules of thumb and recipes), descriptive laws or technological rules (which take an "if A then B" form), and technological theories (either grounded in scientific theory or bringing scientific method to bear on human-technology interactions). German philosophers of technology such as Hans Lenk, Gunter Ropohl, and Bernhard Irrgang, all associated with the VDI promotion of philosophical reflection on technology, are pursuing efforts to develop epistemological analyses of the engineering sciences. And Joseph C. Pitt (2000) makes a determined

effort to identify the distinctive forms of technological and engineering knowledge, drawing especially on the careful analyses of aeronautical engineering history by Walter G. Vincenti (1990) to argue that engineering design possesses its own cognitive features.

Important issues for any theory of technological knowledge remain the characterization of whatever basic epistemic criteria might be analogous to those operative in science such as truth, simplicity, coherence, and explanation. There may be distinctive technological forms of such criteria. But two major candidates for uniquely technological criteria are effectiveness and efficiency. Certainly, many propositions of engineering knowledge are assessed in terms of effectiveness and efficiency more than truth or explanation. A further epistemological challenge is to explicate the distinctive character of models and modeling in the technological and engineering contexts. The relevance of such epistemological analyses nevertheless remains of problematic relevance to ethics and politics.

### **Empirical, Anthropological, and Policy Turns**

Concern for the adequacy of metaphysical definitions of technology—and perhaps exhaustion with endless ethical and political difficulties (with hopes that new approaches might prove more fruitful)—has given rise to what has been called an empirical turn in the philosophy of technology. As advocated by the Dutch philosophers Peter Kroes and Anthonie Meijers, this program argues that "philosophical reflection should be based on empirically adequate descriptions reflecting the richness and complexity of modern technology" (2000, p. xix) and promotes a greater analysis of what technologists and engineers actually do over any extended exegesis of texts, whether those of other philosophers of technology or even engineers and technicians. As such, a natural alliance has developed with social constructivist approaches to science, technology, and society studies in the pursuit of richer metaphysical or ontological understandings of artifacts, epistemological analyses of technical practice, and even ethical decision making among professional engineers. From the perspective of Jozef Keulartz et al. (2002), this also provides a solid opportunity for advancing a pragmatist ethics for technological culture.

Two topics of prominence in the empirical turn from the interpretation of texts to the interpretation of technical artifacts have been those of design and function. Design is often identified as the essence of engineering, and there have been numerous technical studies of design methodology. At the same time engineering design must be distinguished from aesthetic design as well as design by means of evolutionary processes in nature. Even within the realm of engineering design, studies such as those by Vincenti (1990), Louis Bucciarelli (1994), and Richard Buchanan and Victor Margolin (1995) have very different implications for assessing proposals for consumer, green, sustainable, or participatory design. With regard to technical functions, analyses have focused on the relation between functions in organisms, social institutions, and artifacts; on the relation between functional and physical descriptions of artifacts; and on the extent to which functions are determined by design or use.

A different sense for new beginnings has emerged in relation to prospects in the development of the new fields of bioengineering and biotechnology—especially when applied to humans. The leader in this case is the medical scientist and philosopher Leon Kass, the chair of the Bush administration's President's Council on Bioethics. In his turn Kass has tried to go outside the boundaries of standard bioethics in at least four ways: to promote thinking that enrolls more than professional bioethicists, that does more than piecemeal or specialized analyses, that references human nature as a norm, and that builds toward policy results. As in *Beyond Therapy: Biotechnology and*

the Pursuit of Happiness (2003), Kass et al. at the council seek to raise broad issues about what it means to be human in the presence of possibilities for the reengineering not just of the external world but of the inner world of human birth, growth, and experience. He has been especially concerned about the possibilities for the deformation of humanity not from above by totalitarian governmental use of technology but from below by positive consumer endorsement of behaviors that would from a traditional perspective be assessed as temptations.

Beyond the policy-oriented work of Kass and colleagues, policy questions have become increasingly central not just as aspects of ethical responsibility but as issues in their own right. What precisely is technological policy, as opposed to technological politics? Does policy decision making take different forms in relation to science and to engineering? How are policies to be formulated and assessed?

The extent to which these turns in the philosophy of technology will define its future are questions that the professional community must examine. Any such examination will also need to include a self-criticism that considers the special responsibilities of a regionalization in philosophy that, more than the philosophy of science or of art, has as part of its heritage public responsibilities and a large measure of ethical concerns.

### **(The Nature of) Technology?**

The question, What is technology? or What is the nature of technology?, is both a central question that philosophers of technology aim to answer and a question the answer to which determines the subject matter of philosophy of technology. One can think of philosophy of technology as the philosophical examination of technology, in the same way as the philosophy of science is the philosophical examination of science and the philosophy of biology the philosophical study of a particular subdomain of science. However, in this respect the philosophy of technology is in a similar situation as the philosophy of science finds itself in.

Central questions in the philosophy of science have long been what science is, what characterizes science and what distinguishes science from non-science (the demarcation problem). These questions have recently somewhat moved out of focus, however, due to the lack of acceptable answers. Philosophers of science have not been able to satisfactorily explicate the nature of science or to specify any clear-cut criterion by which science could be demarcated from non-science or pseudo-science. As philosopher of science Paul Hoyningen-Huene (2008: 168) wrote: "fact is that at the beginning of the 21<sup>st</sup> century there is no consensus among philosophers or historians or scientists about the nature of science."

The nature of technology, however, is even less clear than the nature of science. As philosopher of science Marx Wartofsky put it, "'Technology' is unfortunately too vague a term to define a domain; or else, so broad in its scope that what it does define includes too much. For example, one may talk about technology as including all artifacts, that is, all things made by human beings. Since we "make" language, literature, art, social organizations, beliefs, laws and theories as well as tools and machines, and their products, such an approach covers too much" (Wartofsky, 1979: 176). More clarity on this issue can be achieved by looking at the history of the term (for example, Nye, 2006: Chapter 1; Misa, 2009; Mitcham & Schatzberg, 2009) as well as at recent suggestions to define it. Jacob Bigelow, an early author on technology, conceived of it as a specific domain of knowledge: technology was "an account [...] of the principles, processes, and nomenclatures of the more conspicuous arts" (Bigelow, 1829, quoted in Misa, 2009: 9; Mitcham & Schatzberg, 2009: 37). In a

similar manner, Günter Ropohl (1990: 112; 2009: 31) defined “technology” as the ‘science of technics’ (“Wissenschaft von der Technik”, where “Technik” denotes the domain of crafts and other areas of manufacturing, making, etc.). The important aspect of Bigelow’s and Ropohl’s definitions is that “technology” does not denote a domain of human activity (such as making or designing) or a domain of objects (technological innovations, such as solar panels), but a domain of knowledge. In this respect, their usage of the term is continuous with the meaning of the Greek “techne” (Section 1.a).

A review of a number of definitions of “technology” (Li-Hua, 2009) shows that there is not much overlap between the various definitions that can be found in the literature. Many definitions conceive of technology in Bigelow’s and Ropohl’s sense as a particular body of knowledge (thus making the philosophy of technology a branch of epistemology), but do not agree on what kind of knowledge it is supposed to be. On some definitions it is seen as firm-specific knowledge about design and production processes, while others conceive of it as knowledge about natural phenomena and laws of nature that can be used to satisfy human needs and solve human problems (a view which closely resembles Francis Bacon’s).

Philosopher of science Mario Bunge presented a view of the nature of technology along the latter lines (Bunge, 1966). According to Bunge, technology should be understood as constituting a particular subdomain of the sciences, namely “applied science”, as he called it. Note that Bunge’s thesis is not that technology is applied science in the sense of the application of scientific theories, models, etc. for practical purposes. Although a view of technology as being “just the totality of means for applying science” (Scharff, 2009: 160) remains present among the general public, most engineers and philosophers of technology agree that technology cannot be conceived of as the application of science in this sense. Bunge’s view is that technology is the subdomain of science characterized by a particular aim, namely application. According to Bunge, natural science and applied science stand side by side as two distinct modes of doing science: while natural science is scientific investigation aimed at the production of reliable knowledge about the world, technology is scientific investigation aimed at application. Both are full-blown domains of science, in which investigations are carried out and knowledge is produced (knowledge about the world and how it can be applied to concrete problems, respectively). The difference between the two domains lies in the nature of the knowledge that is produced and the aims that are in focus. Bunge’s statement that “technology is applied science” should thus be read as “technology is science for the purpose of application” and not as “technology is the application of science.”

Other definitions reflect still different conceptions of technology. In the definition accepted by the United Nations Conference on Trade and Development (UNCTAD), technology not only includes specific knowledge, but also machinery, production systems and skilled human labor force. Li-Hua (2009) follows the UNCTAD definition by proposing a four-element definition of “technology” as encompassing technique (that is, a specific technique for making a particular product), specific knowledge (required for making that product; he calls this technology in the strict sense), the organization of production and the end product itself. Friedrich Rapp, in contrast, defined “technology” even more broadly as a domain of human activity: “in simplest terms, technology is the reshaping of the physical world for human purposes” (Rapp, 1989: xxiii).

Thus, attempts to define “technology” in such a way that this definition would express the nature of technology, or only some of the principal characteristics of technology, have not led to any generally accepted view of what technology is. In this context, historian of science and technology

Thomas J. Misa observed that historians of technology have so far resisted defining “technology” in the same way as “no scholarly historian of art would feel the least temptation to define “art”, as if that complex expression of human creativity could be pinned down by a few well-chosen words” (Misa, 2009: 8). The suggestion clearly is that technology is far too complex and too diverse a domain to define or to be able to talk about the nature of technology. Nordmann (2008: 14) went even further by arguing that not only can the term “technology” not be defined, but also it should not be defined. According to Nordmann, we should accept that technology is too diverse a domain to be caught in a compact definition. Accordingly, instead of conceiving of “technology” as the name of a particular fixed collection of phenomena that can be investigated, Nordmann held that “technology” is best understood as what Grunwald & Julliard (2005) called a “reflective concept”. According to the latter authors, “technology” should simply be taken to mean whatever we mean when we use the term. While this clearly cannot be an adequate definition of the term, it still can serve as a basis for reflections on technology in that it gives us at least some sense of what it is that we are reflection on. Using “technology” in this extremely loose manner allows us to connect reflections on very different issues and phenomena as being about – in the broadest sense – the same thing. In this way, “technology” can serve as the core concept of the field of philosophy of technology.

Philosophy of technology faces the challenge of clarifying the nature of a particular domain of phenomena without being able to determine the boundaries of that domain. Perhaps the best way out of this situation is to approach the question on a case-by-case basis, where the various cases are connected by the fact that they all involve technology in the broadest possible sense of the term. Rather than asking what technology is, and how the nature of technology is to be characterized, it might be better to examine the natures of particular instances of technology and in so doing achieve more clarity about a number of local phenomena. In the end, the results from various case studies might to some extent converge – or they might not.

## **Dominance**

**Theory of Technology Dominance** Main dependent construct(s)/factor(s) TTD has two dependent factors:

1. Reliance - The extent to which and individual applies the intelligent decision aid and integrates the recommendations of that aid into his or her judgment.
2. Dominance - The state of decision making where the intelligent decision aid, as opposed to its user, takes primary control of a decision making process.

## **Main independent construct(s)/factor(s)**

TTD has four independent factors:

1. Task Experience - The level of experience a decision maker has regarding the completion of a task as well as the extent to which the decision maker has developed strategies for completing that particular task.
2. Task Complexity - The extent to which the cognitive abilities of the decision maker are challenged with completing a certain task. (In psychology this is often termed Task Difficulty.)
3. Decision Aid Familiarity - The extent to which the decision maker is comfortable with the intelligent decision aid based on prior experience and/or significant training with the aid (or similar aids).

4. Cognitive Fit – The extent to which the cognitive processes used with the decision aid to complete a task match the cognitive processes normally applied by the decision maker using the aid.

### **Concise description of theory**

The Theory of Technology Dominance (TTD) posits that a decision maker may become reliant on an intelligent decision aid under two conditions:

1. The decision maker is low in task experience.
2. The decision maker is high in all factors (task experience, task complexity, decision aid familiarity, and cognitive fit).

According to TDD, reliance on an intelligent decision aid can create a long-term, de-skilling effect in the user as well as hinder that user's growth of knowledge and advancement in his or her domain. Furthermore, TDD states that a negative relationship exists between the user's expertise level and the risk of poor decision making when the expertise of the user and intelligent decision aid are mismatched. When the expertise of the user and the aid are matched, however, a positive relationship exists between reliance on the aid and improved decisions making.

Conceptually, TTD can be divided into three sections which are built on a total of eight testable propositions. The three sections are:

- Section 1: Addresses the factors that determine the likelihood that a decision maker will rely on an intelligent decision aid.
- Section 2: Addresses the conditions under which a decision maker is vulnerable to being dominated by the intelligent decision aid.
- Section 3: Addresses the long-term impact of intelligent decision aid use on de-skilling domain experts and impeding epistemological evolution.

The eight testable propositions are (Arnold & Sutton, 1998):

### **Section 1 - Factors influencing reliance**

- Proposition 1: "When users have a low to moderate level of experience, there is a negative relationship between task experience and reliance on a decision aid."
- Proposition 2: "There is a positive relationship between task complexity and reliance on a decision aid."
- Proposition 3: "When task experience and perceived task complexity are high, there is a positive relationship between decision aid familiarity and reliance on the decision aid."
- Proposition 4: "When task experience and perceived task complexity are high, there is a positive relationship between cognitive fit and reliance on the decision aid."

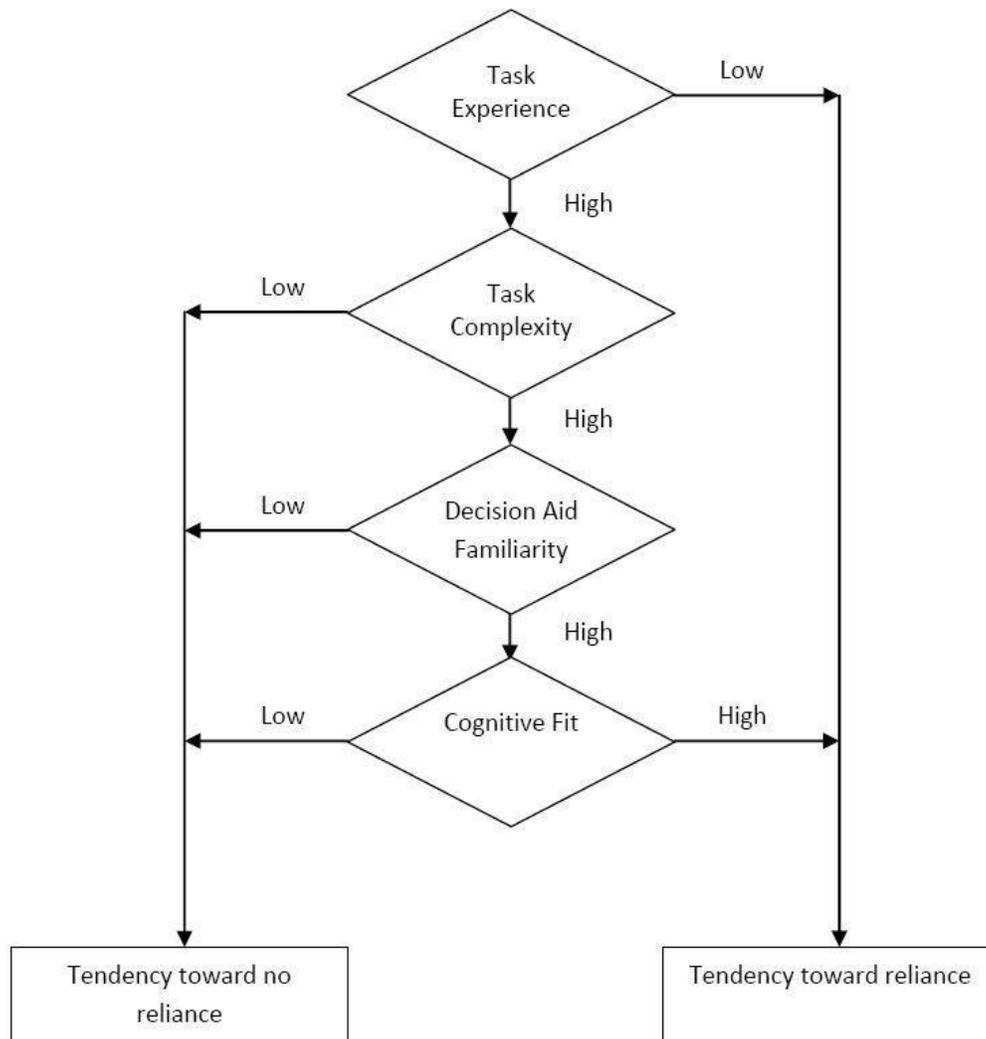

### **Section 2 – Conditions favorable for dominance**

- Proposition 5: "When the expertise of the user and intelligent decision aid are mismatched, there is a negative relationship between the user's expertise level and the risk of poor decision making."
- Proposition 6: "When the expertise level of the user and intelligent decision aid are matched, there is a positive relationship between reliance on the aid and improved decisions making."

### Sction 3 – Long-term effects

- Proposition 7: "There is a positive relationship between continued use of an intelligent decision aid and the de-skilling of auditors' abilities for the domain in which the aid is used."
- Proposition 8: "There is negative relationship between the broad- based, long-term use of an intelligent decision aid in a given problem domain and the growth in knowledge and advancement of the domain."

### Diagram/schematic of theory

Recreated from Arnold and Sutton (1998)

### Power and Social inequalities

Power and inequality determine the socioeconomic conditions of different classes.

## Key Points

- Social stratification is a concept involving the classification of persons into groups based on shared socioeconomic conditions.
- Conflict theories, such as Marxism, focus on the inaccessibility of resources and lack of social mobility found in stratified societies.
- Social stratification has been shown to cause many social problems, including homicide, infant mortality, obesity, teenage pregnancies, emotional depression, teen suicide, and a high prison population.
- In modern Western societies, stratification is broadly organized into three main layers: upper class, middle class, and lower class.
- Conflict theories, such as Marxism, point to the inaccessibility of resources and lack of social mobility found in stratified societies.
- In Marxist theory, the capitalist mode of production consists of two main economic parts: the substructure and the Superstructure. Marx
- Social stratification has been shown to cause many social problems.

## Key Terms

- **Marxist Theory:** An economic and sociopolitical worldview and method of socioeconomic inquiry centered upon a materialist interpretation of history, a dialectical view of social change, and an analysis–critique of the development of capitalism.
- **Conflict Theories:** Perspectives in social science that emphasize the social, political, or material inequality of a social group, critique the broad socio-political system, or otherwise detract from structural functionalism and ideological conservatism.
- **Weberian:** Of or relating to Max Weber (1864–1920), influential German sociologist and political economist.

## Power and Inequality

In social science and politics, power is the ability to influence the behavior of people. The term *authority* is often used for power perceived as legitimate by the social structure. Power can be seen as evil or unjust, but the exercise of power is accepted as endemic to (or regularly found in) humans as social beings. French philosopher Michel Foucault (1926–1984) saw power as “a complex strategic situation in a given society social setting”. Power may be held through authority, social class (material wealth), personal charisma, expertise or knowledge, persuasion, force (such as law or violence), and a myriad of other dynamics.

Because power operates both relationally and reciprocally, sociologists speak of the balance of power between people in a relationship. All parties to all relationships have some power; the sociological examination of power concerns itself with discovering and describing the relative strengths – equal or unequal, stable or subject to periodic change. Given that power is not innate and can be granted to others, to acquire power you must possess or control a form of power currency (such as wealth, social status, authority, etc.).

## **Social inequality and stratification**

Social inequality refers to relational processes in society that have the effect of limiting or harming a group's social status, social class, and social circle. Areas of social inequality include access to voting rights, freedom of speech and assembly, the extent of property rights and access to education, health care, quality housing, traveling, transportation, vacationing and other social goods and services.

The reasons for social inequality can vary, but are often broad and far reaching. Social inequality can emerge through a society's understanding of appropriate gender roles, or through the prevalence of social stereotyping. They can also be established through discriminatory legislation. Social inequalities exist between ethnic or religious groups, classes and countries, making the concept a global phenomenon.

In sociology, social stratification is a concept involving the classification of persons into groups based on shared socioeconomic conditions; it is a relational set of inequalities with economic, social, political and ideological dimensions. Theories of social stratification are based on four basic principles:

- 1) Social stratification is a trait of society, not simply a reflection of individual differences.
- 2) Social stratification carries over from generation to generation.
- 3) Social stratification is universal but variable.
- 4) Social stratification involves not just inequality but beliefs as well.

## **Classifications of stratification**

In modern Western societies, stratification is broadly organized into three main layers: upper class, middle class, and lower class.

The upper class in modern societies is the social class composed of the wealthiest members of society, who also wield the greatest political power. The upper class is generally contained within the wealthiest 1–2 percent of the population, with wealth passed from generation to generation.

In Weberian socioeconomic terms, the middle class is the broad group of people in contemporary society who fall socioeconomically between the working class and upper class. The common measures of what constitutes middle class vary significantly between cultures.

The working class describes the group of people employed in lower tier jobs, often including those in unemployment or otherwise possessing below-average incomes. Working classes are mainly found in industrialized economies and in urban areas of non-industrialized economies.

## **Social Stratification and Marxism**

Conflict theories, such as Marxism, focus on the inaccessibility of resources and lack of social mobility found in stratified societies. Many sociological theorists have criticized the extent to which the working classes are unlikely to advance socioeconomically; the wealthy tend to hold political power which they use to exploit the proletariat inter-generationally.

In Marxist theory, the capitalist mode of production consists of two main economic parts: the substructure and the superstructure. Marx saw classes as defined by people's relationship to the

means of productions in two basic ways: either they own productive property or they labor for others. The base comprehends the forces and relations of production: employer-employee work conditions, the technical division of labor, and property relations—into which people enter to produce the necessities and amenities of life. These relations determine society's other relationships and ideas, which are described as its superstructure. The superstructure of a society includes its culture, institutions, political power structures, roles, rituals, and state.

Social stratification has been shown to cause many social problems. A comprehensive study of major world economies revealed that homicide, infant mortality, obesity, teenage pregnancies, emotional depression, teen suicide, and prison population all correlate with higher social inequality.

### **There are three common characteristics of stratified systems:**

1. Rankings apply to social categories of people who share a common characteristic without necessarily interacting or identifying with each other. The process of being ranked can be changed by the person being ranked, and it can differ based on race, gender, and social class.
2. People's life experiences and opportunities depend on their social category. This characteristic can be changed by the amount of work a person can put into their interests. The use of resources can influence others.
3. The ranks of different social categories change slowly over time. This has occurred frequently in the United States ever since the American revolution—the U.S. Constitution has been altered several times to specify rights for everyone.

### **Democratization of technology**

**Democratization of technology** refers to the process by which access to technology rapidly continues to become more accessible to more people. New technologies and improved user experiences have empowered those outside of the technical industry to access and use technological products and services. At an increasing scale, consumers have greater access to use and purchase technologically sophisticated products, as well as to participate meaningfully in the development of these products. Industry innovation and user demand have been associated with more affordable, user-friendly products. This is an ongoing process, beginning with the development of mass production and increasing dramatically as digitization became commonplace.

Thomas Friedman argued that the era of globalization has been characterized by the democratization of technology, democratization of finance, and democratization of information. Technology has been critical in the latter two processes, facilitating the rapid expansion of access to specialized knowledge and tools, as well as changing the way that people view and demand such access.

### **History**

Scholars and social critics often cite the invention of the printing press as a major invention that changed the course of history. The force of the printing press rested not in its impact on the printing industry or inventors, but on its ability to transmit information to a broader public by way of mass production. This event is so widely recognized because of its social impact – as a democratizing force. The printing press is often seen as the historical counterpart to the Internet. After the development of the Internet in 1969, its use remained limited to communications between scientists and within government, although use of email and boards gained popularity among those

with access. It did not become a popular means of communication until the 1990s. In 1993 the US federal government opened the Internet to commerce and the creation of HTML formed the basis for universal accessibility.

## **Major innovations**

The Internet has played a critical role in modern life as a typical feature of most Western households, and has been key in the democratization of knowledge. It not only constitutes arguably the most critical innovation in this trend thus far; it has also allowed users to gain knowledge of and access to other technologies. Users can learn of new developments more quickly, and purchase high-tech products otherwise only actively marketed to recognized experts. Some have argued that cloud computing is having a major effect by allowing users greater access through mobility and pay-as-you-use capacity.

Social media has also empowered and emboldened users to become contributors and critics of technological developments.

The open-source model allows users to participate directly in development of software, rather than indirect participation, through contributing opinions. By being shaped by the user, development is directly responsive to user demand and can be obtained for free or at a low cost. In a comparable trend, arduino and littleBits have made electronics more accessible to users of all backgrounds and ages. The development of 3D printers has the potential to increasingly democratize production.

## **Cultural impact**

This trend is linked to the spread of knowledge of and ability to perform high-tech tasks, challenging previous conceptions of expertise.

Widespread access to technology, including lower costs, was critical to the transition to the new economy. Similarly, democratization of technology was also fuelled by this economic transition, which produced demands for technological innovation and optimism in technology-driven progress.

Since the 1980s, a spreading constructivist conception of technology has emphasized that the social and technical domains are critically intertwined. Scholars have argued that technology is non-neutral, defined contextually and locally by a certain relationship with society.

Andrew Feenberg, a central thinker in the philosophy of technology, argued that democratizing technology means expanding technological design to include alternative interests and values. When successful in doing so, this can be a tool for increasing inclusiveness. This also suggests an important participatory role for consumers if technology is to be truly democratic. Feenberg asserts that this must be achieved by consumer intervention in a liberated design process.

Improved access to specialized knowledge and tools has been associated with an increase in the "do it yourself" (DIY) trend. This has also been associated with consumerization, whereby personal or privately owned devices and software are also used for business purposes. Some have argued that this is linked to reduced dependence on traditional information technology departments.

Astra Taylor, the author of the book *The People's Platform: Taking Back Power and Culture in the Digital Age*, argues, "The promotion of Internet-enabled amateurism is a lazy substitute for real equality of opportunity."

### **Industry impact**

In some ways, democratization of technology has strengthened this industry. Markets have broadened and diversified. Consumer feedback and input is available at a very low or no cost.

However, related industries are experiencing decreased demand for qualified professionals as consumers are able to fill more of their demands themselves. Users of a range of types and status have access to increasingly similar technology. Because of the decreased costs and expertise necessary to use products and software, professionals (e.g. in the audio industry) may experience loss of work.

In some cases, technology is accessible but sufficiently complex that most users without specialized training are able to operate it without necessarily understanding how it works. Additionally, the process of consumerization has led to an influx in the number of devices in businesses and accessing private networks that IT departments cannot control or access. While this can lead to lowered operating costs and increased innovation, it is also associated with security concerns that most businesses are unable to address at the pace of the spread of technology.

### **Political impact**

At a demonstration at BMVIT, banners read, "Democracy needs anonymity – stop data retention" (left) and "Liberty dies with security" (right).

Some scholars have argued that technological change will bring about a third wave of democracy. The Internet has been recognized for its role in promoting increased citizen advocacy and government transparency. Jesse Chen, a leading thinker in democratic engagement technologies, distinguishes the democratizing effects of technology from democracy itself. Chen has argued that, while the Internet may have democratizing effects, the Internet alone cannot deliver democracy at all levels of society unless technologies are purposely designed for the nuances of democracy, specifically the engagement of large groups of people in between elections in and beyond government.

The spread of the Internet and other forms of technology has led to increased global connectivity. Many scholars believe that it has been associated in the developing world not only with increased Western influence, but also with the spread of democracy through increased communication, efficiency, and access to information. Scholars have drawn associations between the level of technological connectedness and democracy in many nations.

Technology can enhance democracy in the developed world as well. In addition to increased communication and transparency, some electorates have implemented online voting to accommodate an increased number of citizens.

### **Public evaluation of science and technology**

Although there was much technological progress in the Roman empire and during the Middle Ages, philosophical reflection on technology did not grow at a corresponding rate. Comprehensive works

such as Vitruvius' *De architectura* (first century BC) and Agricola's *De re metallica* (1556) paid much attention to practical aspects of technology but little to philosophy.

In the realm of scholastic philosophy, there was an emergent appreciation for the mechanical arts. They were generally considered to be born of—and limited to—the mimicry of nature. This view was challenged when alchemy was introduced in the Latin West around the mid-twelfth century. Some alchemical writers such as Roger Bacon were willing to argue that human art, even if learned by imitating natural processes, could successfully reproduce natural products or even surpass them (Newman 2004). The result was a philosophy of technology in which human art was raised to a level of appreciation not found in other writings until the Renaissance. However, the last three decades of the thirteenth century witnessed an increasingly hostile attitude by religious authorities toward alchemy that culminated eventually in the denunciation *Contra alchymistas*, written by the inquisitor Nicholas Eymeric in 1396 (Newman 2004).

The Renaissance led to a greater appreciation of human beings and their creative efforts, including technology. As a result, philosophical reflection on technology and its impact on society increased. Francis Bacon is generally regarded as the first modern author to put forward such reflection. His view, expressed in his fantasy *New Atlantis* (1627), was overwhelmingly positive. This positive attitude lasted well into the nineteenth century, incorporating the first half-century of the industrial revolution.

For example, Karl Marx did not condemn the steam engine or the spinning mill for the vices of the bourgeois mode of production; he believed that ongoing technological innovation were necessary steps toward the more blissful stages of socialism and communism of the future.

A turning point in the appreciation of technology as a socio-cultural phenomenon is marked by Samuel Butler's *Erewhon* (1872), written under the influence of the Industrial Revolution, and Darwin's *On the Origin of Species* (1859). Butler's book gave an account of a fictional country where all machines are banned and the possession of a machine or the attempt to build one is a capital crime. The people of this country had become convinced by an argument that ongoing technical improvements are likely to lead to a 'race' of machines that will replace mankind as the dominant species on earth.

During the last quarter of the nineteenth century and most of the twentieth century a critical attitude predominated in philosophical reflection on technology. The representatives of this attitude were, overwhelmingly, schooled in the humanities or the social sciences and had virtually no first-hand knowledge of engineering practice. Whereas Bacon wrote extensively on the method of science and conducted physical experiments himself, Butler, being a clergyman, lacked such first-hand knowledge. Ernst Kapp, who was the first to use the term 'philosophy of technology' in his book *Eine Philosophie der Technik* (1877 [2018]), was a philologist and historian. Most of the authors who wrote critically about technology and its socio-cultural role during the twentieth century were philosophers of a general outlook, such as Martin Heidegger (1954 [1977]), Hans Jonas (1979 [1984]), Arnold Gehlen (1957 [1980]), Günther Anders (1956), and Andrew Feenberg (1999). Others had a background in one of the other humanities or in social science, such as literary criticism and social research in the case of Lewis Mumford (1934), law in the case of Jacques Ellul (1954 [1964]), political science in the case of Langdon Winner (1977, 1980, 1983) and literary studies in the case of Albert Borgmann (1984). The form of philosophy of technology constituted by the writings of these and others has been called by Carl Mitcham (1994) "humanities philosophy of technology", because it takes its point of departure from the social sciences and the humanities

rather than from the practice of technology, and it approaches technology accepting “the primacy of the humanities over technologies” (1994: 39), since technology originates from the goals and values of humans.

Humanities philosophers of technology tend to take the phenomenon of technology itself largely for granted; they treat it as a ‘black box’, a given, a unitary, monolithic, inescapable phenomenon. Their interest is not so much to analyze and understand this phenomenon itself but to grasp its relations to morality (Jonas, Gehlen), politics (Winner), the structure of society (Mumford), human culture (Ellul), the human condition (Hannah Arendt), or metaphysics (Heidegger). In this, these philosophers are almost all openly critical of technology: all things considered, they tend to have a negative judgment of the way technology has affected human society and culture, or at least they single out for consideration the negative effects of technology on human society and culture. This does not necessarily mean that technology itself is pointed out as the principal cause of these negative developments. In the case of Heidegger, in particular, the paramount position of technology in modern society is rather a symptom of something more fundamental, namely a wrongheaded attitude towards Being which has been on the rise for almost 25 centuries. It is therefore questionable whether Heidegger should be considered as a philosopher of technology, although within the traditional view he is considered to be among the most important ones. Much the same could be said about Arendt, in particular her discussion of technology in *The Human Condition* (1958), although her position in the canon of humanities philosophy of technology is not as prominent.

To be sure, the work of these founding figures of humanities philosophy of technology has been taken further by a second and third generation of scholars— in particular the work of Heidegger remains an important source of inspiration— but who in doing so have adopted a more neutral rather than overall negative view of technology and its meaning for human life and culture. Notable examples are Ihde (1979, 1993) and Verbeek (2000 [2005]).

In its development, humanities philosophy of technology continues to be influenced not so much by developments in philosophy (e.g., philosophy of science, philosophy of action, philosophy of mind) but by developments in the social sciences and humanities. Although, for example, Ihde and those who take their point of departure with him, position their work as phenomenologist or postphenomenologist, there does not seem to be much interest in either the past or the present of this diffuse notion in philosophy, and in particular not much interest in the far from easy question to what extent Heidegger can be considered a phenomenologist. Of particular significance has been the emergence of ‘Science and Technology Studies’ (STS) in the 1980s, which studies from a broad social- scientific perspective how social, political, and cultural values affect scientific research and technological innovation, and how these in turn affect society, politics, and culture. For a detailed treatment Mitcham’s 1994 book provides an excellent overview. Olsen, Selinger and Riis (2008) offer a collection of more recent contributions; Scharff and Dusek (2003 [2014]) and Kaplan (2004 [2009]) present comprehensive anthologies of texts from this tradition.

## **A Basic Ambiguity in the Meaning of Technology**

Mitcham contrasts ‘humanities philosophy of technology’ to ‘engineering philosophy of technology’, where the latter refers to philosophical views developed by engineers or technologists as “attempts ... to elaborate a technological philosophy” (1994: 17). Mitcham discusses only a handful of people as engineering philosophers of technology, however: Ernst Kapp, Peter Engelmeier, Friedrich Dessauer, and much more briefly Jacques Lafitte, Gilbert Simondon, Hendrik van Riessen, Juan David García Bacca, R. Buckminster Fuller and Mario Bunge. The label raises serious questions, however: several of them hardly classify as ‘engineers or technologists’ and it is also not very

clear how the notion of 'a technological philosophy' should be understood. As philosophers these authors seem all to be rather isolated figures, whose work shows little overlap and who seem to be sharing mainly the absence of a 'working relation' with established philosophical disciplines. It is not so clear what sort of questions and concerns underlie the notion of 'engineering philosophy of technology'. A larger role for systematic philosophy could bring it quite close to some examples of humanities philosophy of technology, for instance the work of Jacques Ellul, where the analyses would be rather similar and the remaining differences would be ones of attitude or appreciation.

In the next section we discuss in more detail a form of philosophy of technology that we consider to occupy, currently, the position of alternative to the humanities philosophy of technology. It emerged in the 1960s and gained momentum in the past fifteen to twenty years. This form of the philosophy of technology, which may be called 'analytic', is not primarily concerned with the relations between technology and society but with technology itself. It expressly does not look upon technology as a 'black box' but as a phenomenon that should be studied in detail. It regards technology perhaps not in its entirety as a practice but as something grounded in a practice, basically the practice of engineering. It analyses this practice, its goals, its concepts and its methods, and it relates its findings to various themes from philosophy.

In focusing on technology as a practice sustained by engineers, similar to the way philosophy of science focuses on the practice of science as sustained by scientists, analytic philosophy of technology could be thought to amount to the philosophy of engineering. Indeed many of the issues related to design, could be singled out as forming the subject matter of the philosophy of engineering. The very title of *Philosophy of Technology and Engineering Sciences* (Meijers 2009), an extensive up-to-date overview, which contains contributions to all of the topics treated in the next section, expresses the view that technology and engineering do not coincide. Which is not to say, however, that the book offers a clear conception of what makes technology different from engineering, or more than engineering. In fact, the existence of humanities philosophy of technology and analytic philosophy of technology next to each other reflects a basic ambiguity in the notion of technology that the philosophical work that has been going on has not succeeded in clarifying.

Technology can be said to have two 'cores' or 'dimensions', which can be referred to as instrumentality and productivity. Instrumentality covers the totality of human endeavours to control their lives and their environments by interfering with the world in an instrumental way, by using things in a purposeful and clever way. Productivity covers the totality of human endeavours to bring new things into existence that can do certain things in a controlled and clever way. For the study of instrumentality, however, it is in principle irrelevant whether or not the things that are made use of in controlling our lives and environments have been made by us first; if we somehow could rely on natural objects to always be available to serve our purposes, the analysis of instrumentality and its consequences for how we live our lives would not necessarily be affected. Likewise, for the analysis of what is involved in the making of artifacts, and how the notion of artifact and of something new being brought into existence are to be understood, it is to a large extent irrelevant how human life, culture and society are changed as a result of the artifacts that are in fact produced. Clearly, humanities philosophy of technology has until now been more attracted by the instrumentality core whereas analytic philosophy of technology has mainly gone for the productivity core. But technology as one of the basic phenomena of modern society, if not the most basic one, clearly is constituted by the processes centering on and involving both cores. It has proved difficult, however, to come to an overarching approach in which the interaction between these two dimensions of technology are adequately dealt with—no doubt partly due to the great differences in philosophical orientation and methodology associated with the two traditions and their separate foci. To improve

this situation is arguably the most urgent challenge that the field of philosophy of technology as a whole is facing, since the continuation of the two orientations leading their separate lives threatens its unity and coherence as a discipline in the first place. Notwithstanding its centrality and urgency, the ambiguity noted here seems hardly to be confronted directly in the literature. It is addressed by Lawson (2008, 2017) and by Franssen and Koller (2016).

After presenting the major issues of philosophical relevance in technology and engineering that are studied by analytic philosophers of technology in the next section, we discuss the problems and challenges that technology poses for the society in which it is practiced in the third and final section.

## **Analytic Philosophy of Technology**

**Introduction:** Philosophy of Technology and Philosophy of Science as Philosophies of Practices

It may come as a surprise to those new to the topic that the fields of philosophy of science and philosophy of technology show such great differences, given that few practices in our society are as closely related as science and technology. Experimental science is nowadays crucially dependent on technology for the realization of its research set-ups and for gathering and analyzing data. The phenomena that modern science seeks to study could never be discovered without producing them through technology.

Theoretical research within technology has come to be often indistinguishable from theoretical research in science, making engineering science largely continuous with 'ordinary' or 'pure' science. This is a relatively recent development, which started around the middle of the nineteenth century, and is responsible for great differences between modern technology and traditional, craft-like techniques. The educational training that aspiring scientists and engineers receive starts off being largely identical and only gradually diverges into a science or an engineering curriculum. Ever since the scientific revolution of the seventeenth century, characterized by its two major innovations, the experimental method and the mathematical articulation of scientific theories, philosophical reflection on science has focused on the method by which scientific knowledge is generated, on the reasons for thinking scientific theories to be true, or approximately true, and on the nature of evidence and the reasons for accepting one theory and rejecting another. Hardly ever have philosophers of science posed questions that did not have the community of scientists, their concerns, their aims, their intuitions, their arguments and choices, as a major target. In contrast it is only recently that the philosophy of technology has discovered the community of engineers.

It might be claimed that it is up to the philosophy of technology, and not the philosophy of science, to target first of all the impact of technology—and with it science—on society and culture, because science affects society only through technology. This, however, will not do. Right from the start of the scientific revolution, science affected human culture and thought fundamentally and directly, not with a detour through technology, and the same is true for later developments such as relativity, atomic physics and quantum mechanics, the theory of evolution, genetics, biochemistry, and the increasingly dominating scientific world view overall. Philosophers of science overwhelmingly give the impression that they leave questions addressing the normative, social and cultural aspects of science gladly to other philosophical disciplines, or to historical studies. There are exceptions, however, and things may be changing; Philip Kitcher, to name but one prominent philosopher of science, has since 2000 written books on the relation of science to politics, ethics and religion (Kitcher 2001, 2011).

There is a major difference between the historical development of modern technology as compared to modern science which may at least partly explain this situation, which is that science emerged in the seventeenth century from philosophy itself. The answers that Galileo, Huygens, Newton, and others gave, by which they initiated the alliance of empiricism and mathematical description that is so characteristic of modern science, were answers to questions that had belonged to the core business of philosophy since antiquity. Science, therefore, kept the attention of philosophers. Philosophy of science is a transformation of epistemology in the light of the emergence of science. The foundational issues— the reality of atoms, the status of causality and probability, questions of space and time, the nature of the quantum world—that were so lively discussed during the end of the nineteenth and the beginning of the twentieth century are an illustration of this close relationship between scientists and philosophers. No such intimacy has ever existed between those same philosophers and technologists; their worlds still barely touch. To be sure, a case can be made that, compared to the continuity existing between natural philosophy and science, a similar continuity exists between central questions in philosophy having to do with human action and practical rationality and the way technology approaches and systematizes the solution of practical problems. To investigate this connection may indeed be considered a major theme for philosophy of technology. This continuity appears only by hindsight, however, and dimly, as the historical development is at most a slow convening of various strands of philosophical thinking on action and rationality, not a development into variety from a single origin. Significantly it is only the academic outsider Ellul who has, in his idiosyncratic way, recognized in technology the emergent single dominant way of answering all questions concerning human action, comparable to science as the single dominant way of answering all questions concerning human knowledge (Ellul 1954 [1964]). But Ellul was not so much interested in investigating this relationship as in emphasizing and denouncing the social and cultural consequences as he saw them. It is all the more important to point out that humanities philosophy of technology cannot be differentiated from analytic philosophy of technology by claiming that only the former is interested in the social environment of technology. There are studies which are rooted in analytic philosophy of science but address specifically the relation of technology to society and culture, and equally the relevance of social relations to practices of technology, without taking an evaluative stand with respect to technology; an example is B. Preston 2012.

## **The Relationship Between Technology and Science**

The close relationship between the practices of science and technology may easily keep the important differences between the two from view. The predominant position of science in the philosophical field of vision made it difficult for philosophers to recognize that technology merits special attention for involving issues that do not emerge in science. This view resulting from this lack of recognition is often presented, perhaps somewhat dramatically, as coming down to a claim that technology is 'merely' applied science.

A questioning of the relation between science and technology was the central issue in one of the earliest discussions among analytic philosophers of technology. In 1966, in a special issue of the journal *Technology and Culture*, Henryk Skolimowski argued that technology is something quite different from science (Skolimowski 1966). As he phrased it, science concerns itself with what is, whereas technology concerns itself with what is to be. A few years later, in his well-known book *The Sciences of the Artificial* (1969), Herbert Simon emphasized this important distinction in almost the same words, stating that the scientist is concerned with how things are but the engineer with how things ought to be. Although it is difficult to imagine that earlier philosophers were

blind to this difference in orientation, their inclination, in particular in the tradition of logical empiricism, to view knowledge as a system of statements may have led to a conviction that in technology no knowledge claims play a role that cannot also be found in science. The study of technology, therefore, was not expected to pose new challenges nor hold surprises regarding the interests of analytic philosophy.

In contrast, Mario Bunge (1966) defended the view that technology is applied science, but in a subtle way that does justice to the differences between science and technology. Bunge acknowledges that technology is about action, but an action heavily underpinned by theory—that is what distinguishes technology from the arts and crafts and puts it on a par with science. According to Bunge, theories in technology come in two types: substantive theories, which provide knowledge about the object of action, and operative theories, which are concerned with action itself. The substantive theories of technology are indeed largely applications of scientific theories. The operative theories, in contrast, are not preceded by scientific theories but are born in applied research itself. Still, as Bunge claims, operative theories show a dependence on science in that in such theories the method of science is employed. This includes such features as modeling and idealization, the use of theoretical concepts and abstractions, and the modification of theories by the absorption of empirical data through prediction and retrodiction.

In response to this discussion, Ian Jarvie (1966) proposed as important questions for a philosophy of technology what the epistemological status of technological statements is and how technological statements are to be demarcated from scientific statements. This suggests a thorough investigation of the various forms of knowledge occurring in either practice, in particular, since scientific knowledge has already been so extensively studied, of the forms of knowledge that are characteristic of technology and are lacking, or of much less prominence, in science. A distinction between 'knowing that'—traditional propositional knowledge—and 'knowing how'—non-articulated and even impossible-to-articulate knowledge—had been introduced by Gilbert Ryle (1949) in a different context. The notion of 'knowing how' was taken up by Michael Polanyi under the name of tacit knowledge and made a central characteristic of technology (Polanyi 1958). However, emphasizing too much the role of unarticulated knowledge, of 'rules of thumb' as they are often called, easily underplays the importance of rational methods in technology. An emphasis on tacit knowledge may also be ill-fit for distinguishing the practices of science and technology because the role of tacit knowledge in science may well be more important than current philosophy of science acknowledges, for example in concluding causal relationships on the basis of empirical evidence. This was also an important theme in the writings of Thomas Kuhn on theory change in science (Kuhn 1962).

## **The Centrality of Design to Technology**

To claim, with Skolimowski and Simon, that technology is about what is to be or what ought to be rather than what is may serve to distinguish it from science but will hardly make it understandable why so much philosophical reflection on technology has taken the form of socio-cultural critique. Technology is an ongoing attempt to bring the world closer to the way one wishes it to be. Whereas science aims to understand the world as it is, technology aims to change the world. These are abstractions, of course. For one, whose wishes concerning what the world should be like are realized in technology? Unlike scientists, who are often personally motivated in their attempts at describing and understanding the world, engineers are seen, not in the least by engineers themselves, as undertaking their attempts to change the world as a service to the public. The ideas on what is to be or what ought to be are seen as originating outside of technology itself; engineers then take it upon

themselves to realize these ideas. This view is a major source for the widely spread picture of technology as being instrumental, as delivering instruments ordered from 'elsewhere', as means to ends specified outside of engineering, a picture that has served further to support the claim that technology is neutral with respect to values. This view involves a considerable distortion of reality, however. Many engineers are intrinsically motivated to change the world; in delivering ideas for improvement they are, so to speak, their own best customers. The same is true for most industrial companies, particularly in a market economy, where the prospect of great profits is another powerful motivator. As a result, much technological development is 'technology-driven'.

To understand where technology 'comes from', what drives the innovation process, is of importance not only to those who are curious to understand the phenomenon of technology itself but also to those who are concerned about its role in society. Technology or engineering as a practice is concerned with the creation of artifacts and, of increasing importance, artifact-based services. The design process, the structured process leading toward that goal, forms the core of the practice of technology. In the engineering literature, the design process is commonly represented as consisting of a series of translational steps; At the start are the customer's needs or wishes. In the first step these are translated into a list of functional requirements, which then define the design task an engineer, or a team of engineers, has to accomplish. The functional requirements specify as precisely as possible what the device to be designed must be able to do. This step is required because customers usually focus on just one or two features and are unable to articulate the requirements that are necessary to support the functionality they desire. In the second step, the functional requirements are translated into design specifications, which the exact physical parameters of crucial components by which the functional requirements are going to be met. The design parameters chosen to satisfy these requirements are combined and made more precise such that a blueprint of the device results. The blueprint contains all the details that must be known such that the final step to the process of manufacturing the device can take place. It is tempting to consider the blueprint as the end result of a design process, instead of a finished copy being this result. However, actual copies of a device are crucial for the purpose of prototyping and testing. Prototyping and testing presuppose that the sequence of steps making up the design process can and will often contain iterations, leading to revisions of the design parameters and/or the functional requirements. Even though, certainly for mass-produced items, the manufacture of a product for delivery to its customers or to the market comes after the closure of the design phase, the manufacturing process is often reflected in the functional requirements of a device, for example in putting restrictions on the number of different components of which the device consists. The complexity of a device will affect how difficult it will be to maintain or repair it, and ease of maintenance or low repair costs are often functional requirements. An important modern development is that the complete life cycle of an artifact is now considered to be the designing engineer's concern, up till the final stages of the recycling and disposal of its components and materials, and the functional requirements of any device should reflect this. From this point of view, neither a blueprint nor a prototype can be considered the end product of engineering design.

The biggest idealization that this scheme of the design process contains is arguably located at the start. Only in a minority of cases does a design task originate in a customer need or wish for a particular artifact. First of all, as already suggested, many design tasks are defined by engineers themselves, for instance, by noticing something to be improved in existing products. But more often than not design starts with a problem pointed out by some societal agent, which engineers are then invited to solve. Many such problems, however, are ill-defined or wicked problems, meaning that it is not at all clear what the problem is exactly and what a solution to the problem would consist in. The 'problem' is a situation that people—not necessarily the people 'in' the situation—find

unsatisfactory, but typically without being able to specify a situation that they find more satisfactory in other terms than as one in which the problem has been solved. In particular it is not obvious that a solution to the problem would consist in some artifact, or some artifactual system or process, being made available or installed. Engineering departments all over the world advertise that engineering is problem solving, and engineers easily seem confident that they are best qualified to solve a problem when they are asked to, whatever the nature of the problem. This has led to the phenomenon of a technological fix, the solution of a problem by a technical solution, that is, the delivery of an artifact or artifactual process, where it is questionable, to say the least, whether this solves the problem or whether it was the best way of handling the problem.

A candidate example of a technological fix for the problem of global warming would be the currently much debated option of injecting sulfate aerosols into the stratosphere to offset the warming effect of greenhouse gases such as carbon dioxide and methane. Such schemes of geoengineering would allow us to avoid facing the—in all likelihood painful—choices that will lead to a reduction of the emission of greenhouse gases into the atmosphere, but will at the same time allow the depletion of the Earth's reservoir of fossil fuels to continue. See for a discussion of technological fixing, e.g., Volti 2009: 26–32. Given this situation, and its hazards, the notion of a problem and a taxonomy of problems deserve to receive more philosophical attention than they have hitherto received.

These wicked problems are often broadly social problems, which would best be met by some form of 'social action', which would result in people changing their behavior or acting differently in such a way that the problem would be mitigated or even disappear completely. In defense of the engineering view, it could perhaps be said that the repertoire of 'proven' forms of social action is meager. The temptation of technical fixes could be overcome—at least that is how an engineer might see it—by the inclusion of the social sciences in the systematic development and application of knowledge to the solution of human problems. This however, is a controversial view. Social engineering is to many a specter to be kept at as large a distance as possible instead of an ideal to be pursued. Karl Popper referred to acceptable forms of implementing social change as 'piecemeal social engineering' and contrasted it to the revolutionary but completely unfounded schemes advocated by, e.g., Marxism. In the entry on Karl Popper, however, his choice of words is called 'rather unfortunate'. The notion of social engineering, and its cogency, deserves more attention than it is currently receiving.

An important input for the design process is scientific knowledge: knowledge about the behavior of components and the materials they are composed of in specific circumstances. This is the point where science is applied. However, much of this knowledge is not directly available from the sciences, since it often concerns extremely detailed behavior in very specific circumstances. This scientific knowledge is therefore often generated within technology, by the engineering sciences. But apart from this very specific scientific knowledge, engineering design involves various other sorts of knowledge. In his book *What Engineers Know and How They Know It* (Vincenti 1990), the aeronautical engineer Walter Vincenti gave a six-fold categorization of engineering design knowledge (leaving aside production and operation as the other two basic constituents of engineering practice). Vincenti distinguishes

1. Fundamental design concepts, including primarily the operational principle and the normal configuration of a particular device;
2. Criteria and specifications;
3. Theoretical tools;

4. Quantitative data;
5. Practical considerations;
6. Design instrumentalities.

The fourth category concerns the quantitative knowledge just referred to, and the third the theoretical tools used to acquire it. These two categories can be assumed to match Bunge's notion of substantive technological theories. The status of the remaining four categories is much less clear, however, partly because they are less familiar, or not at all, from the well-explored context of science. Of these categories, Vincenti claims that they represent prescriptive forms of knowledge rather than descriptive ones. Here, the activity of design introduces an element of normativity, which is absent from scientific knowledge. Take such a basic notion as 'operational principle', which refers to the way in which the function of a device is realized, or, in short, how it works. This is still a purely descriptive notion. Subsequently, however, it plays a role in arguments that seek to prescribe a course of action to someone who has a goal that could be realized by the operation of such a device. At this stage, the issue changes from a descriptive to a prescriptive or normative one. An extensive discussion of the various kinds of knowledge relevant to technology is offered by Houkes (2009).

Although the notion of an operational principle—a term that seems to originate with Polanyi (1958)—is central to engineering design, no single clear-cut definition of it seems to exist. The issue of disentangling descriptive from prescriptive aspects in an analysis of the technical action and its constituents is therefore a task that has hardly begun. This task requires a clear view on the extent and scope of technology. If one follows Joseph Pitt in his book *Thinking About Technology* (1999) and defines technology broadly as 'humanity at work', then to distinguish between technological action and action in general becomes difficult, and the study of technological action must absorb all descriptive and normative theories of action, including the theory of practical rationality, and much of theoretical economics in its wake. There have indeed been attempts at such an encompassing account of human action, for example Tadeusz Kotarbinski's *Praxiology* (1965), but a perspective of such generality makes it difficult to arrive at results of sufficient depth. It would be a challenge for philosophy to specify the differences among action forms and the reasoning grounding them in, to single out three prominent fields of study, technology, organization and management, and economics.

A more restricted attempt at such an approach is Ilkka Niiniluoto's (1993). According to Niiniluoto, the theoretical framework of technology as the practice that is concerned with what the world should be like rather than is, the framework that forms the counterpoint to the descriptive framework of science, is design science. The content of design science, the counterpoint to the theories and explanations that form the content of descriptive science, would then be formed by technical norms, statements of the form 'If one wants to achieve X, one should do Y'. The notion of a technical norm derives from Georg Henrik von Wright's *Norm and Action* (1963). Technical norms need to be distinguished from anankastic statements expressing natural necessity, of the form 'If X is to be achieved, Y needs to be done'; the latter have a truth value but the former have not. Von Wright himself, however, wrote that he did not understand the mutual relations between these statements. Ideas on what design science is and can and should be are evidently related to the broad problem area of practical rationality—see this entries on practical reason and instrumental rationality—and also to means-ends reasoning, discussed.

## Methodological Issues: Design as Decision Making

Design is an activity that is subject to rational scrutiny but in which creativity is considered to play an important role as well. Since design is a form of action, a structured series of decisions to proceed in one way rather than another, the form of rationality that is relevant to it is practical rationality, the rationality incorporating the criteria on how to act, given particular circumstances. This suggests a clear division of labor between the part to be played by rational scrutiny and the part to be played by creativity. Theories of rational action generally conceive their problem situation as one involving a choice among various course of action open to the agent. Rationality then concerns the question how to decide among given options, whereas creativity concerns the generation of these options. This distinction is similar to the distinction between the context of justification and the context of discovery in science. The suggestion that is associated with this distinction, however, that rational scrutiny only applies in the context of justification, is difficult to uphold for technological design. If the initial creative phase of option generation is conducted sloppily, the result of the design task can hardly be satisfactory. Unlike the case of science, where the practical consequences of entertaining a particular theory are not taken into consideration, the context of discovery in technology is governed by severe constraints of time and money, and an analysis of the problem how best to proceed certainly seems in order. There has been little philosophical work done in this direction; an overview of the issues is given in Kroes, Franssen, and Bucciarelli (2009).

The ideas of Herbert Simon on bounded rationality (see, e.g., Simon 1982) are relevant here, since decisions on when to stop generating options and when to stop gathering information about these options and the consequences when they are adopted are crucial in decision making if informational overload and calculative intractability are to be avoided. However, it has proved difficult to further develop Simon's ideas on bounded rationality since their conception in the 1950s. Another notion that is relevant here is means-ends reasoning. In order to be of any help here, theories of means-ends reasoning should then concern not just the evaluation of given means with respect to their ability to achieve given ends, but also the generation or construction of means for given ends. A comprehensive theory of means-ends reasoning, however, is not yet available; for a proposal on how to develop means-ends reasoning in the context of technical artifacts. In the practice of technology, alternative proposals for the realization of particular functions are usually taken from 'catalogs' of existing and proven realizations. These catalogs are extended by ongoing research in technology rather than under the urge of particular design tasks.

When engineering design is conceived as a process of decision making, governed by considerations of practical rationality, the next step is to specify these considerations. Almost all theories of practical rationality conceive of it as a reasoning process where a match between beliefs and desires or goals is sought. The desires or goals are represented by their value or utility for the decision maker, and the decision maker's problem is to choose an action that realizes a situation that, ideally, has maximal value or utility among all the situations that could be realized. If there is uncertainty concerning the situations that will be realized by a particular action, then the problem is conceived as aiming for maximal expected value or utility. Now the instrumental perspective on technology implies that the value that is at issue in the design process viewed as a process of rational decision making is not the value of the artifacts that are created. Those values are the domain of the users of the technology so created. They are supposed to be represented in the functional requirements defining the design task. Instead the value to be maximized is the extent to which a particular design meets the functional requirements defining the design task. It is in this sense that engineers share an overall perspective on engineering design as an exercise in optimization. But although optimization is a value-orientated notion, it is not itself perceived as a value

driving engineering design.

The functional requirements that define most design problems do not prescribe explicitly what should be optimized; usually they set levels to be attained minimally. It is then up to the engineer to choose how far to go beyond meeting the requirements in this minimal sense. Efficiency, in energy consumption and use of materials first of all, is then often a prime value. Under the pressure of society, other values have come to be incorporated, in particular safety and, more recently, sustainability. Sometimes it is claimed that what engineers aim to maximize is just one factor, namely market success. Market success, however, can only be assessed after the fact. The engineer's maximization effort will instead be directed at what are considered the predictors of market success. Meeting the functional requirements and being relatively efficient and safe are plausible candidates as such predictors, but additional methods, informed by market research, may introduce additional factors or may lead to a hierarchy among the factors.

Choosing the design option that maximally meets all the functional requirements (which may but need not originate with the prospective user) and all other considerations and criteria that are taken to be relevant, then becomes the practical decision-making problem to be solved in a particular engineering-design task. This creates several methodological problems. Most important of these is that the engineer is facing a multi-criteria decision problem. The various requirements come with their own operationalizations in terms of design parameters and measurement procedures for assessing their performance. This results in a number of rank orders or quantitative scales which represent the various options out of which a choice is to be made. The task is to come up with a final score in which all these results are 'adequately' represented, such that the option that scores best can be considered the optimal solution to the design problem. Engineers describe this situation as one where trade-offs have to be made: in judging the merit of one option relative to other options, a relative bad performance on one criterion can be balanced by a relatively good performance on another criterion. An important problem is whether a rational method for doing this can be formulated. It has been argued by Franssen (2005) that this problem is structurally similar to the well-known problem of social choice, for which Kenneth Arrow proved his notorious impossibility theorem in 1950, implying that no general rational solution method exists for this problem. This poses serious problems for the claim of engineers that their designs are optimal solutions, since Arrow's theorem implies that in most multi-criteria problems the notion of 'optimal' cannot be rigorously defined.

This result seems to except a crucial aspect of engineering activity from philosophical scrutiny, and it could be used to defend the opinion that engineering is at least partly an art, not a science. Instead of surrendering to the result, however, which has a significance that extends much beyond engineering and even beyond decision making in general, we should perhaps conclude instead that there is still a lot of work to be done on what might be termed, provisionally, 'approximative' forms of reasoning. One form of reasoning to be included here is Herbert Simon's bounded rationality, plus the related notion of 'satisficing'. Since their introduction in the 1950s (Simon 1957) these two terms have found wide usage, but we are still lacking a general theory of bounded rationality. It may be in the nature of forms of approximative reasoning such as bounded rationality that a general theory cannot be had, but even a systematic treatment from which such an insight could emerge seems to be lacking.

Another problem for the decision-making view of engineering design is that in modern technology almost all design is done by teams. Such teams are composed of experts from many different disciplines. Each discipline has its own theories, its own models of interdependencies, its own as-

assessment criteria, and so forth, and the professionals belonging to these disciplines must be considered as inhabitants of different object worlds, as Louis Bucciarelli (1994) phrases it. The different team members are, therefore, likely to disagree on the relative rankings and evaluations of the various design options under discussion. Agreement on one option as the overall best one can here be even less arrived at by an algorithmic method exemplifying engineering rationality. Instead, models of social interaction, such as bargaining and strategic thinking, are relevant here. An example of such an approach to an (abstract) design problem is presented by Franssen and Bucciarelli (2004).

To look in this way at technological design as a decision-making process is to view it normatively from the point of view of practical or instrumental rationality. At the same time it is descriptive in that it is a description of how engineering methodology generally presents the issue how to solve design problems. From that somewhat higher perspective there is room for all kinds of normative questions that are not addressed here, such as whether the functional requirements defining a design problem can be seen as an adequate representation of the values of the prospective users of an artifact or a technology, or by which methods values such as safety and sustainability can best be elicited and represented in the design process.

### **Metaphysical Issues: The Status and Characteristics of Artifacts**

Understanding the process of designing artifacts is the theme in philosophy of technology that most directly touches on the interests of engineering practice. This is hardly true for another issue of central concern to analytic philosophy of technology, which is the status and the character of artifacts. This is perhaps not unlike the situation in the philosophy of science, where working scientists seem also to be much less interested in investigating the status and character of models and theories than philosophers are.

Artifacts are man-made objects: they have an author. The artifacts that are of relevance to technology are, in particular, made to serve a purpose. This excludes, within the set of all man-made objects, on the one hand byproducts and waste products and on the other hand works of art. Byproducts and waste products result from an intentional act to make something but just not precisely, although the author at work may be well aware of their creation. Works of art result from an intention directed at their creation (although in exceptional cases of conceptual art, this directedness may involve many intermediate steps) but it is contested whether artists include in their intentions concerning their work an intention that the work serves some purpose. A further discussion of this aspect belongs to the philosophy of art. An interesting general account has been presented by Diptert (1993).

Technical artifacts, then, are made to serve some purpose, generally to be used for something or to act as a component in a larger artifact, which in its turn is either something to be used or again a component. Whether end product or component, an artifact is 'for something', and what it is for is called the artifact's function. Several researchers have emphasized that an adequate description of artifacts must refer both to their status as tangible physical objects and to the intentions of the people engaged with them. Kroes and Meijers (2006) have dubbed this view "the dual nature of technical artifacts"; its most mature formulation is Kroes 2012. They suggest that the two aspects are 'tied up', so to speak, in the notion of artifact function. This gives rise to several problems. One, which will be passed over quickly because little philosophical work seems to have been done concerning it, is that structure and function mutually constrain each other, but the constraining is only partial. It is unclear whether a general account of this relation is possible and what problems need

to be solved to arrive there. There may be interesting connections with the issue of multiple realizability in the philosophy of mind and with accounts of reduction in science; an example where this is explored is Mahner and Bunge 2001.

It is equally problematic whether a unified account of the notion of function as such is possible, but this issue has received considerably more philosophical attention. The notion of function is of paramount importance for characterizing artifacts, but the notion is used much more widely. The notion of an artifact's function seems to refer necessarily to human intentions. Function is also a key concept in biology, however, where no intentionality plays a role, and it is a key concept in cognitive science and the philosophy of mind, where it is crucial in grounding intentionality in non-intentional, structural and physical properties. Up till now there is no accepted general account of function that covers both the intentionality-based notion of artifact function and the non-intentional notion of biological function—not to speak of other areas where the concept plays a role, such as the social sciences. The most comprehensive theory, that has the ambition to account for the biological notion, cognitive notion and the intentional notion, is Ruth Millikan's 1984. The collection of essays edited by Ariew, Cummins and Perlman (2002) presents a recent introduction to the general topic of defining the notion of function in general, although the emphasis is, as is generally the case in the literature on function, on biological functions.

Against the view that, at least in the case of artifacts, the notion of function refers necessarily to intentionality, it could be argued that in discussing the functions of the components of a larger device, and the interrelations between these functions, the intentional 'side' of these functions is of secondary importance only. This, however, would be to ignore the possibility of the malfunctioning of such components. This notion seems to be definable only in terms of a mismatch between actual behavior and intended behavior. The notion of malfunction also sharpens an ambiguity in the general reference to intentions when characterizing technical artifacts. These artifacts usually engage many people, and the intentions of these people may not all pull in the same direction. A major distinction can be drawn between the intentions of the actual user of an artifact for a particular purpose and the intentions of the artifact's designer. Since an artifact may be used for a purpose different from the one for which its designer intended it to be used, and since people may also use natural objects for some purpose or other, one is invited to allow that artifacts can have multiple functions, or to enforce a hierarchy among all relevant intentions in determining the function of an artifact, or to introduce a classification of functions in terms of the sorts of determining intentions. In the latter case, which is a sort of middle way between the two other options, one commonly distinguishes between the proper function of an artifact as the one intended by its designer and the accidental function of the artifact as the one given to it by some user on private considerations. Accidental use can become so common, however, that the original function drops out of memory.

Closely related to this issue to what extent use and design determine the function of an artifact is the problem of characterizing artifact kinds. It may seem that we use functions to classify artifacts: an object is a knife because it has the function of cutting, or more precisely, of enabling us to cut. On closer inspection, however, the link between function and kind-membership seems much less straightforward. The basic kinds in technology are, for example, 'knife', 'aircraft' and 'piston'. The members of these kinds have been designed in order to be used to cut something with, to transport something through the air and to generate mechanical movement through thermodynamic expansion. However, one cannot create a particular kind of artifact just by designing something with the intention that it be used for some particular purpose: a member of the kind so created must actually be useful for that purpose. Despite innumerable design attempts and claims,

the perpetual motion machine is not a kind of artifact. A kind like 'knife' is defined, therefore, not only by the intentions of the designers of its members that they each be useful for cutting but also by a shared operational principle known to these designers, and on which they based their design. This is, in a different setting, also defended by Thomasson, who in her characterization of what she in general calls an artifactual kind says that such a kind is defined by the designer's intention to make something of that kind, by a substantive idea that the designer has of how this can be achieved, and by his or her largely successful achievement of it (Thomasson 2003, 2007). Qua sorts of kinds in which artifacts can be grouped, a distinction must therefore be made between a kind like 'knife' and a corresponding but different kind 'cutter'. A 'knife' indicates a particular way a 'cutter' can be made. One can also cut, however, with a thread or line, a welding torch, a water jet, and undoubtedly by other sorts of means that have not yet been thought of. A 'cutter' would then refer to a truly functional kind. As such, it is subject to the conflict between use and design: one could mean by 'cutter' anything that can be used for cutting or anything that has been designed to be used for cutting, by the application of whatever operational principle, presently known or unknown.

This distinction between artifact kinds and functional kinds is relevant for the status of such kinds in comparison to other notions of kinds. Philosophy of science has emphasized that the concept of natural kind, such as exemplified by 'water' or 'atom', lies at the basis of science. On the other hand it is generally taken for granted that there are no regularities that all knives or airplanes or pistons answer to. This, however, is loosely based on considerations of multiple realizability that fully apply only to functional kinds, not to artifact kinds. Artifact kinds share an operational principle that gives them some commonality in physical features, and this commonality becomes stronger once a particular artifact kind is subdivided into narrower kinds. Since these kinds are specified in terms of physical and geometrical parameters, they are much closer to the natural kinds of science, in that they support law-like regularities. A recent collection of essays that discuss the metaphysics of artifacts and artifact kinds is Franssen, Kroes, Reydon and Vermaas 2014.

## **Ethics of Technology**

It was not until the twentieth century that the development of the ethics of technology as a systematic and more or less independent subdiscipline of philosophy started. This late development may seem surprising given the large impact that technology has had on society, especially since the industrial revolution.

A plausible reason for this late development of ethics of technology is the instrumental perspective on technology. This perspective implies, basically, a positive ethical assessment of technology: technology increases the possibilities and capabilities of humans, which seems in general desirable. Of course, since antiquity, it has been recognized that the new capabilities may be put to bad use or lead to human hubris. Often, however, these undesirable consequences are attributed to the users of technology, rather than the technology itself, or its developers. This vision is known as the instrumental vision of technology resulting in the so-called neutrality thesis. The neutrality thesis holds that technology is a neutral instrument that can be put to good or bad use by its users. During the twentieth century, this neutrality thesis met with severe critique, most prominently by Heidegger and Ellul, but also by philosophers from the Frankfurt School, such as Horkheimer and Adorno (1947 [2002]), Marcuse (1964), and Habermas (1968 [1970]).

The scope and the agenda for ethics of technology to a large extent depend on how technology is conceptualized. The second half of the twentieth century has witnessed a richer variety of conceptualizations of technology that move beyond the conceptualization of technology as a neutral tool,

as a world view or as a historical necessity. This includes conceptualizations of technology as a political phenomenon (Winner, Feenberg, Sclove), as a social activity (Latour, Callon, Bijker and others in the area of science and technology studies), as a cultural phenomenon (Ihde, Borgmann), as a professional activity (engineering ethics, e.g., Davis), and as a cognitive activity (Bunge, Vincenti). Despite this diversity, the development in the second half of the twentieth century is characterized by two general trends. One is a move away from technological determinism and the assumption that technology is a given self-contained phenomenon which develops autonomously to an emphasis on technological development being the result of choices (although not necessarily the intended result). The other is a move away from ethical reflection on technology as such to ethical reflection of specific technologies and to specific phases in the development of technology. Both trends together have resulted in an enormous increase in the number and scope of ethical questions that are asked about technology. The developments also imply that ethics of technology is to be adequately empirically informed, not only about the exact consequences of specific technologies but also about the actions of engineers and the process of technological development. This has also opened the way to the involvement of other disciplines in ethical reflections on technology, such as Science and Technology Studies (STS) and Technology Assessment (TA).

## **Approaches in the Ethics of Technology**

Not only is the ethics of technology characterized by a diversity of approaches, it might even be doubted whether something like a subdiscipline of ethics of technology, in the sense of a community of scholars working on a common set of problems, exists. The scholars studying ethical issues in technology have diverse backgrounds (e.g., philosophy, STS, TA, law, political science) and they do not always consider themselves (primarily) ethicists of technology. To give the reader an overview of the field, three basic approaches or strands that might be distinguished in the ethics of technology will be discussed.

### **1. Cultural and political approaches**

Both cultural and political approaches build on the traditional philosophy and ethics of technology of the first half of the twentieth century. Whereas cultural approaches conceive of technology as a cultural phenomenon that influences our perception of the world, political approaches conceive of technology as a political phenomenon, i.e., as a phenomenon that is ruled by and embodies institutional power relations between people.

Cultural approaches are often phenomenological in nature or at least position themselves in relation to phenomenology as post-phenomenology. Examples of philosophers in this tradition are Don Ihde, Albert Borgmann, Peter-Paul Verbeek and Evan Selinger (e.g., Borgmann 1984; Ihde 1990; Verbeek 2000 [2005], 2011). The approaches are usually influenced by developments in STS, especially the idea that technologies contain a script that influences not only people's perception of the world but also human behavior, and the idea of the absence of a fundamental distinction between humans and non-humans, including technological artifacts (Akrich 1992; Latour 1992, 1993; Ihde & Selinger 2003). The combination of both ideas has led some to claim that technology has (moral) agency.

Political approaches to technology mostly go back to Marx, who assumed that the material structure of production in society, in which technology is obviously a major factor, determined the economic and social structure of that society. Similarly, Langdon Winner has argued that technologies can embody specific forms of power and authority (Winner 1980). According to him, some tech-

nologies are inherently normative in the sense that they require or are strongly compatible with certain social and political relations. Railroads, for example, seem to require a certain authoritative management structure. In other cases, technologies may be political due to the particular way they have been designed. Some political approaches to technology are inspired by (American) pragmatism and, to a lesser extent, discourse ethics. A number of philosophers, for example, have pleaded for a democratization of technological development and the inclusion of ordinary people in the shaping of technology (Winner 1983; Sclove 1995; Feenberg 1999).

Although political approaches have obviously ethical ramifications, many philosophers who have adopted such approaches do not engage in explicit ethical reflection on technology. An interesting recent exception, and an attempt to consolidate a number of recent developments and to articulate them into a more general account of what an ethics of technology should look like, is the volume *Pragmatist Ethics for a Technological Culture* (Keulartz et al. 2002). In this volume, the authors plead for a revival of the pragmatist tradition in moral philosophy because it is better fit to deal with a number of moral issues in technology. Instead of focusing on how to reach and justify normative judgments about technology, a pragmatist ethics focuses on how to recognize and trace moral problems in the first place. Moreover, the process of dealing with these problems is considered more important than the outcome.

## **I. Engineering ethics**

Engineering ethics is a relatively new field of education and research. It started off in the 1980s in the United States, merely as an educational effort. Engineering ethics is concerned with “the actions and decisions made by persons, individually or collectively, who belong to the profession of engineering” (Baum 1980: 1). According to this approach, engineering is a profession, in the same way as medicine is a profession.

Although there is no agreement on how a profession exactly should be defined, the following characteristics are often mentioned:

- A profession relies on specialized knowledge and skills that require a long period of study;
- The occupational group has a monopoly on the carrying out of the occupation;
- The assessment of whether the professional work is carried out in a competent way is done by, and it is accepted that this can only be done by, professional peers;
- A profession provides society with products, services or values that are useful or worthwhile for society, and is characterized by an ideal of serving society;
- The daily practice of professional work is regulated by ethical standards, which are derived from or relate to the society-serving ideal of the profession.

Typical ethical issues that are discussed in engineering ethics are professional obligations of engineers as exemplified in, for example, codes of ethics of engineers, the role of engineers versus managers, competence, honesty, whistle-blowing, concern for safety and conflicts of interest (Da-

vis 1998, 2005; Martin & Schinzinger 2005; Harris, Pritchard, & Rabins 2008).

Recently, a number of authors have pleaded for broadening the traditional scope of engineering ethics (e.g., Herkert 2001; van de Poel & Royakkers 2011). This call for a broader approach derives from two concerns. One concern is that the traditional micro-ethical approach in engineering ethics tends to take the context in which engineers have to work for given, while major ethical issues pertain to how this context is 'organized'. Another concern is that the traditional micro-ethical focus tends to neglect issues relating to the impact of technology on society or issues relating to decisions about technology. Broadening the scope of engineering ethics would then, among others, imply more attention for such issues as sustainability and social justice.

## **II. Ethics of specific technologies**

The last decades have witnessed an increase in ethical inquiries into specific technologies. This may now be the largest of the three strands discussed, especially given the rapid growth in technology-specific ethical inquiries in the last two decades. One of the most visible new fields is probably computer ethics (e.g., Moor 1985; Floridi 2010; Johnson 2009; Weckert 2007; van den Hoven & Weckert 2008), with more recently a focus on robotics, artificial intelligence, machine ethics, and the ethics of algorithms (Lin, Abney, & Jenkins 2017; Nucci & Santoni de Sio 2016; Mittelstadt et al. 2016; Bostrom & Yudkowsky 2014; Wallach & Allen 2009). But biotechnology has spurred dedicated ethical investigations as well (e.g., Sherlock & Morrey 2002; P. Thompson 2007). More traditional fields like architecture and urban planning have also attracted specific ethical attention (Fox 2000). More recently, nanotechnology and so-called converging technologies have led to the establishment of what is called nanoethics (Allhoff et al. 2007). Other examples are the ethics of nuclear deterrence (Finnis et al. 1988), nuclear energy (Taebi & Roeser 2015) and geoengineering (C. Preston 2016).

Obviously the establishment of such new fields of ethical reflection is a response to social and technological developments. Still, the question can be asked whether the social demand is best met by establishing new fields of applied ethics. This issue is in fact regularly discussed as new fields emerge. Several authors have for example argued that there is no need for nanoethics because nanotechnology does not raise any really new ethical issues (e.g., McGinn 2010). The alleged absence of newness here is supported by the claim that the ethical issues raised by nanotechnology are a variation on, and sometimes an intensification of, existing ethical issues, but hardly really new, and by the claim that these issues can be dealt with the existing theories and concepts from moral philosophy. For an earlier, similar discussion concerning the supposed new character of ethical issues in computer engineering.

The new fields of ethical reflection are often characterized as applied ethics, that is, as applications of theories, normative standards, concepts and methods developed in moral philosophy. For each of these elements, however, application is usually not straightforward but requires a further specification or revision. This is the case because general moral standards, concepts and methods are often not specific enough to be applicable in any direct sense to specific moral problems. 'Application' therefore often leads to new insights which might well result in the reformulation or at least refinement of existing normative standards, concepts and methods. In some cases, ethical issues in a specific field might require new standards, concepts or methods. Beauchamp and Childress for example have proposed a number of general ethical principles for biomedical ethics (Beauchamp & Childress 2001). These principles are more specific than general normative standards, but still so general and abstract that they apply to different issues in biomedical ethics. In

computer ethics, existing moral concepts relating to for example privacy and ownership has been redefined and adapted to deal with issues which are typical for the computer age (Johnson 2003). New fields of ethical application might also require new methods for, for example, discerning ethical issues that take into account relevant empirical facts about these fields, like the fact that technological research and development usually takes place in networks of people rather than by individuals (Zwart et al. 2006). Another more

general issue that applies to many new technologies is how to deal with the uncertainties about (potential) social and ethical impacts that typically surround new emerging technologies. Brey's (2012) proposal for an anticipatory ethics may be seen as a reply to this challenge. The issue of anticipation is also one of the central concerns in the more recent interdisciplinary field of responsible innovation (e.g., Owen et al. 2013).

Although different fields of ethical reflection on specific technologies might well raise their own philosophical and ethical issues, it can be questioned whether this justifies the development of separate subfields or even subdisciplines. One obvious argument might be that in order to say something ethically meaningful about new technologies, one needs specialized and detailed knowledge of a specific technology. Moreover such subfields allow interaction with relevant non-philosophical experts in for example law, psychology, economy, science and technology studies (STS) or technology assessment (TA). On the other side, it could also be argued that a lot can be learned from interaction and discussion between ethicists specializing in different technologies, and a fruitful interaction with the two other strands discussed above (cultural and political approaches and engineering ethics). Currently, such interaction in many cases seems absent, although there are of course exceptions.

## **2. Some Recurrent Themes in the Ethics of Technology**

We now turn to the description of some themes in the ethics of technology. We focus on a number of general themes that provide an illustration of general issues in the ethics of technology and the way these are treated.

### **III. Neutrality versus moral agency**

One important general theme in the ethics of technology is the question whether technology is value-laden. Some authors have maintained that technology is value-neutral, in the sense that technology is just a neutral means to an end, and accordingly can be put to good or bad use (e.g., Pitt 2000). This view might have some plausibility in as far as technology is considered to be just a bare physical structure. Most philosophers of technology, however, agree that technological development is a goal-oriented process and that technological artifacts by definition have certain functions, so that they can be used for certain goals but not, or far more difficulty or less effectively, for other goals. This conceptual connection between technological artifacts, functions and goals makes it hard to maintain that technology is value-neutral. Even if this point is granted, the value-ladenness of technology can be construed in a host of different ways. Some authors have maintained that technology can have moral agency. This claim suggests that technologies can autonomously and freely 'act' in a moral sense and can be held morally responsible for their actions.

The debate whether technologies can have moral agency started off in computer ethics (Bechtel 1985; Snapper 1985; Dennett 1997; Floridi & Sanders 2004) but has since broadened. Typically, the authors who claim that technologies (can) have moral agency often redefine the notion of

agency or its connection to human will and freedom (e.g., Latour 1993; Floridi & Sanders 2004, Verbeek 2011). A disadvantage of this strategy is that it tends to blur the morally relevant distinctions between people and technological artifacts. More generally, the claim that technologies have moral agency sometimes seems to have become shorthand for claiming that technology is morally relevant. This, however, overlooks the fact technologies can be value-laden in other ways than by having moral agency (see, e.g., Johnson 2006; Radder 2009; Illies & Meijers 2009; Peterson & Spahn 2011). One might, for example, claim that technology enables (or even invites) and constrains (or even inhibits) certain human actions and the attainment of certain human goals and therefore is to some extent value-laden, without claiming moral agency for technological artifacts. A good overview of the debate can be found in Kroes and Verbeek 2014.

The debate about moral agency and technology is now particularly salient with respect to the design of intelligent artificial agents. James Moor (2006) has distinguished between four ways in which artificial agents may be or become moral agents:

1. Ethical impact agents are robots and computer systems that ethically impact their environment; this is probably true of all artificial agents.
2. Implicit ethical agents are artificial agents that have been programmed to act according to certain values.
3. Explicit ethical agents are machines that can represent ethical categories and that can 'reason' (in machine language) about these.
4. Full ethical agents in addition also possess some characteristics we often consider crucial for human agency, like consciousness, free will and intentionality.

It might perhaps never be possible to technologically design full ethical agents, and if it were to become possible it might be questionable whether it is morally desirable to do so (Bostrom & Yudkowsky 2014). As Wallach and Allen (2009) have pointed out, the main problem might not be to design artificial agents that can function autonomously and that can adapt themselves in interaction with the environment, but rather to build enough, and the right kind of, ethical sensitivity into such machines.

#### **IV. Responsibility**

Responsibility has always been a central theme in the ethics of technology. The traditional philosophy and ethics of technology, however, tended to discuss responsibility in rather general terms and were rather pessimistic about the possibility of engineers to assume responsibility for the technologies they developed. Ellul, for example, has characterized engineers as the high priests of technology, who cherish technology but cannot steer it. Hans Jonas (1979 [1984]) has argued that technology requires an ethics in which responsibility is the central imperative because for the first time in history we are able to destroy the earth and humanity.

In engineering ethics, the responsibility of engineers is often discussed in relation to code of ethics that articulate specific responsibilities of engineers. Such codes of ethics stress three types of responsibilities of engineers: (1) conducting the profession with integrity and honesty and in a competent way, (2) responsibilities towards employers and clients and (3) responsibility towards the public and society. With respect to the latter, most US codes of ethics maintain that engineers 'should hold paramount the safety, health and welfare of the public'.

As has been pointed out by several authors (Nissenbaum 1996; Johnson & Powers 2005; Swierstra & Jelsma 2006), it may be hard to pinpoint individual responsibility in engineering. The reason is that the conditions for the proper attribution of individual responsibility that have been discussed in the philosophical literature (like freedom to act, knowledge, and causality) are often not met by individual engineers. For example, engineers may feel compelled to act in a certain way due to hierarchical or market constraints, and negative consequences may be very hard or impossible to predict beforehand. The causality condition is often difficult to meet as well due to the long chain from research and development of a technology till its use and the many people involved in this chain. Davis (2012) nevertheless maintains that despite such difficulties individual engineers can and do take responsibility.

One issue that is at stake in this debate is the notion of responsibility. Davis (2012), and also for example Ladd (1991), argue for a notion of responsibility that focuses less on blame and stresses the forward-looking or virtuous character of assuming responsibility. But many others focus on backward-looking notions of responsibility that stress accountability, blameworthiness or liability. Zandvoort (2000), for example has pleaded for a notion of responsibility in engineering that is more like the legal notion of strict liability, in which the knowledge condition for responsibility is seriously weakened. Doorn (2012) compares three perspectives on responsibility ascription in engineering—a merit-based, a right-based and a consequentialist perspective—and argues that the consequentialist perspective, which applies a forward-looking notion of responsibility, is most powerful in influencing engineering practice.

The difficulty of attributing individual responsibility may lead to the Problem of Many Hands (PMH). The term was first coined by Dennis Thompson (1980) in an article about the responsibility of public officials. The term is used to describe problems with the ascription of individual responsibility in collective settings. Doorn (2010) has proposed a procedural approach, based on Rawls' reflective equilibrium model, to deal with the PMH; other ways of dealing with the PMH include the design of institutions that help to avoid it or an emphasis on virtuous behavior in organizations (van de Poel, Royackers, & Zwart 2015).

## **V. Design**

In the last decades, increasingly attention is paid not only to ethical issues that arise during the use of a technology, but also during the design phase. An important consideration behind this development is the thought that during the design phase technologies, and their social consequences, are still malleable whereas during the use phase technologies are more or less given and negative social consequences may be harder to avoid or positive effects harder to achieve.

In computer ethics, an approach known as Value Sensitive Design (VSD) has been developed to explicitly address the ethical nature of design. VSD aims at integrating values of ethical importance in engineering design in a systematic way (Friedman & Kahn 2003). The approach combines conceptual, empirical and technical investigations. There is also a range of other approaches aimed at including values in design. 'Design for X' approaches in engineering aim at including instrumental values (like maintainability, reliability and costs) but they also include design for sustainability, inclusive design, and affective design (Holt & Barnes 2010). Inclusive design aims at making designs accessible to the whole population including, for example, handicapped people and the elderly (Erlandson 2008). Affective design aims at designs that evoke positive emotions with the users and so contributes to human well-being. Van de Hoven, Vermaas, and van de Poel 2015 gives a good overview of the state-of-the art of value sensitive design for various values and

application domains.

If one tries to integrate values into design one may run into the problem of a conflict of values. The safest car is, due to its weight, not likely to be the most sustainability. Here safety and sustainability conflict in the design of cars. Traditional methods in which engineers deal with such conflicts and make trade-off between different requirements for design include cost-benefit analysis and multiple criteria analysis. Such methods are, however, beset with methodological problems like those discussed (Franssen 2005; Hansson 2007). Van de Poel (2009) discusses various alternatives for dealing with value conflicts in design including the setting of thresholds (satisficing), reasoning about values, innovation and diversity.

## VI. Technological risks

The risks of technology are one of the traditional ethical concerns in the ethics of technology. Risks raise not only ethical issues but other philosophical issues, such as epistemological and decision-theoretical issues as well (Roeser et al. 2012).

Risk is usually defined as the product of the probability of an undesirable event and the effect of that event, although there are also other definitions around (Hansson 2004b). In general it seems desirable to keep technological risks as small as possible. The larger the risk, the larger either the likeliness or the impact of an undesirable event is. Risk reduction therefore is an important goal in technological development and engineering codes of ethics often attribute a responsibility to engineers in reducing risks and designing safe products. Still, risk reduction is not always feasible or desirable. It is sometimes not feasible, because there are no absolutely safe products and technologies. But even if risk reduction is feasible it may not be acceptable from a moral point of view. Reducing risk often comes at a cost. Safer products may be more difficult to use, more expensive or less sustainable. So sooner or later, one is confronted with the question: what is safe enough? What makes a risk (un)acceptable?

The process of dealing with risks is often divided into three stages: risk assessment, risk evaluation and risk management. Of these, the second is most obviously ethically relevant. However, risk assessment already involves value judgments, for example about which risks should be assessed in the first place (Shrader-Frechette 1991). An important, and morally relevant, issue is also the degree of evidence that is needed to establish a risk. In establishing a risk on the basis of a body of empirical data one might make two kinds of mistakes. One can establish a risk when there is actually none (type I error) or one can mistakenly conclude that there is no risk while there actually is a risk (type II error). Science traditionally aims at avoiding type I errors. Several authors have argued that in the specific context of risk assessment it is often more important to avoid type II errors (Cranor 1990; Shrader-Frechette 1991). The reason for this is that risk assessment not just aims at establishing scientific truth but has a practical aim, i.e., to provide the knowledge on basis of which decisions can be made about whether it is desirable to reduce or avoid certain technological risks in order to protect users or the public.

Risk evaluation is carried out in a number of ways (see, e.g., Shrader-Frechette 1985). One possible approach is to judge the acceptability of risks by comparing them to other risks or to certain standards. One could, for example, compare technological risks with naturally occurring risks. This approach, however, runs the danger of committing a naturalistic fallacy: naturally occurring risks may (sometimes) be unavoidable but that does not necessarily make them morally acceptable. More generally, it is often dubious to judge the acceptability of the risk of technology A by

comparing it to the risk of technology B if A and B are not alternatives in a decision.

A second approach to risk evaluation is risk-cost benefit analysis, which is based on weighing the risks against the benefits of an activity. Different decision criteria can be applied if a (risk) cost benefit analysis is carried out (Kneese, Ben-David, and Schulze 1983). According to Hansson (2003: 306), usually the following criterion is applied: ... a risk is acceptable if and only if the total benefits that the exposure gives rise to outweigh the total risks, measured as the probability-weighted disutility of outcomes.

A third approach is to base risk acceptance on the consent of people who suffer the risks after they have been informed about these risks (informed consent). A problem of this approach is that technological risks usually affect a large number of people at once. Informed consent may therefore lead to a "society of stalemates" (Hansson 2003: 300).

Several authors have proposed alternatives to the traditional approaches of risk evaluation on the basis of philosophical and ethical arguments. Shrader-Frechette(1991) has proposed a number of reforms in risk assessment and evaluation procedures on the basis of a philosophical critique of current practices. Roeser (2012) argues for a role of emotions in judging the acceptability of risks. Hansson has proposed the following alternative principle for risk evaluation:

Exposure of a person to a risk is acceptable if and only if this exposure is part of an equitable social system of risk-taking that works to her advantage. (Hansson 2003: 305)

Hansson's proposal introduces a number of moral considerations in risk evaluation that are traditionally not addressed or only marginally addressed. These are the consideration whether individuals profit from a risky activity and the consideration whether the distribution of risks and benefits is fair.

Some authors have criticized the focus on risks in the ethics of technology. One strand of criticism argues that we often lack the knowledge to reliably assess the risks of a new technology before it has come into use. We often do not know the probability that something might go wrong, and sometimes we even do not know, or at least not fully, what might go wrong and what possible negative consequences may be. To deal with this, some authors have proposed to conceive of the introduction of new technology in society as a social experiment and have urged to think about the conditions under which such experiments are morally acceptable (Martin & Schinzingler 2005; van de Poel 2016). Another strand of criticism states that the focus on risks has led to a reduction of the impacts of technology that are considered (Swierstra & te Molder 2012). Only impacts related to safety and health, which can be calculated as risks, are considered, whereas 'soft' impacts, for example of a social or psychological nature, are neglected, thereby impoverishing the moral evaluation of new technologies.

## **Computer and Information Ethics**

This section surveys the field of computer and information ethics. The first section will define the field and will consider its aims and scope, its history, and major approaches and orientations. In the section thereafter, major topics in computer ethics will be surveyed, including privacy, security, free expression and content control, equity issues, intellectual property, and issues of moral responsibility. The final section will focus on the approaches of values in design and valuesensitive design, which aim to analyze embedded values in computer software and systems, and to devise methodologies for incorporating values into the design process.

Approaches in Computer and Information ethics Computer ethics is a field of applied ethics that addresses ethical issues in the use, design and management of information technology and in the formulation of ethical policies for its regulation in society. Computer ethics, which has also been called cyberethics, took off as a field in the 1980s, together with the rise of the personal computer. Early work in the field had already started in the 1940s, soon after the invention of the computer. MIT Professor Norbert Wiener was a precursor of the field, already identifying many issues of computer ethics in his book *The Human Use of Human Beings* [Wiener, 1950]. The term “computer ethics” was first introduced in the mid-1970s by Walter Maner, who also promoted the idea of teaching computer ethics in computer science curricula [Maner, 1980]. The watershed year of 1985 saw the appearance of seminal publications by Jim Moor [1985] and Deborah Johnson [1985] that helped define the field. Since then, it has become a recognized field of applied ethics, with its own journals and conference series. In recent years, the field is sometimes also related to a more general field of information ethics, which includes computer ethics, media ethics, library ethics, and bioinformation ethics.

Why would there be a need for computer ethics, while there is no need for a separate field of ethics for many other technologies, like automobiles and appliances? Jim Moor [1985] has argued that the computer has had an impact like no other recent technology. The computer seems to impact every sector of society, and seems to require us to rethink many of our policies, laws and behaviors. According to Moor, this great impact is due to the fact that computers have logical malleability, meaning that their structure allows them to perform any activity that can be specified as a logical relation between inputs and outputs. Many activities can be specified in this way, and the computer therefore turns out to be an extremely powerful and versatile machine that can perform an incredible amount of functions, from word processor to communication device to gaming platform to financial manager.

The versatility of computers is an important reason for the occurrence of a computer revolution, or information revolution, which is now transforming many human activities and social institutions. Many important things that humans do, including many that raise moral questions like stealing from someone, defaming someone, or invading someone’s privacy now also exist in electronic form. In addition, the computer also makes substantially new types of activities possible that are morally controversial, such as the creation of virtual child pornography for which no real children were abused. Because many of the actions made possible by computers are different and new, we often lack policies and laws to guide them. They generate what Moor has called policy vacuums, being the lack of clear policies or rules of conduct. The task of computer ethics, then, is to propose and develop new ethical policies, ranging from explicit laws to informal guidelines, to guide new types of actions that involve computers. Computer ethics has taken off since its birth in the mid-80s, and has established itself as a mature field with its own scientific journals, conferences and organizations.

The field initially attracted most of its interests from computer scientists and philosophers, with many computer science curricula nowadays requiring a course or module on computer ethics. However, given the wide implications for human action sketched by Moor, computer ethics is also of interest to other fields that focus on human behavior and social institutions, such as law, communication studies, education, political science and management. Moreover, computer ethics is also an important topic of debate in the public arena, and computer ethicists regularly contribute to public discussions regarding the use and regulating of computer technology. Computer ethics is sometimes defined as a branch of professional ethics similar to other branches like engineering ethics and journalism ethics. On this view, the aim of computer ethics is to define and ana-

lyze the moral and professional responsibilities of computer professionals. Computer professionals are individuals employed in the information technology branch, for example as hardware or software engineer, web designer, network or database administrator, computer science instructor or computer-repair technician.

Computer ethics, on this view, should focus on the various moral issues that computer professionals encounter in their work, for instance in the design, development and maintenance of computer hardware and software. Within this approach to computer ethics, most attention goes to the discussion of ethical dilemmas that various sorts of computer professionals may face in their work and possible ways of approaching them. Such dilemmas may include, for example, the question how one should act as a web designer when one's employer asks one to install spyware into a site built for a client, or the question to what extent software engineers should be held accountable for harm incurred by software malfunction. Next to the discussion of specific ethical dilemmas, there is also general discussion of the responsibilities of computer professionals towards various other parties, such as clients, employers, colleagues, and the general public, and of the nature and importance of ethical codes in the profession.

A recent topic of interest has been the development of methods for value-sensitive design, which is the design of software and systems in such a way that they conform to a desired set of (moral) values [Friedman, Kahn and Borning, 2006]. While the professional ethics view of computer ethics is important, many in the field employ a broader conception that places the focus on general ethical issues in the use and regulation of information technology. This approach may be called the philosophical ethics approach to computer ethics. This conception holds, following Moor [1985], that computer ethics studies moral issues that are of broad societal importance, and develops ethical policies to address them. Such policies may regulate the conduct of organizations, groups and individuals and the workings of institutions.

The philosophical approach focuses on larger social issues like information privacy and security, computer crime, issues of access and equity, and the regulation of commerce and speech on the Internet. It asks what ethical principles should guide our thinking about these issues, and what specific policies (laws, social and corporate policies, social norms) should regulate conduct with respect to them. Within this approach, some researchers focus on the development of ethical guidelines for users of computer technology. Others place more emphasis on policy issues, and try to formulate ethical policies for organizations, government agencies or lawmakers. Still others focus on computer technologies themselves, and try to identify and evaluate morally relevant features in their design. Some also focus on theoretical and metaethical issues.

## **Topics in Computer and Information Ethics**

Introductions to computer ethics show considerable agreement on what the central issues for computer ethics are. They include ethical issues of privacy, security, computer crime, intellectual property, free expression, and equity and access, and issues of responsibility and professional ethics.

### **Privacy**

Privacy is a topic that has received much attention in computer ethics from early on. Information technology is often used to record, store and transmit personal information, and it may happen that this information is accessed or used by third parties without the consent of the corresponding persons, thus violating their privacy. Privacy is the right of persons to control access to their per-

sonal affairs, such as their body, thoughts, private places, private conduct, and personal information about themselves. The most attention in computer ethics has gone to information privacy, which is the right to control the disclosure of personal data. Information technology can easily be used to violate this right.

Privacy issues come into play on the Internet, where cookies, spyware, browser tracking and access to the records of internet providers may be used to study the Internet behavior of individuals or to get access to their PCs. They also come into play in the construction of databases with personal information by corporations and government organizations, and the merging of such databases to create complex records about persons or to find matches across databases. Other topics of major concern include the privacy implications of video surveillance and biometric technologies, and the ethics of medical privacy and privacy in the workplace. It has also been studied whether people have a legitimate expectation to privacy in public areas, whether they can be freely recorded, screened and tracked whenever they appear in public and how the notion of "public" itself has changed in light of information technology.

### **Security and crime**

Security has become a major issue in computer ethics, because of rampant computer crime and fraud, the spread of computer viruses, malware and spam, and national security concerns about the status of computer networks as breeding grounds for terrorist activity and as vulnerable targets for terrorist attacks. Computer security is the protection of computer systems against the unauthorized disclosure, manipulation, or deletion of information and against denial of service attacks. Breaches of computer security may cause harms and rights violations, including economic losses, personal injury and death, which may occur in so-called safety-critical systems, and violations of privacy and intellectual property rights.

Much attention goes to the moral and social evaluation of computer crime and other forms of disruptive behavior, including hacking (non-malicious break-ins into systems and networks), cracking (malicious break-ins), cybervandalism (disrupting the operations of computer networks or corrupting data), software piracy (the illegal reproduction or dissemination of proprietary software), and computer fraud (the deception for personal gain in online business transactions by assuming a false online identity or by altering or misrepresenting data). Another recently important security-related issue is how state interests in monitoring and controlling information infrastructures to better protect against terrorist attacks should be balanced against the right to privacy and other civil rights [Nissenbaum, 2005].

### **Free expression and content control**

The Internet has become a very important medium for the expression of information and ideas. This has raised questions about whether there should be content control or censorship of Internet information, for example by governments or service providers. Censorship could thwart the right to free expression, which is held to be a basic right in many nations. Free expression includes both freedom of speech (the freedom to express oneself through publication and dissemination) and freedom of access to information.

Several types of speech have been proposed as candidates for censorship. These include pornography and other obscene forms of speech, hate speech such as websites of fascist and racist organizations, speech that can cause harm or undermine the state, such as information as to how to

build bombs, speech that violates privacy or confidentiality, and libelous and defamatory speech. Studies in computer ethics focus on the permissibility of these types of speech, and on the ethical aspects of different censorship methods, such as legal prohibitions and software filters.

**Equity and access** The information revolution has been claimed to exacerbate inequalities in society, such as racial, class and gender inequalities, and to create a new, digital divide, in which those that have the skills and opportunities to use information technology effectively reap the benefits while others are left behind. In computer ethics, it is studied how both the design of information technologies and their embedding in society could increase inequalities, and how ethical policies may be developed that result in a fairer and more just distribution of their benefits and disadvantages. This research includes ethical analyses of the accessibility of computer systems and services for various social groups, studies of social biases in software and systems design, normative studies of education in the use of computers, and ethical studies of the digital gap between industrialized and developing countries.

**Intellectual property** Intellectual property is the name for information, ideas, works of art and other creations of the mind for which the creator has an established proprietary right of use. Intellectual property laws exist to protect creative works by ensuring that only the creators benefit from marketing them or making them available, be they individuals or corporations. Intellectual property rights for software and digital information have generated much controversy. There are those who want to ensure strict control of creators over their digital products, whereas others emphasize the importance of maintaining a strong public domain in cyberspace, and argue for unrestricted access to electronic information and for the permissibility of copying proprietary software. In computer ethics, the ethical and philosophical aspects of these disputes are analyzed, and policy proposals are made for the regulation of digital intellectual property in its different forms. Patentability of software is also a topic of major concern, which is problematic due to the non-tangible nature of software as well as the difficulty in specifying what counts as the identity of a piece of software (cf. Turner and Eden, forthcoming b).

## **Moral Responsibility**

Society strongly relies on computers. It relies on them for correct information, for collaboration and social interaction, for aid in decision-making, and for the monitoring and execution of tasks. When computer systems malfunction or make mistakes, harm can be done, in terms of loss of time, money, property, opportunities, or even life and limb. Who is responsible for such harms? Computer professionals, end-users, employers, policy makers and others could all be held responsible for particular harms.

It has even been argued that intelligent computer systems can bear moral responsibility themselves [Dodig-Crnkovic and Persson, 2008]. In computer ethics, it is studied how the moral responsibility of different actors can be defined, and what kinds of decisions should be delegated to computers to begin with. It is studied how a proper assignment of responsibility can minimize harm and allows for attributions of accountability and liability.

## **Foundational Issues in Computer Ethics**

Foundational, metaethical and methodological issues have received considerable attention in computer ethics. Many of these issues have been discussed in the context of the so-called foundationalist debate in computer ethics [Floridi and Sanders, 2002; Himma, 2007a]. This is an on-

going metatheoretical debate on the nature and justification of computer ethics and its relation to metaethical theories. Three questions central to the foundationalist debate are: "Is computer ethics a legitimate field of applied ethics?", "Does computer ethics raise any ethical issues that are new or unique?" and "Does computer ethics require substantially new ethical theories, concepts or methodologies different from those used elsewhere in applied ethics?"

The first question, whether computer ethics is a legitimate field of applied ethics, has often been discussed in the context of the other two questions, with discussants arguing that the legitimacy of computer ethics depends on the existence of unique ethical issues or questions in relation to computer technology. The debate on whether such issues exist has been called the uniqueness debate [Tavani, 2002].

In defense of uniqueness, Maner [1996] has argued that unique features of computer systems, like logical malleability, superhuman complexity and the ability to make exact copies, raise unique ethical issues to which no non-computer analogues exist. Others remain unconvinced that any computer ethics issue is genuinely unique. Johnson [2003] has proposed that issues in computer ethics are new species of traditional moral issues. They are familiar in that they involve traditional ethical concepts and principles like privacy, responsibility, harm and ownership, but the application of these concepts and principles is not straightforward because of special properties of computer technology, which require a rethinking and retooling of ethical notions and new ways of applying them. Floridi and Sanders [2002; Floridi, 2003] do not propose the existence of unique ethical issues but rather argue for the need of new ethical theory. They argue that computer ethics needs a metaethical and macrotheoretical foundation, which they argue be different from the standard macroethical theories like utilitarianism and Kantianism. Instead, they propose a macroethical theory they call Information Ethics, which assigns intrinsic value to information. The theory covers not just digital or analogue information, but in fact analyzes all of reality as having an informational ontology, being built out of informational objects.

Since informational objects are postulated to have intrinsic value, moral consideration should be given to them, including the informational objects produced by computers. In contrast to these various authors, Himma [2007a] has argued that computer technology does not need to raise new ethical issues or require new ethical theories to be a legitimate field of applied ethics. He argues that issues in computer ethics may not be unique and may be approached with traditional ethical theories, and that it nevertheless is a legitimate field because computer technology has given rise to an identifiable cluster of moral issues in much the same way like medical ethics and other fields of applied ethics.

Largely separately from the foundationalist debate, several authors have discussed the issue of proper methodology in computer ethics, discussing standard methods of applied ethics and their limitations for computer ethics [Van den Hoven, 2008; Brey, 2000]. An important recent development that has methodological and perhaps also metaethical ramifications is the increased focus on cultural issues. In intercultural information ethics [Ess and Hongladarom, 2007; Brey, 2007], ethicists attempt to compare and come to grips with the vastly different moral attitudes and behaviors that exist towards information and information technology in different cultures. In line with this development, Gorniak-Kocykowska [1995] and others have argued that the global character of cyberspace requires a global ethics which transcends cultural differences in value systems.

## Other Topics

There are many other social and ethical issues that are studied in computer ethics next to these central ones. Some of these include the implications of IT for community, identity, the quality of work, and the quality of life, the relation between information technology and democracy, the ethics of Internet governance and electronic commerce, and the ethics of trust online. Many new ethical issues come up together with the development of new technologies or applications. Recently, much attention has been devoted to ethical aspects of social networking sites like Facebook, MySpace and Youtube, to ubiquitous computing and ambient intelligence, and to robotics and artificial agents. The constant addition of new products and services in information technology and the emergence of new uses and correlated social and cultural consequences ensures that the field keeps meeting new challenges.

## Values and Computer Systems Design

Although most ethical commentary in the philosophical approach is directed at the use of computers by individuals and organizations, attention has also started to be paid to systems and software themselves. It has come to be recognized that the systems themselves are not morally neutral but contain values and biases in their design that must also be analyzed. Approaches of this sort have been called values in design approaches [Nissenbaum, 1998; Flanagan, Howe and Nissenbaum, 2007]. Values in design approaches hold that computer software and systems can be morally evaluated partially or wholly independently of actual uses of them. They can be said to embody values in the sense that they have a tendency to promote or sustain particular values when used. This may sound like technological determinism, but proponents usually do not subscribe to the strong determinist thesis that embodied values necessitate certain effects in whatever way the system is used.

Yet, they do hold a weak determinism according to which systems may embody values that systematically engender certain effects across a wide range of uses, at least including typical or "normal" ways of using the system. For a system to embody a value, then, means that there is a tendency for that value to be promoted or realized when the system is used. This observation has led proponents to argue that more attention should be paid to ethical aspects in the design of computer systems rather than just their use.

Friedman and Nissenbaum [1996] have studied how values may enter into computer systems, with a focus on justice and bias. They argue that bias can enter into computer systems in three ways. Preexisting bias emerges from the practices and attitudes of designers and the social institutions in which they function. Technical bias arises from technical constraints. Emergent bias arises after the design of the system, when a context of use emerges that is different from the one anticipated. These three origins of bias may be generalized to apply to other values as well. Brey [2000] has proposed a particular values in design approach termed disclosive computer ethics. He claims that a significant part of the effort of computer ethics should be directed at deciphering and subsequently evaluating embedded moral values in computer software and systems.

The focus should be on widely held public and moral values, such as privacy, autonomy, justice, and democracy. Research, Brey argues, should take place at three levels: the disclosure level, at which morally charged features of computer systems are detected and disclosed, the theoretical level, at which relevant moral theory is developed, and the application level, at which ethical theory is used in the evaluation of the disclosed morally charged features. He claims that such research should be interdisciplinary, involving ethicists, computer scientists and social scientists.

The approach of value-sensitive design [Friedman, Kahn and Borning, 2006; Friedman & Kahn, 2003] is not so much concerned with the identification and evaluation of values in computer systems, but rather with the development of methods for incorporating values into the design process. It is an approach to software engineering and systems development that builds on values in design approaches and studies how accepted moral values can be operationalized and incorporated into software and systems. Its proposed methodology integrates conceptual investigations into values, empirical investigations into the practices, beliefs and intentions of users and designers, and technical investigations into the way in which technological properties and mechanisms support or hinder the realization of values. It also seeks procedures to incorporate and balance the values of different stakeholders in the design process.

## **Biotechnology**

The term “techno science” is increasingly being used to refer to such contemporary disciplines as information and communication technology, nanotechnology, artificial intelligence and to biotechnology. The popularity of the term is illustrated by the fact that even a group of social scientists reporting on the changing attitudes of European public towards biotechnology invokes the term to mark the departure of this particular field from the norms and values once held to be essential to the ethos of science. The evident commercialization and industrialization of biotechnology, with the pursuit of private knowledge, patents and profits, hardly meets Merton's criteria of universalism, communism, disinterestedness and skepticism, or the public's expectations about the values, accountability and social responsibility of science. Biotechnology has become a techno science, a commercial enterprise accountable to financial markets and to shareholders. It is interesting to note that the public, according to these social scientists, have not yet fully accommodated to the new commercial realities of “techno science” and still entertain expectations about science that modern biotechnology is unlikely going to meet.

In the seventeenth century the philosophers Francis Bacon (1561–1626) and René Descartes (1596–1650) advocated a new way of doing science that would have the power to conquer nature for human benefit. (The old science had seemed to be more concerned with contemplating nature than controlling it.) In the contemporary world biotechnology is providing the technology for controlling and changing living nature, including human nature. However, because biotechnological power over the living world offers not only the promise for doing good but also an opportunity for doing evil, this has provoked an ethical debate over the modern scientific project for the mastery of nature through technology.

Biotechnology can be defined as the technical manipulation of living organisms or parts of those organisms to provide products and services to satisfy human desires. If it is defined in this broad way, one can see that biotechnology has been employed throughout human history.

### **Biotechnology in History**

Biotechnology can be defined as the technical manipulation of living organisms or parts of those organisms to provide products and services to satisfy human desires. If it is defined in this broad way, one can see that biotechnology has been employed throughout human history.

The history of biotechnology can be divided into three periods: ancient, modern, and contemporary. Ancient biotechnology began more than 10,000 years ago with the emergence of agriculture in ancient Mesopotamia. Modern biotechnology began in the nineteenth century with the develop-

ment of industrial microbiology. Contemporary biotechnology began in the 1970s with new techniques for genetic engineering. In each period one can see the power humans have acquired to manipulate nature. But one also can see the natural limits of this power, which is constrained by the natural potentialities available in wild plants and animals and the natural complexities of behavioral traits in the living world.

Ancient biotechnology began when human beings started to domesticate plants and animals for human use. Throughout most of the history of the human species, spanning approximately six million years, human beings fed themselves by gathering wild plants and hunting wild animals. Then some people in a few parts of the world began to produce food by cultivating domesticated plants and herding domesticated animals. As a consequence those farmers and herders bred for and selected genetic modifications in domesticated organisms that were more suitable to human desires. Even in the early twenty-first century all of human civilization depends on this project in agricultural biotechnology.

The human power of domestication is limited, however, by the natural potentiality of wild plants and animals. Most plant and animal species in the wild are not suitable for domestication. For example, most wild plants are not good as a source of food because they are woody or do not produce fruit, leaves, or roots that are edible. Most wild animals are not susceptible to successful domestication because they cannot be bred and herded in a manner that makes them useful for human beings. Although advances in biological knowledge have increased human biotechnological power over living nature, that power will always be limited by the potentialities found in nature.

Modern biotechnology arose in the nineteenth century as growing knowledge in the biological sciences was applied to the technological manipulation of the living world for human purposes. For example, the chemist Louis Pasteur's (1822–1895) microbiological explanation of fermentation as resulting from the activity of microscopic organisms allowed improvements in the brewing of beer and other industries that depend on using fermentation by yeast to produce food and beverages. Pasteur also showed that infectious diseases are caused by disease-producing microorganisms and perfected techniques for vaccination that would create immunity to some of those diseases. Later, in the twentieth century, the discovery of the ways in which some fungi produce antibiotics such as penicillin revolutionized the medical treatment of bacterial infections. In the early 2000s there are hundreds of pharmaceutical agents derived from fungal fermentation.

However, even modern biotechnology shows the technical limits set by nature. Bacteria vulnerable to fungal toxins can evolve to become resistant to those toxins. Indeed, bacteria have been so successful in evolving tolerance to antibiotics that there is a growing fear in the medical profession that the age of antibiotic protection against infectious diseases is reaching its end. The power of this aspect of biotechnology for controlling living nature is great but limited.

The contemporary biotechnology that began in the last half of the twentieth century arose from a deeper knowledge of genetics and molecular biology and has provided humans with greater power over the living world. Even so, contemporary biotechnology is limited in its technical means by the physical and chemical limits of nature.

Contemporary biotechnology began in 1973 when Herbert Boyer and Stanley Cohen developed the technology for recombinant DNA, which allows scientists to alter DNA molecules and thus artificially create new forms of life. They did this by combining a number of discoveries. Bacteria protect themselves against certain viruses through the use of restriction enzymes that cut up viral DNA at specific sequences of nucleotide bases; this allows a scientist with the right restriction

enzyme to cut out a specific genetic sequence. Bacteria contain plasmids, which are small loops of DNA that can pass from one bacterium to another. This allows bacteria to develop antibiotic resistance quickly if the genes for resistance are passed by plasmids. Boyer and Cohen showed how one could use a restriction enzyme to cut out a specific genetic sequence and then glue that sequence into a bacterial plasmid. That plasmid, with its new combination of genetic sequences, could be introduced into a bacterial cell. As the bacterial cell divided, it would produce copies of the recombinant plasmid, which then could be extracted from the bacteria.

An illustration of the value of this recombinant DNA technique is provided by the production of human insulin. People with diabetes do not have enough of the protein insulin to regulate blood-sugar levels. After the 1920s diabetic patients were treated with injections of insulin extracted from pigs and cattle. This is an example of modern biotechnology. Although pig and cow insulin is very similar to human insulin, there are enough differences that some people with diabetes have had allergic reactions. Contemporary biotechnology provided a solution to the problem by using recombinant DNA techniques. The human gene for insulin was identified and then could be inserted into a bacterial cell through a plasmid so that the bacterium would produce human insulin that could be harvested for use by human patients. In 1982 human insulin produced in genetically modified bacteria became the first drug of contemporary biotechnology to be approved by the U.S. Food and Drug Administration.

Contemporary biotechnology has developed hundreds of products with agricultural, environmental, and medical benefits. Agricultural biotechnology uses reliable techniques for genetic manipulation to produce new kinds of plants and animals to provide food that is cheaper and more nutritious. Environmental biotechnology is used to design genetically modified organisms that can clean up environmental pollution by consuming toxic materials. Medical biotechnology is used to devise new drugs and vaccines and therapeutic techniques that relieve or prevent suffering, cure disease, and enhance physical and mental well-being.

## **Ethical Issues**

Despite its many benefits, biotechnology has provoked ethical controversy in six areas of moral concern: safety, liberty, justice, environmental nature, humannature, and religious beliefs.

**SAFETY.** Safety is a moral concern for opponents of biotechnology who worry that its power disrupts the complex balance in living nature in ways that are likely to be harmful. Individuals such as Jeremy Rifkin (1977) and groups such as Greenpeace have warned that genetically modified crops and foods could endanger human health as well as the health of the environment. Critics of medical biotechnology fear that biotechnology medicine alters the human body and mind in radical ways that could produce harmful consequences—perhaps far into the future—in ways that are hard to foresee.

Proponents of biotechnology such as James Watson (2003) and Michael Fumento (2003) argue that its techniques are so precise and controlled that it tends to be far safer than older forms of technology. Breeders of plants and animals have genetically modified organisms for thousands of years without understanding exactly what they were doing. But biotechnology in the early 2000s provides a better understanding of and greater power over genetic mechanisms so that it is possible to minimize the risks. In fact, there is no clear evidence that any human being among the hundreds of millions who have been exposed has become sick from eating genetically modified foods. Similarly, the risks to human health from medical biotechnology can be reduced by means of careful testing and new techniques for designing drugs and therapies that are designed specifically for

individual patients with unique genetic traits. Nevertheless, the history of unforeseen harm from all technologies justifies a cautious approach.

**LIBERTY.** Liberty is a moral concern for those who fear that biotechnology will give some people tyrannical power over others. The history of eugenics, in which governments used coercion to eliminate those judged to be biologically "unfit," illustrates the danger of encroachments on liberty. Libertarian proponents of biotechnology such as Fumento and Virginia Postrel (1998) insist that there should be no threat to liberty as long as biotechnology is chosen freely by individuals in a free market economy. But conservatives such as Leon Kass (2002) worry that people could be coerced informally by social pressure, employers, and insurance companies so that they will feel compelled to adopt biotechnology products and procedures. Moreover, Kass and others suggest that biotech can give parents the power to control the nature and behavior of their children in ways that threaten the liberty of the children.

**JUSTICE.** Justice is a moral concern for people who anticipate that biotechnology will be so expensive that only the richest individuals will benefit from it so that the rich will have an unjust advantage over the poor. Even proponents of biotechnology such as Lee Silver (1998) worry that reproductive biotechnology eventually could divide humanity into two separate species based on the wealth or poverty of their ancestors: the "genrich" who would be genetically designed to be superior and the "genpoor" who would be left behind as biologically inferior beings. Of course in some ways this problem is not unique to biotechnology because rich people always have unfair advantages over the poor, but the libertarian defenders of biotechnology foresee that in a free-market society prices for biotechnology products and services eventually will decline as a result of competition, and this will lessen the advantages of the rich over the poor. Similarly, critics of biotechnology argue that the rich nations of the world will benefit more from this new technology than will the poor nations, yet libertarians predict that international free trade will spread the advantages of biotechnology around the world.

**ENVIRONMENTAL NATURE.** Environmental nature is a moral concern for environmentalists such as Rifkin and Bill McKibben (2003). Those environmentalists predict that biotechnology will promote the replacement of the natural environment with a purely artificial world and that this will deprive human beings of healthy contact with wild nature. They also fear that introducing genetically modified organisms into the environment will produce monstrous forms of life that will threaten human beings and the natural world.

Proponents of biotechnology respond by noting that beginning with agriculture, human beings have been creating genetically modified organisms that transform the environment for thousands of years. All organisms modify their environments, sometimes with global effects. For example, the oxygen in the earth's atmosphere has been produced over billions of years by photosynthetic organisms. Biologists such as F. John Odling-Smee (2003) have called this "niche construction." So human beings are not unique in their capacity for changing their environments. Although this sometimes has produced disasters such as the extinction of plants and animals and the emergence of new disease-causing agents, people have learned to adjust to these dangers, and contemporary biotechnology provides more precise knowledge and techniques to recognize and avoid such dangers. Moreover, environmental biotechnology is developing new organisms, such as bacteria genetically engineered to metabolize toxic wastes, to restore dangerous natural environments to a condition that is safe for human beings.

## HUMAN NATURE.

Human nature is a moral concern for anyone who fears that biotechnology could change or even abolish human nature. Both environmentalists such as Rifkin and McKibben and conservatives such as Kass and Francis Fukuyama (2002) worry that the biotechnological transformation of human nature will produce a "posthuman" world with no place for human dignity rooted in human nature. On the other side of this debate Nick Bolstrom (2003) and others in the World Transhumanist Association welcome the prospect of using biotechnology to move toward a "transhuman" condition. More moderate proponents of biotechnology dismiss both positions for being based on exaggerated views of the power of biotechnology.

In a report by the President's Council on Bioethics (2003) Kass and other members of the council contend that biotechnology expresses a willful lack of humility in pursuing a scientific mastery of nature that carries out the modern scientific project first described by Francis Bacon. When a physician uses medical therapy to restore the health of a patient, the physician cultivates the body's natural capacity for healing to serve the natural goal of health. Such medical treatment is guided in both its means and its ends by nature. But when biotechnologists use genetic engineering or psychotropic drugs to extend human bodily or mental powers beyond their normal range, they act not as nature's servant but as nature's master because they are forcing nature to serve their own willful desires.

As an example Kass and other members of the council point to the use of psychotropic drugs such as Prozac that alter the biochemistry of the brain to elevate mood. Using such drugs to cure severely depressed patients can be justified as therapy directed toward restoring normal mental health, but their use to change human personality radically—perhaps by inducing feelings of contentment that never yield to sadness—would violate the normal range of human mental experience set by nature. The ultimate aim of such a psychopharmacological science would be a drug-dependent fantasy of happiness that would be dehumanizing. Furthermore, scientists such as David Healy (2004) have warned that any drug powerful enough to change human personality is likely to have severely harmful side effects.

The President's Council (2003) warns against the excessive pride inherent in Bacon's project for mastering nature, which assumes that nature is mere material for humans to shape to their desires. Rather, it urges people to adopt an attitude of humility and respect and treat the natural world as a "gift." To respect the "giftedness" of the natural world is to recognize that the world is given to humans as something not fully under their control and that even human powers for changing the world belong to human nature as the unchanging ground of all change (Kass 2003).

Proponents of biotechnology could respond by defending Bacon's project as combining respect for nature with power over nature. At the beginning of the *Novum Organon* Bacon observed that "nature to be commanded must be obeyed" because "all that man can do is to put together or put asunder natural bodies," and then "the rest is done by nature working within" (Bacon 1955, p. 462). Kass has used the same words in explaining how the power of biotechnology is limited by the potentialities inherent in nature (Kass 1985).

Throughout the history of biotechnology—from the ancient Mesopotamian breeders of plants and animals, to Pasteur's use of microorganisms for fermentation and vaccination, to Boyer and Cohen's techniques for gene splicing—people have employed nature's properties for the satisfaction of human desires. Boyer and Cohen did not create restriction enzymes and bacterial plasmids but discovered them as parts of living nature. They then used those natural processes to bring about

outcomes, such as the production of human insulin for persons with diabetes, that would benefit human beings. Biotechnology has the ability to change nature only insofar as it conforms to the laws of nature. To command nature people must obey it.

Baconian biotechnology is thus naturally limited in its technical means because it is constrained by the potentialities of nature. It is also naturally limited in its moral ends because it is directed toward the goals set by natural human desires. Kass and the President's Council (2003) acknowledge this by showing how biotechnology is employed to satisfy natural desires such as the desire of parents for happy children and the desire of all human beings for life and health. As they indicate, it is not enough to respect the "giftedness" of nature because some of the "gifts" of nature, such as diabetes and cancer, are undesirable. People accept some of nature's gifts and reject others on the basis of the desires inherent in human nature.

**RELIGIOUS BELIEFS.** To appreciate life as a gift that should elicit a feeling of humility rather than mastery is a religious emotion. Some of the moral concerns about biotechnology express the religious attitude that life is sacred and therefore the biotechnological manipulation of life shows a lack of reverence for the divinely ordained cosmic order. The biblical story of the Tower of Babel (Genesis 11:1–9) suggests that the human lust for technical power over the world provokes divine punishment.

In 1977 the environmentalist Jeremy Rifkin wrote a book attacking biotechnology with the title *Who Should Play God?: The Artificial Creation of Life and What It Means for the Future of the Human Race*. The title conveys the direction of his argument. The "creation of life" is proper only for God. For human beings to create life "artificially" is a blasphemous transgression of God's law that will bring punishment upon the human race. Rifkin often uses the imagery of the Frankenstein story. Like Doctor Frankenstein, biotech scientists are trying to take God's place in creating life, and the result can only be the creation of monsters. When people such as Rifkin use the phrase "playing God," they evoke a religious sense that nature is a sacred expression of God's will and therefore should not be changed by human intervention. Rifkin has said that "the resacralization of nature stands before us as the great mission of the coming age" (Rifkin 1983, p. 252).

In contrast to Rifkin, Bacon thought that regarding nature as sacred was a pagan idea contrary to biblical religion. In pagan antiquity the natural world was the sacred image of God, but the Bible teaches that God is the transcendent Creator of nature; therefore, God's mysterious will is beyond nature. Although nature declares God's power and wisdom, it does not declare the will and true worship of God. Bacon believed that true religion as based on faith in biblical revelation must be separated from true philosophy based on the rational study of nature's laws (Bacon 1955).

Some biblical theologians, such as Philip Hefner (2003) and Ted Peters (2003), have restated this Baconian claim that the biblical conception of God as the supernatural creator of nature separates the sacred and the natural and thus denies pagan pantheism. They argue that because human beings have been created in God's image and God is the Creator, human beings must share somehow in God's creativity. The Bible declares that when God made humanity in his image, this was to include "dominion" or "mastery" over all the earth, including all the animals (Genesis 1:26–28). Hefner reads the Bible as teaching that human beings are "created cocreators." As "created," humans are creatures and cannot create in the same way as God, who can create *ex nihilo*, "from nothing." However, as "cocreators" people can contribute to changes in creation. Of course, Hefner warns, people must do this as cautious and respectful stewards of God's creation, but it is not appropriate to worship nature as sacred and thus inviolable.

The theological idea of human beings as cocreators was affirmed by Pope John Paul II in his 1981 encyclical *Laborem Exercens* and criticized as a "remarkably bad idea" by the Protestant theologian Stanley Hauerwas (Houck and Williams 1983). In his 1991 encyclical *Centesimus Annus* the Pope stressed the importance of human technological knowledge in improving the conditions of life (Novak 1993).

That God transcends nature, that nature is thus not sacred, that human beings as created in God's image share in God's creative activity, that human beings have the power and the duty to master nature by artful manipulation, and that they have the moral duty to do this as an activity of charity for the improvement of human life—all the precepts Bacon drew from the Bible to support his view of the new science—have been accepted by some biblical believers. But many of those believers worry that modern science promotes an atheistic materialism that denies the dignity of human beings and of the natural world generally as God's Creation. In particular they worry about whether biotechnology expresses an unduly willful attitude toward the world as merely raw material for human manipulation and survival.

## **Environmental ethics Introduction**

Environmental ethics is a sub-discipline of philosophy that deals with the ethical problems surrounding environmental protection. It aims to provide ethical justification and moral motivation for the cause of global environmental protection.

## **Body**

- Environmental ethics focuses on questions concerning how we ought to inhabit the world; what constitutes a good life or a good society; and who, where, or what merits moral standing. The field emerged most significantly in the 1960s from an increasing awareness of the global environmental condition.
- It is concerned with the issue of responsible personal conduct with respect to natural landscapes, resources, species, and non-human organisms. It is a cluster of beliefs, values and norms regarding how humans should interact with the environment.

## **Issues involved in environmental ethics**

- a) **Consumption of natural resources:** Since humans are part of nature, sustainable use of resources can be achieved through cooperation with nature.
- b) **Destruction of forests:** Big industries and multinational companies form the major section which exploits forests unsustainably. However, the brunt of the destruction is faced by the poor and tribals who are the inhabitants of the forests. It leads to the loss of biodiversity, habitats and extinction of plants and animals.
- c) **Environmental pollution:** Consequences of environmental pollution do not respect national boundaries. Moreover, the poor and weaker sections of society are disproportionately affected by negative effects of climate change.
- d) **Anthropocentrism:** It refers to an ethical framework that grants "moral standing" solely to human beings. Thus, an anthropocentric ethic claims that only human beings are morally considerable in their own right, meaning that all the direct moral obligations we possess, including

those we have with regard to the environment, are owed to our fellow human beings.

- e) **Equity:** People living in the economically-advanced sections/ parts use greater amount of resources and energy per individual and also waste more resources. This is at the cost of poor people who are resource-deprived.
- f) **Animal rights:** The plants and animals that share the Earth with us too have a right to live and share the Earth's resources and living space. Animal

welfare is relevant to environmental ethics because animals exist within the natural environment and thus form part of environmentalists' concerns.

### **Measures to maintain environmental ethics**

- The **"land ethic"** of Aldo Leopold: It demands that we stop treating the land as a mere object or resource. Land is not merely soil, instead, it is a fountain of energy, flowing through a circuit of soils, plants and animals.
- In order to preserve the relations within the land, Leopold claims that we must move towards a "land ethic", thereby granting moral standing to the land community itself, not just its individual members.
- Deep ecology: There are eight principles or statements that are basic to deep ecology:
  - The well-being and flourishing of human and non-human life on Earth have value in themselves. These values are independent of the usefulness of the non-human world for human purposes.
  - Richness and diversity of life forms contribute to the realization of these values and are also values in themselves.
  - Humans have no right to reduce this richness and diversity except to satisfy vital needs.
  - The flourishing of human life and cultures is compatible with a substantial decrease of the human population. The flourishing of non-human life requires such a decrease.
  - Present human interference with the non-human world is excessive, and the situation is rapidly worsening.
  - Policies must therefore be changed. These policies affect basic economic, technological and ideological structures. The resulting state of affairs will be deeply different from the present.
  - The ideological change is mainly that of appreciating life quality rather than adhering to an increasingly higher standard of living.
  - Those who subscribe to the foregoing points have an obligation directly or indirectly to try to implement the necessary changes.

**The conservation ethics and traditional value systems:** Since olden days, people have always valued mountains, rivers, forests, trees and several animals. Thus, much of nature was venerated and protected. Traditions held plants and animals as an important aspect of nature and were considered the basis of life-support systems and integral to bring about a harmonious life.

**Virtue ethics:** Virtue ethics is a way of thinking about how to behave well, which focuses on the character of moral agents and the nature of the good life. Virtue ethics is based on a positive view of human nature, one that takes into account that humans are strongly predisposed to recognize excellence in others (including non-human) whom they can take as role models and gain fulfillment from a life lived virtuously.

## Conclusion

To cope with the issues of environmental ethics, human beings must reach some value consensus and cooperate with each other at the personal, national, regional, multinational and global levels. Global environmental protection depends on global governance. An environmental ethic is, therefore, typically a global ethic with a global perspective.

## Nature as means or end

From the Latin *natura* (Gr. φύσις), a term with many related meanings in philosophy and with extensive applications in theology. Among philosophers it is commonly taken to mean the essence of a thing as this is the source of its properties or operations; more strictly, however, it is a primary and per se principle of motion and rest that is found in natural things as opposed to artifacts. It is sometimes used in the more restricted sense of human nature, for which meaning see man. Theologians use the term in opposition to grace or to supernature, particularly when discussing human nature, and in opposition to person, particularly in Trinitarian theology and Christology.

Since nature is the proper subject of the philosophy of nature, the major emphasis in this article is on nature as studied in natural philosophy. Topics treated include the primary meanings of the concept, its development among the Greeks, modifications in it occasioned by the rise of modern science, an Aristotelian analysis of its meaning in natural philosophy, and various secondary meanings.

**Primary Meanings.** On Nature (Περὶ φύσεως) is the title under which the writings of the pre-Socratics have been handed down to posterity. Some doubt exists as to what precisely was the first meaning, but it is generally admitted that at least an early and important use of the term φύσις was to designate the primordial stuff or underlying substratum persisting through all change. It is likely that the early Ionian philosophers imagined the world as developing in an orderly fashion from within, somewhat as a living being, and hence the primary substance would have been viewed, though indistinctly, as a source of activity. Thus φύσις was an intrinsic principle that accounted for the ceaseless change or becoming of things. Moreover, the very process of becoming, it seems, was itself called φύσις, a term that is etymologically related to φύω, to grow (cf. Lat. *natura* and *nascor*). Finally, at some later date the term was applied to the changing things themselves taken in their totality. This is possibly the most common sense of nature in modern usage and was probably the meaning of φύσις intended in the title Περὶ φύσεως.

**Greek Development.** The attempt of the Ionians of the 6th century b.c. to explain all becoming in terms of one material principle (e.g., water or air or fire) reached its logical conclusion in Parmenides with the very denial of nature as process. For Parmenides all being must be one and exclude all nonbeing; as such it is perfectly immutable, and only as such is it knowable; all change is but sensory illusion. After Parmenides, there was an attempt to reconcile being, stable object of intellect, with the becoming of sensory experience. Fundamental reality remained immutable; it was, however, multiple: the four elements of Empedocles; the "seeds," infinite in number, of Anaxagoras; the atoms of Leucippus and Democritus. These particles, in motion, combined and separated, and

as such were principles of change and of a multiplicity of changing compounds. The atomists, with their homogeneous particles differing only in size and shape, interpreted all change in terms of movement in space ("void") and all sensible qualities, such as color, in terms of quantitative differences. They have been considered as forerunners to modern science. So too have the Pythagoreans, who, from the 6th century b.c., had been seeking to explain the world in the light of numbers.

The claim to find the ultimate explanation of reality in the random motions of corporeal elements, i.e., in nature and chance, was strongly opposed by Plato. If nature means the primary source of becoming, what is truly nature, for him, could only be what is really first, and that is intelligence and art. Thus, with Plato, nature in the commonly accepted sense gave way to divine soul, and chance to divine direction (Laws 888E–899D). Finality, introduced as conscious design, was lodged in a principle (soul) distinct from the purely corporeal. Likewise, the intelligibility of sensible bodies was to be sought beyond them, in the changeless, purely intelligible Ideas, of which they are imperfect imitations. The order of the sensible world could be seen, too, in terms of the a priori principles of pure number. As for the changing imitations considered in themselves, of these there could be no science, but only a likely account.

Nature was reinstated as a true principle and a real source of explanation within the material universe by Aristotle, who thus restored the philosophy of nature to the rank of a science (*scientia*). Aristotle continued the naturalist tradition of the pre-Socratics, his science being qualitative rather than mathematical, empirical rather than rationalist. It was far from being a mere return, however. After Plato there was form to be reckoned with. In Aristotle the natural world becomes intelligible in itself only because nature is identified with form in matter—with form now seen as the actuality of matter—even more properly than with matter itself. This form becomes the origin of activity, and matter, considered in itself, is reduced to a principle of mere passivity and receptivity. The realization of form in matter is the goal of natural activity, and although there are various combinations and separations of elements, it is always for the sake of a form; hence, the teleological view, as opposed to the mechanistic, remains dominant. But purpose is now found in the unconscious workings of form as well as in the conscious activities of rational soul. Although Aristotle conceived the natural universe as impregnated with and illuminated by form, for the ultimate explanation he too reached beyond nature. It is the desire to imitate the fully actual reality of Pure Form that, in the final analysis, explains all the ceaseless processes of nature.

**Later Modifications.** Both the Platonist and the Aristotelian view of nature extended into the Middle Ages. The early period was largely Neoplatonist, but in the 13th century the commentaries of St. Albert the Great and especially of St. Thomas Aquinas brought the Aristotelian doctrine of nature into the foreground.

In the 16th and 17th centuries, the rapid development of the new empirico-mathematical science was accompanied by an emphatic rejection of teleology: the conception of natures tending to ends. At first, change was Platonistically explained by an inherent, creative principle (*natura naturans*) animating and directing the world of nature (*natura naturata*)—terms that go back to the Latin translation of Averroës. Before long, however, under the influence of F. Bacon, J. Kepler, G. Galilei, R. Descartes, I. Newton, and others, the account became thoroughly mechanistic. With the rejection of the geocentric astronomy and the adoption of the universal law of gravitation, the qualitatively differentiated world of Aristotle gave place to a totally homogeneous universe. Purely qualitative differences, such as color, were considered to be functions of quantitative structure, and were soon dismissed as mere appearances to a sentient mind. Matter as potency was replaced by matter as mass and extension. All change was reduced to the motion of smallest parts in space;

all causality, to prior events, i.e., to prior motions, identical causes being followed by identical effects. The spontaneous activity of bodies gave way to the idea of force (impact, attraction) and the impulse toward ends was displaced by inertia, the disposition to remain always the same. Nature thus became, for the scientist and the philosopher of nature alike, a mechanical system of inert, homogeneous mass-bodies, situated in space and time, moved by external forces, and utterly devoid of all but quantitative properties.

In the 20th century, the adequacy of purely mechanistic principles of explanation has been seriously questioned for the biological and psychological sciences. Further, the scientific theories of evolution along with the physicist's conception of matter as energy have made more generally acceptable a view that was already to some degree in evidence in the philosophies of G. W. Leibniz and G. W. F. Hegel, viz, the idea of nature as internally active and engaged in process. This conception, to which in some instances has been added the idea of aim, has found philosophical expression in the works of such thinkers as H. Bergson, S. Alexander, and A.N. Whitehead.

**Aristotelian Analysis.** A fuller presentation of the Aristotelian concept of nature, which has been generally adopted by scholastic thinkers, entails considering his definition of nature, nature as passive, nature as active, end as nature, and related concepts.

**Definition of Nature.** Aristotle (Phys. 192b 8–32) reached his definition of nature by way of a comparison of the things that exist by nature (viz, animals and their parts, plants and simple bodies) with those that exist by other causes, in particular by art. The former are seen to have within them a tendency to move, i.e., to change. The artifact as such has no such tendency. It has an inclination to change only accidentally insofar as it is made of a natural substance. Nature, then, concluded Aristotle, is the principle or cause of being moved and being at rest in that in which it is primarily, by reason of itself and not accidentally.

"Being moved" implies passivity. Strictly speaking, the principle that constitutes a thing as a mover is a nature only when the mover by its activity is itself moved. Also, motion here includes any kind of corporeal change, accidental or substantial; it excludes, however, spiritual operations, such as intellection. "Rest" implies the attainment of the end to which the movement was directed. The phrase "by reason of itself and not accidentally" excludes such cases as the doctor who cures himself. The art of medicine is, in this case, intrinsic but accidental to the one who is being cured, considered as such.

**Nature as Passive.** Nature, thus defined, was identified by Aristotle first (Phys. 193a 10–30) with matter taken as the substratum of change, i.e., as the passive, potential principle of being moved. In opposition to the pre-Socratics, Aristotle conceived of the ultimate material principle (primary matter) as being of itself bereft of all form, purely passive, pure potentiality. The matter, however, from which becoming proceeds, taken in its concrete existence, is always determined matter. The substantial form currently possessed, determining the matter in a particular way, always limits and defines matter's immediate potentialities. This is true both for the potency of primary matter for new substantial forms and more obviously for the accidental receptivities characteristic of any given being. Furthermore, since the form already possessed by the matter can be the source of certain activities as well, the matter on which a natural agent operates, just as it is never pure potency, need not be entirely passive. Its activity, in fact, may run contrary to the aim of the agent.

**Nature as Active.** It is especially with form, however, that Aristotle is concerned to identify nature (Phys. 193a 30–b 19). The ancients, not distinguishing the two principles of matter and form, had

conceived of their primordial stuff as already determined and capable of activity. Once substantial form is disassociated from matter and recognized as principle of essential determination, source of activity, and end of generation, it becomes obvious that form more than matter deserves to be called nature. Nature, then, as active principle of movement, is substantial form. (Note that, although one says "Nature acts," strictly speaking it is the composite substance that acts in virtue of its nature.)

Form is the source of two different types of activity in nature. First and more obviously, form is the intrinsic source of the vital activities of the living body. As such, it is known as soul. And as such it is a nature, since, by these activities, the living being is itself moved. The soul, in fact, is the primary source of activity whereby one part of the heterogeneous composite moves another part. Moreover, all the vital activities are either movements themselves (e.g., growth) or essentially connected with movements (e.g., sensation) or they pre-suppose movements (e.g., intellection). The soul, however, is also the principle of generation, an activity that is essentially directed to another substance. But even as such, it is a nature, insofar as the movement takes place within the same species, if not within the same individual.

Second, form is the intrinsic source of the spontaneous activities characteristic of a given body, e.g., a chemical element. Inanimate bodies, not having differentiated parts, do not move themselves. Their activities, on the contrary, are directed to other bodies that in turn may affect them. The forms, in this case, satisfy the requirement of interiority in the definition of nature insofar as they are parts within a system of interrelated active and passive potencies.

In Aristotle's cosmology, however, there are certain movements of bodies that do arise from an intrinsic source (Phys. 254b 33–255b 31), as in his example of a body falling to the ground—a movement that does not appear to require an external agent. In this case, however, nature functions as a principle of activity without constituting the thing as a mover. The body, in fact, does not move itself, part moving part, as does the living thing. For Aristotle, rather, the movement arises spontaneously from the impulse of the form toward what is appropriate to it, which, in this instance, is a suitable environment.

### **End as Nature.**

Whether a movement is natural or not cannot always be determined by sole reference to the active and passive principles. The determining factor is ultimately the end of becoming, and this too is nature.

Nature, in one sense, has been identified with the receptive and determinable principle. There are, however, in the world of nature, potencies that are not natural: the capacity of a natural body to take on an artificial form, or the capacity to be altered by some violent action. The natural potency differs from these in that it is a positive inclination to an act that perfects or fulfills the being so inclined, or else contributes to the good of the species or even to the good of the universe as a whole. The passive principle in nature, moreover, is normally related to a natural agent, through the activity of which it is brought to act. The activity of natural agents is accounted for by the tendency of the form in nature to actualize and bring to completion what is potential either within the same individual or beyond. The natural agent, then, actively tends to that good or perfection to which the potential principle is passively inclined. Furthermore, the natural agent, fixed in its species by its form, is also determined by this same principle with respect to specific goals, which it attains for the most part. Thus the acts to which it naturally directs matter by its activity are determinate acts.

It is in this sense that a nature is said to act for an end. (Obviously, the end as a good is more easily recognized in the activity of living beings than it is in the workings of the inanimate world.) Consequently, it is the act or form, considered as the end to which a natural being tends either actively or passively, that determines whether a process is or is not in accordance with nature. And in those cases where the good of the whole is in opposition to the good of the individual (as in the case of corruption), it is the former that takes precedence as a determining principle.

The form considered as end, furthermore, is itself properly called nature. It is a principle of becoming, and one that, in the essential order of things, is prior even to the passive and active principles as such. It is also intrinsic, insofar as natural movements are for the sake of the form (*finis cui*) from which they spring. In fact, the natural form seeks its own preservation and development within the individual; it tends by generation to its own continuance, as a specific form, in other individuals; and ultimately, by realizing its specific ends, it contributes to the order and preservation of the universe, i.e., to the good of the whole of which it is a part.

Related Concepts. Art, violence, and chance are all active principles that presuppose nature but operate outside the order of natural finality.

**Secondary Meanings.** From nature meaning the form or essence that is the end of generation, the word has been extended to signify any essence whatsoever without reference at all to becoming. This sense, as applicable to any being, material or immaterial, is frequently conveyed by the terms definition and quiddity. A meaning somewhat closer to the original is that of essence as the source of any activity, whether of physical movement or of spiritual operation (*De ente* 1). This sense, too, is sometimes conveyed by the term substance.

### **Aldo-Leopold; land-ethics**

When god-like Odysseus returned from the wars in Troy, he hanged all on one rope a dozen slave-girls of his household whom he suspected of misbehavior during his absence. This hanging involved no question of propriety. The girls were property. The disposal of property was then, as now, a matter of expediency, not of right and wrong. Concepts of right and wrong were not lacking from Odysseus'. Greece: witness the fidelity of his wife through the long years before at last his black galleys clove the wine-dark seas for home. The ethical structure of that day covered wives, but had not yet been extended to human chattels. During the three thousand years which have since elapsed, ethical criteria have been extended to many fields of conduct, with corresponding shrinkages - in those judged by expediency only.

### **The Ethical Sequence**

This extension of ethics, so far studied only by philosophers, is actually a process in ecological evolution. Its sequences may be described in ecological as well as in philosophical terms. An ethic, ecologically, is a limitation on freedom of action in the struggle for existence. An ethic, philosophically, is a differentiation of social from anti-social conduct. These are two definitions of one thing. The thing has its origin in the tendency of interdependent individuals or groups to evolve modes of co-operation. The ecologist calls these symbioses. Politics and economics are advanced symbioses in which the original free-for-all competition has been replaced, in part, by co-operative mechanisms with an ethical content. The complexity of co-operative mechanisms has increased with population density, and with the efficiency of tools. It was simpler, for example, to define the anti-social uses of sticks and stones in the days of the mastodons than of bullets and billboards in the age of motors. The first ethics dealt with the relation between individuals; the Mosaic Decalogue is

an example. Later accretions dealt with the relation between the individual and society. The Golden Rule tries to integrate the individual to society; democracy to integrate social organization to the individual. There is as yet no ethic dealing with man's relation to land and to the animals and plants which grow upon it. Land, like Odysseus' slave-girls, is still property. The land-relation is still strictly economic, entailing privileges but not obligations.

The extension of ethics to this third element in human environment is, if I read the evidence correctly, an evolutionary possibility and an ecological necessity. It is the third step in a sequence. The first two have already been taken. Individual thinkers since the days of Ezekiel and Isaiah have asserted that the despoliation of land is not only inexpedient but wrong. Society, however, has not yet affirmed their belief. I regard the present conservation movement as the embryo of such an affirmation. An ethic may be regarded as a mode of guidance for meeting ecological situations so new or intricate, or involving such deferred reactions, that the path of social expediency is not discernible to the average individual. Animal instincts are modes of guidance for the individual in meeting such situations. Ethics are possibly a kind of community instinct in-the-making.

### **The Community Concept**

All ethics so far evolved rest upon a single premise: that the individual is a member of a community of interdependent parts. His instincts prompt him to compete for his place in the community, but his ethics prompt him also to co-operate (perhaps in order that there may be a place to compete for). The land ethic simply enlarges the boundaries of the community to include soils, waters, plants, and animals, or collectively: the land.

This sounds simple: do we not already sing our love for and obligation to the land of the free and the home of the brave? Yes, but just what and whom do we love? Certainly not the soil, which we are sending helter-skelter downriver. Certainly not the waters, which we assume have no function except to turn turbines, float barges, and carry off sewage. Certainly not the plants, of which we exterminate whole communities without batting an eye. Certainly not the animals, of which we have already extirpated many of the largest and most beautiful species. A land ethic of course cannot prevent the alteration, - management, and use of these 'resources,' but it does affirm their right to continued existence, and, at least in spots, their continued existence in a natural state.

In short, a land ethic changes the role of Homo sapiens from conqueror of the land-community to plain member and citizen of it. It implies respect for his fellow-members, and also respect for the community as such. In human history, we have learned (I hope) that the conqueror role is eventually self-defeating. Why? Because it is implicit in such a role that the conqueror knows, ex cathedra, just what makes the community clock tick; and just what and who is valuable, and what and who is worthless, in community life. It always turns out that he knows neither, and this is why his conquests eventually defeat themselves.

In the biotic community, a parallel situation exists. Abraham knew exactly what the land was for: it was to drip milk and honey into Abraham's mouth. At the present moment, the assurance with which we regard this assumption is inverse to the degree of our education: The ordinary citizen today assumes that science knows what makes the community clock tick; the scientist is equally sure that he does not. He knows that the biotic mechanism is so complex that its workings may never be fully understood: That man is, in fact, only a member of a biotic team is shown by an ecological interpretation of history. Many historical events, hitherto explained solely in terms of hu-

man enterprise, were actually biotic interactions between people and land. The characteristics of the land determined the facts quite as potently as the characteristics of the men who lived on it.

Consider, for example, the settlement of the Mississippi valley. In the years following the Revolution, three groups were contending for its control: the native Indian, the French and English traders, and the American settlers. Historians wonder what would have happened if the English at Detroit had thrown a little more weight into the Indian side of those tipsy scales which decided the outcome of the colonial migration into the cane-lands of Kentucky. It is time now to ponder the fact that the cane-lands, when subjected to the particular mixture of forces represented by the cow, plow, fire, and axe of the pioneer, became bluegrass.

What if the plant succession inherent in this dark and bloody ground had, under the impact of these forces, given us some worthless sedge, shrub, or weed? Would Boone and Kenton have held out? Would there have been any overflow into Ohio, Indiana, Illinois, and Missouri? Any Louisiana Purchase? Any transcontinental union of new states? Any Civil War?

Kentucky was one sentence in the drama of history. We are commonly told what the human actors in this drama tried to do, but we are seldom told that their success, or the lack of it, hung in large degree on the reaction of particular soils to the impact of the particular forces exerted by their occupancy. In the case of Kentucky, we do not even know where the bluegrass came from whether it is a native species, or a stowaway from Europe.

Contrast the cane-lands with what hindsight tells us about the Southwest, where the pioneers were equally brave, resourceful, and persevering. The impact of occupancy here brought no bluegrass, or other plant fitted to withstand the bumps and buffetings of hard use. This region, when grazed by livestock, reverted through a series of more and more worthless grasses, shrubs, and weeds to a condition of unstable equilibrium. Each recession of plant types bred erosion; each increment to erosion bred a further recession of plants. The result today is a progressive and mutual deterioration, not only of plants and soils, but of the animal community subsisting thereon. The early settlers did not expect this: on the cienegas of New Mexico some even cut ditches to hasten it. So subtle has been its progress that few residents of the region are aware of it. It is quite invisible to the tourist who finds this wrecked landscape colorful and charming (as indeed it is, but it bears scant resemblance to what it was in 1848).

This same landscape was 'developed' once before, but with quite different results. The Pueblo Indians settled the Southwest in pre-Colombian times, but they happened not to be equipped with range live stock. Their civilization expired, but not because their land expired. In India, regions devoid of any sod-forming grass have been settled, apparently without wrecking the land, by the simple expedient of carrying the grass to the cow, rather than vice versa. (Was this the result of some deep wisdom, or was it just good luck? I do not know.) In

short, the plant succession stared the course of history; the pioneer simply demonstrated, for good or ill, what successions inhered in the land. Is history taught in this spirit? It will be, once the concept of land as a community really penetrates our intellectual life.

## **The Ecological Conscience**

Conservation is a state of harmony between men and land. Despite nearly a century of propaganda, conservation still proceeds at a snail's pace; progress still consists largely of letterhead pieties and convention oratory. On the back forty we still slip two steps backward for each forward stride.

The usual answer to this dilemma is 'more conservation education.' No one will debate this, but is it certain that only the volume of education needs stepping up? Is something lacking in the content as well? It is difficult to give a fair summary of its content in brief form, but, as I understand it, the content is substantially this: obey the law, vote right, join some organizations, and practice what conservation is profitable on your own land; the government will do the rest. Is not this formula too easy to accomplish anything worth while? It defines no right-or-wrong, assigns no obligation, calls for no sacrifice, implies no change in the current philosophy of values. In respect of land use, it urges only enlightened self-interest. Just how far will such education take us? An example will perhaps yield a partial answer.

By 1930 it had become clear to all except the ecologically blind that southwestern Wisconsin's topsoil was slipping seaward. In 1933 the farmers were told that if they would adopt certain remedial practices for five years, the public would donate CCC labor to install them, plus the necessary machinery and materials. The offer was widely accepted, but the practices were widely forgotten when the five-year contract period was up. The farmers continued only those practices that yielded an immediate and visible economic gain, for themselves.

This led to the idea that maybe farmers would learn more quickly if they themselves wrote the rules. Accordingly the Wisconsin Legislature in 1937 passed the Soil Conservation District Law. This said to farmers, in effect: We, the public, will furnish you free technical service and loan you specialized machinery, if you will unite your own rules for land-use. Each county may write its own rules, and these will have the force of law. Nearly all the counties promptly organized to accept the proffered help, but after a decade of operation, no county has yet written a single rule. There has been visible progress in such practices as strip-cropping, pasture renovation, and soil liming, but none in fencing woodlots against grazing, and none in excluding plow and cow from steep slopes. The farmers, in short, have selected those remedial practices which were profitable anyhow, and ignored those which were profitable to the community, but not clearly profitable to themselves.

When one asks why no rules have been written, one is told that the community is not yet ready to support them; education must precede rules. But the education actually in progress makes no mention of obligations to land over and above those dictated by self-interest. The net result is that we have more education but less soil, fewer healthy woods, and as many floods as in 1937.

The puzzling aspect of such situations is that the existence of obligations over and above self-interest is taken for granted in such total community enterprises as the betterment of roads, schools, churches, and baseball teams. Their existence is not taken for granted, nor as yet seriously discussed, in bettering the behavior of the water that falls on the land, or in the preserving of the beauty or diversity of the farm landscape. Land use ethics are still governed wholly by economic self-interest, just as social ethics were a century ago.

To sum up: we asked the farmer to do what he conveniently could to save his soil, and he has done just that, and only that. The farmer who clears the woods off a 75 percent slope, turns his cows into the clearing, and dumps its rainfall, rocks, and soil into the community creek, is still (if otherwise decent) a respected member of society. If he puts lime on his fields and plants his crops on contour, he is still entitled to all the privileges and emoluments of his Soil Conservation District. The District is a beautiful piece of social machinery, but it is coughing along on two cylinders because we have been too timid, and too anxious for quick success, to tell the farmer the true magnitude of his obligations. Obligations have no meaning without conscience, and the problem we face is the extension of the social conscience from people to land.

No important change in ethics was ever accomplished without an internal change in our intellectual emphasis loyalties, affections, and convictions. The proof that conservation has not yet touched these foundations of conduct lies in the fact that philosophy and religion have not yet heard of it. In our attempt to make conservation easy, we have made it trivial.

### **Substitutes for a Land Ethic**

When the logic of history hungers for bread and we hand out a stone, we are at pains to explain how much the stone resembles bread. I now describe some of the stones which serve in lieu of a land ethic. One basic weakness in a conservation system based wholly on economic motives is that most members of the land community, have no economic value. Wildflowers and songbirds are examples. Of the 22,000 higher plants and animals native to Wisconsin, it is doubtful whether more than 5 per cent can be sold, fed, eaten, or otherwise put to economic use. Yet members of the biotic community; and if (as I believe) its stability depends on its integrity, they are entitled to continuance. When one of these non-economic categories is threatened; and if we happen to love it, we invent subterfuges to give it economic importance. At the beginning of the century songbirds were supposed to be disappearing. Ornithologists jumped to the rescue with some distinctly shaky evidence to the effect that insects would eat us up if birds failed to control them. The evidence had to be economic in order to be valid. It is painful to read these circumlocutions today. We have no land ethic yet, but we have at least drawn nearer the point of admitting that birds should continue as a matter of biotic right, regardless of the presence or absence of economic advantage to us.

A parallel situation exists in respect of predatory mammals, raptorial birds, and fish-eating birds. Time was when biologists somewhat overworked the evidence that these creatures preserve the health of game by killing weaklings, or that they control rodents for the farmer, or that they prey only on 'worthless' species. Here again, the evidence had to be economic in order to be valid. It is only in recent years that we hear the more honest argument that predators are members of the community, and that no special interest has the right to exterminate them for the sake of a benefit, real or fancied, to itself. Unfortunately this enlightened view is still in the talk stage. In the field the extermination of predators goes merrily on: witness the impending erasure of the timber wolf by fiat of Congress, the Conservation Bureaus, and many state legislatures.

Some species of trees have been 'read out of the party' by economics-minded foresters because they grow too slowly, or have too low a sale value to pay as - timber crops: white cedar, tamarack, cypress, beech, and hemlock are examples. In Europe, where forestry is ecologically - more advanced, the non-commercial tree species are recognized as members of the native forest community, to be preserved as such, within reason. Moreover some (like beech) have been found to have a valuable function in building up soil fertility. The interdependence of the forest and its constituent tree species, ground flora, and fauna is taken for granted.

Lack of economic value is sometimes a character not only of species or groups, but of entire biotic communities: marshes, bogs, dunes, and 'deserts' are examples. Our formula in such cases is to relegate their conservation to government as refuges, monuments, or parks. The difficulty is that these communities are usually interspersed with more valuable private lands; the government cannot possibly own or control such scattered parcels. The net effect is that we have relegated some of them to ultimate extinction over large areas. If the private owner were ecologically minded, he would be proud to be the custodian of a reasonable proportion of such areas, which add diversity and beauty to his farm and to his community. In some instances, the assumed lack of profit

in these 'waste' areas has proved to be wrong, but only after most of them had been done away with. The present scramble to reflood muskrat marshes is a case in point.

There is a clear tendency in American conservation to relegate to government all necessary jobs that private landowners fail to perform. Government ownership, operation, -subsidy, or regulation is now widely prevalent in forestry, range management, soil and watershed management, park and wilderness conservation, fisheries management, and migratory bird management, with more to come. Most of this growth in governmental conservation is proper and logical, some of it is inevitable. That I imply no disapproval of it is implicit in the fact that I have spent most of my life working for it. Nevertheless the question arises: What is the ultimate magnitude of the enterprise? Will the tax base carry its eventual ramifications? At what point will governmental conservation, like the mastodon, become handicapped by its own dimensions? The answer, if there is any, seems to be in a land ethic, or some other force which assigns more obligation to the private landowner.

Industrial landowners and users, especially lumbermen and stockmen, are inclined to wail long and loudly about the extension of government ownership and regulation to land, but (with notable exceptions) they show little disposition to develop the only visible alternative: the voluntary practice of conservation on their own lands. When the private landowner is asked to perform some unprofitable act for the good of the community, he today assents only without stretched palm. If the act costs him cash this is fair and proper, but when it costs only fore-thought, open-mindedness, or time, the issue is at least debatable. The overwhelming growth of land-use subsidies in recent years must be ascribed, in large part, to the government's own agencies for conservation education: the land bureaus, the agricultural colleges, and the extension services. As far as I can detect, no ethical obligation toward land is taught in these institutions.

To sum up: a system of conservation based solely on economic self-interest is hopelessly lopsided. It tends to ignore, and thus eventually to eliminate, many elements in the land community that lack commercial value, but that are (as far as we know) essential to its healthy functioning. It assumes, falsely, I think, that the economic parts of the biotic cluck will function without the uneconomic parts. It tends to relegate to government many functions eventually too large, too complex, or too widely dispersed to be performed by government. An ethical obligation on the part of the private owner is the only visible remedy for these situations.

## **The Land Pyramid**

An ethic to supplement and guide the economic relation to land presupposes the existence of some mental image of land as a biotic mechanism. We can be ethical only in relation to something we can see, feel, understand, love, or otherwise have faith in. The image commonly employed in conservation education is 'the balance of nature.' For reasons too lengthy to detail here, this figure of speech \* fails to describe accurately what little we know about the land mechanism.- A much truer image is the one employed in ecology: the biotic pyramid. I shall first sketch the pyramid as a symbol of develop some of its implications in terms of land-use.

Plants absorb energy from the sun. This energy flows through a circuit called the biota, which may be represented by a pyramid consisting of layers. The bottom layer is the soil. A plant layer rests on the soil, an insect layer on the plants, a bird and rodent layer on the insects, and so on up through various animal groups to the apex layer, which consists of the larger carnivores. The species of a layer are alike not in where they came from, or in what they look like, but rather in what they eat. Each successive layer depends on those below it for food and often for other services,

and each in turn furnishes food and services to those above. Proceeding upward, each successive layer decreases in numerical abundance. Thus, for every carnivore there are hundreds of his prey, thousands of their prey, millions of insects, uncountable plants. The pyramidal form of the system reflects this numerical progression from apex to base. Man shares an intermediate layer with the bears, raccoons, and squirrels which eat both meat and vegetables.

The lines of dependency for food and other services are called food chains. Thus soil-oak-deer-Indian is a chain that has now been largely converted to soil-corn-cow-farmer. Each species, including ourselves, is a link in many chains. The deer eats a hundred plants other than oak, and the cow a hundred plants other than corn. Both; then, are links in a hundred chains. The pyramid is a tangle of chains so complex as to seem disorderly, yet the stability of the system proves it to be a highly organized structure. Its functioning depends on the cooperation and competition of its diverse parts.

In the beginning; the pyramid of life was low and squat; the food chains short and simple. Evolution has added layer after layer, link after link. Man is one of thousands of accretions to the height and complexity of the pyramid. Science has given us many doubts, .but it has given us at least one certainty: the trend ; of evolution .is to elaborate and diversify the biota. Land, then, is not merely soil; it is a fountain of energy flowing through a circuit of soils, plants, and animals. Food chains are the living channels which conduct energy upward; death and decay return it to the soil. The circuit is not closed; some energy is dissipated in decay, some is added by absorption from the air, some is stored in soils, peats and longlived forests; but it is a sustained circuit, like a slowly augmented revolving fund of life. There is always a net loss by downhill wash, but this is normally small and offset by the decay of rocks. It is deposited in the ocean and, in the course of geological time, raised to form new lands and new pyramids.

The velocity and character of the upward flow of energy depend on the complex structure of the plant and animal community, much as the upward flow of sap in a tree depends on its complex cellular organization. Without this complexity, normal circulation would presumably not occur. Structure means the characteristic numbers, as well as the characteristic kinds and functions, of the component species. This interdependence between the .complex structure of the land and its smooth functioning as -an, energy unit is one of its basic attributes.

When a change occurs in one part: of the circuit, may other parts must adjust themselves to it. Change does not . necessarily obstruct or divert the flow of energy; evolution is a long series of self-induced changes, the net result of which has been to elaborate the flow, mechanism, and to lengthen. the circuit. Evolutionary changes; however, are usually slow and local. Man's invention of tools has enabled him to make changes of unprecedented violence, rapidity, and scope.

One change is in the composition of floras and faunas. The larger predators are lopped off the apex of the pyramid; food chains, for the first time in history, become shorter rather than longer. Domesticated species from other lands are substituted for wild ones, and wild ones are moved to new habitats. In this world-wide pooling of faunas and floras, some species get out of bounds as pests and diseases, others are, extinguished. Such effects are seldom intended or foreseen; they represent unperfected and often untraceable readjustments in the structure. Agricultural science is largely a race between the emergence of new pests and the emergence of new techniques for their control.

Another change touches the flow of energy through plants and `animals and its return to the soil. Fertility is the ability of soil to receive, store, and release energy. Agriculture, by overdrafts on the

soil, or by too radical a substitution of domestic for native species in the superstructure; may derange the channels of flow or deplete storage. Soils depleted of their storage, or of the organic matter which anchors it, wash away faster than they form. This is erosion. Waters, like soil; are part of the energy circuit. Industry, by polluting waters or obstructing them with dams, may exclude the plants and -animals necessary to keep energy incirculation.

Transportation brings about another basic change: the plants or animals grown in one region are now consumed and returned to-the soil in another. Transportation taps the energy stored in rocks, and in the air, and uses it elsewhere; thus we fertilize the garden with nitrogen gleaned by the guano birds from the fishes of seas on the other side of the Equator. Thus the formerly localized and self- contained circuits are pooled on a world-wide scale.

The process of altering the pyramid for human occupation releases stored energy, and this often gives rise, during the pioneering period; to a deceptive exuberance of plant and animal life, both wild and tame. These releases of biotic capital tend to becloud or postpone the penalties of violence.

This thumbnail sketch of land as an energy circuit conveys three basic ideas:

- (1) (1) That land is not merely soil.
- (2) That the native plants and animals kept the energy circuit open; others may or may not.
- (3) That man-made changes are of -a different order than evolutionary changes, and have effects more comprehensive than is intended or foreseen.

These ideas, 'collectively; raise two- basic issues: Can the land adjust itself to the new order? Can the desired alterations be accomplished with less violence?

Biotas seem to differ in their capacity . to sustain violent conversion. Western Europe, for example, carries- a far different pyramid than Caesar found there. Some large animals are lost; swampy forests have become meadows or plowland; many new plants and animals are introduced, some of which escape as pests; the remaining natives are greatly changed in distribution and abundance. Yet the soil is still there and, with the help of imported nutrients, still fertile; the waters flow normally; the new structure seems to function and to persist. There is no visible stoppage or derangement of the circuit.

Western Europe, then, has a resistant biota. Its inner processes are tough, elastic, resistant to strain. No matter how violent the alterations, the pyramid, so far, has developed some new *modus vivendi* which preserves its habitability for man, and for most of the other natives. Japan seems to present another instance of radical conversion without disorganization. Most other civilized regions, and some as yet barely touched by civilization, display various stages of disorganization, varying from initial symptoms to advanced wastage: In Asia Minor and North Africa diagnosis is confused by climatic changes, which may have been either the cause or the effect of advanced wastage. In the United States the degree of disorganization varies locally; it is worst in the Southwest, the Ozarks, and parts of the South, and least in New England and the Northwest. Better land-uses may still arrest it in the less :advanced regions. In parts of Mexico, South America, South Africa, and Australia a violent and accelerating wastage is in progress, but I cannot assess the prospects.

This almost world-wide display of disorganization in the land seems to be similar to disease in an

animal, except that it never culminates in complete disorganization or death. The land \_ recovers, but at some reduced level of complexity, and with a reduced carrying capacity for people, plants, and animals: Many biotas currently regarded as lands of opportunity' are in fact already subsisting on exploitative agriculture, i.e. they have already exceeded their sustained carrying capacity. Most of South America is overpopulated in this sense.

In arid regions we attempt to offset the process of wastage by reclamation, but it is only too evident that the prospective longevity of reclamation projects is often short. In our own West, the best of them may not last a century.

The combined evidence of history and ecology seems to support one general deduction: the less violent the man-made changes, the greater the probability of successful readjustment in the pyramid. Violence, in turn, varies with human population density; a dense population requires a more violent conversion. In this respect, North America has a better chance for permanence than Europe, if she can contrive to limit her density.

This deduction runs counter to our current philosophy, which assumes that because a small increase in density enriched human life, that an indefinite increase will enrich it indefinitely. Ecology knows of no density relationship that holds for indefinitely wide limits. All gains from density are subject to a law of diminishing returns.

Whatever may be the equation for men and land, it is improbable that we as yet know all its terms. Recent discoveries in mineral and vitamin nutrition reveal unsuspected dependencies in the up-circuit: incredibly minute quantities of certain substances determine the value of soils to plants, of plants to animals. What of the down-circuit? What of the vanishing species, the preservation of which we now regard as an esthetic luxury? They helped build the soil; in what unsuspected ways may they be essential to its maintenance? Professor Weaver proposes that we use prairie flowers to reflocculate the wasting soils of the dust bowl; who knows for what purpose cranes and condors, otters and grizzlies may some day be used?

## **Land Health and the A-B Cleavage**

A land, ethic, then, reflects the existence of an ecological conscience, and this in turn reflects a conviction of individual responsibility for the -health of 'the land. Health is the capacity of . the land for self-renewal. Conservation is our effort to understand and preserve this capacity.

Conservationists are notorious for their dissensions. Superficially these seem to add up to mere confusion, but a more careful scrutiny reveals a single plane of cleavage common to many specialized fields. In each field one group (A) regards the land as soil, and its function as commodity-production; another group (B) regards the land as a biota, and its. function as something broader. How much broader is admittedly in a state of doubt and confusion.

In my own field, forestry, group A is quite content to grow trees like cabbages, with cellulose as the sic forest commodity. It feels no inhibition against violence; its ideology is agronomic. Group B, on the other hand, sees forestry as fundamentally different from agronomy because it, employs natural species, and manages a natural environment rather than creating an artificial one. Group B prefers natural reproduction on principle. It worries on biotic as well as economic grounds about the loss of species like chestnut, and the threatened lugs of the white pines. It worries about a whole

series of secondary forest Functions: wildlife, recreation, watersheds, wilderness areas. To my mind, Group B feels the stirrings of an ecological conscience.

In the wildlife field, a parallel cleavage exists. For Group A the basic commodities are sport and meat; the yardsticks of production are ciphers of take in pheasants and trout. Artificial propagation is acceptable as a permanent as well as a temporary recourse if its unit costs permit. Group B, on the other hand, worries about a whole series of biotic side-issues. What is the cast in predators of producing a game crop? Should we have further recourse to exotics? How can management restore the shrinking species, like prairie grouse, already hopeless as shootable game? How can management restore the threatened ratites, like trumpeter-swan and whooping crane? Can management principles be extended to wildflowers? Here again it is dear to me that we have the same A-B cleavage as in forestry.

In the larger field of agriculture I am less competent to speak, but there seem to be somewhat parallel cleavages. Scientific agriculture was actively developing before ecology was born, hence a slower penetration of ecological concepts might be expected. Moreover the farmer, by the very nature of his techniques, must modify the biota more radically than the forester or the wildlife manager. Nevertheless, there are many discontents in agriculture which seem to add up to a new vision of biotic farming.'

Perhaps the most important of these is the new evidence that poundage or tonnage is no measure of the food-value of farm crops; the products of fertile soil may be qualitatively as well as quantitatively superior. We can bolster poundage from depleted soils by pouring on imported fertility, but we are not necessarily bolstering food-value. The possible ultimate ramifications of this idea are so immense that I must leave their exposition to abler pens.

The discontent that labels itself 'organic farming,' while bearing some of the earmarks of a cult, is nevertheless biotic in its direction, particularly in its insistence on the importance of soil flora and fauna.

The ecological fundamentals of agriculture are just as poorly known to the public as in other fields of land-use. For example, few educated people realize that the marvelous advances in technique made during recent decades are improvements in the pump, rather than the well. Acre for acre, they have barely sufficed to offset the sinking level of fertility.

In all of these cleavages, we see repeated the same basic paradoxes: man the conqueror versus man the biotic citizen; science the sharpener of his sword versus science the searchlight on his universe; land the slave and servant versus land the collective organism. Robinson's injunction to Tristram may well be applied, at this juncture, to Homo Sapiens as a species in geological time

Whether you will or not You are a King, Tristram, for you are one Of the time- tested few that leave the world, When they are gone, not the same place it was. Mark what you leave.

## **The Outlook**

It is inconceivable to me that an ethical relation to land can exist without love, respect, and admiration for land, and a high regard for its value. By value, I of course mean something far broader than mere economic value; I mean value in the philosophical sense.

Perhaps the most serious obstacle impeding the evolution of a land ethic is the fact that our education is headed away from, rather than toward, an intense consciousness of land. Your true modern is

separated from the land by many middlemen, and by innumerable physical gadgets. He has no vital relation to it; to him it is the space between cities on which crops grow. Turn him loose for a day on the land, and if the spot does not happen to be a golf links or a 'scenic' area, he is bored stiff. If crops could be raised by hydroponics instead of farming, it would suit him very well. Synthetic substitutes for wood, leather, wool, and other natural land products suit him better than the originals. In short, land is something he has 'outgrown.'

Almost equally serious as an obstacle to a land ethic is the attitude of the farmer for whom the land is still an adversary, or a taskmaster that keeps him in slavery. Theoretically, the mechanization of farming ought to cut the farmer's chains, but whether it really does is debatable.

One of the requisites for an ecological comprehension of land is an understanding of ecology, and this is by no means co-extensive with 'education'; in fact, much higher education seems deliberately to avoid ecological concepts. An understanding of ecology does not necessarily originate in courses bearing ecological labels; it is quite as likely to be labeled geography, botany, agronomy, history, or economics. This is as it should be, but whatever the label, ecological training is scarce.

The case for a land ethic would appear hopeless but for the minority which is in obvious revolt against these 'modern' trends.

The 'key-log' which must be moved to release the evolutionary process for an ethic is simply this: quit thinking about decent land-use as solely an economic problem. Examine each question in terms of what is ethically and esthetically right, as well as what is economically expedient. A thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community. It is wrong when it tends otherwise.

It of course goes without saying that economic feasibility limits the tether of what can or cannot be done for land. It always has and it always will. The fallacy the economic determinists have tied around our collective neck, and which we now need to cast off, is the belief that economics determines all land use. This is simply not true. An innumerable host of actions and attitudes, comprising perhaps the bulk of all land relations, is determined by the land-users' tastes and predilections, rather than by his purse. The bulk of all land relations hinges on investments of time, forethought, skill, and faith rather than on investments of cash. As a land-user thinketh, so is he.

I have purposely presented the land ethic as a product of social evolution because nothing so important as an ethic is ever 'written.' Only the most superficial student of history supposes that Moses 'wrote' the Decalogue; it evolved in the minds of a thinking community, and Moses wrote a tentative summary of it for a 'seminar.' We say tentative because evolution never stops.

The evolution of a land ethic is an intellectual as well as emotional process. Conservation is paved with good intentions which prove to be futile, or even dangerous, because they are devoid of critical understanding either of the land, or of economic land-use. We think it is a truism that as the ethical frontier advances from the individual to the community, its intellectual content increases.

The mechanism of operation is the same for any ethic: social approbation for right actions: social disapproval for wrong actions.

By and large, our present problem is one of attitudes and implements. We are remodeling the AI with a steam-shovel, and we are proud of our yardage. We shall hardly relinquish the shovel, which after--all has many good points, but we are in need of gentler and more objective criteria for

its successful use.

## Deep Ecology

“Deep ecology” was born in Scandinavia, the result of discussions between Næss and his colleagues Sigmund Kvaløy and Nils Faarlund; for a historical survey and commentary on the development of deep ecology). All three shared a passion for the great mountains. On a visit to the Himalayas, they became impressed with aspects of “Sherpa culture” particularly when they found that their Sherpa guides regarded certain mountains as sacred and accordingly would not venture onto them. Subsequently, Næss formulated a position which extended the reverence the three Norwegians and the Sherpas felt for mountains to other natural things in general.

The “shallow ecology movement”, as Næss (1973) calls it, is the “fight against pollution and resource depletion”, the central objective of which is “the health and affluence of people in the developed countries.” The “deep ecology movement”, in contrast, endorses “biospheric egalitarianism”, the view that all living things are alike in having value in their own right, independent of their usefulness to others. The deep ecologist respects this intrinsic value, taking care, for example, when walking on the mountainside not to cause unnecessary damage to the plants.

Inspired by Spinoza’s metaphysics, another key feature of Næss’s deep ecology is the rejection of atomistic individualism. The idea that a human being is such an individual possessing a separate essence, Næss argues, radically separates the human self from the rest of the world. To make such a separation not only leads to selfishness towards other people, but also induces human selfishness towards nature. As a counter to egoism at both the individual and species level, Næss proposes the adoption of an alternative relational “total-field image” of the world. According to this relationalism, organisms (human or otherwise) are best understood as “knots” in the biospherical net. The identity of a living thing is essentially constituted by its relations to other things in the world, especially its ecological relations to other living things. If people conceptualise themselves and the world in relational terms, the deep ecologists argue, then people will take better care of nature and the world in general.

As developed by Næss and others, the position also came to focus on the possibility of the identification of the human ego with nature. The idea is, briefly, that by identifying with nature we can enlarge the boundaries of the self beyond my skin. My larger—ecological—Self (the capital “S” emphasizes that we are something larger than our body and consciousness), deserves respect as well. To respect and to care for my Self is also to respect and to care for the natural environment, which is actually part of me and with which I should identify. “Self-realization”, in other words, is the reconnection of the shriveled human individual with the wider natural environment. Næss maintains that the deep satisfaction that we receive from identification with nature and close partnership with other forms of life in nature contributes significantly to our life quality. (One clear historical antecedent to this kind of nature spiritualism is the romanticism of Jean-Jacques Rousseau as expressed in his last work, the *Reveries of the Solitary Walker*)

When Næss’s view crossed the Atlantic, it was sometimes merged with ideas emerging from Leopold’s land ethic; But Næss—wary of the apparent totalitarian political implications of Leopold’s position that individual interests and well-being should be subordinated to the holistic good of the earth’s biotic community—has always taken care to distance himself from advocating any sort of “land ethic”. Some critics have argued that Næss’s deep ecology is no more than an extended social-democratic version of utilitarianism, which counts human interests in the same calculation

alongside the interests of all natural things (e.g., trees, wolves, bears, rivers, forests and mountains) in the natural environment. However, Næss failed to explain in any detail how to make sense of the idea that oysters or barnacles, termites or bacteria could have interests of any morally relevant sort at all. Without an account of this, Næss's early "biospheric egalitarianism"—that all living things whatsoever had a similar right to live and flourish—was an indeterminate principle in practical terms. It also remains unclear in what sense rivers, mountains and forests can be regarded as possessors of any kind of interests. This is an issue on which Næss always remained elusive.

Biospheric egalitarianism was modified in the 1980s to the weaker claim that the flourishing of both human and non-human life have value in themselves. At the same time, Næss declared that his own favoured ecological philosophy— "Ecosophy T", as he called it after his Tvergastein mountain cabin—was only one of several possible foundations for an environmental ethic. Deep ecology ceased to be a specific doctrine, but instead became a "platform", of eight simple points, on which Næss hoped all deep green thinkers could agree. The platform was conceived as establishing a middle ground, between underlying philosophical orientations, whether Christian, Buddhist, Daoist, process philosophy, or whatever, and the practical principles for action in specific situations, principles generated from the underlying philosophies. Thus the deep ecological movement became explicitly pluralist.

While Næss's Ecosophy T sees human Self-realization as a solution to the environmental crises resulting from human selfishness and exploitation of nature, some of the followers of the deep ecology platform in the United States and Australia further argue that the expansion of the human self to include non-human nature is supported by the Copenhagen interpretation of quantum theory, which is said to have dissolved the boundaries between the observer and the observed. These "relationalist" developments of deep ecology are, however, criticized by some feminist theorists. The idea of nature as part of oneself, one might argue, could justify the continued exploitation of nature instead. For one is presumably more entitled to treat oneself in whatever ways one likes than to treat another independent agent in whatever ways one likes. According to some feminist critics, the deep ecological theory of the "expanded self" is in effect a disguised form of human colonialism, unable to give nature its due as a genuine "other" independent of human interest and purposes.

Meanwhile, some third-world critics accused deep ecology of being elitist in its attempts to preserve wilderness experiences for only a select group of economically and socio-politically well-off people. The Indian writer Ramachandra Guha (1989, 1999) for instance, depicts the activities of many western-based conservation groups as a new form of cultural imperialism, aimed at securing converts to conservationism (cf. Bookchin 1987 and Brennan 1998a). "Green missionaries", as Guha calls them, represent a movement aimed at further dispossessing the world's poor and indigenous people. "Putting deep ecology in its place," he writes, "is to recognize that the trends it derides as "shallow" ecology might in fact be varieties of environmentalism that are more apposite, more representative and more popular in the countries of the South." Although Næss himself repudiates suggestions that deep ecology is committed to any imperialism. Guha's criticism raises important questions about the application of deep ecological principles in different social, economic and cultural contexts. Finally, in other critiques, deep ecology is portrayed as having an inconsistent utopian vision.

## **Peter Singer; Animal Rights**

Moral philosopher and Princeton professor Peter Singer described what he called a "momentous

revolution in thinking” regarding animal welfare during a talk in the Ames Courtroom at the Harvard Law School on Friday.

During the event, entitled “Ethics and Animals: Where are We Now,” Singer described the economically-driven processes of factory farming and mass-fishing and the laws that the European Union and United Kingdom have implemented in the past decade to strictly regulate the treatment of animals during those practices.

But, Singer cautioned, while the world has come a long way, outlooks surrounding the ethics and the treatment of animals have not been pushed as far as he thinks they could.

“Animals have interests,” Singer said. “When these are similar to ours, or their pain is on a similar level, why give them less consideration?”

Singer cited the Bible, in which God grants the humans dominion over the animals, as the first documentation of humanity’s obligation to animals. He said that he thinks “dominion” has come to be interpreted as the right “to do as we will,” rather than as responsible stewardship.

“The question is not ‘Can they reason?’ nor ‘Can they talk?’ but ‘Can they suffer?’” said Singer, quoting the logic used by nineteenth-century philosopher Jeremy Bentham, Bentham’s ideology has also been applied to discussions about slaves, infants, and those with cognitive disabilities.

The case for animal consciousness and the need to acknowledge their interests, Singer said, is evidenced by the similarities between animals and humans— anatomically, physiologically, and behaviorally. He also pointed to the shared evolutionary history between the two.

“We are animals,” Singer said, citing Darwin’s theory of evolution.

Singer, a professor of bioethics at Princeton and the University of Melbourne, is the author of the controversial book *Animal Liberation*, which asserts that animals’ interests should be given equal weight to those of humans. The book drew criticism upon its release in 1975.

Friday’s talk was part of a series sponsored by the Petrie-Flom Center for Health Law Policy, Biotechnology, and Bioethics at the Law School. Singer also spoke later in the day in the Science Center about effective altruism—a utilitarian stance on how best to affect change in the world.

“If God were a utilitarian, Singer would be his patron saint,” Law School professor and Petrie-Flom Center co-director Glenn Cohen said in his introduction.

## **Medical-Ethics: Surrogacy**

“Surrogacy is often thought to be a ‘treatment’ option for the infertile or an alternative to adoption, and so to be celebrated in fulfilling people’s desires to be parents. However, surrogacy also brings a wealth of more complex ethical issues around gender, labour, payment, exploitation and inequality.”

## **Payment**

Take the issue of payment: surrogacy involves literal labour (physical and often emotional effort in both gestating and birthing). However, many see it as distinct from labour (working in a factory or teaching a class). This raises an ethical question around whether surrogacy is different from other kinds of paid work and, if it isn’t, shouldn’t we remunerate surrogates?

Some philosophers argue that surrogacy is unique when compared to other work. For instance, they claim that women are intimately connected to their reproductive capacities and bodies (so pregnancy and birth are special and should not be bought), or that being pregnant requires an unusual time commitment (unlike other kinds of work, the woman works for 24 hours a day, seven days a week, for nine months).

Others argue that there is equivalence to traditional work. Various occupations demand control over the body (ballerinas and astronauts are heavily controlled in what they can eat and how much they exercise, just as surrogates are) and longevity of work (writing a book can take longer than gestating and delivering a baby). All this work should be paid, so the argument goes.

## **Gender**

Ethics also come into play when thinking about the gendered nature of surrogacy and intended parenting. Biologically, the surrogate has to be someone with the capacity to gestate and give birth – usually a woman. As gendered labour, surrogacy triggers important feminist concerns, such as about bodily autonomy, vulnerability, inequality and rights.

For example, whether women who are surrogates maintain autonomy over their body when they are carrying a foetus for another individual or couple, or when decisions are being made about what happens to that foetus when there is disagreement. I think about the complexity of these sorts of questions and defend the importance of protecting and promoting women's autonomy in my broader work on feminist conceptions of autonomy.

Intended parenthood raises feminist concerns too, such as on gendered roles and expectations. This includes whether women in particular feel that being mothers is critical to being 'proper' women (and hence why they might pursue surrogacy if they cannot carry their own children). Likewise, women might feel breastfeeding is what 'real' mothers (and women) do (and why intended mothers – ie, women who are not pregnant – might want to induce lactation).

Interestingly, at SUK's annual conference in September, it was noted that lactation can be induced in men using a similar process as for non-pregnant women. (It has been used for a transgender woman who wanted to breastfeed recently too). For feminists worried about unequal gender roles in parenting in general, this could be further ammunition for dispelling myths about women as 'natural' carers because of their biological capacities.

## **Exploitation**

A final ethical issue to mention is exploitation. The UK, Ukraine, US, Australia and India have different regulations about surrogacy. Some countries see the surrogate, while others the intended mother, as the legitimate mother. Some favour altruistic forms of surrogacy, while others allow commercial forms. Some countries give parental rights to intended parents before or at the birth of the child, while others only after six weeks.

There are good reasons to worry about a country-specific approach to surrogacy, as outlined in the recent. In particular, the country-specific approach opens up the potential to exploit legal loopholes, intended parents, and, ultimately those doing the majority of the labour – surrogates.

Despite the inevitable difficulties of securing global agreement, concerns about exploitation – of all parties, but especially the most vulnerable – provides a significant reason to push for a global

approach to surrogacy arrangements.

These are just three ethical puzzles of surrogacy. All of the themes, and more beyond, require careful consideration since what we think about each is not just philosophically intriguing but is likely to have implications for how we believe our practice, laws and policy should be shaped. As the UK is currently reviewing its legislation on surrogacy, giving attentive thought to these issues is a particularly timely demand on all of us.

## **Social, ethical, medical & legal aspects of surrogacy:**

### **An Indian Scenario**

On examining the thousands of years old records of Indian Vedic literature and based on the discoveries of today's science dealing with molecules, genes and DNA it appears that the motherhood is an instinct driven physiological phenomena. Instinct of motherhood is the most powerful desire that exists in all the living creatures that include all animals and humans. According to ancient Indian philosophy the biological purpose of life is to propagate once own traits (genes) and all living creatures are here on a transition phase to pass their own traits (genes) to the next generation. Propagation is the ultimate purpose of any species, therefore, birth of an offspring is always dependent on the factors that lead to high chances of survival of the offspring. For example, birds migrate thousands of kilometers to find out suitable place where environment can support the high chances of survival of their offsprings. In the Canadian Inuit Community which is 300 miles north of Arctic Circle, the seasonality was reported till 1970. But due to modernization and decline of traditional life-style the seasonality in this community has not been reported in the later years.

Infertility is generally known as a social stigma in India. It is hypothesized that the agony and trauma of infertility is best felt and described by the infertile couples themselves. Though, infertility does not claim the life of an individual but it inflicts devastating influence on life of an individual for not fulfilling the biological role of parenthood for no fault of his or her own. It is also known that in general, Indian society has got a very stable family structure, strong desire for children and particularly for son to carry forth the lineage or Vansh. With the enormous advances in the field of medicine, the infertility can now be treated using the new medical technologies collectively called as Assisted Reproductive Technology (ART) such as in vitro fertilization (IVF) or intracytoplasmic sperm injection (ICSI), etc. The birth of the world's first child, Louise Brown on July 25, 1978, through the technique of in vitro fertilization was a path-breaking step in control of infertility; and is considered as one of the most important medical advances of the last century. In October 1978, Dr Subhash Mukherjee, Kolkata (India) announced the birth of country's first test tube baby. Dr Mukherjee and his team used the cryopreserved embryo.

There are different types of infertility and in some cases it would be physically or medically impossible/ undesirable to carry a baby to term and hence, to fulfill the desire of such infertile couple to have a child, the surrogacy comes as an important option.

## **Surrogacy**

In Latin "Surrogatus" means a substitute i.e. a person appointed to act in the place of another. As per the Black's Law Dictionary surrogacy means the process of carrying and delivering a child for another person. The New Encyclopedia Britannica defines surrogacy as a practice in which a woman bears a child for a couple unable to produce children in the usual way. According to Warnock Report (1984) HF&E, surrogacy is the practice whereby one woman carries a child for another with

the intension that the child should be handed over after birth.

There are two types of surrogacy practices prevailing in India: (i) Traditional/Natural/Partial surrogacy; and (ii) Gestational surrogacy.

Like in other countries, in India also, the following two types of surrogacy arrangements are being practiced:

**Altruistic surrogacy:** Where the surrogate mother receives no financial rewards for her pregnancy or the relinquishment of the child to the genetic parents except necessary medical expenses.

**Commercial surrogacy:** Where the surrogate mother is paid over and above the necessary medical expenses.

Surrogacy is the union of science, society, services and person that make it a reality. Surrogacy leads to a win-win situation for both the infertile couple and the surrogate mother. The infertile couple is able to fulfill their most important desire and the surrogate mother receives the suitable reward.

To give a womb for rent means to nurture the fertilized egg of another couple in your womb and give birth to the child with a specific intention, the intention here being either money, or service, or because of altruistic reasons.

Bhadaraka has described the following misconceptions regarding a surrogate mother:

- (i) She is not the genetic mother of the child whom she nurtures and gives birth to.
- (ii) She is not the wife of the father of the child to whom she gives birth.
- (iii) This is a scientific idea, a scientific process. There is no need for any physical contact.
- (iv) She is not an asocial woman.
- (v) This is not an illegal practice.
- (vi) She is not forced into this. She herself decides whether she wants to become a surrogate mother or not.
- (vii) She has no claim or rights over the child that is born.
- (viii) "This is my child", "this child is my inheritance" - she cannot articulate such thoughts, because of social, scientific and legal restrictions.
- (ix) She is not a woman who sells children.
- (x) She is not responsible for the child (once the child is born).
- (xi) Surrogacy is a mutually beneficial concept of providing services.

It is necessary to mention here that the couple's insistence does not agree with what science believes. It does not matter as to which religion the surrogate belongs, as the child is genetically of the couple. Religion is interpreted according to the conditions, education, time and the circumstances.

Surrogacy is a social act of highest level of service which is scientific and brims with goodwill. A person's opinion based on a lack of information should not harm others. Like medicine is prescribed for treatment of a disorder, in the same way surrogacy is also a method of treatment.

Bhadaraka reported that the majority of the Indian society considered surrogate mother as an

amalgam of religion, culture and science with following noble services: (i) She shows a strong inclination to society by doing something novel, (ii) She abolishes the stigma of infertility from the society, (iii) She fulfils her duty by doing something worthwhile for the society, and (iv) She is an example of a model woman in society.

As per the proposed draft Assisted Reproductive Technology (Regulation) Bill the surrogacy and related terms are defined in the following ways: (i) Surrogacy means an arrangement in which a woman agrees to a pregnancy, achieved through assisted reproductive technology, in which neither of the gametes belong to her or her husband, with the intention to carry it to term and hand over the child to the person or persons for whom she is acting as a surrogate; (ii) Surrogate mother means a woman who agrees to have an embryo generated from the sperm of a man who is not her husband and the oocyte of another woman, implanted in her to carry the pregnancy to full term and deliver the child to its biological parents; and (iii) Surrogacy agreement means a contract between the persons availing of assisted reproductive technology and the surrogate mother.

### **Issues related with surrogacy**

Surrogacy, by ART, should be considered only for those infertile women for whom it would be physically or medically impossible/ undesirable to carry a baby to the term. Surrogate mother should sign an agreement with the commissioning couple which shall have legal bindings on both the parties. Before signing the agreement, the written consent of her spouse shall be required. A woman seeking or agreeing to act as a surrogate shall be medically tested for diseases such as sexually transmitted diseases or otherwise, as may be necessary, and all other communicable diseases which may endanger the health of the child or children, and must declare in writing that she has not received a blood transfusion or a blood product in the last six months. The commissioning parent(s) shall ensure that the surrogate and the child or children she delivers are appropriately insured until the time the child is handed over to the commissioning parent(s) or any other person as per the agreement and till the surrogate is free of all health complications arising out of surrogacy. Surrogate mother must register as a patient in her own name in the hospital after signing the appropriate agreement. While registering, the surrogate mother must mention that she is a surrogate mother and should provide all the necessary information about the commissioning parents. Surrogate mother should not use or register in the name of the commissioning couple for whom she is acting as surrogate as this would pose legal issues, particularly in the untoward event of maternal death.

The birth certificate shall be in the name of the commissioning parents. The ART clinic should also provide a certificate to the commissioning parents giving the name and address of the surrogate mother. All the expenses of surrogate mother during the period of pregnancy and postnatal care relating to pregnancy should be borne by the commissioning couple. The surrogate mother would also be entitled a monetary compensation from the commissioning couple for agreeing to act as a surrogate. The exact value of the compensation should be decided by discussion between the commissioning couple. and the prospective surrogate mother or an appropriate formula may be developed by the Government to calculate the minimum compensation to be paid to the surrogate mother. A surrogate mother should never donate her own oocyte to the commissioning couple. Surrogate mother as well as the donor shall relinquish all parental rights related with the offsprings in writing.

## Background of proposed draft ART (Regulation) Bill

After the birth of the first scientifically well documented test tube baby in 1986 in India, there was mushrooming of IVF clinics in the country. The services offered by some of these IVF clinics were questionable. The reason for this was a lack of ART guidelines as well as legislation on ART in the country, no accreditation, supervisory and regulatory body and no control of Government. Therefore, the Indian Council of Medical Research (ICMR) developed draft National Guidelines for Accreditation, Supervision & Regulation of ART Clinics in India in 2002. The draft document was then subjected to extensive public debate throughout the country (in seven cities; New Delhi, Jodhpur, Mumbai, Bangalore, Chennai, Hyderabad & Kolkata) where more than four thousand people participated. To obtain the opinion of the people on the various issues where the consensus of all the members of the Committee could not be established, a prescribed proforma was designed and given to the participants (85% general public, 13% Indian doctors and 2% international doctors).

Based on the opinion of this survey (Table), comments and suggestions received from the various stakeholders including National Commission for Women and National Human Right Commission, the National Guidelines were finalized and after the approval of the Drafting Committee the revised document was submitted to the Ministry of Health & Family Welfare, Government of India. The Ministry of Health & Family Welfare examined these guidelines and after slight modifications published the National Guidelines for Accreditation, Supervision & Regulation of ART Clinics in India as National Guidelines of Government of India in 2005.

Table Opinion of the people on various issues obtained during the public debates

Sl. no.	Issues	Opinion of the people (%)					
		Doctor			General public		
		Yes	No	No opinion	Yes	No	No opinion
1	Whether surrogacy should be allowed in the Country?	96	2	2	92	3	5
2	Whether commercial surrogacy should be allowed in the Country?	80	15	5	72	24	4
3	Whether relatives/friends should be allowed to act as a surrogate mother?	45	52	3	14	83	3
4	Whether the identity of the donor should be known to the infertile couple?	37	58	5	7	89	4
5	Whether relatives/friends should be allowed for gamete donation?	44	54	2	8	91	1
6	Whether you are satisfied or agreed with the points mentioned under the heading "How may sperm and oocytes donors be sourced?"	54	42	4	81	15	4

On obtaining the feedback from different States of the country it was noticed that these National

Guidelines were not being followed properly in the country. Therefore, the Indian Council of Medical Research developed draft Assisted Reproductive Technology (Regulation) Bill in 2008 with the help of a Drafting Committee of ICMR. The draft Assisted Reproductive Technology (Regulation) Bill-2008 was again subjected to extensive public debate not only throughout the country but globally by placing the draft Bill on the websites of the Ministry of Health & Family Welfare, Government of India and of the ICMR. Based on the comments received from various stakeholders including the comments from other countries and as per the recommendations of the Drafting Committee, the draft Assisted Reproductive Technology (Regulation) Bill was revised and finalized. The finalized version of draft Assisted Reproductive Technology (Regulation) Bill- 2010 was sent to the Ministry of Health & Family Welfare, and has now been revised by the Ministry of Law & Justice as Assisted Reproductive Technology (Regulation) Bill - 2013. The Assisted Reproductive Technology (Regulation) Bill- 2014 has now become a part of the Cabinet Note.

## **Conclusion**

The draft Assisted Reproductive Technology (Regulation) Bill proposes to establish National Board, State Boards and National Registry of Assisted Reproductive Technology (ART) in India for accreditation and supervision of ART clinics and ART Banks, ensuring that services provided by these are ethical and that the medical, social and legal rights of all those concerned including surrogate mother are protected with maximum benefit to all the stakeholders within a recognized framework of ethics and good medical practices.

## **The doctor-patient relationship Introduction**

The doctor-patient relationship plays an essential role in ordering the health care system and medical ethics, and since it is a form of communication, it necessitates ethical, philosophical, psychological, and sociological considerations. The present paper aims to evaluate the essence of the doctor-patient relationship in order to re-examine its conceptual framework. In the first part, the philosophical, psychological and sociological significance of this relationship is explored, and in the final section, the theoretical implications will be discussed. It seems that despite the imbalance in the relationship between doctors and patients resulting from the greater significance of the physicians' ethics, organization of this relationship is not possible without enhancing patient ethics.

Simultaneous consideration of sociological, psychological and philosophical dimensions of the doctor-patient relationship can contribute to developing theoretical foundations and multidisciplinary bases for establishing practical ethical codes. The result will eventually be a more effective interaction between the two.

## **A) The Philosophical Essence of the Doctor-Patient Relationship**

In investigating the philosophical essence of the doctor-patient relationship, three points should be taken into consideration. First, ethical demands in doctor-patient interactions must have distinct definitions and terms; second, the phenomenological ethical debates on this issue need to be explored; and third, modern topics in the philosophy of the relationship should be considered, and relationships with the others should be analyzed from different perspectives.

## **Ethical Demands**

Various organizations and professions differ in their attitudes towards ethical demands, recommendations, norms, values and judgments. The three components of inclusion, priority and severity

are presented below as the criteria for judgment in ethical issues.

**1. Inclusion:** The main questions to answer in regard to this component are: "What are the ethical limits?" and "Should all of our actions be judged ethically or only some of them are included in the scope of ethical judgment?" In other words, is it enough to avoid doing the wrong thing, or is doing right among our moral duties too? It seems that the doctors' moral duties include doing the right thing as well. This important matter is embedded within the principles of beneficence and non-maleficence.

**2. Priority:** The component of priority relies on the answers to the following questions: "If what morality is demanding is in conflict with our personal interests (for example it concerns our self, family, friends and so on), which side should we take? Should we always take the ethical side and forget about our personal interests? Or personal interests could have priority over moral obligations?" Nigel and Stalker explain that autonomy and our personal integrity have priority over what morality is demanding from us, or as Kagan and Singer say, demandingness of morality can even affect autonomy and our personal integrity. It seems that on the one hand the altruism of a practitioner as a professional should be based on the priority of patients' interests, and on the other hand it should safeguard the practitioner's own autonomy.

**3. Severity:** The main questions here are: Can ethics press extreme and costly demands from us? Or are the obligations of morality lighter and easier in the way that most people could overcome?" Apparently if ethics are founded on costly demands, we will be more likely to fail to fulfill our ethical duties.

Based on the above-mentioned considerations and classifications, three macro-positions emerge in the ethical relationship, including: maximal ethics, ordinary ethics, and minimal ethics.

**Maximal Ethics:** Maximal ethics include all the three components discussed above. In this type of ethics, ethical inclusion does not have any limits and covers all human actions. Extremist moralities consider ethical inclusion to be an absolute matter that covers all life styles and signify that no human action should be outside of this infinite circle.

**Ordinary Ethics:** This is the sort of ethics that most people believe in, and because of its affinity to the contemporary human life, it is also referred to as "common ethics". Here what ethics demands from us are boundaries. In other words, moderate ethics often state that after performing our obligations and moral duties, in a relatively wide range of personal interests we can start selecting. Thus, our actions are not always subject to moral judgment.

**Minimal Ethics :** This type of ethics is contradicted with maximal ethics. According to minimalists, the only forbidden action is intentional harassment. Followers of minimal ethics believe in a wide range of choices and selection areas; they recognize only a limited range of constraints and are in favor of acting upon personal interests.

It is a growing concern in medical ethics that the doctor-patient relationship is not approached in a sufficiently broad way and that this overly narrow medical perspective leaves doctors, nurses and other health care professionals badly equipped to deal with ethical dilemmas. Phenomenology could broaden this perspective and serve as a strong basis to understand moral sensitivity. Two notions in phenomenology have a central role in understanding the concept of the doctor-patient relationship: intentionality and first-person point of view.

## **Intentionality and first-person point of view**

One of the basic concepts of phenomenology is attainment of phenomenal intentionality, which occurs when a person recognizes earlier assumptions and adopts a perspective. Some thinkers like Franz Brentano believe that intentionality and the phenomenological approach can be applied to the first-person point of view. For instance the first sighting of a beautiful landscape elevates us in a way that may not happen in later encounters. The reason is that later encounters are accompanied by presuppositions of the observer, who will be more used to the landscape. It seems that the phenomenological approach can be applied to the doctor-patient relationship. Doctors must reexamine and restrict assumptions toward patients, and at the same time value intentionality in order not to fall into habits.

## **Moral Sensitivity**

Moral sensitivity may be enhanced in two ways. First, through reinforcing the phenomenological approach by renewing the first sight experience, that is, in each re-identification (of the patient for instance), priorities should be observed. Second, since any situation could come to a fork and ethical conflicts may rise, the adverse impacts should be considered and every situation must be regarded from an ethical perspective. Although at commencement moral sensitivity appears to overlap with maximal ethics, it is of particular importance especially in heterogeneous communications such as the doctor-patient relationship. It may be added that enhancing moral sensitivity even seems to be the target of the phenomenology of ethics in the doctor-patient relationship.

## **Communication with Others**

The term "communication" can be defined through the philosophical approaches of great thinkers such as Levinas, Marcel and Buber who set their philosophical arguments in the relationship between "me" and "the other". Levinas insists on the maximum responsibility of any other; Marcel assists on turning the me-that relationship to the me-you relationship and replacing absence with presence; Buber finds God in "Thou".

## **B) The Psychological Essence of The Doctor-Patient Relationship**

In terms of psychology, the doctor-patient relationship is imbalanced as the doctor has superiority over the patient. Such imbalanced relationships may give rise to various patterns of communication behavior. Psychologists have distinguished the following four communication behavior patterns based on components such as honesty, perspicuity, respect and inhibition:

### **1) Submissiveness**

Submissive persons are shy, and although they speak honestly, they are usually taciturn and cannot express themselves perspicuously. They are also afraid of being judged or offending others, so they are incapable of making eye contact while speaking. Their voices are weak and unsteady, and they speak hesitantly. Submissive people avoid conflict rather than try to resolve it. They speak indirectly and in general terms because they cannot express themselves openly and may quickly feel depressed and vulnerable. People with this behavioral pattern admittedly let others abuse them and treat them disrespectfully. These patterns work both for doctors and patients. Patients who evade their responsibilities and encourage physicians to patriarchy in the process of therapy, or doctors who are not able to say "no" to patients easily consent to inappropriate and ineffective treatments.

## 2) Dominance

Domineering people feel insecure and believe that they do not possess good qualities. Accordingly, they try to deceive others and take advantage. Domineering persons do not have the perspicuity and honesty necessary for earning their wishes. They express themselves in general terms and sometimes their voices shake. These people use others to achieve their goals and make light of this inhibition and deception, so they take away another person's autonomy and freedom. This behavioral pattern is often seen in doctors and sometimes among patients as well. Doctors who prefer patient satisfaction to authority thus create a false autonomy for the patients and will eventually be dominated by them, and patients with this behavioral pattern impair the healing process by inhibition and deception.

## 3) Aggressiveness

The target of aggressive and domineering people is very similar and that is exploitation and domination of others. Their difference is that a domineering person achieves this aim by secrecy and cheating, while an aggressive person follows it frankly and openly. Unlike the domineering type, aggressive people are honest and straightforward; they are horrible listeners, always accuse others, get angry soon, get confused by criticism, and are usually grim in appearance. They have loud voices and look hostile, and in conflicts, they tend to destroy their opponents. This pattern is seen among both physicians and patients. Impatient physicians that do not listen, shout all the time and sometimes make irreparable mistakes during the healing process, or patients with lower anger thresholds who create tension in medical environments belong in the category of aggressive people.

## 4) Assertiveness

Assertiveness is the most creative behavioral pattern of communication. Assertive people respect themselves and others, and observe the authority of all sides. They are both honest and frank, and do not accuse themselves or others. Their approach to matters is problem-oriented, that is, when dealing with a problem, instead of accusing themselves and others, they think of a solution. They listen effectively and speak appropriately and understandably. During conflict they emphasize conversation. Their arguments are clear, specified, objective, fair and respectful, and eventually they are the most successful communicators. Issues such as breaking bad news, wasted treatments and medical mistakes are easy and solvable with this type of behavioral pattern. While submissiveness, dominance and aggression lead to lose-lose situations in long term, assertiveness, is a helpful behavioral pattern and finally results in win-win solutions.

**Based on the above-mentioned notions, the following practical hints should be outlined:**

- 1. Psychic Distance:** An important topic in aesthetics and artistic criticism that is also related to ethics is psychic distance. In aesthetics, this refers to the distance that should exist between a work of art and the viewer, so that aesthetic entente is created and art is not confused with reality. Omitting the psychic distance and forming deep sympathy and psychological identification with the work of art obstructs artistic judgment and aesthetic approach. In medical ethics, the concept seems to be important while encountering patients. Reduction of psychic distance and excessive sympathy with patients prevent an effective doctor-patient relationship as a fundamental element of treatment.
- 2. Body Language:** Nonverbal communication skills are referred to as body language. This type of

communication is very important in the doctor-patient relationship due to factors such as the limited visiting time, and linguistic and discourse differences.

**3. Truth-Telling versus Pain Relief:** One of the oldest ethical challenges is the pain and suffering that can be caused by telling the truth. On the other hand, we can bring comfort and relief to patients by lying to them. Physicians can employ various methods at their discretion, but it seems that health care systems are more inclined toward telling the truth, and doctors must try to maintain a balance between the two.

**4. Emotional Quotient (EQ):** Unlike intelligence quotient that does not improve after the second decade of life, emotional quotient can continue to improve till the end. Emotional quotient refers to the ability to control emotions, sentiments and unwanted desires. People with high intelligence quotient dealing with people with lower intelligence quotient are susceptible to reckless, impulsive behavior and may gradually lose their EQ. In order to improve the doctor-patient relationship, health providers must be instructed in techniques to promote their emotional quotient.

### **C) The Sociological Essence of the Doctor-Patient Relationship**

Unlike the psychological approach, the sociological approach to the doctor-patient relationship examines the essence of this (individualistic) relationship in a social context. In other words, the sociological approach regards the doctor-patient relationship beyond a merely mutual connection and therefore external elements are considered particularly important.

In order to investigate this relationship from the sociological perspective, communicative actions serve as a valid basis. They have been included among the most important sociological criteria in the last few decades as a set of social actions oriented towards reaching entente. The target of communication action theory is to subvert a single prophetic and patriarchal individualism in human interactions. Jürgen Habermas has developed this notion in his famous book *The Theory of Communicative Action*, and his ideas are quite often presented in ethical manuscripts and medical ethics books. In this book Habermas distinguishes and characterizes his theory by drawing a distinction between instrumental action and communicative action.

#### **Instrumental Action**

Jürgen Habermas states, "We call an action oriented to success instrumental when we consider it in the light of following the rules of rational choice and assess the efficiency of influencing the decisions of a rational opponent. By contrast, I shall speak of communicative action whenever the actions of the agents involved are coordinated not through egocentric calculations of success but through acts aiming at reaching an understanding. In communicative action the participants are not primarily oriented to their own individual successes; they pursue their individual goals under the condition that they can harmonize their plans of action on the basis of common situation definitions. In this respect, negotiating the definitions of the situation is an essential element of the interpretive accomplishments required for communicative action".

Reducing an individual to only one of the functions of his or her integrity is called instrumentalism. The function of a ticket seller in a bus station is just like that of a machine and therefore his human dimension could easily be overlooked. In the doctor-patient relationship both sides (especially the doctor) are susceptible to perceive others as mere instruments. The power that is practiced over patients by "medical gazing" makes them abject by reducing them to bodies that are examined

simply to locate illness. Three fundamental concepts in sociology and philosophy have been proposed to deal with instrumentalism:

### **1) Teleological view of others by emphasizing the task:**

In his works on the Golden Rule, Kant argues that instrumental action is inconsistent with socialization and human dignity, and proposes to regard others as an acme, not an instrument. The universal version of this rule is that you should like for others whatever you like for yourself and vice versa. One concrete technique for applying this rule is that human beings constantly put themselves in other people's positions and see the world from their perspectives.

### **2) The distinction between mysterious looks and issue makers:**

Martin Buber and Gabriel Marcel emphasize the difference between the I-Thou and I-It relationship. In the former, a human is a mystery that unfolds and in the latter, an issue that resolves.

### **3) Maximum responsibility toward others:**

Emmanuel Levinas states, "We are responsible for each other, and me more so...". This approach considers responsibility toward others as an unconditional matter, but does not require others to be equally responsible in return.

## **Communicative Action**

Communicative action is allegedly an action focused on entente. Whoever wants to be successful in reaching entente should be prepared to bring up claims. Habermas states that the communication between a speaker and a listener is constituted by the existence of three universally valid claims: the claims for truth, rightness and truthfulness. The terms of these claims in the doctor-patient relationship accurately reveal the sociological essence of this relationship. Doctors should speak understandably and beware of ambiguity and opacity in their speech. On the other hand, they should make true statements and propositions, scientific and other. They should be honest and have faith in what they say, and ultimately they can use their discretion to determine the content of their relationship with patients.

## **Analysis**

To clarify the concept of relationship and connectedness, we used a hybrid concept analysis including: identifying essential attributes, critiquing the existing definitions, examining boundaries and identifying antecedents. On the basis of the comparative concept analysis, the doctor-patient relationship is an interdisciplinary notion and a mono-disciplinary approach will reduce this relationship to communicative skills.

## **Discussion and Conclusion**

The doctor-patient relationship has greater impact on the health system than it may seem at first. In this paper, three novel dimensions of the doctor-patient relationship were deeply explored. The philosophical approach emphasizes the importance of promoting moral sensitivity. Communicating with others entails considerations rooted in the human soul that provoke great philosophical concerns. The psychological approach emphasizes learning about behavioral patterns, enhancing the intelligence quotient, and creating a balance between truth-telling and pain relief. Finally, the sociological approach demonstrates that the doctor-patient relationship is part of a macro social relationship in a community and discovers various aspects beyond the two-person relation-

ship.

## **Abortion**

An overview of the moral and legal aspects of abortion and evaluates the most important arguments. The central moral aspect concerns whether there is any morally relevant point during the biological process of the development of the fetus from its beginning as a unicellular zygote to birth itself that may justify not having an abortion after that point. Leading candidates for the morally relevant point are: the onset of movement, consciousness, the ability to feel pain, and viability. The central legal aspect of the abortion conflict is whether fetuses have a basic legal right to live, or, at least, a claim to live. The most important argument with regard to this conflict is the potentiality argument, which turns on whether the fetus is potentially a human person and thus should be protected. The question of personhood depends on both empirical findings and moral claims.

## **Preliminary Distinctions**

One of the most important issues in biomedical ethics is the controversy surrounding abortion. This controversy has a long history and is still heavily discussed among researchers and the public—both in terms of morality and in terms of legality. The following basic questions may characterize the subject in more detail: Is abortion morally justifiable? Does the fetus (embryo, conceptus, and zygote) have any moral and/or legal rights? Is the fetus a human person and, thus, should be protected? What are the criteria for being a person? Is there any morally relevant break along the biological process of development from the unicellular zygote to birth? This list of questions is not meant to be exhaustive, but it describes the issues of the following analysis.

### **1) Three Views on Abortion**

There are three main views: first, the extreme conservative view (held by the Catholic Church); second, the extreme liberal view (held by Singer); and third, moderate views which lie between both extremes. Some opponents (anti-abortionists, pro-life activists) holding the extreme view, argue that human personhood begins from the unicellular zygote and thus – according to the religious stance – one should not have an abortion by virtue of the *imago dei* of the human being (for example, Schwarz 1990). To have an abortion would be, by definition, homicide. The extreme liberal view is held by proponents (abortionists). They claim that human personhood begins immediately after birth or a bit later (Singer). Thus, they consider the relevant date is at birth or a short time later (say, one month). The proponents of the moderate views argue that there is a morally relevant break in the biological process of development – from the unicellular zygote to birth – which determines the justifiability and non-justifiability of having an abortion. According to them, there is a gradual process from being a fetus to being an infant where the fetus is not a human being but a human offspring with a different moral status.

The advantage of the extreme conservative view is the fact that it defines human personhood from the beginning of life (the unicellular zygote); there is no slippery slope. However, it seems implausible to say that the zygote is a human person. The advantage of the extreme liberal view is that its main claim is supported by a common philosophical usage of the notion “personhood” and thus seems more sound than the extreme conservative view because the offspring is far more developed; as the unicellular zygote. This view also faces severe problems; for example, it is not at all clear where the morally relevant difference is between the fetus five minutes before birth and a just born offspring. Some moderate views have commonsense plausibility especially when it is argued that there are significant differences between the developmental stages. The fact that they also claim for a break in the biological process, which is morally relevant, seems to be a relapse into

old and unjustified habits. As Gillespie stresses in his article "Abortion and Human Rights" (1984, 94-102) there is no morally relevant break in the biological process of development. But, in fact, there are differences, which make a comparative basis possible without having to solve the problem of drawing a line. How should one decide?

## **2) The Standard Argument**

The standard argument is the following practical syllogism:

1. The killing of human beings is prohibited.
2. A fetus is a human being.
3. The killing of fetuses is prohibited.

Hence, abortion is not allowed since homicide is prohibited. It seems obvious to question the result of the practical syllogism since one is able to argue against both premises. First, there are possible situations where the first premise could be questioned by noting, for example that killing in self-defense is not prohibited. Second, the second premise could also be questioned since it is not at all clear whether fetuses are human beings in the sense of being persons, although they are of course human beings in the sense of being members of the species of homo sapiens. Consecutively, one would deny that fetuses are persons but admit that a young two year old child may be a person. Although, in the end, it may be difficult to claim that every human being is a person. For example, people with severe mental handicaps or disorder seem not to have personhood. That is, if personhood is defined with regard to specific criteria like the capacity to reason, or to have consciousness, self-consciousness, or rationality, some people might be excluded. But, in fact, this does not mean that people with severe mental handicaps who lack personhood can be killed. Even when rights are tied to the notion of personhood, it is clearly prohibited to kill disabled people. Norbert Hoerster, a well-known German philosopher, claims that fetuses with severe handicaps can be – like all other fetuses – aborted, as born human beings with severe handicaps they have to be protected and respected like all other human beings, too (1995, 159).

## **3) The Modified Standard Argument**

However, it seems appropriate to modify the standard argument and to use a more sophisticated version. Replace the notion "human being" with "human life form." The new practical syllogism is:

4. The killing of human life forms is prohibited.
5. A fetus is a human life form.
6. The killing of fetuses is prohibited.

The objection against the first premise of the standard argument still holds for the new more sophisticated version. But, the second modified premise is much stronger than the previous one because one has to determine what a human life form really is. Is a fetus a human life form? But, even if the fetus is a human life form, it does not necessarily follow that it should be protected by that fact, simpliciter. The fetus may be a human life form but it hardly seems to be a person (in the ordinary sense of the notion) and thus has no corresponding basic right to live. However, as already stated, this kind of talk seems to go astray because the criteria for personhood may be suitable for just-borns but not appropriate for fetuses, embryos, or unicellular zygotes, like some biological (human being), psychological (self-consciousness), rational (ability to reasoning), social (sympathy/love), or legal (being a human life form with rights) criteria may indi-

cate (for example, Jane English 1984). Jane English persuasively argues in "Abortion and the Concept of a Person" that even if the fetus is a person, abortion may be justifiable in many cases, and if the fetus is no person, the killing of fetuses may be wrong in many cases.

## Personhood

What does it mean to claim that a human life form is a person? This is an important issue since the ascription of rights is at stake. I previously stated that it is unsound to say that a fetus is a person or has personhood since it lacks, at least, rationality and self-consciousness. It follows that not every human being is also a person according to the legal sense, and, thus, also lacks moral rights (extreme case). The fetus is by virtue of his genetic code a human life form but this does not mean that this would be sufficient to grant it legal and moral rights. Nothing follows from being a human life form by virtue of one's genes, especially not that one is able to derive legal or moral rights from this very fact (for example, speciesism). Is a human person exclusively defined by her membership of the species *Homo sapiens sapiens* and thus should be protected? To accept this line of argumentation would entail the commitment of the existence of normative empirical features. It seems premature to derive the prohibition to kill a life form from the bare fact of its genetic feature – including the human life form – unless one argues that human beings do have the basic interest of protecting their offspring. Is a human life form a moral entity? This seems to be a good approach. The argument runs as follows: It seems plausible to claim that human beings create values and, if they have the basic interest of protecting their offspring, human beings may establish a certain morality by which they can argue, for example, for the prohibition of abortions. The moral judgment can be enforced through legal norms.

To be more precise about the assumption of the existence or non-existence of normative, empirical features: Critics of the view to tie the right to live and the biological category of being a human being claim that the protagonists effect the is-ought fallacy. Why is it unsound to take the bare fact of being a member of the biological species *Homo sapiens* as a solid basis for granting the right to live? The linkage seems only justified when there are sound factual reasons. If there are none, the whole line of reasoning would "hang in the air" so that one could also easily argue for the right to live for cats and dogs. Only factual relevant features may be important for the linkage. What could these relevant features look like?

Jane English presents in her article "Abortion and the Concept of a Person" several features of personhood which characterize the human person. Her notion of personhood can be grouped into five sectors (English 1984, pp. 152): (i) the biological sector (being a human being, having extremities, eating and sleeping); the psychological sector (perception, emotions, wishes and interests, ability to communicate, ability to make use of tools, self-consciousness); (iii) the rational sector (reasoning, ability to make generalizations, to make plans, learning from experience); (iv) the social sector (to belong to different groups, other people, sympathy and love); and (v) the legal sector (to be a legal addressee, ability to make contracts, to be a citizen). According to English, it is not necessary for a human life form to comply with all five sectors and different aspects to count as a person. A fetus lies right in the penumbra where the concept of personhood is hard to apply. There is no core of necessary and sufficient features that could be ascribed to a human life form in order to be sure that these features constitute a person (English 1984, 153).

Mary Anne Warren claims that a human life form should qualify as a person when, at least, some of the following aspects (especially i-iii) are at stake: (i) consciousness and the ability to feel pain; (ii) reasoning; (iii) a self-motivated activity; (iv) ability to communicate; and (v) the existence of a

self-concept (for example, individual, racial) and self-consciousness (Warren 1984, 110-113). Warren argues that the fetus is no person since it lacks the criteria of personhood and, thus, an abortion is justified.

The aim is not to give an airtight definition of the concept of personhood. The main question is whether a fetus could qualify as a person. The following can be stated: The fetus is a human offspring but is not a legal, social, and rational person in the ordinary sense of the notions. Some aspects of the psychological sector for example, the ability to feel and perceive can be ascribed to the fetus but not to the embryo, conceptus, or the (unicellular) zygote. It seems implausible to say that a fetus (or embryo, conceptus, zygote) is a person, unless one additionally claims that the genetic code of the fetus is a sufficient condition. However, this does not mean, in the end, that one could always justify an abortion. It only shows that the fetus could hardly be seen as a human person.

It is hard to keep the legal and moral aspects of the conflict of abortion apart. There are overlaps which are due to the nature of things since legal considerations are based on the ethical realm. This can also be seen according to the notion person. What a person is is not a legal question but a question which is to be decided within a specific ethics. If one characterizes the notion of a person along some criteria, then the question of which criteria are suitable or not will be discussed with regard to a specific moral approach (for example, Kantianism, utilitarianism, virtue ethics). The relevant criteria, in turn, may come from different areas like the psychological, rational, or social sphere. If the criteria are settled, this influences the legal sector because the ascription of legal rights – especially the right to live in the abortion debate – is tied to persons and respectively to the concept of personhood.

## **Moral Aspects of the Abortion Conflict**

The main question with regard to the moral sphere concerns identification of the right developmental point of the fetus (or the embryo, conceptus, zygote) to decide which break may morally justify an abortion or not (proponents of the moderate view and the extreme liberal view claim that there is such a break). The main arguments in the debate will be evaluated in the following. Before we analyze the arguments, it is necessary to say something about moral rights.

### **a) Moral Rights**

Some authors claim that the talk of moral rights and moral obligations is an old never-ending tale. There are no “moral rights” or “moral obligations” per se; at least, in the sense that there are also moral rights and moral obligations apart from legal rights and legal obligations. There is no higher ethical authority which may enforce a specific moral demand. Rights and obligations rest on law. According to ethics, one should better say “moral agreements” (for example, Gauthier). The proponents claim that moral agreements do have a similar status to legal rights and legal obligations but stress that no person has an enforceable demand to have her moral rights prevail over others. The suitability is the essential aspect of the metaphysics of rights and obligations. Only the formal constraint establishes rights and obligations within a given society (for example, Hobbes); the informal constraint within a given society – though it may be stronger – is not able to do so. Without a court of first instance there are no rights and obligations. Only by using the legal system is one able to establish specific moral rights and specific moral obligations. Those authors claim that there are no absolute moral rights and moral obligations which are universally valid; moral agree-

ments are always subjective and relative. Hence, there are also no (absolute) moral rights which the fetus (embryo, conceptus, or zygote) may call for. The only solution may be that the survival of the fetus rests on the will of the human beings in a given moral society. According to their view, it is only plausible to argue that an abortion is morally reprehensible if the people in a given society do have a common interest not to abort and make a moral agreement which is enforced by law.

### **b) At Birth**

Proponents of the liberal view contend that the morally significant break in the biological development of the fetus is at birth. This means that it is morally permitted to have an abortion before birth and morally prohibited to kill the offspring after birth. The objection against this view is simple because there seems to be no morally relevant difference between a short time (say five minutes) before birth and after it. Factually, the only biological difference is the physical separation of the fetus from the mother. However it seems unsound to interpret this as the morally significant difference; the bare evidence with regard to the visibility of the offspring and the physical separation (that is, the offspring is no longer dependent on the woman's body) seems insufficient.

### **c) Viability**

Proponents of the moderate view often claim that the viability criterion is a hot candidate for a morally significant break because the dependence of the nonviable fetus on the pregnant woman gives her the right to make a decision about having an abortion. The aspect of dependence is insufficient in order to determine the viability as a possible break. Take the following counter-example: A son and his aged mother who is nonviable without the intensive care of her son; the son has no right to let his mother die by virtue of her given dependence. However, one may object that there is a difference between "needing someone to care for you" and "needing to live off a particular person's body." Furthermore, one may stress that the nonviable and the viable fetus both are potential human adults. But as below the argument of potentiality is flawed since it is unclear how actual rights could be derived from the bare potentiality of having such rights at a later time. Hence, both types of fetuses cannot make claim for a right. There is also another objection that cannot be rebutted: the viability of the fetus regarding the particular level of medical technology. On the one hand, there is a temporal relativity according to medical technology. The understanding of what constitutes the viability of the fetus has developed over time according to the technical level of embryology in the last centuries and decades. Today, artificial viability allows physicians to rescue many premature infants who would have previously died. On the other hand, there exists a local relativity according to the availability of medical supplies in and within countries which determines whether the life of a premature infant will be saved. The medical supply may vary greatly. Consequently, it seems inappropriate to claim that viability as such should be regarded as a significant break by being a general moral justification against abortions.

### **d) First Movement**

The first movement of the fetus is sometimes regarded as a significant break because proponents stress its deeper meaning which usually rests on religious or non-religious considerations. Formerly the Catholic Church maintained that the first movement of the fetus shows that it is the breathing of life into the human body (animation) which separates the human fetus from animals. This line of thinking is out-of-date and the Catholic Church no longer uses it. Another point is that the first movement of the fetus that women experience is irrelevant since the real first movement of the fetus is much earlier. Ultrasonic testing shows that the real first movement of the fetus is somewhere between the 6th and 9th week. But even if one considers the real first movement prob-

lems may arise. The physical ability to move is morally irrelevant. One counter-example: What about an adult human being who is quadriplegic and is unable to move? It seems out of the question to kill such people and to justify the killing by claiming that people who are disabled and simply lack the ability to move are, therewith, at other people's disposal.

### **e) Consciousness and the Ability to Feel Pain**

In general, proponents of moderate views believe that consciousness and the ability to feel pain will develop after about six months. However the first brain activities are discernable after the seventh week so that it is possible to conclude that the fetus may feel pain after this date. In this respect, the ability to suffer is decisive for acknowledging a morally significant break. One may object to this claim, that the proponents of this view redefine the empirical feature of "the ability to suffer" as a normative feature (is-ought fallacy). It is logically unsound to conclude from the bare fact that the fetus feels pain that it is morally reprehensible or morally prohibited per se to abort the fetus.

### **f) Unicellular Zygote**

Proponents of the extreme conservative view claim that the morally significant break in the biological development of the fetus is given with the unicellular human zygote. They argue that the unicellular zygote is a human person, and thus, it is prohibited to have an abortion because one kills a human being (for example, Schwarz).

The extreme conservative proponents argue that biological development from the fetus to a human being is an incremental process which leaves no room for a morally significant break (liberals deny this line of thinking). If there is no morally significant break, then the fetus has the same high status of a newborn, or the newborn has the same low status of the fetus.

To many opponents of the "extreme" conservative position, it seems questionable to claim that a unicellular zygote is a person. At best, one may maintain that the zygote will potentially develop into a human being. Except the potentiality argument is flawed since it is impossible to derive current rights from the potential ability of having rights at a later time. Opponents (for example, Gert) also object to any attempt to base conclusions on religious considerations that they believe cannot stand up to rational criticism. For these reasons, they argue that the conservative view should be rejected.

### **g) Thomson and the Argument of The Sickly Violinist**

Judith Jarvis Thomson presents an interesting case in her landmark article "A Defense of Abortion" (1971) in order to show that, even if the fetus has a right to live, one is still able to justify an abortion for reasons of a woman's right to live/integrity/privacy. Thomson's famous example is that of the sickly violinist: You awake one morning to find that you have been kidnapped by a society of music lovers in order to help a violinist who is unable to live on his own by virtue of his ill-health. He has been attached to your kidneys because you alone have the only blood type to keep him alive. You are faced with a moral dilemma because the violinist has a right to live by being a member of the human race; there seems to be no possibility to unplug him without violating this right and thus killing him. However, if you leave him attached to you, you are unable to move for months, although you did not give him the right to use your body in such a way (Thomson 1984, 174-175).

First, Thomson claims that the right to live does not include the right to be given the means necessary for survival. If the right to live entails the right to those means, one is not justified in preventing the violinist from the on-going use of one's kidneys. The right to the on-going use of the kidneys necessarily implies that the violinist's right to his means for survival always trumps the right to another person's body. Thomson refuses this and claims that "the fact that for continued life that violinist needs the continued use of your kidneys does not establish that he has a right to be given the continued use of your kidneys" (Thomson 1984, 179). She argues that everybody has a right of how his own body is used. That is, the violinist has no right to use another person's body without her permission. Therefore, one is morally justified in not giving the violinist the use of one's own kidneys.

Second, Thomson contends that the right to live does not include the right not to be killed. If the violinist has the right not to be killed, then another person is not justified in removing the plug from her kidneys although the violinist has no right to their use. According to Thomson, the violinist has no right to another person's body and hence one cannot be unjust in unplugging him: "You surely are not being unjust to him, for you gave him no right to use your kidneys, and no one else can have given him any such right" (Thomson 1984, 180). If one is not unjust in unplugging oneself from him, and he has no right to the use of another person's body, then it cannot be wrong, although the result of the action is that the violinist will be killed.

### **Legal Aspects of the Abortion Conflict**

What is the legal status of the fetus (embryo, conceptus, and zygote)? Before the question is answered, one should pay some attention to the issue of the genesis of a legal system. Which ontological status do legal rights have? Where do they come from? Usually we accept the idea that legal rights do not "fall from the blue sky" but are made by human beings. Other conceptions which had been provided in the history of human kind are:

1. rights rest on God's will;
2. rights rest on the strongest person; or
3. rights rest on a specific human feature like a person's wisdom or age.

However, let us take the following description for granted: There is a legal community in which the members are legal entities with (legal) claims and legal addressees with (legal) obligations. If someone refuses the addressee's legal obligation within such a system, the legal entity has the right to call the legal instance in order to let his right be enforced. The main question is whether the fetus (or the embryo, conceptus, zygote) is a legal person with a basic right to live or not and, furthermore, whether there will be a conflict of legal norms, that is a conflict between the fetus' right to live and the right of self-determination of the pregnant woman (principle of autonomy). Is the fetus a legal entity or not?

#### **a) The Account of Quasi-Rights**

It was previously stated that the fetus as such is no person and that it seems unsound to claim that fetuses are persons in the ordinary sense of the notion. If rights are tied to the notion of personhood, then it seems appropriate to say that fetuses do not have any legal rights. One can object that animals of higher consciousness have some "rights" or quasi-rights because it is prohibited to kill them without good reason (killing great apes and dolphins for fun is prohibited in most coun-

tries). Their “right” not to be killed is based on the people’s will and their basic interest not to kill higher developed animals for fun. But, it would be wrong to assume that those animals are legal entities with “full” rights, or that they have only “half” rights. Thus, it seems reasonable to say that animals have “quasi-rights.” There is a parallel between the so-called right of the fetus and the quasi-rights of some animals: both are not persons in the normal sense of the notion but it would cause us great discomfort to offer them no protection and to deliver them to the vagaries of the people. According to this line of argument, it seems sound to claim that fetuses also have quasi-rights. It does not follow that the quasi-rights of the fetuses and the quasi-rights of the animals are identical; people would normally stress that the quasi-rights of fetuses are of more importance than that of animals.

However, there are some basic rights of the pregnant woman, for example, the right of self-determination, the right of privacy, the right of physical integrity, and the right to live. On the other hand, there is the existential quasi-right of the fetus, that is, the quasi-right to live. If the presumption is right that legal rights are tied to the notion of personhood and that there is a difference between rights and quasi-rights, then it seems right that the fetus has no legal right but “just” a quasi-right to live. If this is the case, what about the relation between the existential quasi-right of the fetus and the basic legal rights of the pregnant woman? The answer seems obvious: quasi-rights cannot trump full legal rights. The fetus has a different legal status that is based on a different moral status (see above). On this view there is no legal conflict of rights.

## **b) The Argument of Potentiality**

Another important point in the debate about the ascription of legal rights to the fetus is the topic of potential rights. Joel Feinberg discusses this point in his famous article “Potentiality, Development, and Rights” (1984, 145-151) and claims that the thesis that actual rights can be derived from the potential ability of having such rights is logically flawed because one is only able to derive potential rights from a potential ability of having rights. Feinberg maintains that there may be cases where it is illegal or wrong to have an abortion even when the fetus does not have any rights or is not yet a moral person. To illustrate his main argument – that rights do not rest on the potential ability of having them – Feinberg considers Stanley Benn’s argument which I slightly modified:

If person X is President of the USA and thus is Commander in Chief of the army, then person X had the potential ability to become the President of the USA and Commander in Chief of the army in the years before his rule.

But, it does not follow that:

The person X has the authority to command the army as potential President of the USA.

Thus, it seems incorrect to derive actual rights from the bare potential ability to have legal rights at a later time. It should be added that Benn – despite his criticism on the argument of potential rights – also claims that there are valid considerations which do not refer to the talk of rights and may provide plausible reasons against infanticide and late abortions even when fetuses and newborns are lawless beings with no personhood.

## **A Pragmatic Account**

There is always a chance that women get pregnant when they have sex with their (heterosexual) partners. There is not a 100% certainty of not getting pregnant under “normal circumstances”; there is always a very small chance even by using contraception to get pregnant. However, what

does the sphere of decisions look like? A pregnancy is either deliberate or not. If the woman gets deliberately pregnant, then both partners (respectively the pregnant woman) may decide to have a baby or to have an abortion. In the case of having an abortion there may be good reasons for having an abortion with regard to serious health problems, for example, a (seriously) disabled fetus or the endangerment of the woman's life. Less good reasons seem to be: vacation, career prospects, or financial and social grievances. If the pregnancy is not deliberate, it is either self-caused in the sense that the partners knew about the consequences of sexual intercourse and the contraception malfunctioned or it is not self-caused in the sense of being forced to have sex (rape). In both cases the fetus may be aborted or not. The interesting question concerns the reasons given for the justification of having an abortion.

There are at least two different kinds of reasons or justifications: The first group will be called "first order reasons"; the second "second order reasons." First order reasons are reasons of justifications which may plausibly justify an abortion, for example, (i) rape, (ii) endangerment of the woman's life, and (iii) a serious mentally or physically disabled fetus. Second order reasons are reasons of justifications which are, in comparison to first order reasons, less suitable in providing a strong justification for abortion, for example, (i) a journey, (ii) career prospects, (iii) by virtue of financial or social grievances.

## **a) First Order Reasons**

### **i. Rape**

It would be cruel and callous to force the pregnant woman who had been raped to give birth to a child. Judith Jarvis Thomson maintains in her article "A Defense of Abortion" that the right to live does not include the right to make use of a foreign body even if this means having the fetus aborted (Thomson 1984, pp. 174 and pp. 177). Both the fetus and the raped woman are "innocent," but this does not change "the fact" that the fetus has any rights. It seems obvious in this case that the raped woman has a right to abort. Forcing her not to abort is to remind her of the rape day-by-day which would be a serious mental strain and should not be enforced by law or morally condemned.

However, this assumption would be premature from John Noonan's viewpoint according to his article "An Almost Absolute Value in History" (Noonan 1970, 51- 59). He claims that the fetus as human [is] a neighbor; his life [has] parity with one's own [...] [which] could be put in humanistic as well as theological terms: do not injure your fellow man without reasons. In these terms, once the humanity of the fetus is perceived, abortion is never right except in self-defense. When life must be taken to save life, reason alone cannot say that a mother must prefer a child's life to her own. With this exception, now of great rarity, abortion violates the rational humanist tenet of the equality of human lives.

Hence, the woman has no right to abort the fetus even if she had been raped and got pregnant against her will. This is the consequence of Noonan's claim since he only permits having an abortion in self-defense while Thomson argues that women, in general, have a right to abort the fetus when the fetus is conceived as an intruder (for example, due to rape). But, it remains unclear what Noonan means by "self-defense." At the end of his article he states that "self-sacrifice carried to the point of death seemed in extreme situations not without meaning. In the less extreme cases, preference for one's own interests to the life of another seemed to express cruelty or selfishness irreconcilable with the demands of love"

(Noonan 1970). On this view, even in the standard case of self-defense – for example, either the

woman's life or the life of the fetus – the pregnant woman's death would not be inappropriate and in less extreme cases the raped woman would express cruelty or selfishness when she aborts the fetus – a judgment not all people would agree with.

## **ii. Endangerment of the Woman's Life**

Furthermore, there is no good reason to proceed with a pregnancy when the woman's life is in serious danger. Potential life should not be more valued than actual life. Of course, it is desirable to do everything possible to rescue both but it should be clear that the woman's life "counts more" in this situation. To force her at the risk of her life means to force her to give up her right of self-defense and her right to live. There seems to be no good reason to suspend her basic right of self-defense.

## **iii. Serious Mentally or Physically Disabled Fetuses**

It is hard to say when exactly a fetus is seriously mentally or physically disabled because this hot issue raises the vital question of whether the future life of the disabled fetus is regarded as worth living (problem of relativity). Hence, there are simple cases and, of course, borderline cases which lie in the penumbra and are hard to evaluate. Among the simple cases take the following example: Imagine a human torso lacking arms and legs that will never develop mental abilities like self-consciousness, the ability to communicate, or the ability to reason. It seems quite obvious to some people that such a life is not worth living. But what about the high number of borderline cases? Either parents are not entitled to have a healthy and strong offspring, nor are the offspring entitled to become healthy and strong. Society should not force people to give birth to seriously disabled fetuses or morally worse to force mothers who are willing to give birth to a disabled fetus to have an abortion (for example, Nazi Germany). It seems clear that a rather small handicap of the fetus is not a good reason to abort it.

Often radical groups of disabled persons claim that, if other people hold the view that it is all right to abort fetuses with (serious) genetic handicaps, the same people therewith deny the basic right to live of disabled adults with serious handicaps. This objection is unreasonable since fetuses in contrast to adult human beings have no basic interest in continuing to live their lives. Disabled fetuses maybe aborted like other fetuses, disabled (adult) human persons have to be respected like other people.

## **b) Second Order Reasons**

### **i. A Journey to Europe**

With regard to the reasons of justification according to the second group, there is a specific view which is based on the argument that it is the decision of the woman to have an abortion or not.

There is a related view that rests on the assumption of the pregnant woman who claims that the fetus is a part of her body like a limb so that she has the right to do what ever she wants to do with the fetus. The argument is wrong. The fetus is certainly not a simple part of the pregnant woman but, rather, a dependent organism that relies on the woman.

The following example, the journey to Europe from North America, is based on the feminist argument but it is somewhat different in stressing another point in the line of argumentation: A young woman is pregnant in the seventh month and decides to make a journey to Europe for a sight-

seeing four. Her pregnancy is an obstacle to this and she decides to have an abortion. She justifies her decision by claiming that it will be possible for her to get pregnant whenever she wants but she is only able to make the journey now by virtue of her present career prospects. What can be said of her decision? Most authors may feel a deep discomfort not to morally condemn the action of the woman or not to reproach her for her decision for different reasons. But, there seems only two possible answers which may count as a valid basis for morally blaming the woman for her decision: First, if the young woman lives in a moral community where all members hold the view that it is immoral to have an abortion with regard to the reason given, then her action may be morally reprehensible. Furthermore, if the (moral) agreement is enforced by law, the woman also violated the particular law for which she has to take charge of. Second, one could also blame her for not showing compassion for her potential child. People may think that she is a callous person since she prefers to make the journey to Europe instead of giving birth to her almost born child (seventh month). If the appeal to her mercy fails, one will certainly be touched by her "strange" and "inappropriate" action. However, the community would likely put some informal pressure on the pregnant woman to influence her decision not to have an abortion. But some people may still contend that this social pressure will not change anything about the fact that the fetus has no basic right to live while claiming that the woman's decision is elusive.

## **ii. Financial and Social Reasons**

A woman got pregnant (not deliberately) and wants to have an abortion by virtue of her bad financial and social background because she fears that she will be unable to offer the child an appropriate life perspective. In this case, the community should do everything possible to assist the woman if she wants to give birth to her child. Or, some may argue, that society should offer to take care of her child in special homes with other children or to look for other families who are willing to house another child. According to this line of thinking, people may claim that the financial or social background should not be decisive for having an abortion if there is a true chance for help.

## **c) First Order Reasons vs. Second Order Reasons**

There is a difference between the first order reasons and the second order reasons. We already saw that the first order reasons are able to justify an abortion while the second order reasons are less able to do so. That is because people think that the second order reasons are weaker than the reasons of the first group. It seems that the human ability to show compassion for the fetus is responsible for our willingness to limit the woman's basic right of autonomy where her reasons are too elusive. However, one may state that there are no strong compulsive reasons which could morally condemn the whole practice of abortion. Some people may not unconvincingly argue that moral agreements and legal rights are due to human beings so that reasons for or against abortion are always subjective and relative. According to this view, one is only able to contend the "trueness" or "wrongness" of a particular action in a limited way. Of course, there are other people who argue for the opposite (for example, Kantians, Catholic Church). One reason why people have strong feelings about the conflict of abortion is that human beings do have strong intuitive feelings, for example, to feel compassion for fetuses as helpless and most vulnerable human entities. But moral intuitionism falls short by being a valid and objective basis for moral rights.

In the end, it is a question of a particular moral approach whether one regards an abortion as morally justifiable or not. But not every approach is justified. There is no anything goes.

## **Public Policy and Abortion**

One of the most difficult issues is how to make a sound policy that meets the needs of most people in a given society without focusing on the extreme conservative view, or the extreme liberal view, or the many moderate views on the conflict of abortion. The point is simple, one cannot wait until the philosophical debate is settled, for maybe there is no one solution available. But, in fact, people in a society must know what the policy is; that is, they have to know when and under what circumstances abortion is permitted or altogether prohibited. What are the reasons for a given policy? Do they rest on religious beliefs or do they depend on cultural claims? Whose religious beliefs and whose cultural claims? Those beliefs and claims of most people or of the dominant group in a given society? What about the problem of minority rights? Should they be respected or be refused? These are hard questions; no one is able to yet give a definite response.

But, of course, the problem of abortion has to be “solved,” at least, with regard to practical matters. This means that a good policy does not rest on extreme views but tries to cover as many points of views, although being aware of the fact that one is not able to please every person in society. This would be an impossible task. It seems that one should adopt a moderate view rather than the proposed extreme views. This is not because the moderate view is “correct” but because one needs a broad consensus for a sound policy. The hardliners in the public debate on the conflict of abortion, be they proponents or opponents, may not be aware of the fact that neither view is sustainable for most people.

A sound way for governments with regard to a reasonable policy could be the acceptance of a more or less neutral stance that may function as a proper guide for law. But, in fact, the decisive claim of a “neutral stance” is, in turn, questionable. All ethical theories try to present a proper account of a so-called neutral stance but there is hardly any theory that could claim to be sustainable with regard to other approaches. However, the key seems to be, again, to accept a middle way to cover most points of views. In the end, a formation of a policy seeks a sound compromise people could live with. But this is not the end of the story. One should always try to find better ways to cope with hard ethical problems. The conflict of abortion is of that kind and there is no evidence to assume otherwise.

## **Clinical Ethics Consultation and Abortion**

The vital issue of how one chooses whether or not to have an abortion is of utmost importance since people, in particular women, want to have a proper “guideline” that can support them in their process of ethical decision-making. According to pregnant women, the most crucial point seems not to be whether abortion is morally legitimate or not but, rather, how one should deliberate in the particular case. In fact, observations regularly show that women will nearly have the same number of abortions in contexts in which it is legal or not.

Gert is right in claiming that “the law can allow behavior that some people regard as morally unacceptable, such as early abortion, and it can prohibit behavior that some people regard as morally acceptable, such as late abortion. No one thinks that what the law decides about abortion settles the moral issue” (Gert 2004, 138). But what follows from that? What aspects should one consider and how should one decide in a particular case?

It would be best to consult a neutral person who has special knowledge and experiences in medicine and medical ethics (for example, clinical ethics consultation). Most people are usually not faced with hard conflicts of abortion in their daily lives and get simply swamped by it; they are un-

able to determine and evaluate all moral aspects of the given case and to foresee the relevant consequences of the possible actions (for example, especially with regard to very young women who get pregnant by mistake). They need professional help without being dominated by the person in order to clarify their own (ethical) stance.

However, the conflict of abortion as such may not be solvable, in the end, but the experienced professional is able to provide persons with feasible solutions for the particular case.

## **Euthanasia**

Euthanasia, also called 'Mercy Killing' and 'Physician Assisted Suicide'; is a term in medical ethics for the practice of interfering or intervening in a natural process towards death. In other words it is accelerating the natural course of death in terminally ill patients, when all treatments become ineffective or much too painful for the patient to bear. In short Euthanasia is ending a human life with the intention of relieving the person from an unbearable pain. Haris (2001) precisely defines Euthanasia as 'a deliberate intervention undertaken with the express intention of ending a life to relieve intractable suffering'.

The issue of Euthanasia has always remained controversial and still has failed to carry legal and constitutional support in most parts of the world. Suicide in any form and by any means is either punished or at least disapproved in human history. There is no permissibility of such a killing/suicide in Islam so Euthanasia can never be the part of Muslim law in Islamic world. Therefore the origin and development of this concept can be historically located in the non Muslim countries especially of the west.

Back in 400 BC when the father of medicine Hippocrates formulated the oath still taken by the fresh medical graduates dictates 'I will give no deadly medicine to any one if asked, nor suggest any such counsel', speaks against physician assisted suicide. Even in the 19th century, the US legislation proclaimed that if a suicide is committed on the advice of another person, the adviser would be guilty of a murder. In the early 20th century, the Supreme Court reevaluated its judgments concerning 'living will' and focusing how best to ensure the dignity and the independence for the 'end of life' with considerable changes in the health laws. In 1920 the book "Permitting the Destruction of Life not Worthy of Life" was published, in which the author Hoche advocated the death assistance be given under very controlled conditions. In 1935 Euthanasia society was formed in England to support mercy killing. 1939's Nazi's Euthanasia became very popular when Hitler ordered mercy killing of the sick and disabled. From 1995 to 2008, Euthanasia has been legalized in countries like parts of Australia, Netherland, Belgium and few states of the United States of America. [2]

There are several forms or kinds of Euthanasia; each form has its own ethical issues.

**Active Euthanasia:** is the one which causes immediate death of the patient, by the direct and deliberate action of the physician. For example when a lethal injection is given to the patient or an overdose of a pain killer when the physician knows the after effects of such a dose.

**Passive Euthanasia** involves an indirect action by the physician for the death of the patient. This may include withdrawing or withholding the required treatment. For example switching off the life supporting machine like ventilator or not doing the required surgical procedures that can keep the person alive though for a short time.

**Voluntary Euthanasia:-** takes place with the will of the patient, usually on his request to the physi-

cian.

Non-Voluntary Euthanasia occurs when the patient is unconscious or in comma for a long time, or unable to make decision for example a very young child, or a mentally retarded person. Therefore someone else related to the patient makes the decision of ending the patient's life.

Involuntary Euthanasia:- is oftentimes equated to murder because in this case the patient does not opt for death but he is killed as the doctor thinks it to be in his benefit.

Indirect Euthanasia: – does not involve the intentional killing by the physician, but the side effects of the treatment, usually given to reduce the pain accelerate the death of the patient.

Assisted Suicide:- includes cases when the patient seeks help from his physician to die. This can include making the lethal drugs available for the patients.

The most common argument given by the proponents of Euthanasia is its effective way of relieving excruciating pain. To this one argument there can be two counter arguments. Firstly the advancements made today in the field of medicine, especially in pain management weakens the justification for Euthanasia. Secondly research shows that terminally ill patients choose suicide not because of the physical pain but because of depression. A study of terminally ill patients published in The American Journal of Psychiatry in 1986 concluded:

'The striking feature of [our] results is that all of the patients who had either desired premature death or contemplated suicide were judged to be suffering from clinical depressive illness; that is, none of those patients who did not have clinical depression had thoughts of suicide or wished that death would come early'.

Researchers believe that a person diagnosed with terminal illness should be given time and support to pass through the five stages of the process – denial, anger, bargaining, depression and acceptance, and killing them before they come to terms with the situation is nothing less than a murder.

## **View our services**

Boston Globe survey of 1991 shows that patients with incurable illnesses who see suicide as an option are mostly those who are neither tired of pain or of restricted life style, nor the fear of machine dependency but rather the feeling of being a burden on their family. Sometimes it's the family who advocate Euthanasia for the terminally ill patient, considering his life unworthy, and therefore a burden; which in turn throws the patient in the abbeys of depression. One should be afraid of the day when legalization of the right to die will become duty to die, pressurizing the already tormented patients to select Euthanasia as an only option. [3]

If we look at Euthanasia from another angle it is not a right to die but gives someone a right to kill. A right given to doctors and the relatives of a person to intentionally end his life. There is a need to differentiate between suicide and killing. Suicide is an individual act, whereas Euthanasia is not a private act. It involves the will of the person or the relatives and action of the physician, and known by everyone around. It is therefore more close to public killing than suicide. Such a power to kill can be abused for the most vulnerable people in the population.

There should be a public realization that if all forms of treatments fail or become ineffective or continuation of any medical or surgical procedure would increase the pain rather than alleviating it, the suffering soul should be given support in all possible ways and all efforts should be directed toward minimizing his agony and making whatever little time he has, comfortable.

As followers of Islam such an option as Euthanasia can never cross our minds for ourselves or for our dear ones. I have a personal experience of accompanying a close kin of mine to the dialysis sessions, where patients were not only dependent on machines for their lives but were not even allowed to drink water during the warmest summers, but never did I once heard a patient or any of his relative praying for a quick demise. They would seek Allah's blessings during the hardest of times and a kind of hope would get them going. I saw doctors trying to look for options to improve the quality of life of such patients but any thought of eliminating the patient's pain through killing them was out of question and option.

As Muslims it is our firm belief that every life is sacred and Allah never creates and sustains anyone without purpose. In the holy Quran He says 'And if anyone saved a life, it would be as if he has saved the life of whole people'. (Quran 5:32). Allah further commands 'take not the life which Allah made sacred otherwise in the course of justice'.

If we equate voluntary Euthanasia with suicide, then again none of us has a right to take his own life. How can we have this right when we have not created ourselves, in fact how can we destroy something of which we are not the owners. Our bodies and souls belong to the Almighty and have been entrusted to us to be taken care of in the best ways possible. Suicide is a crime which is not only punishable in this world but also unforgivable sin in the hereafter. Prophet Mohammad warned the people against suicide by saying "Whoever kills himself with an iron instrument will be carrying it forever in hell. Whoever takes poison and kills himself will forever keep sipping that poison in hell. Whoever jumps off a mountain and kills himself will forever keep falling down in the depths of hell". [4]

Our religion Islam not only emphasize on seeking all possible medical help during illness but further consoles the patients in pain by giving him the happy tidings for reward if he endures the pain with patience. In one of the hadith it is mentioned that when a true believer is afflicted with pain, even a prick of a thorn and he bears it with patience, then his sins will be forgiven and his wrongdoings will be discarded as the tree sheds off its leaves. Such words by the Holy Prophet can be a huge support for a sufferer of a terminal illness or of incurable and painful disease. Euthanasia cannot therefore be a part of the dictionary of a true believer.

The weak value system of the west has come up with the idea of deserting the old, weak and the sick by leaving them in the old houses and hospitals. These so called facilities also sometimes cost them huge amounts, which make them claim that people who become unproductive for the society and a burden on the productive fellows should die for the good of the people around and for their own ease. But the east has still kept its value system strong. Our religious and social values dictate us to take care with respect and dignity of the old, weak, sick and the helpless. Allah has specially stressed upon respecting and serving the parents specially when they become old. "and that you be kind to your parents. Whether one or both of them attain old age in your life, say not to them a word of contempt but address them in terms of honor. And lower to them the wing of humility out of compassion, and say: my Lord, bestow on them your mercy even as they cherished me in childhood" (Qur'an 17:25- 25). As far as the issue of heavy cost is concerned to keep a terminally ill patient alive, Islam makes it a responsibility of the state and the society as a

whole to cover the health care needed.

Euthanasia might be categorized into several kinds but Islam emphasizes the intentions involved in the act. If for example physician intends to alleviate the pain of the patients but the dose somehow kill him, the doctor cannot be accused of murder, or cannot be said to have practiced Euthanasia. The doctor is expected to help the patient in the process of life and not in process of death.

Important enough is to consider the relative nature of the terms like pain, suffering and agony. It really depends on the patience and tolerance level of each individual, which of course varies. What is suffering for one person might not be the same for the other, similarly excruciating pain for one can be bearable for someone else.

Conclusion: – Humans might be the wisest form of God's creation but still not wise enough to be given a right to decide for their own death or for the death of another of their own kind. All lives are precious and sacred and only such value system can be the basis of a human society, where the sanctity of life is maintained. Euthanasia in any of its forms, involves the intention of killing or finishing a still living human weakens the fabric of the society and gives an altogether a different lens to the members to see death as the only solution for all pains and torments, which blurs the vision to see other possibilities to fight the situation. Euthanasia should therefore be discouraged in all its forms and in all parts of the world.

Euthanasia, also called 'Mercy Killing' and 'Physician Assisted Suicide'; is a term in medical ethics for the practice of interfering or intervening in a natural process towards death. Euthanasia should therefore be discouraged in all its forms and in all parts of the world.

## **Female-infanticide What is infanticide?**

Infanticide is the unlawful killing of very young children. It is found in both indigenous and sophisticated cultures around the world.

## **Female infanticide**

Female infanticide is the deliberate killing of girl babies.

It is also described as gender-selective killing or "gendercide". (Similar words like 'gynocide' and 'femicide' are used to describe the killing of females of any age.)

Female infanticide is more common than male infanticide, and in some countries, particularly India and China, is likely to have serious consequences on the balance of the sexes in the population.

The reasons behind it are almost always cultural, rather than directly religious. The causes:

## **Anti-female bias**

Societies that practise female infanticide always show many other signs of bias against females.

Women are perceived as subservient because of their role as carers and homemakers, whilst men predominantly ensure the family's social and economic stability.

## Family economics

Girl babies are often killed for financial reasons.

- **Earning power:** Men are usually the main income-earners, either because they are more employable or earn higher wages for the same work, or because they are able to do more agricultural work in subsistence economies. Since male babies have a greater income potential, they are less likely to be killed.
- **Potential pensions:** In many societies, parents depend on their children to look after them in old age. But in many of these cultures a girl leaves her parental family and joins her husband's family when she marries. The result is that parents with sons gain extra resources for their old age, when their sons marry, while parents with daughters lose their 'potential pensions' when they marry and move away. This gives parents a strong reason to prefer male children. Some parents (particularly poor ones) who can't afford to support a large family, will kill female babies. Girls are considered a drain on family resources during their childhood without bringing economic benefits later on.
- **Dowry:** Some girl babies are killed so that the family doesn't have to pay a dowry when they get married. In Indian society it is tradition for the parents of the bride to give a dowry to the groom and his family. The dowry consists of large amounts of money and valuable goods. For families with several daughters this can be a serious financial burden.

## Government policy

Governmental policies have also increased female infanticide as an unpredicted side-effect. For example, when the Chinese Government introduced a One Child per Family Policy there was a surge in female infanticide. Families needed to have a son because of their higher earning potential, so a girl baby was an economic disaster for them, and there was a strong motive to ensure that girl babies did not survive.

## Caste

Some female infants are killed because they are regarded as being lower in the **caste** hierarchy than males.

## Where does female infanticide occur?

Female infanticide is a significant problem in parts of Asia - infanticide does occur in the West, but usually as isolated family tragedies with no underlying pattern or gender bias.

## India

Female infanticide and **female foeticide** (the selective abortion of girls in the womb) are significant issues in India.

Female infanticide has been a problem for centuries, partly as a result of the patriarchal nature of Indian society.

## **Tackling the issue**

Modern India has tried several ways to tackle the issue. One initiative in the state of Tamil Nadu was taken to attack the underlying economic problems.

Where parents had one or two daughters but no son, and either of the parents was willing to be sterilised, the government offered the parents money to help look after the children. This money was to be paid annually throughout the daughter's education, followed by a lump sum on her twentieth birthday, either for use as a dowry or to fund further education.

## **China**

Female infanticide has existed in China for a long time, and although the One Child per Family policy has added to the problem, it didn't cause it.

The One Child Policy was introduced by the Chinese Government in 1979 with the intention of keeping the population within sustainable limits even in the face of natural disasters and poor harvests, and improving the quality of life for the Chinese population as a whole.

Under the policy, parents who have more than one child may have their wages reduced and be denied some social services.

Despite the egalitarian nature of Chinese society, many parents believe that having a son is a vital element of providing for their old age. Therefore in extreme cases, a baby is killed if it is not of the preferred sex, because of the pressure not to have more than one child.

## **Tackling the issue**

The Chinese Government have acknowledged the problem and introduced laws to deal with it:

- Marriage law prohibits female infanticide.
- Women's Protection Law prohibits infanticide and bans discrimination against women who choose to keep female babies.
- Maternal Health Care Law forbids the use of technological advances, such as ultra-sound machines, to establish the sex of foetuses, so as not to pre-determine the fate of female infants or encourage selective abortion.

## **Origins of infanticide**

Infanticide occurs in most cases as a way of restricting poverty and population. Throughout history infanticide has been regarded as a productive and efficient way to control starvation and poor standards of living caused by over population.

## **Confucianism**

The male bias in China is deeply rooted in Chinese traditions which leads parents to want their first child to be a boy.

Confucianism regards male children as more desirable since they provide security for the elderly, work and are important for the performance of ancestral rites.

## **Hinduism**

Hindu authorities condemn infanticide.

Son-preference in Hindu cultures is largely based on the fact that men are better providers, and that sons are required for the proper performance of funeral rites.

Some writers argue that Hindu culture has long had a patriarchal bias against women.

## **Sikhism**

Sikh authorities condemn infanticide.

The Sikh religion is one of the most gender-neutral, and explicitly proclaims the equality of men and women. This makes it more surprising that censuses in India show there are far more male children than female children in the Sikh community.

In practice there does appear to be a strong preference for boys in the Sikh heartland. The community appears to give greater respect to the parents of boys, and boys themselves.

In response the Sikh religious organisation Akal Takht has re-emphasised that women are equal to men. It has banned neo-natal sex identification, selective abortion and the killing of female babies.

## **Islam**

Islam has always condemned infanticide.

Female infanticide was common in pre-Islamic Arabia. However, by the time of Muhammad, and the revelation of the Qur'an female infanticide was strictly forbidden, and regarded as seriously as adult murder.

### **The Qur'an on female infanticide:**

When the infant girl, is buried alive, is questioned, for what crime she was killed.

#### **Surah 81 v 8 - 9**

You shall not kill your children for fear of want. We will provide for them and for you. To kill them is a grievous sin.

#### **Surah 17 v 31**

## **Christianity**

Christianity has always condemned infanticide.

## **Judaism**

Judaism has always condemned infanticide. **Professional Ethics: Corporate Governance The ends and means of corporate governance** There is significant debate about the ends and means of corporate governance, i.e., about who firms should be managed for, and who should (ultimately) man-

agethem. Much of this debate is carried on with the large publicly-traded corporation in view.

### **Ends: shareholder primacy or stakeholder balance?**

There are two main views about the proper ends of corporate governance. According to one view, firms should be managed in the best interests of shareholders. It is typically assumed that managing firms in shareholders' best interests requires maximizing their wealth. This view is often called "shareholder primacy" (Stout 2002) or—in order to contrast it more directly with its main rival (to be discussed below) "shareholder theory". (Confusingly, the label 'shareholder primacy' is sometimes used—e.g., by Bainbridge [2008]—to refer to the view that shareholders should have ultimate control over the firm.) Shareholder primacy is the dominant view about the ends of corporate governance among financial professionals and in business schools.

A few writers argue for shareholder primacy on deontological grounds. On this argument, shareholders own the firm, and hire managers to run it for them on the condition that the firm is managed in their interests. Shareholder primacy is thus based on a promise that managers make to shareholders (Friedman 1970; Hasnas 1998). In response, some argue that shareholders do not own the firm. They own stock, a type of corporate security (Bainbridge 2008; Stout 2002); the firm itself may be unowned (Strudler 2017). Others argue that managers do not make, explicitly or implicitly, any promises to shareholders to manage the firm in a certain way (Boatright 1994). More writers argue for shareholder primacy on consequentialist grounds. On this argument, managing firms in the interests of shareholders is more efficient than managing them in any other way (Hansmann & Kraakman 2001; Jensen 2002). In support of this, some argue that, if managers are not given a single objective that is clear and measurable—viz., maximizing shareholder value—then they will have an enhanced opportunity for self-dealing (Stout 2002). Consequentialist arguments for shareholder primacy run into problems that afflict many versions of consequentialism: in requiring all firms to be managed in a certain way, it does not allow sufficient scope for personal choice (Hussain 2012). Most think that people should be able to pursue projects, including economic projects, that matter to them, even if those projects do not maximize welfare.

The second main view about the proper ends of corporate governance is given by stakeholder theory. This theory was first put forward by Freeman in the 1980s (Freeman 1984; Freeman & Reed 1983), and then refined by Freeman and various collaborators over the next 30 years (see, e.g., Freeman et al. 2010; Jones, Wicks, & Freeman 2002). According to stakeholder theory—or at least, early formulations of the theory—instead of managing the firm in the best interests of shareholders only, managers should seek to "balance" the interests of all stakeholders, where a stakeholder is anyone who has a "stake", or interest (including a financial interest), in the firm.

To its critics, stakeholder theory has seemed both insufficiently articulated and weakly defended. With respect to articulation, one question that has been pressed is: Who are the stakeholders (Orts & Strudler 2002, 2009)? The groups most commonly identified are shareholders, employees, the community, suppliers, and customers. But other groups have stakes in the firm, including creditors, the government, and competitors. It makes a great deal of difference where the line is drawn, but stakeholder theorists have not provided a clear rationale for drawing a line in one place rather than another. Another question is: What does it mean to "balance" the interests of all stakeholders—other than not always giving precedence to shareholders' interests (Orts & Strudler 2009)? With respect to defense, critics have wondered what the rationale for managing firms in the interests of all stakeholders is. In one place, Freeman (1984) offers an instrumental argument for his view, claiming that balancing stakeholders' interests is better for the firm strategically than maxim-

izing shareholder wealth. (This is precisely what defenders of shareholder primacy say about that view.) In another, he gives an argument that appeals to Rawls's justice as fairness.

In recent years, questions have been raised about whether stakeholder theory is appropriately seen as a genuine competitor to shareholder primacy, or is even appropriately called a "theory". In one article, Freeman and collaborators say that stakeholder theory is simply "the body of research ... in which the idea of 'stakeholders' plays a crucial role" (Jones et al. 2002). In another, Freeman describes stakeholder theory as "a genre of stories about how we could live"

(1994: 413). It may be, as Norman (2013) says, that stakeholder is now best regarded as "mind-set", i.e., a way of looking at the firm that emphasizes its embeddedness in a network of relationships.

It is important to realize that a resolution of the debate between shareholder and stakeholder theorists (however we conceive of the latter) will not resolve all or even most of the ethical questions in business. This is because this is a debate about the ends of corporate governance; it cannot answer all of the questions about the moral constraints that must be observed in pursuit of those ends (Goodpaster 1991; Norman 2013). Neither shareholder primacy nor stakeholder theory is plausibly interpreted as the view that corporate managers should do whatever is possible to maximize shareholder wealth and balance all stakeholders' interests, respectively. Rather, these views should be interpreted as views that managers should do whatever is morally permissible to achieve these ends. A large part of business ethics is trying to determine what morality permits in this domain.

### **Means: control by shareholders or others too?**

Answers to questions about the means of corporate governance often mirror answers to question about the ends of corporate governance. Often the best way to ensure that a firm is managed in the interests of a certain party P is to give P control over it. Conversely, justifications for why the firm should be managed in the interests of P sometimes appeal P's rights to control it.

Thus Friedman (1970) thinks that shareholders' ownership of the firm gives them a right to control the firm (which they can use to ensure that the firm is run in their interests). We might see control rights for shareholders as following analytically from the concept of ownership. To own a thing is to have a bundle of rights with respect to that thing. One of the standard "incidents" of ownership is control.

As noted, in recent years the idea that the firm is something that can be owned has been challenged (Bainbridge 2008; Strudler 2017). But contractarian arguments for shareholder control of firms have been constructed which do not rely on the assumption of firm ownership. All that is assumed in these arguments is that some people own capital, and others own labor. Capital can "hire" labor (and other inputs of production), on terms that it draws up, or labor can "hire" capital, on terms that it draws up, with society setting limits on what the terms may be. It just so happens that, in most cases, capital hires labor. These points are emphasized especially by those who regard the firm as a "nexus of contracts" among various parties.

Many writers find this result troubling. Even if the governance structure in most firms is in some sense agreed to, they say that it is unjust in other ways. Anderson (2015) characterizes standard corporate governance regimes as oppressive and unaccountable private dictatorships. To address this injustice, these writers call for various forms of worker participation in managerial decision-

making, including the ability by workers to reject arbitrary directives by managers (Hsieh 2005), worker co-determination of firms' policies and practices, and exclusive control of productive enterprises by workers.

Arguments for these governance structures take various forms. One type of argument appeals to the value of protecting workers' interests (Brenkert 1992a; Hsieh 2005). A second type of argument appeals to the value of autonomy, or a right to freely determine one's actions, including one's actions at work (McCall 2001). A third type of argument for worker participation in managerial decision-making is the "parallel case" argument. According to it, if states should be governed democratically, then so should firms, because firms are like states in the relevant respects (Dahl 1985; Walzer 1983). A fourth argument for worker participation in firm decision-making sees it as valuable or even necessary training for participation in political processes in the broader society (Cohen 1989).

Space considerations prevent a detailed examination of these arguments. But criticisms generally fall into two categories. The first insists on the normative priority of agreements, of the sort described above. There are few legal restrictions on the types of governance structures that firms can have. And some firms are in fact controlled by workers (Dow 2003; Hansmann 1996). To insist that other firms should be governed this way is to say, according to this argument, that people should not be allowed to arrange their economic lives as they see fit. Another criticism of worker participation appeals to efficiency. Allowing workers to participate in managerial decision-making may decrease the pace of decision-making, since it requires giving many workers a chance to make their voices heard (Hansmann 1996). It may also raise the cost of capital for firms, as investors may demand more favorable terms if they are not given control of the enterprise in return (McMahon 1994). Both sources of inefficiency may put the firm at a significant disadvantage in a competitive market. And it may not be just a matter of competitive disadvantage. If it were, the problem could be solved by making all firms worker-controlled. The problem may be one of diminished productivity more generally.

### **Corporate social responsibility**

Corporate social responsibility is based on the premise that a business can only thrive if it operates within a thriving society. In that way, the business depends on the community it operates within, and as such, has an ethical and moral responsibility towards that community. A business is perceived as legitimate when its activities are congruent with the goals and values of the society in which the business operates.

Consumers and other companies are likely to shun firms that develop unethical reputations. And arguably, companies that don't pay attention to their social and ethical responsibilities are more likely to stumble into legal troubles, such as mass corruption or accounting fraud scandals – threatening the sustainability of the business itself.

By promoting respect for the company in the marketplace, CSR can result in higher sales, enhance employee loyalty and attract better personnel to the firm. It is also a way to connect to the personal well-being of customers. In this way, the CSR can contribute towards higher profits for the company.

Therefore, by ensuring brand loyalty and consumer patronage, CSR can ensure that the business remains sustainable in the long-term and it stays profitable.

## **Ethical Responsibility**

Responsibility is an ethical concept that refers to the fact that individuals and groups have morally based obligations and duties to others and to larger ethical and moral codes, standards and traditions.

## **Ethical Principles of Responsibility and Accountability**

Responsibility in a business context refers to “a sphere of duty or obligation assigned to a person by the nature of that person’s position, function or work.”

The roles taken on by decision-makers imply a responsibility to perform certain functions associated with those roles. To be more specific, responsibility refers to more than just the primary function of a role; it refers to the multiple facets of that function, which includes both processes and outcomes, and the consequences of the acts performed as part of that set of obligations. A responsible actor may be seen as one whose job involves a predetermined set of obligations that need to be met in order for the job to be accomplished.

According to Aristotle, moral responsibility was viewed as originating with the moral agent as decision-maker, and grew out of an ability to reason, an awareness of action and consequences, and a willingness to act free from external compulsion.

Accountability is the readiness or preparedness to give an explanation or justification to stakeholders for one’s judgments, intentions and actions.

“It is a readiness to have one’s actions judged by others and, where appropriate, accept responsibility for errors, misjudgments and negligence and recognition for competence, conscientiousness, excellence and wisdom.” While responsibility is defined as a bundle of obligations associated with a role, accountability could be defined as “blaming or crediting someone for an action”—normally associated with a recognized responsibility. The accountable actor is “held to external oversight, regulation, and mechanisms of punishment aimed to externally motivate responsive adjustment in order to maintain adherence with appropriate moral standards of action.”

In the professional context, accountability is about answering to clients, colleagues and other relevant professionals. The demand to give an account of one’s judgments, acts and omissions arises from the nature of the professional-client and the professional-professional relationships. For communication professionals, accountability has more specific implications. Recent years have seen more practical and concrete interpretation of the concept of accountability by communication specialists. It is associated with responsiveness to the views of all stakeholders, which includes a willingness to explain, defend, and justify actions.

While tracing the lines of responsibility and accountability can be difficult, in the end, if one is responsible in any way for an action, then one must accept some degree of accountability. On the other hand, if responsibility and accountability are not equitably shared and if the process by which they are assigned is not transparent, then problems will arise. In the corporate world, not every actor is blame-worthy, especially if the actor’s autonomy is limited by structure, process, or circumstance. However, lack of autonomy is not an excuse for avoiding accountability entirely.

## **Media Ethics: ethical issues in Privacy Introduction**

The use of social media is growing at a rapid pace and the twenty-first century could be described

as the “boom” period for social networking. According to reports provided by Smart Insights, as at February 2019 there were over 3.484 billion social media users. The Smart Insight report indicates that the number of social media users is growing by 9% annually and this trend is estimated to continue. Presently the number of social media users represents 45% of the global population. The heaviest users of social media are “digital natives”; the group of persons who were born or who have grown up in the digital era and are intimate with the various technologies and systems, and the “Millennial Generation”; those who became adults at the turn of the twenty-first century. These groups of users utilize social media platforms for just about anything ranging from marketing, news acquisition, teaching, health care, civic engagement, and politicking to social engagement.

The unethical use of social media has resulted in the breach of individual privacy and impacts both physical and information security. Reports in 2019, reveal that persons between the ages 8 and 11 years spend an average 13.5 hours weekly online and 18% of this age group are actively engaged on social media. Those between ages 12 and 15 spend on average 20.5 hours online and 69% of this group are active social media users. While children and teenagers represent the largest Internet user groups, for the most part they do not know how to protect their personal information on the Web and are the most vulnerable to cyber-crimes related to breaches of information privacy.

In today’s IT-configured society data is one of, if not the most, valuable asset for most businesses/organizations. Organizations and governments collect information via several means including invisible data gathering, marketing platforms and search engines such as Google. Information can be attained from several sources, which can be fused using technology to develop complete profiles of individuals. The information on social media is very accessible and can be of great value to individuals and organizations for reasons such as marketing, etc.; hence, data is retained by most companies for future use.

## **Privacy**

Privacy or the right to enjoy freedom from unauthorized intrusion is the negative right of all human beings. Privacy is defined as the right to be left alone, to be free from secret surveillance, or unwanted disclosure of personal data or information by government, corporation, or individual (dictionary.com). In this chapter we will define privacy loosely, as the right to control access to personal information. Supporters of privacy posit that it is a necessity for human dignity and individuality and a key element in the quest for happiness. According to Baase [5] in the book titled “A Gift of Fire: Social, Legal and Ethical Issues for Computing and the Internet,” privacy is the ability to control information about one’s self as well as the freedom from surveillance from being followed, tracked, watched, and being eavesdropped on. In this regard, ignoring privacy rights often leads to encroachment on natural rights.

Privacy, or even the thought that one has this right, leads to peace of mind and can provide an environment of solitude. This solitude can allow people to breathe freely in a space that is free from interference and intrusion. According to Richards and Solove, Legal scholar William Prosser argued that privacy cases can be classified into four related “torts,” namely:

1. Intrusion—this can be viewed as encroachment (physical or otherwise) on one’s liberties/solitude in a highly offensive way.
2. Privacy facts—making public, private information about someone that is of no “legitimate con-

cern" to anyone.

3. False light—making public false and “highly offensive” information about others.
4. Appropriation—stealing someone’s identity (name, likeness) to gain advantage without the permission of the individual.

Technology, the digital age, the Internet and social media have redefined privacy however as surveillance is no longer limited to a certain pre-defined space and location. An understanding of the problems and dangers of privacy in the digital space is therefore the first step to privacy control. While there can be clear distinctions between informational privacy and physical privacy, as pointed out earlier, intrusion can be both physical and otherwise.

This chapter will focus on informational privacy which is the ability to control access to personal information. We examine privacy issues in the social media context focusing primarily on personal information and the ability to control external influences. We suggest that breach of informational privacy can impact: solitude (the right to be left alone), intimacy (the right not to be monitored), and anonymity (the right to have no public personal identity and by extension physical privacy impacted). The right to control access to facts or personal information in our view is a natural, inalienable right and everyone should have control over whose their personal information and how it is disseminated.

In May 2019 the General Data Protection Regulation (GDPR) clearly outlined that it is unlawful to process personal data without the consent of the individual (subject). It is a legal requirement under the GDPR that privacy notices be given to individuals that outline how their personal data will be processed and the conditions that must be met that make the consent valid. These are:

- 1) “Freely given—an individual must be given a genuine choice when providing consent and it should generally be unbundled from other terms and conditions (e.g., access to a service should not be conditional upon consent being given).”
- 2) “Specific and informed—this means that data subjects should be provided with information as to the identity of the controller(s), the specific purposes, types of processing, as well as being informed of their right to withdraw consent at any time.”
- 3) “Explicit and unambiguous—the data subject must clearly express their consent (e.g., by actively ticking a box which confirms they are giving consent—pre-ticked boxes are insufficient).”
- 4) “Under 13s—children under the age of 13 cannot provide consent and it is therefore necessary to obtain consent from their parents.”

Arguments can be made that privacy is a cultural, universal necessity for harmonious relationships among human beings and creates the boundaries for engagement and disengagement. Privacy can also be viewed as instrumental good because it is a requirement for the development of certain kinds of human relationships, intimacy and trust. However, achieving privacy is much more difficult in light of constant surveillance and the inability to determine the levels of interaction with various publics. Some critics argue that privacy provides protection against anti-social behaviors such as trickery, disinformation and fraud, and is thought to be a universal right. However, privacy can also be viewed as relative as privacy rules may differ based on several factors such as “climate, religion, technological advancement and political arrangements”. The need for privacy is an objective reality though it can be viewed as “culturally rational” where the need for personal privacy is viewed as relative based on culture. One example is the push by the government, businesses and Singaporeans to make Singapore a smart nation. According to GovTech 2018 reports

there is a push by the government in Singapore to harness the data “new gold” to develop systems that can make life easier for its people. The report points out that Singapore is using sensors robots Smart Water Assessment Network (SWAN) to monitor water quality in its reservoirs, seeking to build smart health system and to build a smart transportation system to name a few. In this example privacy can be describe as “culturally rational” and the rules in general could differ based on technological advancement and political arrangements.

In today’s networked society it is naïve and ill-conceived to think that privacy is over-rated and there is no need to be concerned about privacy if you have done nothing wrong. The effects of information flow can be complex and may not be simply about protection for people who have something to hide. Inaccurate information flow can have adverse long-term implications for individuals and companies. Consider a scenario where someone’s computer or tablet is stolen. The perpetrator uses identification information stored on the device to access their social media page which could lead to access to their contacts, friends and friends of their “friends” then participate in illegal activities and engage in anti- social activities such as hacking, spreading viruses, fraud and identity theft. The victim is now in danger of being accused of criminal intentions, or worse. These kinds of situations are possible because of technology and networked systems. Users of social media need to be aware of the risks that are associated with participation.

## **Social media**

The concept of social networking pre-dates the Internet and mass communication as people are said to be social creatures who when working in groups can achieve results in a value greater than the sum of its parts. The explosive growth in the use of social media over the past decade has made it one of the most popular Internet services in the world, providing new avenues to “see and be seen”. The use of social media has changed the communication landscape resulting in changes in ethical norms and behavior. The unprecedented level of growth in usage has resulted in the reduction in the use of other media and changes in areas including civic and political engagement, privacy and safety. Alexa, a company that keeps track of traffic on the Web, indicates that as of August, 2019 YouTube, Facebook and Twitter are among the top four (4) most visited sites with only Google, being the most popular search engine, surpassing these social media sites.

Social media sites can be described as online services that allow users to create profiles which are “public, semi-public” or both. Users may create individual profiles and/or become a part of a group of people with whom they may be acquainted offline. They also provide avenues to create virtual friendships. Through these virtual friendships, people may access details about their contacts ranging from personal background information and interests to location. Social networking sites provide various tools to facilitate communication. These include chat rooms, blogs, private messages, public comments, ways of uploading content external to the site and sharing videos and photographs. Social media is therefore drastically changing the way people communicate and form relationships.

Today social media has proven to be one of the most, if not the most effective medium for the dissemination of information to various audiences. The power of this medium is phenomenal and ranges from its ability to overturn governments (e.g., Moldova), to mobilize protests, assist with getting support for humanitarian aid, organize political campaigns, organize groups to delay the passing of legislation (as in the case with the copyright bill in Canada) to making social media billionaires and millionaires. The enabling nature and the structure of the media that social networking offers provide a wide range of opportunities that were nonexistent before technology. Face-

book and YouTube marketers and trainers provide two examples. Today people can interact with and learn from people millions of miles away. The global reach of this medium has removed all former pre-defined boundaries including geographical, social and any other that existed previously. Technological advancements such as Web 2.0 and Web 4.0 which provide the framework for collaboration, have given new meaning to life from various perspectives: political, institutional and social.

## **Privacy and social media**

Social media and the information/digital era have “redefined” privacy. In today’s Information Technology–configured societies, where there is continuous monitoring, privacy has taken on a new meaning. Technologies such as closed-circuit cameras (CCTV) are prevalent in public spaces or in some private spaces including our work and home. Personal computers and devices such as our smart phones enabled with Global Positioning System (GPS), Geo locations and Geo maps connected to these devices make privacy as we know it, a thing of the past. Recent reports indicate that some of the largest companies such as Amazon, Microsoft and Facebook as well as various government agencies are collecting information without consent and storing it in databases for future use. It is almost impossible to say privacy exists in this digital world (@nowthisnews).

The open nature of the social networking sites and the avenues they provide for sharing information in a “public or semi-public” space create privacy concerns by their very construct. Information that is inappropriate for some audiences are many times inadvertently made visible to groups other than those intended and can sometimes result in future negative outcomes. One such example is a well-known case recorded in an article entitled “The Web Means the End of Forgetting” that involved a young woman who was denied her college license because of backlash from photographs posted on social media in her private engagement.

Technology has reduced the gap between professional and personal spaces and often results in information exposure to the wrong audience. The reduction in the separation of professional and personal spaces can affect image management especially in a professional setting resulting in the erosion of traditional professional image and impression management. Determining the secondary use of personal information and those who have access to this information should be the prerogative of the individual or group to whom the information belongs. However, engaging in social media activities has removed this control.

Privacy on social networking sites (SNSs) is heavily dependent on the users of these networks because sharing information is the primary way of participating in social communities. Privacy in SNSs is “multifaceted.” Users of these platforms are responsible for protecting their information from third-party data collection and managing their personal profiles. However, participants are usually more willing to give personal and more private information in SNSs than anywhere else on the Internet. This can be attributed to the feeling of community, comfort and family that these media provide for the most part. Privacy controls are not the priority of social networking site designers and only a small number of the young adolescent users change the default privacy settings of their accounts. This opens the door for breaches especially among the most vulnerable user groups, namely young children, teenagers and the elderly. The nature of social networking sites such as Facebook and Twitter and other social media platforms cause users to re-evaluate and often change their personal privacy standards in order to participate in these social networked communities.

While there are tremendous benefits that can be derived from the effective use of social media there are some unavoidable risks that are involved in its use. Much attention should therefore be given to what is shared in these forums. Social platforms such as Facebook, Twitter and YouTube are said to be the most effective media to communicate to Generation Y's (Gen Y's), as teens and young adults are the largest user groups on these platforms. However, according to Bolton et al. Gen Y's use of social media, if left unabated and unmonitored will have long-term implications for privacy and engagement in civic activities as this continuous use is resulting in changes in behavior and social norms as well as increased levels of cyber-crime.

Today social networks are becoming the platform of choice for hackers and other perpetrators of antisocial behavior. These media offer large volumes of data/information ranging from an individual's date of birth, place of residence, place of work/business, to information about family and other personal activities.

In many cases users unintentionally disclose information that can be both dangerous and inappropriate. Information regarding activities on social media can have far reaching negative implications for one's future. A few examples of situations which can, and have been affected are employment, visa acquisition, and college acceptance. Indiscriminate participation has also resulted in situations such as identity theft and bank fraud just to list a few. Protecting privacy in today's networked society can be a great challenge. The digital revolution has indeed distorted our views of privacy, however, there should be clear distinctions between what should be seen by the general public and what should be limited to a selected group. One school of thought is that the only way to have privacy today is not to share information in these networked communities. However, achieving privacy and control over information flows and disclosure in networked communities is an ongoing process in an environment where contexts change quickly and are sometimes blurred. This requires intentional construction of systems that are designed to mitigate privacy issues.

## **Ethics and social media**

Ethics can be loosely defined as "the right thing to do" or it can be described as the moral philosophy of an individual or group and usually reflects what the individual or group views as good or bad. It is how they classify particular situations by categorizing them as right or wrong. Ethics can also be used to refer to any classification or philosophy of moral values or principles that guides the actions of an individual or group. Ethical values are intended to be guiding principles that if followed, could yield harmonious results and relationships. They seek to give answers to questions such as "How should I be living? How do I achieve the things that are deemed important such as knowledge and happiness or the acquisition of attractive things?" If one chooses happiness, the next question that needs to be answered is "Whose happiness should it be; my own happiness or the happiness of others?" In the domain of social media, some of the ethical questions that must be contemplated and ultimately answered are:

- Can this post be regarded as oversharing?
- Has the information in this post been distorted in anyway?
- What impact will this post have on others?

As previously mentioned, users within the ages 8–15 represent one of the largest social media user groups. These young persons within the 8–15 age range are still learning how to interact with the people around them and are deciding on the moral values that they will embrace. These moral

values will help to dictate how they will interact with the world around them. The ethical values that guide our interactions are usually formulated from some moral principle taught to us by someone or a group of individuals including parents, guardians, religious groups, and teachers just to name a few. Many of the Gen Y's/"Digital Babies" are "newbies" yet are required to determine for themselves the level of responsibility they will display when using the varying social media platforms. This includes considering the impact a post will have on their lives and/or the lives of other persons. They must also understand that when they join a social media network, they are joining a community in which certain behavior must be exhibited. Such responsibility requires a much greater level of maturity than can be expected from them at that age.

It is not uncommon for individuals to post even the smallest details of their lives from the moment they wake up to when they go to bed. They will openly share their location, what they eat at every meal or details about activities typically considered private and personal. They will also share likes and dislikes, thoughts and emotional states and for the most part this has become an accepted norm. Often times however, these shares do not only contain information about the person sharing but information about others as well. Many times, these details are shared on several social media platforms as individuals attempt to ensure that all persons within their social circle are kept updated on their activities. With this openness of sharing risks and challenges arise that are often not considered but can have serious impacts. The speed and scale with which social media creates information and makes it available—almost instantaneously—on a global scale, added to the fact that once something is posted there is really no way of truly removing it, should prompt individuals to think of the possible impact a post can have. Unfortunately, more often than not, posts are made without any thought of the far-reaching impact they can have on the lives of the person posting or others that may be implicated by the post.

### **Why do people share?**

According to Berger and Milkman there are five (5) main reasons why users are compelled to share content online, whether it is every detail or what they deem as highlights of their lives. These are:

- cause related
- personal connection to content
- to feel more involved in the world
- to define who they are
- to inform and entertain

People generally share because they believe that what they are sharing is important. It is hoped that the shared content will be deemed important to others which will ultimately result in more shares, likes and followers.

Figure below sums up the findings of Berger and Milkman which shows that the main reason people feel the need to share content on the varying social media platform is that the content relates to what is deemed as worthy cause. 84% of respondents highlighted this as the primary motivation for sharing. Seventy-eight percent said that they share because they feel a personal connection to the content while 69 and 68%, respectively said the content either made them feel more involved with the world or helped them to define who they were. Forty-nine percent share because of the entertainment or information value of the content. A more in depth look at each reason for sharing

follows.

### Figure

Why people share source: Global Social Media Research.

### Content related to a cause

Social media has provided a platform for people to share their thoughts and express concerns with others for what they regard as a worthy cause. Cause related posts are dependent on the interest of the individual. Some persons might share posts related to causes and issues happening in society. In one example, the parents of a baby with an aggressive form of leukemia, who having been told that their child had only 3 months to live unless a suitable donor for a blood stem cell transplant could be found, made an appeal on social media. The appeal was quickly shared and a suitable donor was soon found. While that was for a good cause, many view social media merely as platforms for freedom of speech because anyone can post any content one creates. People think the expression of their thoughts on social media regarding any topic is permissible. The problem with this is that the content may not be accepted by law or it could violate the rights of someone thus giving rise to ethical questions.

### Content with a personal connection

When social media users feel a personal connection to their content, they are more inclined to share the content within their social circles. This is true of information regarding family and personal activities. Content created by users also invokes a deep feeling of connection as it allows the users to tell their stories and it is natural to want the world or at least friends to know of the achievement. This natural need to share content is not new as humans have been doing this in some form or the other, starting with oral history to the media of the day; social media. Sharing the self-created content gives the user the opportunity of satisfying some fundamental needs of humans to be heard, to matter, to be understood and emancipated. The problem with this however is that in an effort to gratify the fundamental needs, borders are crossed because the content may not be sharable (can this content be shared within the share network?), it may not be share-worthy (who is the audience that would appreciate this content?) or it may be out of context (does the content fit the situation?).

## **Content that makes them feel more involved in the world**

One of the driving factors that pushes users to share content is the need to feel more in tune with the world around them. This desire is many times fueled by jealousy. Many social media users are jealous when their friends' content gets more attention than their own and so there is a lot of pressure to maintain one's persona in social circles, even when the information is unrealistic, as long as it gets as much attention as possible. Everything has to be perfect. In the case of a photo, for example, there is lighting, camera angle and background to consider. This need for perfection puts a tremendous amount of pressure on individuals to ensure that posted content is "liked" by friends. They often give very little thought to the amount of their friend's work that may have gone on behind the scenes to achieve that perfect social post.

Social media platforms have provided everyone with a forum to express views, but, as a whole, conversations are more polarized, tribal and hostile. With Facebook for instance, there has been a huge uptick in fake news, altered images, dangerous health claims and cures, and the proliferation of anti-science information. This is very distressing and disturbing because people are too willing to share and to believe without doing their due diligence and fact-checking first.

## **Content that defines who they are**

Establishing one's individuality in society can be challenging for some persons because not everyone wants to fit in. Some individuals will do all they can to stand out and be noticed. Social media provides the avenue for exposure and many individuals will seek to leverage the media to stand out of the crowd and not just be a fish in the school. Today many young people are currently being brought up in a culture that defines people by their presence on social media where in previous generations, persons were taught to define themselves by their career choices. These lessons would start from childhood by asking children what they wanted to be when they grew up and then rewarding them based on the answers they give. In today's digital era, however, social media postings and the number of "likes" or "dislikes" they attract, signal what is appealing to others. Therefore, posts that are similar to those that receive a large number of likes but which are largely unrealistic are usually made for self-gratification.

## **Content that informs and entertains**

The acquisition of knowledge and skills is a vital part of human survival and social media has made this process much easier. It is not uncommon to hear persons realizing that they need a particular knowledge set that they do not possess say "I need to learn to do this. I'll just YouTube it." Learning and adapting to change in as short as possible time is vital in today's society and social media coupled with the Internet put it all at the finger tips. Entertainment has the ability to bring people together and is a good way for people to bond. It provides a diversion from the demands of life and fills leisure time with amusement. Social media is an outlet for fun, pleasurable and enjoyable activities that are so vital to human survival. It is now common place to see persons watching a video, viewing images and reading text that is amusing on any of the available social media platforms. Quite often these videos, images and texts can be both informative and entertaining, but there can be problems however as at times they can cross ethical lines that can lead to conflict.

## **Ethical challenges with social media use**

The use of modern-day technology has brought several benefits. Social media is no different and chief amongst its benefit is the ability to stay connected easily and quickly as well as build rela-

tionships with people with similar interests. As with all technology, there are several challenges that can make the use of social media off putting and unpleasant. Some of these challenges appear to be minor but they can have far reaching effects into the lives of the users of social media and it is therefore advised that care be taken to minimize the challenges associated with the use of social media.

A major challenge with the use of social media is oversharing because when persons share on social media, they tend to share as much as is possible which is often times too much. When persons are out and about doing exciting things, it is natural to want to share this with the world as many users will post a few times a day when they head to lunch, visit a museum, go out to dinner or other places of interest. While this all seems relatively harmless, by using location-based services which pinpoint users with surprising accuracy and in real time, users place themselves in danger of laying out a pattern of movement that can be easily traced. While this seems more like a security or privacy issue it stems from an ethical dilemma—"Am I sharing too much?" Oversharing can also lead to damage of user's reputation especially if the intent is to leverage the platform for business. Photos of drunken behavior, drug use, partying or other inappropriate content can change how you are viewed by others.

Another ethical challenge users of social media often encounter is that they have no way of authenticating content before sharing, which becomes problematic when the content paints people or establishments negatively. Often times content is shared with them by friends, family and colleagues. The unauthenticated content is then reshared without any thought but sometimes this content may have been maliciously altered so the user unknowingly participates in maligning others. Even if the content is not altered the fact that the content paints someone or something in a bad light should send off warning bells as to whether or not it is right to share the content which is the underlying principle of ethical behavior.

### **Conflicting views**

Some of the challenges experienced by social media posts are a result of a lack of understanding and sometimes a lack of respect for the varying ethical and moral standpoints of the people involved. We have established that it is typical for persons to post to social media sites without any thought as to how it can affect other persons, but many times these posts are a cause of conflict because of a difference of opinion that may exist and the effect the post may have. Each individual will have his or her own ethical values and if they differ then this can result in conflict. When an executive of a British company made an Instagram post with some racial connotations before boarding a plane to South Africa it started a frenzy that resulted in the executive's immediate dismissal. Although the executive said it was a joke and there was no prejudice intended, this difference in views as to the implications of the post, resulted in an out of work executive and a company scrambling to maintain its public image.

### **Impact on personal development**

In this age of sharing, many young persons spend a vast amount of time on social media checking the activities of their "friends" as well as posting on their own activities so their "friends" are aware of what they are up to. Apart from interfering with their academic progress, time spent on these posts can have long term repercussions. An example is provided by a student of a prominent university who posted pictures of herself having a good time at parties while in school. She was denied employment because of some of her social media posts. While the ethical challenge here is the question of the employee's right to privacy and whether the individual's social media profile

should affect their ability to fulfill their responsibilities as an employee, the impact on the individual's long term personal growth is clear.

## **Conclusion**

In today's information age, one's digital footprint can make or break someone; it can be the deciding factor on whether or not one achieves one's life-long ambitions. Unethical behavior and interactions on social media can have far reaching implications both professionally and socially. Posting on the Internet means the "end of forgetting," therefore, responsible use of this medium is critical. The unethical use of social media has implications for privacy and can result in security breaches both physically and virtually. The use of social media can also result in the loss of privacy as many users are required to provide information that they would not divulge otherwise. Social media use can reveal information that can result in privacy breaches if not managed properly by users. Therefore, educating users of the risks and dangers of the exposure of sensitive information in this space, and encouraging vigilance in the protection of individual privacy on these platforms is paramount. This could result in the reduction of unethical and irresponsible use of these media and facilitate a more secure social environment. The use of social media should be governed by moral and ethical principles that can be applied universally and result in harmonious relationships regardless of race, culture, religious persuasion and social status.

Analysis of the literature and the findings of this research suggest achieving acceptable levels of privacy is very difficult in a networked system and will require much effort on the part of individuals. The largest user groups of social media are unaware of the processes that are required to reduce the level of vulnerability of their personal data. Therefore, educating users of the risk of participating in social media is the social responsibility of these social network platforms. Adapting universally ethical behaviors can mitigate the rise in the number of privacy breaches in the social networking space. This recommendation coincides with philosopher Immanuel Kant's assertion that, the Biblical principle which states "Do unto others as you have them do unto you" can be applied universally and should guide human interactions. This principle, if adhered to by users of social media and owners of these platforms could raise the awareness of unsuspecting users, reduce unethical interactions and undesirable incidents that could negatively affect privacy, and by extension security in this domain.

## **Cyberspace**

**Cyberspace** is a global domain within the information environment consisting of the interdependent network of information technology infrastructures (ITI) including the Internet, telecommunication networks, computer systems, and embedded processors and controllers. The term originates in science fiction, where it also includes various kinds of virtual reality (which is the experience of "being" in the alternate reality, or the simulated "being" in such a reality").

Cyberspace raises unique issues, especially regarding intellectual property and copyright infringement, and may call for new models of commerce. Furthermore, cyberspace has also become a unique area for developing human relationships and communities. While some argue that this universal ground for communication helps bring the world together, others point out that people will continue to associate narrowly with those of similar interests and economic and social status. Nevertheless, largely through the Internet, cyberspace has become a common ground for the rapid communication of ideas and values.

While cyberspace itself is a neutral space that allows for the rapid communication of ideas, the use

of this space will determine its value and benefit for humankind. While the free use of this space is indeed valuable, especially as this cyberspace binds all humankind together in inseparable, interdependent relationships, the free use of this space also calls for its responsible use in order to ensure its value for humanity's overall pursuit of freedom and happiness. Thus, cyberspace mandates the responsible use of technology and reveals the need for a value-based perspective of the use of such technology.

## **Origins of the term**

The word "cyberspace" (from cybernetics and space) was coined by sciencefiction author William Gibson in his 1982 story, "Burning Chrome," and popularized by his 1984 novel *Neuromancer*. The portion of *Neuromancer* cited in this respect is usually the following:

**Cyberspace.** A consensual hallucination experienced daily by billions of legitimate operators, in every nation, by children being taught mathematical concepts... A graphic representation of data abstracted from banks of every computer in the human system. Unthinkable complexity. Lines of light ranged in the nonspace of the mind, clusters and constellations of data. Like city lights, receding (69).

Gibson later commented on the origin of the term in the 2000 documentary *No Maps for These Territories*:

**Note:** The term "cyberspace" was coined by science fiction writer William Gibson

All I knew about the word "cyberspace" when I coined it, was that it seemed like an effective buzzword. It seemed evocative and essentially meaningless. It was suggestive of something, but had no real semantic meaning, even for me, as I saw it emerge on the page.

## **Metaphorical**

The term Cyberspace started to become a de facto synonym for the Internet, and later the World Wide Web, during the 1990s. Author Bruce Sterling, who popularized this meaning, credits John Perry Barlow as the first to use it to refer to "the present-day nexus of computer and telecommunications networks."

## **Cyberspace as an internet metaphor**

While cyberspace should not be confused with the real internet, the term is often used to refer to objects and identities that exist largely within the communication network itself, so that a web site, for example, might be metaphorically said to "exist in cyberspace." According to this interpretation, events taking place on the Internet are not, therefore, happening in the countries where the participants or the servers are physically located, but "in cyberspace."

The "space" in cyberspace has more in common with the abstract, mathematical meanings of the term than physical space. It does not have the duality of positive and negative volume (while in physical space for example a room has the negative volume of usable space delineated by positive volume of walls, Internet users cannot enter the screen and explore the unknown part of the Net as an extension of the space they are in), but spatial meaning can be attributed to the relationship between different pages (of books as well as web servers), considering the unturned pages to be somewhere "out there." The concept of cyberspace therefore refers not to the content being pre-

sented to the surfer, but rather to the possibility of surfing among different sites, with feedback loops between the user and the rest of the system creating the potential to always encounter something unknown or unexpected.

Videogames differ from text-based communication in that on-screen images are meant to be figures that actually occupy a space and the animation shows the movement of those figures. Images are supposed to form the positive volume that delineates the empty space. A game adopts the cyberspace metaphor by engaging more players in the game, and then figuratively representing them on the screen as avatars. Games do not have to stop at the avatar-player level, but current implementations aiming for more immersive playing space (such as in Laser tag) take the form of augmented reality rather than cyberspace, fully immersive virtual realities remaining impractical.

Although the more radical consequences of the global communication network predicted by some cyberspace proponents (that is, the diminishing of state influence envisioned by John Perry Barlow) failed to materialize and the word lost some of its novelty appeal, the term continues to be used.

Some virtual communities explicitly refer to the concept of cyberspace, for example, Linden Lab calling their customers "Residents" of Second Life, while all such communities can be positioned "in cyberspace" for explanatory and comparative purposes (as Sterling did in *The Hacker Crackdown* and many journalists afterwards), integrating the metaphor into a wider cyber-culture.

The metaphor has been useful in helping a new generation of thought leaders to reason through new military strategies around the world, led largely by the U.S. Department of Defense (DoD). The use of cyberspace as a metaphor has had its limits, however, especially in areas where the metaphor becomes confused with physical infrastructure.

### **Alternate realities in philosophy and art**

**Predating computers**  
Before cyberspace became a technological possibility, many philosophers suggested the possibility of a reality, or suggested that the reality in which we live in now is a reflection of some reality perhaps more pure than what we are aware of. In *The Republic*, Plato sets out his allegory of the cave, widely cited as one of the first conceptual realities. He suggests that we are already in a form of virtual reality which we are deceived into thinking is true. True reality for Plato is accessible only through mental training and is the reality of the forms. These ideas are central to Platonism and neoplatonism. Depending on how one views cyberspace in relation to physical reality, either people are living in a cyberspace-like reality in relation to a higher realm of ideas or cyberspace contains the abstract ideas that take form in the current, tangible reality.

Another forerunner of the modern idea of cyberspace is Descartes' hypothetical that people might be deceived by an evil demon which feeds them a false reality, and so the only thing one can be certain of is that one thinks; in other words, one is a thinking thing. This argument is the direct predecessor of the modern ideas of brain in a vat and many popular conceptions of cyberspace take Descartes' ideas as their starting point.

Visual arts have a tradition, stretching back to antiquity, of artifacts meant to fool the eye and be mistaken for reality. This questioning of reality occasionally led some philosophers and especially theologians to distrust art as deceiving people into entering a world which was not real. The artistic challenge was resurrected with increasing ambition as art became more and more realistic with the invention of photography, film and finally, immersive computer simulations.

## **Influenced by computersPhilosophy**

American counterculture exponents like William S. Burroughs (whose literary influence on Gibson and cyberpunk in general is widely acknowledged) were among the first to extol the potential of computers and computer networks for individual empowerment.

Some contemporary philosophers and scientists (such as David Deutsch in *The Fabric of Reality*) use virtual reality in various thought experiments. Philip Zhai connects cyberspace to the platonic tradition:

Let us imagine a nation in which everyone is hooked up to a network of VR infrastructure. They have been so hooked up since they left their mother's wombs. Immersed in cyberspace and maintaining their life by teleoperation, they have never imagined that life could be any different from that. The first person that thinks of the possibility of an alternative world like ours would be ridiculed by the majority of these citizens, just like the few enlightened ones in Plato's allegory of the cave.

## **Cyberspace and virtual reality**

Although cyberspace and virtual reality are often used interchangeably, these two concepts have a different orientation. While virtual reality refers to the simulated experience of reality, cyberspace refers to the plane of reality, or environment, within which this experience is made possible. Thus, experiences in cyberspace can entail aspects of virtual reality when a user is fully immersed in this alternate reality.

The difference between the two can be further described using an analogy of physical (space itself is not physical though) space and concepts of reality. On one hand, human beings presuppose a frame of reference called "space." Whether the space people live in is an empty container like a repository (Newtonian concept) or people exist in space according to the relationship between things (Leibnizian concept) is debatable; likewise, human beings relate to reality through perception (Kantian concept of space as a form of intuition) or through a nexus of meanings (concept of "lived space" in Phenomenology). Either way, human beings presuppose a plane of experience called "space." Within this space, humans physically experience reality through their five senses.

By extension, this sense of reality can be applied to imagined objects. Cyberspace is a frame of reference within which people can have quasi-real experiences with such objects; virtual reality refers to the simulated experiences with these objects.

Human experience of reality is also extended to non-physical events or phenomena such as death and associated emotional feelings about it. Fear, anxiety, joy, and other emotional feelings are real without association with the physical senses. At the same time, virtual reality may suggest a false reality that can be virtually experienced. Thus, the whole question of reality poses a series of questions beyond current epistemological models in modern philosophy, which presuppose the primacy of sense perception.

## **Pornographic Ethics**

"I can't define pornography," one judge once famously said, "but I know it when I see it." (Justice

Stewart in *Jacobellis v. Ohio* 378 US 184 (1964).) Can we do better?

The word “pornography” comes from the Greek for writing about prostitutes. However, the etymology of the term is not much of a guide to its current usage, since many of the things commonly called “pornography” nowadays are neither literally written nor literally about prostitutes.

Here is a first, simple definition. Pornography is any material (either pictures or words) that is *sexually explicit*. This definition of pornography may pick out different types of material in different contexts, since what is viewed as sexually explicit can vary from culture to culture and over time. “Sexually explicit” functions as a kind of indexical term, picking out different features depending on what has certain effects or breaks certain taboos in different contexts and cultures. Displays of women’s uncovered ankles count as sexually explicit in some cultures, but not in most western cultures nowadays (although they once did: the display of a female ankle in Victorian times was regarded as most risqué). There may be borderline cases too: do displays of bared breasts still count as sexually explicit in various contemporary western cultures? However, some material seems clearly to count as sexually explicit in many contexts today: in particular, audio, written or visual representations of sexual acts (e.g., sexual intercourse, oral sex) and exposed body parts (e.g., the vagina, anus and penis—especially the erect penis).

Within the general class of sexually explicit material, there is great variety in content. For example, some sexually explicit material depicts women, and sometimes men, in postures of sexual display (e.g., Playboy centrefolds). Some depicts non-violent sexual acts (both homosexual and heterosexual) between adults who are portrayed as equal and consenting participants. Other sexually explicit representations depict acts of violent coercion: people being whipped, beaten, bound, tortured, mutilated, raped and even killed. Some sexually explicit material may be degrading, without necessarily being overtly violent. This material depicts people (most often women) in positions of servility and subordination in their sexual relations with others, or engaged in sexual acts that many people would regard as humiliating. Some sexually explicit material involves or depicts children. Some portrays bestiality and necrophilia; and so on.

On the first definition of pornography as sexually explicit material, all such material would count as pornography, insofar as it is sexually explicit. But this simple definition is not quite right. Anatomy textbooks for medical students are sexually explicit—they depict exposed genitalia, for example—but are rarely, if ever, viewed as pornography. Sexual explicitness may be a necessary condition for material to count as pornographic, but it does not seem to be sufficient. So something needs to be added to the simple definition. What else might be required?

Here is a second definition. Pornography is sexually explicit material (verbal or pictorial) that is *primarily designed to produce sexual arousal in viewers*. This definition is better: it deals with the problem of anatomy textbooks and the like. Indeed, this definition is one that is frequently employed (or presupposed) in discussions of pornography and censorship. Of course, it is important to distinguish here between sexually explicit material that is *wholly* or *primarily* designed to produce sexual arousal (i.e., whose only or overriding aim is to produce sexual arousal) and material whose aim is to do this in order to make some other artistic or political point. The film, *Last Tango in Paris* arguably aims to arouse audiences, but this is not its primary aim. It does so in order to make a broader political point.

It is sometimes assumed that pornography, in this second sense, is published and consumed by a small and marginalized minority. But, while exact estimates of the size and profitability of the international trade in pornography vary somewhat, it is generally agreed that the pornography indus-

try is a massive international enterprise, with a multi-billion dollar annual turnover. In 2003, the pornography industry (taken to include adult videos, magazines, Cable/Pay per view, Internet and CD-Rom) is estimated to have grossed US\$34 billion world-wide; and in excess of \$8 billion in the U.S. alone, greater than the combined revenue of ABC, CBS, and NBC (\$6.2. billion). Pornography is much more widely consumed than is sometimes supposed, and is a large and extremely profitable international industry.

However the term “pornography” is often used with an additional *normative* force that the first and second definitions leave out. When many people describe something (e.g., a book such as *Tropic of Capricorn* or a film such as *Baise Moi*) as “pornographic”, they seem to be doing more than simply dispassionately describing its sexually explicit content or the intentions of its producers—indeed, in these debates, the intentions of producers are sometimes treated as irrelevant to the work's status as pornography. They seem to be saying, in addition, that it is *bad*—and perhaps also that its badness is not redeemed by other artistic, literary, or political merit the work may possess. (Consider, for example, how people use the term “visual pornography” to condemn certain sorts of art or television, often when the material is not even sexually explicit).

This suggests a third definition: pornography is sexually explicit material designed to produce sexual arousal in consumers *that is bad* in a certain way. This definition of pornography makes it analytically true that pornography is bad: by definition, material that is not bad in the relevant way is not pornography. It might be that *all and only* sexually explicit material is bad in a certain way (e.g., obscene): in which case, “pornography” will refer to all and only the class of sexually explicit materials. But it might be that only *some* sexually explicit material

is objectionable (e.g., degrading to women), in which case only the bad *subset* of sexually explicit material will count as pornography. And, of course, it is possible that *no* sexually explicit material is bad in the relevant way (e.g., harmful to women), in which case we would have an error theory about pornography: there would be no pornography, so defined, merely harmless, sexually explicit “erotica”.

A number of approaches define pornography as sexually explicit material that is bad—although they disagree as to the relevant source of its badness, and consequently about what material is pornographic. A particularly dominant approach has been to define pornography in terms of *obscenity*. (For critical discussions of this approach see Schauer 1982, Feinberg 1987, MacKinnon 1987.) The obscenity might be taken to be intrinsic to the content of the material itself (for example, that it depicts deviant sexual acts that are immoral in themselves) or it may lie in contingent effects that the material has (for example, that it tends to offend “reasonable” people, or to deprave and corrupt viewers, or to erode traditional family and religious values). If all sexually explicit material is obscene by whichever of these standards is chosen, then all sexually explicit material will be pornography on this definition. This is the definition of pornography that moral conservatives typically favour.

But the badness of pornography need not reside in obscenity. Pornography might be defined, not as sexually explicit material that is obscene, but as that sexually explicit material that *harms women*. Thus many contemporary feminist definitions define “pornography” as sexually explicit material that depicts women's subordination in such a way as to *endorse* that subordination. (See Longino 1980, MacKinnon 1987.) This definition of pornography leaves it open in principle that there might be sexually explicit material that is not pornography: sexually explicit material that does not subordinate women will count as harmless “erotica”.

Of course, women may not be the only people harmed by the production or consumption of certain sorts of sexually explicit material. The consumption of sexually explicit material has often been thought to be harmful to its (mostly male) consumers: for example, by corrupting their morals or by making them less likely to have loving, long-term sexual relationships. Many people strongly object to “child pornography”: that subset of sexually explicit material that involves depictions of actual children engaged in sexual activity. This class of sexually explicit material is widely regarded as objectionable because it involves the actual sexual exploitation of children, together with a permanent record of that abuse which may further harm their interests.

I have discussed how, on this third approach to defining “pornography” as sexually explicit material that is bad or harmful in a certain way, there are three possibilities: “pornography” might name *all*, *some* or even *no* sexually explicit material, depending on what (if any) class of sexually explicit material is in fact bad in the relevant way. But it is worth noting that there is an interesting fourth possibility. It is possible that some *non*-sexually explicit material might *also* turn out to be bad in the relevant way. It might be that some non-sexually explicit material is obscene in the relevant sense (e.g., Andres Serrano's famously controversial artwork entitled “Piss Christ”, which displays a plastic crucifix in urine with cow's blood). Or it might turn out that non-sexually explicit advertising that depicts women in positions of sexual servility in such a way as to endorse that subordination is *also* bad in the relevant way. (As many philosophers might be inclined to put the point, the sexually explicit materials that subordinate women via their depiction of women as subordinate may turn out not to form a natural kind.) In this case, there are two options. “Pornography” might be taken to name only the *sexually explicit subset* of material that is bad in the relevant sense (e.g., that depicts women as men's sexual subordinates in such a way as to endorse their subordination); or “pornography” might be taken to refer to *all* the material that is bad in that way, whether that material is sexually explicit or not. The former option would clearly stick more closely to the everyday conception of pornography as involving the sexually explicit. But it might be that this ordinary conception, on reflection, turns out not to capture what is of moral and political interest and importance. There may thus be a theoretical reason to conceive of pornography more broadly than simply sexually explicit material that is bad in a certain way, or perhaps simply to invent a new term that captures the theoretically interesting kind. Some feminists seem inclined to this broader approach, suggesting that material that explicitly depicts women in postures of sexual submission, servility or display in such a way as to endorse it counts as pornography. This may include some non-sexually explicit material that would not ordinarily be thought of as pornography: for example, photographs in artwork, advertising or fashion spreads that depict women bound, chained or bruised in such a way as to glamorise these things.

The term “pornography” is used in all of these different ways in everyday discourse and debate, as well as in philosophical discussions: sometimes it is used to mean merely material which is sexually explicit; sometimes it is used to mean material which is sexually explicit *and* objectionable in some particular way; and so on. It seems to me that we do not need to choose between these different definitions, for all of them capture something of the term's everyday use. What matters crucially is that we know which definition is being used in a particular case. For the fact that “pornography” has different senses can have two very unfortunate consequences if these differences are not clearly noted and kept in mind: it can make it seem that there is disagreement when there is not; and it can obscure the real nature of the disagreement when there is.

Here is one topical example of how this might happen. Some feminists object to pornography on the grounds that it harms women. Other feminists claim that pornography may not always be harmful to women, and may even sometimes be beneficial. It seems that there is genuine disa-

greement here. But is there? Not necessarily. For the two sides might mean different things by “pornography”. Suppose that feminists who object to pornography are defining “pornography” as sexually explicit material that subordinates women. So pornography, for them, is that subset of sexually explicit material that in fact harms women. This definition makes it an analytic truth that pornography, wherever it exists, is bad from a feminist point of view. Feminists who defend pornography, however, may be using “pornography” to mean simply sexually explicit material (regardless of whether it is harmful to women). There may thus be no genuine disagreement here. For both sides might *agree* that sexually explicit material that harms women is objectionable. They might also *agree* that there is nothing objectionable about sexually explicit material that does not harm women (or anyone else). If protagonists in the debate are using “pornography” in different senses in this way, they may simply be talking past each other.

Two really substantive issues at stake in the feminist debate over pornography are 1) whether *any* sexually explicit material is in fact harmful to women; and, if so, what should be done about it?; and 2) whether *all* sexually explicit material is in fact harmful to women; and, if so, what should be done about it? (We can thus phrase two of the important issues, if we like, without mentioning “pornography” at all.) If we define “pornography” simply as sexually explicit material (regardless of whether it is harmful to women), then the first substantive issue must be posed in this way: “is there *any* pornography that is harmful to women; and, if so, what should be done about it?” However, if “pornography” is defined as that sexually explicit material that subordinates women then, while we can ask this question, we must pose it differently: we must ask “which pieces of sexually explicit material, if any, are pornographic; and what should be done about any pornography that exists?” A second substantive issue at stake in the debate is whether *all* sexually explicit material, either in principle or under current social conditions, is or would be harmful to women. Again, it should be noted that this question can be asked using either conception of “pornography”, but it must be posed differently. If we define “pornography” simply as sexually explicit material (regardless of whether it is harmful), the question must be posed like this: “is all pornography as a matter of fact harmful?” On the other hand, if we define “pornography” as sexually explicit material that harms women, we must ask: “is all sexually explicit material as a matter of fact pornographic?” These are just terminological variants of the same substantive question: but when different terminology is used by different participants in the debate, the exact questions at issue, which are actually very simple to state, can be obscured.

## **The shape of the traditional pornography debate**

### **1) Conservative arguments for censorship**

Until comparatively recently, the main opposition to pornography came from moral and religious conservatives, who argue that pornography should be banned because its sexually explicit content is obscene and morally corrupting. By “pornography”, conservatives usually mean simply sexually explicit material (either pictures or words), since conservatives typically view all such material as obscene.

According to conservatives, the sexually explicit content of pornography is an affront to decent family and religious values and deeply offensive to a significant portion of citizens who hold these values. The consumption of pornography is bad for society. It undermines and destabilizes the moral fabric of a decent and stable society, by encouraging sexual promiscuity, deviant sexual practices and other attitudes and behaviour that threaten traditional family and religious institutions, and which conservatives regard as intrinsically morally wrong. Furthermore, pornography is bad for those who consume it, corrupting their character and preventing them from leading a good

and worthwhile life in accordance with family and religious values.

According to conservatives, the state is justified in using its coercive power to uphold and enforce a community's moral convictions and to prevent citizens from engaging in activities that offend prevailing community standards of morality and decency. (See e.g., Devlin 1968, Sandel 1984.) This position is sometimes called 'legal moralism'. Governments also have a responsibility to prevent citizens from harming themselves. This is true, even where the citizen is not a child (who may not yet be competent to make responsible judgements for themselves about what is in their own best interests), but a mature adult who is voluntarily engaged in an activity which they judge to be desirable and which causes no harm to others. The view that the state is entitled to interfere with the freedom of mentally competent adults against their will for their own good is often called 'legal paternalism'.

Conservatives therefore think that it is entirely legitimate for the state to prohibit consenting adults from publishing and viewing pornography, even in private, in order to protect the moral health of would-be consumers and of society as a whole.

## **2) The traditional liberal defence of a right to pornography**

Traditional liberal defenders of pornography famously disagree, rejecting both the principle of legal moralism and the principle of legal paternalism, at least where consenting adults are concerned. This is not to say that liberal defenders of pornography necessarily approve of it. Indeed, they frequently personally find pornography—especially violent and degrading pornography—mindless and offensive. Many concede that pornography—by which they usually mean sexually explicit material whose primary function is to produce sexual arousal in viewers—is “low value” speech: speech that contributes little, if anything, of intellectual, artistic, literary or political merit to the moral and social environment. But this does not mean that it should not be protected—quite the opposite. A vital principle is at stake for liberals in the debate over pornography and censorship. The principle is that mentally competent adults must not be prevented from expressing their own convictions, or from indulging their own private tastes, simply on the grounds that, in the opinion of others, those convictions or tastes are mistaken, offensive or unworthy. Moral majorities must not be allowed to use the law to suppress dissenting minority opinions or to force their own moral convictions on others. The underlying liberal sentiment here is nicely captured in the famous adage (often attributed to the French philosopher, Voltaire): “I disapprove of what you say, but I will defend to the death your right to say it.”

For liberals, there is a very strong presumption in favour of individual freedom, and against state regulation that interferes with that freedom. The *only* grounds that liberals typically regard as providing a legitimate reason for state restrictions on individual freedom is in order to prevent *harm* to others. Hence, in debates over censorship and other forms of state regulation that restrict the liberty of individuals against their will, the burden of proof is always firmly on those who argue for censorship to demonstrate that the speech or conduct in question causes significant harm to others. It must either be shown to directly cause actual *physical violence* to others (e.g., murder, rape, assault, battery), on a narrower understanding of “harm”; or to deliberately or negligently violate sufficiently important *interests* or *rights* of others, on a broader, interest-based conception of “harm”.

Liberals have traditionally defended a right to pornography on three main grounds. (By the “right to pornography” here, and in what follows, I mean the negative right of consenting adults not to be

prevented from making, publishing, exhibiting, distributing and consuming pornography in private). Firstly, on the grounds of *freedom of speech or expression*, which protects the freedom of individuals (in this case, pornographers) to express their opinions and to communicate those opinions to others, however mistaken, disagreeable or offensive others may find them. Liberals have tended to conceive of freedom, including freedom of expression, as *negative* freedom-as non-interference by others-rather than as positive freedom, which involves having the positive goods and facilities required to exercise the freedom. Freedom is thus something that individuals have just so long as there are no coercive external obstacles-notably, physical or legal restrictions-in their way.

Few liberals nowadays think that the (negative) right to freedom of speech is an absolute right: a freedom that can never legitimately be restricted by the state. If the speech causes sufficiently great harm to others then the state may have a legitimate interest in regulating or preventing it. There is no simple general formula or algorithm for determining when the harm caused to others is "sufficiently great" to justify legal restrictions in the case of speech and more generally. This will depend on the outcome of a complex process of carefully weighing and balancing the strength and nature of the harm and the competing interests at stake, and an analysis of the costs and benefits of alternative policies, that needs to be undertaken on a case by case basis.

However, when it comes to legislation that interferes with free speech, the liberal presumption against legislation is especially high. For liberals take freedom of expression to be an especially important right that takes precedence over most other rights and interests (including equality) should they ever conflict. Levels of harm that would normally be sufficient to justify regulating the conduct which causes them may be not be sufficiently great to justify restrictions in cases where the harm is caused by speech or expression. Hence, for liberals, justifying censorship of pornography requires that there is extremely reliable evidence to show that the publication or voluntary private consumption of pornography by consenting adults causes *especially* great and serious harm to others. The harm caused by expression must be very certain and very great before it is legitimate for a state to prohibit it. We would be justified in banning a certain type of pornography (e.g., bondage pictures) only when we are very sure that, on average, tokens of that type (i.e., most particular bondage pictures) cause very great harm.

Secondly, liberals have defended a right to pornography on the grounds of a right to *privacy* (or "moral independence", as one prominent liberal defender of pornography calls it), which protects a sphere of private activity within which individuals can explore and indulge their own personal tastes and convictions, free from the threat of coercive pressure or interference by the state and other individuals. The spectre of state intrusion into the private lives of individuals underpins much of the liberal discomfort about censorship of pornography.

Like the right to freedom of speech, the liberal commitment to privacy is not absolute. It can be overridden if the private activities of individuals are such as to cause significant harm to others. Thus, if there is reliable evidence to suggest that the voluntary private consumption of pornography causes sufficiently great harm to others then- providing this harm is sufficiently great and that state prohibitions are the only effective way of preventing it-the state would have a legitimate interest in prohibiting it.

But-and this is the third prong of the traditional liberal defence-pornography is comparatively *harmless*. Neither the expression of pornographic opinions, nor the indulging of a private taste for pornography, causes significant harm to others, in the relevant sense of 'harm' (i.e., crimes of physical violence or other significant wrongful rights-violations). Hence, the publication and voluntary private consumption of pornography is none of the state's business.

## The 'harm principle': when is the state justified in restricting individual liberty?

These three central ingredients in the liberal defence of pornography find their classic expression in a famous and influential passage from John Stuart Mill's *On Liberty* (1859). In this passage, Mill sets out the principle that underpins the prevailing liberal view about when it is justified for the state to coercively interfere with the liberty of its citizens. It is a principle that continues to provide the dominant liberal framework for the debate over pornography and censorship. Mill writes:

The only principle for which power can be rightfully exercised over any member of a civilized community, against his will, is to prevent harm to others. His own good, either physical or moral, is not a sufficient warrant. He cannot rightfully be compelled to do or forbear because it will be better for him to do so, because it will make him happier, because, in the opinion of others, to do so would be wise or even right. These are good reasons for remonstrating with him, or reasoning with him, or persuading him, or entreating him, but not for compelling him, or visiting him with any evil in case he do otherwise. To justify that, the conduct from which it is desired to deter him, must be calculated to produce evil to someone else. The only part of the conduct of any one for which he is amenable to society, is that which concerns others. In the part which merely concerns himself, his independence is, of right, absolute. (Mill 1975: 15)

Mill's central claim is that society is justified in interfering with the freedom of mentally competent adults to say and do what they wish *only* when their conduct will cause harm to others. This has come to be known as the 'liberty principle' or 'harm principle'; and it forms the cornerstone of the traditional liberal defence of individual liberty. It protects the freedom of all mentally competent individuals to live and shape their own lives in accordance with their own preferences and beliefs, so long as they do not harm others in the process.

Mill goes on to stress that the harm principle is meant to apply "only to human beings in the maturity of their faculties" (Mill 1975:15). So the principle permits paternalistic intervention in the case of those who are not competent to make an informed decision about what is in their best interests for themselves, and so who "must be protected against their own actions as well as external injury": for example, young children or those adults whose decision-making abilities are temporarily or permanently impaired.

It is generally thought to follow that child pornography, which is taken to involve the *actual* sexual abuse or exploitation of children (with or without their apparent consent), can legitimately be banned in order to protect the interests of children, who are not yet competent to fully understand the nature of the choice they are making or to grasp the impact of their decisions on their present and future interests. (This is not entirely uncontroversial, however: for it might be denied that children are harmed by participating in pornography. The North American Man Boy Love Association (NAMBLA), for example, denies that having sex with adults is harmful for children.) For the same reason, liberals think that children can quite rightly be prevented by parents or by the state from purchasing or viewing pornography, if this is thought likely to harm them. That child pornography should be banned is common ground between liberals and conservatives. However, pornography that involves the *simulated* abuse of children (for example, consenting adult actors dressed up as schoolgirls) cannot legitimately be prohibited under the harm principle, unless there is good evidence to suggest that consumption of this material causes significant harm to people other than those who consume it: by, for example, causing those who consume it to abuse children.

We are now in a better position both to see what it would take for liberals to think that censorship

of pornography is justified and why liberals have been so unsympathetic to the sort of argument against pornography that conservatives make. Conservatives wish to prevent mentally competent adults from publishing and consuming pornography on the grounds that the choice to consume pornography is deeply morally misguided. But, as Mill insists, this is “not a sufficient warrant” for coercive interference with individual liberty. Neither the state nor moral majorities are entitled to restrict the private choices and activities of individuals against their will simply because, in the opinion of state officials or the social majority, that way of life is unworthy or unrewarding. Mill thinks that this sort of legal moralism will lead inevitably to a terrible “tyranny of the majority”, crushing individual diversity and blocking human progress and flourishing.

However, following Mill, liberals are generally happy to allow that considerations of the individual or common good may entitle the state to use other, so-called *non-coercive* means to persuade citizens to make wise or better choices. Thus public education campaigns designed to inform citizens of the dangers of smoking or excessive alcohol consumption, or to persuade them to make “wise” choices (for example, to eat more fruit and vegetables) may be justified. While others cannot force an individual to do something (or to forbear from doing it) when they are not harming others, it is entirely legitimate to seek to advise, instruct or persuade them. So, if there are reasons to think that pornography is not good for the individual who consumes it (say, because it makes them less likely to be able to have successful loving or long-term relationships), public education campaigns to warn consumers of these dangers may be justified. Indeed this-education and debate-is precisely the solution that liberals typically recommend to counter any harm that pornography may cause. (See e.g., Feinberg 1985, Donnerstein et al. 1987, Dworkin 1985) This solution respects the freedom of rational agents to exercise their own rational capacities in deciding what to think and how to live.

However, liberals insist that if attempts at persuasion should fail, and where an individual's conduct poses no significant threat to the physical security or interests of others, the state may not use coercive legal mechanisms to enforce these “wise” choices. “The only freedom which deserves the name is that of pursuing our own good in our own way, so long as we do not attempt to deprive others of theirs, or impede their efforts to obtain it” (Mill 1975: 18). For Mill, the individual person is in the best position to judge what is in his or her own best interests; and, even if individuals may sometimes make bad choices, it is better in general that they be left free to make these mistakes. For no one's opinion about the good life is infallible; and, in any case, a life lived ‘from the inside’, in accordance with values that the individual endorses, is more likely to be a fulfilling one than a life where the individual is forced against their will to live as others as believe best.

In an influential liberal defence of pornography, Ronald Dworkin expresses this commitment in terms of a right to “moral independence”. People, he says, “have the right not to suffer disadvantage in the distribution of social goods and opportunities, including disadvantages in the liberties permitted to them by the criminal law, just on the ground that their officials or fellow-citizens think that their opinions about the right way for them to lead their own lives are ignoble or wrong.” (Dworkin 1985: 353.) The fact, if it is one, that the majority of people in a society prefer that pornography be banned because they regard it as immoral or offensive is not a legitimate reason for interfering with (pornographers') freedom of speech or for preventing consenting adults from consuming it in private. For allowing such illegitimate “external” preferences of a majority to dictate government policy would violate the right to moral independence of the producers and consumers of pornography. It would give moral majorities the power to dictate how members of minority or non-mainstream groups can live on the basis of the majority's opinions about what sort of people are most worthy and what sorts of lives are worth living, and this violates the basic right of all indi-

viduals to be treated with equal concern and respect.

### **Pornography and Offense: Justifying restrictions on the public display of pornography**

However, Dworkin thinks, considerations of offence may provide some justification for preventing or restricting the public display of pornography so as to avoid its causing offense to *non-consenting* adults who might otherwise involuntarily or unwittingly be exposed to it. Joel Feinberg, another well-known liberal defender of pornography, agrees. But Feinberg thinks that such restrictions must be justified by a separate principle to the harm principle, for he thinks that certain sorts of unpleasant psychological states are not in themselves harms. Feinberg calls this additional principle the *offense principle*. The offense principle says that "It is always a good reason in support of a proposed criminal prohibition that it would probably be an effective way of preventing serious offense (as opposed to injury or harm) to persons other than the actor, and that it is probably a necessary means to that end (i.e., there is probably no other means that is equally effective at no greater cost to the other values)."

Like Dworkin, Feinberg thinks that the voluntary private consumption of pornography does not cause harm to others. Hence, wholesale criminal prohibitions on the publication and private voluntary consumption of pornography cannot be justified. But the public display of pornography may nonetheless constitute an "offensive nuisance" to non-consenting adults who are involuntarily exposed to it (just as neighbours who play bad music loudly into the wee hours of the morning may be an "offensive nuisance"). Since the harm-or rather, pseudo-harm-of pornography is the offense it may cause unwitting viewers involuntarily exposed to it, the solution is to restrict its exhibition to domains where such involuntary exposure will not occur, such as inside well sign-posted adult bookshops and cinemas where those who will be offended will know not to venture. Although this may prevent pornographers from distributing their opinions as widely as they might like, and may also cause some minor inconvenience to consumers (who may have to go further out of their way to find and view pornography, or suffer the embarrassment of having to sneak into known adult bookstores), these costs may be relatively small compared with the level of offense that involuntary exposure is likely to cause. Such restrictions on the public display of pornography would not amount to censorship, for pornographers are still free to publish and distribute their opinions. Nor would they violate consumers' right to privacy, for pornography would be freely available for willing consumers to view in private. The Williams Committee Report into Obscenity and Film Censorship in England made a similar recommendation, pointing to general considerations of public decency that prevent "offensive" public displays of conduct (e.g., nudity or sexual intercourse) that is appropriately seen or done only in private. Susan Wendell also agrees that the public display of certain sorts of pornography-visual, audio and written material that depicts and condones the unjustified physical coercion of women or other human beings- should be prohibited, although her particular concern is to remove the anxiety that involuntary exposure to such coercive material is likely to cause women and the harm it is likely to do to their self-esteem (Wendell 1983).

Liberal defenders of the right to pornography may thus allow that restrictions on its public display may be justified. But only if pornography can reliably be shown to cause significant harm to people other than those who voluntarily consume it will there be a legitimate case for prohibiting its voluntary *private* consumption. When an individual's private activities cause harm to others then they become no longer merely a private matter, but of legitimate public interest; and the state may be justified in regulating them. Thus, Dworkin says, were excessive consumption of pornography shown to cause *absenteeism* from work, then the public and the state might have some legitimate interest in preventing it. But, Dworkin thinks, there is as yet no reliable evidence that firmly

establishes that the voluntary private production or consumption of pornography by consenting adults causes this or any other sufficiently significant harm to others, in the relevant sense of 'harm'. Hence, pornography satisfies only harmless personal preferences for sexual gratification; and is therefore none of the state's business.

### **The dangers of censorship**

Liberals also have technical concerns about how censorship laws might work in practice. Many liberal (and feminist) objections to censorship of pornography point to the practical costs and dangers of censorship, arguing that even if pornography does cause some harm to others, the risks involved in censoring it are too great. They point to the difficulties involved in formulating a legal definition of 'pornography' that will be sufficiently precise to minimize the danger that censorship laws targeting pornography will be used (intentionally or unintentionally) to censor other unpopular material, including valuable literary, artistic and political works. Censoring pornography may thus place us on a dangerous "slippery slope" to further censorship of other material; and may have a general "chilling effect" on expression, making people reluctant to say or publish things that might be construed as pornography and for which they could be prosecuted.

These are serious dangers; and they need to be carefully taken into account in weighing the costs and benefits of censorship as a solution to any harm that pornography might cause. But it is worth noting that they are inherent in many existing forms of legislation, and are not always taken to be insoluble or to constitute a decisive reason against censorship in themselves.

### **Recent liberal dissent**

Although traditional defenders of a right to pornography have been liberals, it is important to note that not all contemporary liberals defend such a right. Indeed, the question of whether there might be good liberal grounds for prohibiting or otherwise regulating the voluntary private consumption of (some) pornography has become the subject of increasing and lively debate. Inspired by more recent feminist arguments against pornography, some scholars argue that the liberal commitment to protecting individual autonomy, equality, freedom of expression and other important liberal values may in fact support a policy that prohibits certain kinds of pornography, rather than the permissive stance that liberals have traditionally favoured. (See e.g., Dyzenhaus 1992, Easton 1994: 42–51, Langton 1990, Okin 1987, West 2003.) These theorists do not normally reject the harm principle, broadly understood: They generally agree that the crucial question in determining whether censorship of pornography is justified is whether there is reliable evidence to show that the publication or viewing of pornography by consenting adults causes sufficiently great harm to significant interests of others. Rather, they are open to the legitimacy of censorship because they think that the production and consumption of certain sorts of sexually explicit material—in particular, violent pornography and non-violent but degrading pornography—may in fact cause sufficiently significant harm to others, particularly women.

These theorists often follow social science researchers in drawing more fine-grained distinctions within the general category of pornography (i.e., the sexually explicit material whose primary function is to produce sexual arousal in those who view or read them). They often distinguish between

1) violent pornography; 2) non-violent but degrading pornography; and 3) non-violent and non-degrading pornography, since there is some evidence to suggest that some of these materials (e.g., in categories 1 and 2) may be harmful in ways that other material (e.g., category 3) is

not. I will summarize some of this important evidence shortly.

One important dimension of the disagreement between those liberals who defend a right to pornography and those who think that liberals should be open to the legitimacy of censorship is *empirical*: they disagree about the crucial empirical issue of whether there is reliable evidence to show that the production and consumption of pornography by consenting adults in fact causes harm to others, particularly women. But frequently they also disagree about some important *conceptual* matters as well. In particular, they may disagree (albeit sometimes implicitly) about how three central elements of the harm principle should be understood: (i) exactly what counts as “harm” to others, in the relevant sense; (ii) when can we say that something is a “cause”, or a sufficiently “direct cause”, of a harm; and (iii) how much harm to others is “sufficiently great” to justify coercive sanctions against the speech or conduct that produces it. In other words, they disagree about how the harm principle should be interpreted and applied.

Many argue that more traditional liberal conceptions of the interests or rights that individuals have, and so of what activities can cause harm to them, is too narrow. It ignores the way in which threats to individuals' interests can come not just from the state, but also from other social practices and circumstances (e.g., substantive socio-economic disadvantage) that can prevent the meaningful exercise of freedom just as effectively. The state may thus have a legitimate role to play in promoting the social conditions that enable individuals to exercise their rights in meaningful ways, and in regulating such activities of non-governmental agents or groups as may serve significantly to infringe them.

## **Pornographic Ethics**

A 2008 study on university campuses found that a whopping 87 percent of “emerging” adult men (aged 18-26), and 31 percent of emerging adult women report using porn at some level. Twenty percent of young men report using pornography daily or every other day, and almost half use it at least weekly. But the shock factor of pornography consumption statistics do not stop there: The sky is blue and men view porn—we’ve lost the shock value in our passive acceptance. Perhaps the more telling pornography statistic is that slightly over two thirds of young men, and nearly half of young women believe that porn consumption is morally acceptable.

This statistic of acceptance is particularly interesting because it is pulled from our generation, which often defines right and wrong in terms of consequences. Consequence-based morality maintains that if something doesn’t hurt yourself or others, it’s not wrong. The principle of “Thou shalt not hurt” thus becomes the backbone of discursive moral reasoning, as observed by the National Study of Youth and Religion. Removing an external moral standard from moral reasoning makes it difficult to condemn sex trafficking, exploitation, and violence, much less explicit sexual content and nudity. But even in terms of a “Thou shalt not hurt” moral code, passively accepting pornography overlooks the very real consequences of porn consumption.

Healthy sexuality combines emotional, social, intellectual, and physical elements, but pornography separates the mechanized components of intercourse from real sexuality itself. It leads to decreased sensitivity toward women and increased aggression. It also leads to a decreased ability to build healthy relationships or experience sexual satisfaction; users are increasingly unable to properly link emotional involvement with sex. Indeed, porn fosters incredibly unhealthy views about sexuality and human beings. Most porn portrays women as sex-obsessed, mindless objects, promiscuous and subordinate. As feminist scholar Catharine MacKinnon might propose, the preva-

lence of pornography begs the question: Are women human? Though that question seems extreme, ask yourself if a good society can intentionally engage in a medium that portrays half of its members in such a derogatory manner.

There is much discussion on how the government should regulate the big business of pornography, seesawing between freewheeling libertarianism and heavy-handed censorship.

Indeed, we are increasingly desensitized to discussion about porn use and regulation, even as research proves the effects of pornography are life altering, and stories of sex exploitation, psychological problems, and abuse dominate inspections into the porn industry. Many Americans embrace fair-trade coffee, concerned about the industries that produce their goods, but few consumers express concern about porn industry operations, and its employees and victims.

Even by the often-cited moral standards of individual choice and "Thou shalt not hurt," the porn discussion demands our moral attention. Recent work by neurologists illustrates the very real addictive properties of pornography. Porn addictions restrict real individual choice. University of Texas-San Antonio's Dr. Donald L. Hilton, Jr.'s research on porn addiction explains that pleasure chemicals in the brain are gradually overused when a person views pornography; the brain then limits dopamine production, causing the viewer to become starved for dopamine.

Despite the personal and social costs of pornography, health services are absurdly silent on the issue of such an exploitative and harmful industry. Harvard's University Health Services and Office of Sexual Prevention and Response dance around the issue without offering services or information to students about porn consumption and addiction. OSAPR refused the requests of True Love Revolution officers to assist with the White Ribbon Against Pornography Week without citing any reasons. OSAPR should make a concerted effort to reach out to students who are struggling with porn and educate students on the harmful effects of pornography. University offices shy away from addressing the porn issue as a tangible part of students' personal lives; they instead turn it into a vague, elusive matter.

Perhaps the University avoids the porn issue in order to avoid moral or social controversy, but fear of stirring up debate does few favors for students who struggle with porn consumption. University of Chicago professor Jean Bethke Elshtain argues in *The Social Costs of Pornography* that we should not dismiss the "moral" in our avoidance of the "moralistic." Elshtain maintains that in order to be responsible citizens, we must ask ourselves, "What sort of community is this?"

Is it reasonably decent and kind? Is it a fit place for human habitation, especially for the young? What happens to the most vulnerable among us? How do we ill-dignify the human body, and how do we forestall such affronts?" Such questions demand long-winded, nuanced answers, yet it is worth seeking these answers. They are pertinent to those who are involved in the porn industry, and they are pertinent to our own lives. We should all be asking ourselves whether pornography is compatible with a respectful and good society.

## **Representation**

Representation is simply the act of imitation or the act of identification, people identify themselves by means of their mimetic ability, when they see themselves in others and perceive a state of mutual equality. Representation of reality may refer to simile, similarity and symbolization of the world when we take it as a transformation of myth. The idea of representation at its simple level involves our understanding for the action of representation and how we define that act. This essay details

media representation of reality as outlined by key theorists and their theories in the classical age and it further explains representation as a substitute and also as ideology.

Classical age refers to the antique period before the birth of Jesus Christ (Auerbach, E, 1974). Key philosophers during this period included people such as Plato who is the ancient Greek philosopher; Aristotle who is also a Greek philosopher and he was Plato's student; Saint Thomas Aquinas who is a theologian from Italy; Galileo Galilei an Italian physician, astronomy and philosopher and last but not least Francis Bacon who is an English philosopher and leader of scientific revolution. I will critically do an in-depth analysis/discuss representation as outlined by this philosophers and I will also distinguish representation as a substitute and ideology.

First of all let's consider Plato who takes 'representation' with several meanings and connotations in the dialogue and alters the term according to the context in which he uses it. Plato can perhaps be identified as the culprit behind the idea that representation are lacking in truth or 'real' quality. Plato view representation as imitation or '*mimesis*'. (Annas, 1982)

For Plato, more than two thousand years ago, an image was the representation of something and was not, could not, be an original. It was always an imitation and always lacking in value when compared to the original since it was not an original it had to be a simulacrum, a false claim to being. (Annas, 1982)

Plato simulacrum calls into question, the entire relationship between the real objects and its copy, and also prioritises the two entities in terms of value. Plato discuss 'representation' as likening oneself to another in speech and bodily behaviour and as addressing the lower part of man's soul; he also refers to the epistemology and metaphysics of the concept. (Spring, 1985)

In contradicting this, Aristotle who is known to be Plato's student 'representation' does not refers to the imitation of idea and appearance, like that of Plato. Aristotle view representation as a sign and argues that each area of knowledge is imitated in the sense that as a human being we all learn through imitation (Annas,1982)

According to Angelo (1985) Aristotle is the first to deal with 'representation' as a theory of art. He dwell on the concept of representation as an aesthetic theory of art and considers imitation in terms of the form it is embodied. Aristotle states that all human action are mimetic and that men learn through imitation e.g. in the social learning theory of Albert Bandura it is said that we learn by imitating from an early age. In particular to him 'representation' is a distinguishing quality of an art.

For Plato, the artist was nothing but an imitator. This imitator while pretending to represent the real, did nothing more than give representation to an opinion about the real. Plato's student Aristotle, perhaps more diplomatically than Plato, described the image of painted figure not as the likeness of a character but rather as a sign of the character. Aristotle view representation of reality as referent to someone or something but does not try to pose as that someone or something (Summers, 1996:6).

However, he carefully makes a distinction between difference kinds of knowledge e.g. he claims that art and philosophy deal with different kinds of truth; philosophy deals with concrete and absolute truth, whereas art deals with aesthetic and universal truth. Aristotle take's representation as an active aesthetic process. (Crane, R, S & Keats, W, R et al, 1996)

Plato and Aristotle attributed different meanings to the term representation. Plato considers rep-

representation as in ethical and political context whereas Aristotle uses representation as an aesthetic phenomenon and as an activity of the artist as I have explained in the above paragraph; they both agree that poetry is mimetic but they have different ideas about poetry and representation. (Summers, 1996)

Plato and Aristotle argue that artist (Demiurge) and poet imitate nature, thus, a work of art is a reflection of nature. However, they have different views on the functions of imitation in art and literature. Plato believes in the existence of the ideal world, where exists a real form of every object found in nature. A work of art which reflects nature and is twice far from the reality it represents. Aristotle, on the other hand, does not deal with the ideal world, instead he analyses nature. He argues that a work of art does not imitate nature as it is, but as it should be. In this sense, an artist does not violate the truth but reflects the reality.

Plato's main concern is with the public recitation of dramatic and epic poetry and in Plato there is emulation between philosophy and poetry. The poet influences the character of the young in every way and has corruptive impact upon the education of the young mind. In addition, poets don't have a true knowledge of the things. Plato suggests that the emotional appeal is a threat to reason, that mimetic art is remote from reality, that the poet is not serious and knows nothing about poetry and cannot give satisfactory information about his art.

It is obvious that he resists the concept of imitation in the case of poetic composition. Tragedy, in particular, and poetry, in general, is concerned with pleasure rather than instruction and since it is not possible to imitate a wise and quiet person in the play, since such a person does not fit the content of tragedy, 'representation' is ethically distracting. Therefore, the function of various

discussions of representational art in the Republic is ethical; wherever he mentions art he discusses it in relation to education and ethics (Annas, 1982).

Although Aristotle agrees with Plato that poetry has the power to stimulate emotions, he does not pay much attention to the ethical and epistemological aspects of 'representation'. Yet he dwells on the pleasure that men take in learning and argues that tragedy discharges the feelings and spectators leave the play in a state of calm, free of passions.

Plato worries about the moral effect of poetry, while Aristotle strikes to psychology and returns repeatedly to shuddering terror and pity that the tragedy is creating in the spectator, who therefore repeats or imitates what has already taken place on stage. And that, in its turn, spectator repeats or imitates what has already taken place. (Phillip, 1996)

Plato argues that there is a duality between art (representation and narrative art) and ethics. This manner of representation (impersonation), according to Plato, leads to the loss-of-self or transformation of identity and becomes a matter of moral destruction. Aristotle also takes the same activity of impersonation, but in a different way. (Gerathy, 1996:275)

After few years a medieval catholic theologian Thomas Aquinas acknowledged the vertical nature that symbolic representation had now taken on; a lower verse which indicates points to represent the higher God. Although denying that the higher and the lower are equivalents, Aquinas admitted that the higher can be addressed through the lower. Aquinas view representation as a divine instrument.

According to Aquinas representation have, in the midst of the mysteries of the faith, become almost supernatural mediums between mankind and God. In fact Aquinas encouraged this practice; since we cannot directly be exposed to divine truth, the faith must be translated into something which is represented to be consumed by us through our lower or human sense.

## **Representation and differences-Marginalization**

Media represent one of the most dynamically changing systems in society. The evolution of media has been determined by the progress in the area of information and communication technologies, their spread and mass usage, whereas it includes numerous and diverse political, economic, cultural, ethical, and social implications. The editor of the publication, Rachna Sharma, stated following in the Introduction: "Today, while observing 'movements' on social issues at an increased frequency, with increased participation of the public, the claimed media interventions and the changing role of governments in this triangular relationship, one is compelled to locate the issue of marginalised sections in society."

The present is, above all, the time of social media characterised by a high degree of civic activism and individual freedom in the creation and presentation of the content: on the other hand, the power and economic strength of international media conglomerates has been growing on a regional and global scale. It is often discussed the undeniable contribution of the media to building a democratic society, a healthy public environment and their ability to help to radical social transformations, however we may also see that media provide a diametrically different space for the presentations of certain groups. If they highlight specific social participants, others are out of focus of the mainstream media. This bipolarity in displaying marginalised groups in society is one of the paradoxes of the postmodern society and a significant feature of the contemporary mainstream mass media.

Relevant responding to numerous questions related to the establishment and clarification of relations between media, the state and marginalized groups has become the subject of an academic debate, the results of which have the potential to reach the broader social awareness and media practice. In March 2016, the National seminar on the topic Media, the State and the Marginalized: Tackling Challenges took place at the Department of Journalism, Kalindi College, University of Delhi in India. The reviewed publication consists of selected papers presented at the seminar, edited by Rachna Sharma, Assistant Professor in the Department of Journalism of Lady Shri Ram College for Women at Delhi University, India. The publication includes 21 chapters summarised in five major thematic areas, as follows: Part I: Media and Political Communication, Part II: Representation of the Marginalised and Media Ethics, Part III: New Media, Social Media and Digital Activism, Part IV: Alternative and Community Media: The Media of the Marginalised? and Part V: Critical Theory, Media Criticism and Media Reforms. A part of the proceedings is a brief dictionary, in which the reader can find definitions of key terms related to the solved issues and an index of concepts and names that will help them in orientation in the content. It consists of 331 pages.

As indicated by the structure of the publication, its ambition is to provide a variety of views on the dynamically changing relation between media, the state and marginalized groups in an effort to comprehensively understand current social-political and social-cultural processes, which the contributors managed to accomplish. Individual authors address selected areas in a comparative and interdisciplinary perspective. This is mainly due to the composition of the authors' team, which includes leading Indian experts from different areas, such as media studies, cultural studies, journalism, sociology, Public Relations, as well as long-standing experts from media practice. It is an in-

terdisciplinary approach to exploring how media are in the digital age, who marginalised groups are in current social-political-economic structures and how they are reported by mainstream media that can be considered as a significant contribution of the publication to the wider debate on the subject. Despite the fact that the issue is dealt with by the authors from the domestic, Indian perspective, its overlap lies in a qualitative and quantitative solution. This approach expands the possibilities of publication's use. It can serve not only to academics and researchers, but also to the students of media studies, journalism, political science, and sociology. However, also workers in the media, especially in the news-service and others who are interested in the issue of marginalized groups in Indian society and its various stances can find a lot of inspirational information. Thus, notions presented in individual contributions may serve as the basis for the theoretical and empirical comparative research of the allocated groups in other countries, as well. We should particularly appreciate the fact that the findings published in the book *Media, the State and Marginalisation: Tackling Challenges* may serve as the foundation for institutional debate aimed at addressing the problematic position of the marginalized groups in the Indian society heading towards formulating reforms. Thus, I consider the reviewed publication as an extraordinarily impressive contribution to the discussion on tackling the position of marginalized groups in modern society, with a significant overlap to the theory and the endeavour to practically apply the findings not only in media practice, but also in formulating measures at society-wide level.

## **Martin Slivka**

'The Master of nine crafts', Professor Karol Plicka, was Martin Slivka's role model and inspiration. A few of his films and scholarly analyses published in several books were devoted to Plicka and his extraordinary artistic accomplishments. He was not only Slivka's inspiration but also the object of his profound research inquiries. Slivka's own creative path unfolded from his Master's work he admired so much. This creative path was extraordinarily rich and diverse – he was an excellent documentary filmmaker, screenwriter, playwright, director, as well as a prominent ethnologist, a scientist and, ultimately, a lecturer who inspired and provoked his students by creating a space for free search of connections through his lectures.

He considered education, creativity and ethics to be the basic values any artist should have possessed. He is one of the key personalities of our culture that need to be re-discovered, reflected on by returning to their messages, confronted with the world. Martin Slivka was the co-founder of modern Slovak documentary film; he made more than 140 remarkable film documents. His independent debut, *Water and Work* (1963), highlighted the fact that a gifted filmmaker possessing a precious artistic opinion has just entered the area. The motion picture, which focuses on technical landmarks such as mills, uses artworks of prominent Slovak artists, e.g. music of Ilya Zeljenka and images of Jozef Grussmann, yet without any explicit spoken comments.

In addition to many other Slivka's films worthy of our attention, the documentary from Bulgaria *Man Is Leaving* (1968) is truly exceptional. "He reconsidered the traditionally descriptive ethnographic film works, (...) talking about the place of death in human life, about things that are common in all cultures," *The History of Slovak Cinematography* (2016) claims. The same publication also states that "During the period of 1963 – 1969, the authors of various generations, e.g. Karol Skřípský (1908), Vlado Kubenko (1924), Martin Slivka (1929), Dušan Hanák (1938) and Dušan Trančík (1946) created their masterpieces, their opuses". However, it was no coincidence; the political situation of the 1960s in our country but also anywhere else in the world seemed to universally inspire the best creators of different generations active in different areas of artistic life. Martin

Slivka used similar artistic approaches to creating films about art and film portraits of prominent Slovak artists.

Moreover, he remained faithful to ethnographic film, exploring folk culture in its essence (but through a modern film language), customs and folk theatre that he also reflected on in his academic publications. The publication *The Slovak Folk Theatre* (2002) is the result of his researching and seeking. His precise work preparations necessarily involved searching for co-creators who, in his opinion, would provide their future collective work with the best possible quality. That is why Milan Rúfus, one of the most outstanding personalities of Slovak literature, wrote comments on some of his films. Moreover, world-famous music artists such as Krzysztof Penderecki and Ilya Zeljenka were willing to link their music with Slivka's films. Martin Slivka's filmmaking skills were connected to his ethnological erudition, based on multidisciplinary approaches to the presented themes, as his unique studies on this topic clearly reflected.

He was a rebellious, stubborn debater; his former students, and there are many, are grateful not only for his professional supervision but also for the intellectual search they were lucky to experience while standing beside him. "It is difficult, if I may use his own words, to 'establish Martin Slivka in any structure'. He is a patriarchal tradition of the East and a Renaissance legacy of the West, all in one.

His whole being completely smells of humanity," writes one of his most successful students, the film director Mário Homolka.

While appreciating his work, it is impossible to omit the 13-part television series *The Children of the Wind* (1990) about the lives of Gypsies in many European countries. His son Ľubomír worked with him and despite many difficulties they experienced in many countries while making the series, they created a unique piece of art that is still unmatched in this area of creative expression and, as I daresay, it will remain unmatched for a long time. The film's value will definitely increase, since it offers a set of thorough, yet subtle expressions of the quickly vanishing Romani traditions. Martin Slivka is the winner of many prizes and awards, one of the most discussed Slovak filmmakers. Above all, he will be remembered as an inventive, wise and loving man, as a true renaissance person who knew how to understand human weaknesses and always tried to overcome these weaknesses through considerable doses of irony that was so typical for all his works.

## **Milan Stano**

Painter, graphic designer, cartoonist. Publisher, editor, writer and connoisseur of everything connected with travelling around the world. His inspirations are tangible not only in images and writings he has created but also in endless considerations, comparisons and evaluations reflecting on his works. He is original, capable in each of the mentioned creative fields, unrepeatable. He is tough and hardworking. Most of his paintings are landscapes, images of rural environments and urban visions. Following his paintings, he travels across the country with his rack, sketchbook, colours and brushes. "In his paintings, a calm landscape emerges, radiating harmony, balance; through urban motives and folk architecture, he creates poetic compositions," wrote a critic. The humorous images of Slovak folklore and folk traditions also define the cartoons he has been publishing since 1966: "I love Slovak humour; the soul of the nation, the unbound joy of life, the sense of justice and the mockery of stupidity are all enchanted within it," wrote Milan Stano. That is why he also became the publisher, editor and later editor-in-chief of the independent satirical monthly magazine *Kocúrko*, published by Štúdio humoru a satiry since 1990. That is where he started to

publish books as well. His cartoons are kind, ironic and provocative at the same time, always able to reflect the problems Slovakia has to face – after all, the reader should become acquainted with various cultural or historical contexts –; however, they also point out the more general questions of being, joy and ‘borderless’ stupidity. They represent timelessness and a peculiar dialogue with the universe. His heroes are mostly sketched with a closed line, and that is the hallmark of his work: “I understand the caricature as a system of fine arts philosophy through which I can contribute to creating a certain atmosphere. For example, a humorous drawing allows me to create a sense of good mood, optimism, while a cartoon satire helps me create an atmosphere of criticism. The caricature is a good companion,” wrote the author.

## **Legal Ethics: law and morality**

Ethics is a branch of philosophy that aims to answer the basic question, “What should I do?” It’s a process of reflection in which people’s decisions are shaped by their values, principles, and purpose rather than unthinking habits, social conventions, or self-interest.

Our values, principles, and purpose are what give us a sense of what’s good, right, and meaningful in our lives. They serve as a reference point for all the possible courses of action we could choose. On this definition, an ethical decision is one made based on reflection about the things we think are important and that is consistent with those beliefs.

While each person is able to reflect and discover their own sense of what’s good, right, and meaningful, the course of human history has seen different groups unify around different sets of values, purposes and principles. Christians, consequentialists, Buddhists, Stoics and the rest all provide different answers to that question, “What should I do?” Each of these answers is a ‘morality’.

## **Morality**

Many people find morality extremely useful. Not everyone has the time and training to reflect on the kind of life they want to live, considering all the different combinations of values, principles, and purposes. It’s helpful for them to have a coherent, consistent account that has been refined through history and can be applied in their day to day lives.

Many people also inherit their morality from their family, community or culture – it’s rare for somebody to ‘shop around’ for the morality that most closely fits their personal beliefs. Usually the process is unconscious. There’s a challenge here: if we inherit a ready-made answer to the question of how we should live, it’s possible to apply it to our lives without ever assessing whether the answer is satisfactory or not.

We might live our whole lives under a moral system which, if we’d had the chance to think about, we would have rejected in part or in full.

## **Law**

The law is different. It’s not a morality in the strict sense of the word because, at least in democratic nations, it tries to create a private space where individuals can live according to their own ethical beliefs or morality. Instead, the law tries to create a basic, enforceable standard of behaviour necessary in order for a community to succeed and in which all people are treated equally.

Because of this, the law is narrower in focus than ethics or morality. There are some matters the law will be agnostic on but which ethics and morality have a lot to say. For example, the law will be

useless to you if you're trying to decide whether to tell your competitor their new client has a reputation for not paying their invoices, but our ideas about what's good and right will still guide our judgement here.

There is a temptation to see the law and ethics as the same – so long as we're fulfilling our legal obligations we can consider ourselves 'ethical'. This is mistaken on two fronts. First, the law outlines a basic standard of behaviour necessary for our social institutions to keep functioning. For example, it protects basic consumer rights. However, in certain situations the right thing to do in solving a dispute with a customer might require us to go beyond our legal obligations.

Secondly, there may be times when obeying the law would require us to act against our ethics or morality. A doctor might be obligated to perform a procedure they believe is unethical or a public servant might believe it's their duty to leak classified information to the press. Some philosophers have argued that a person's conscience is more binding on them than any law, which suggests to the letter of the law won't be an adequate substitute for ethical reflection.

## **Law and Morality**

Law and morality are too vague to understand. It must be added here that the notions of law and justice can't be captured and presented before us within a few sentences. These notions are too vast that even words are not sufficient to define them.

In general view morality is the quality of being in accord with standards of right or wrong conduct. Morality, speaks of a system of behavior in regards to standards of right or wrong. The word carries the concepts of: (1) moral standards, with regard to behavior; (2) moral responsibility, referring to our conscience; and (3) a moral identity, or one who is capable of right or wrong action. Morality has become a complicated issue in the multi-cultural world we live in today. Timeless wisdom explains that there cannot be a complete law unless there lays the effect and inclusion of morality. My Project explores what is Moore's concept of morality and how he explains its affects on our behavior, our conscience, our society, and our ultimate destiny.

Law and morality are too vague to understand. It must be added here that the notions of law and justice can't be captured and presented before us within a few sentences. These notions are too vast that even words are not sufficient to define them. Many jurists from the ancient Greek period to the modern and even the post-modern era have attempted numerously to define these concepts, but have failed. One of the reasons may be that the roots of these concepts lie somewhere within the human psyche, which is extremely random and versatile. Well it is required to describe the tenets of the two main schools of law.

## **Theory of Relationship between Law and Morality**

Ever since the revival of the scientific study of jurisprudence the connection of law and morality has much discussed, but the question is not yet, and perhaps never will be settled. Every variety of opinion has been entertained, from the extreme doctrine held by Austin that for the purpose of the jurist, law is absolutely independent of morality, almost to the opposite positions, held by every Oriental cadī, that morality and law are one. The question is an important one, and upon the answer which is given to it depends upon the answer which is consequences. The problem is an intensely practical one.

The popular conception of the connection between law and morality is that in some way the law

exists to promote morality, to preserve those conditions which make the moral life possible, and than to enable men to lead sober and industrious lives. The average man regards law as justice systematized, and justice itself as a somewhat chaotic mass of moral principles. On this view, the positive law is conceived of as a code of rules, corresponding to the code of moral laws, deriving its authority from the obligatory character of those moral laws, and being just or unjust according as it agrees with, or differs from them. This, like all other popular conceptions, is inadequate for scientific purposes, and the jurist, so far at least as he is also a scientist, is compelled to abandon it. For it is contradicted by the fact's. positive laws do not rest upon moral laws and common notions of justice furnish no court of appeal from the decrees of the State. The average man confounds law and morality, and identifies the rules of law with the principles of abstract justice.

### **No Distinction in Ancient Times**

In the earlier stages of the society there was no distinction between law and morals. In Hindu law, the prime source of which are the Vedas and the Smritis, we do not find such distinction in the beginning. However, later on, Mimamsa laid down certain principles to distinguish obligatory from recommendatory injunctions. In the West also the position was similar. The Greeks in the name of the doctrine of 'natural right' formulated a theoretical moral foundation of law. The roman jurist in the name of 'natural law' recognized certain moral principles as the basis of law. In the Middle Ages, the Church became dominant in Europe. The 'natural law' was given a theological basis and Christian morals were considered as the basis of law.

### **Moral as a part of law**

There are some who assert that even if law and morals are distinguishable it remains true that morality is in some way an integral part of law or of legal development, that morality is "secreted in the interstices" of the legal system, and to that extent is inseparable from it.

Thus it has been said that law in action is not a mere system of rules, but involves the use of certain principles, such as that of the equitable and the good (aequum et bonum). By the skilled application of these principles to legal rules the judicial process distills a moral content out of the legal order, though it is admitted that this does not permit the rules themselves to be rejected on the general ground of their immorality.

Another approach would go much further and confer upon the legal process an inherent power to reject immoral rules as essentially non-legal; this seems to resemble the classical natural law mode of thought, but it is urged, the difference is that according to the present doctrine it is a matter of the internal structure of the legal system, which treats immoral rules as inadmissible rather than as being annulled by an external law of nature.

If value judgments such as moral factors, form an inevitable feature of the climate of legal development, as is generally admitted, it is difficult to see the justification for this exclusive attitude.

Value judgment which enter into law will require consideration of what would be a just rule or decision, even though not objective in the sense of being based on absolute truth, may, nevertheless, be relatively true, in the sense of corresponding to the existing moral standards of the community.

Whether it is convenient or not to define law without reference to subjective factors, when we come to observe the phenomena with which law is concerned and to analyze the meaning and use

of legal rules in relation to such phenomena, it will be found impossible to disregard the role of value judgments in legal activity, and we cannot exercise this functional role by stigmatizing such judgments as merely subjective or unscientific.

### **The Problem about the Nature of Law J.Raz (1982)**

The theory of knowledge attempts to clarify the nature of knowledge, the philosophy of logic examines the definition of logic, moral philosophy reflects on the nature and boundaries of morality and so on.

One finds philosophers who took the enquiry concerning the nature of law to be an attempt to define the meaning of the word "law". Traditionally those who adopted the linguistic approach concentrated on the word "law". However, it encountered the overwhelming problem that that word is used in a multiplicity of non-legal contexts. We have laws of nature and scientific laws, laws of God and thought, of logic and of language, etc. Clearly the explanation of "law" has to account for its use in all these contexts and equally clearly any explanation which is so wide and general can be of very little use to legal philosophers.

Only one assumption can the explanation of "law" hope to provide the answer to the legal philosopher's inquiry into the nature of law. That assumption is that the use of "law" in all its contexts but one is analogical or metaphorical or in some other way parasitical on its core meaning as displayed in its use in one type of context and that that core meaning is the one the legal philosopher has at the centre of his enquiry. Unfortunately, the assumption is mistaken. Its implausibility is best seen by examining the most thorough and systemic attempt to provide an analysis of "law" based on this assumption, that proposed by John Austin in *The Province of Jurisprudence Determined*.

### **The Lawyers' Perspective**

Many legal philosophers start from an unstated basic intuition:

"The law has to do with those considerations which it is appropriate for the courts to rely upon in justifying their decisions."

Most theorists tend to be by education and profession lawyers and their audience often consists primarily of law students. Quite naturally and imperceptibly they adopted the lawyers' perspective on the law. Lawyers' activities are dominated by litigation in court, actual or potential. They not only conduct litigation in the courts. They draft documents, conclude legal transactions, advise clients, etc., always with an eye to the likely outcome of possible litigation in which the validity of the document or transaction or the legality of the client's action may be called into question. From the lawyer's point of view the law does indeed consist of nothing but considerations appropriate for courts to rely upon.

Hans Kelsen says he follows a combination of the linguistic approach and the institutional approach: "Any attempt to define a concept in question. In defining the concept of law we must begin by examining the following questions:

Do the social phenomena generally called law present a common characteristic distinguishing them from other social phenomena of a similar kind?

The clue to the methodological approach Kelsen was in fact pursuing is in his insistence that legal theory must be a pure theory. Kelsen regarded it as doubly pure. It is pure of all moral argument and it is pure of all sociological facts. Kelsen indicates his belief that the analysis of legal concepts and the determination of the content of any legal system depends in no way at all on the effects the law has on the society or the economy, nor does it involve examination of people's motivation in obeying the law or in breaking it.

For Kelsen, it is self-evident that legal theory is free of all moral considerations. The task of legal theory is clearly to study law. If law is such that it cannot be studied scientifically then surely the conclusion that if the law does involve moral considerations and therefore cannot be studied scientifically, then legal theory will study only those aspects of the law which can be studied scientifically.

Since Kelsen has no good reason to insist that legal theory should be free from moral consideration, he has no good reason to delimit the law in the way he does.

### **The international Approach**

It is the lawyer's perspective which delivers the verdict. Yet there is something inherently implausible in adopting the lawyer's perspective as one fundamental methodological stance. There is no doubting the importance of the legal profession and of the judicial system in society. It is however, unreasonable to study such institutions exclusively from the lawyer's perspective.

Institutional approach seems much superior to its rivals. The institutional approach strives to present an analysis of a central political institution should be accepted as the analysis of law. From the institutional point of view, the basic intuition is the starting point for further critical reflection. It is entirely plausible to regard the notion of law as bound up with that of a judicial system but what are the essential characteristics of a court and why are they important to the political organization of society? Three features characterize courts of law:

1. They deal with disputes with the aim of resolving them.
2. They issue authoritative rulings which decides these disputes.
3. In their activities they are bound to be guided, at least partly, by positivist authoritative consideration.

At the highest level of philosophical abstraction the doctrine of the nature of law can and should be concerned with explaining law within the wider context of social and political institutions. It shows how the inclination to identify the theory of law with a theory of adjudication and legal considerations with all those appropriate for courts is based on a short sighted doctrine overlooking the connection of law with the distinction between executive and deliberative conclusion. Clearly, a theory of adjudication is a moral theory. It concerns all the considerations affecting reasoning in the courts, both legal and non-legal.

When the doctrine of the nature of law is identified with a theory of adjudication it becomes itself a moral theory. The doctrine of the nature of law yields a test for identifying law the use of which requires no resort to moral or any other evaluative argument. But it does not follow that one can defend the doctrine of the nature of law itself without using evaluative arguments. Its justification is tied to an evaluative judgment about the relative importance of various features of social organiza-

tions and these reflect our moral and intellectual interest and concerns.

## **Law and Morality**

In the modern world, morality and law are almost universally held to be unrelated fields and, where the term "legal ethics" is used, it is taken to refer to the professional honesty of lawyers or judges, but has nothing to do with the possible "rightness" or "wrongness" of particular laws themselves.

This is a consequence of the loss of the sense of any "truth" about man, and of the banishment of the idea of the natural law. It undermines any sense of true human rights, leaves the individual defenseless against unjust laws, and opens the way to different forms of totalitarianism. This should be easy enough to see for a person open to the truth; but many people's minds have set into superficial ways of thinking, and they will not react unless they have been led on, step by step, to deeper reflection and awareness.

## **Relationship between Law and Morality or Ethics**

Law is an enactment made by the state. It is backed by physical coercion. Its breach is punishable by the courts. It represents the will of the state and realizes its purpose.

Laws reflect the political, social and economic relationships in the society. It determines rights and duties of the citizens towards one another and towards the state.

It is through law that the government fulfils its promises to the people. It reflects the sociological need of society.

Law and morality are intimately related to each other. Laws are generally based on the moral principles of society. Both regulate the conduct of the individual in society.

They influence each other to a great extent. Laws, to be effective, must represent the moral ideas of the people. But good laws sometimes serve to rouse the moral conscience of the people and create and maintain such conditions as may encourage the growth of morality.

Laws regarding prohibition and spread of primary education are examples of this nature. Morality cannot, as a matter of fact, be divorced from politics. The ultimate end of a state is the promotion of general welfare and moral perfection of man.

It is the duty of the state to formulate such laws as will elevate the moral standard of the people. The laws of a state thus conform to the prevailing standard of morality. Earlier writers on Political Science never made any distinction between law and morality.

Plato's Republic is as good a treatise on politics as on ethics. In ancient India, the term Dharma connoted both law and morality. Law, it is pointed out, is not merely the command of the sovereign, it represents the idea of right or wrong Based on the prevalent morality of the people.

Moreover, obedience to law depends upon the active support of the moral sentiments of the people. Laws which are not supported by the moral conscience of the people are liable to become dead letters.

For example laws regarding Prohibition in India have not succeeded on account of the fact that full moral conscience of the people has not been aroused in favor of such laws.

As Green put it, "In attempting to enforce an unpopular law, a government may be doing more harm than good by creating and spreading the habit of disobedience to law. The total cost of such an attempt may well be greater than the social gain."

Although law and morality are interdependent yet they differ from each other in their content, definiteness and sanction.

### **Some points of distinction between law and morality may be brought out as follows:**

Law:

The Oxford English Dictionary defines the law as:

'the body of rules, whether proceeding from formal enactment or from custom, which a particular state or community recognizes as binding on its members or subjects.'

That this should be regarded as the definition of law for the English language is evidence of the influence legal positivism has upon the philosophy of law in our culture. The central themes of positivism are the contentions: firstly, that the existence of law rests upon identifiable social facts and, secondly, that it is necessary to maintain a conceptual distinction between law and morality. In this essay I will examine the positivist assertion that law is identifiable independently of morality, with a particular focus on the theory of H.L.A Hart.

1. Law regulates and controls the external human conduct. It is not concerned with inner motives. A person may be having an evil intention in his or her mind but law does not care for it. Law will move into action only when this evil intention is translated into action and some harm is actually done to another person.
2. Law is universal in a particular society. All the individuals are equally subjected to it. It does not change from man to man.
3. Political laws are precise and definite as there is a regular organ in every state for the formulation of laws.
4. Law is framed and enforced by a determinate political authority. It enjoys the sanction of the state. Disobedience of law is generally followed by physical punishment. The fear of punishment acts as a deterrent to the breach of political law.
5. Law falls within the purview of a subject known as Jurisprudence.

### **Morality:**

1. Morality regulates and controls both the inner motives and the external actions. It is concerned with the whole life of man. The province of law is thus limited as compared with that of morality because law is simply concerned with external actions and does not take into its fold the inner motives. Morality condemns a person if he or she has some evil intentions but laws are not applicable

unless these intentions are manifested externally.

2. Morality is variable. It changes from man to man and from age to age. Every man has his own moral principles.
3. Moral laws lack precision and definiteness as there is no authority to make and enforce them.
4. Morality is neither framed nor enforced by any political authority. It does not enjoy the support of the state. Breach of moral principles is not accompanied by any physical punishment. The only check against the breach of morality is social condemnation or individual conscience. 'Moral actions are a matter of choice of inner conscience of the individual, laws are a matter of compulsion'.
5. Morality is studied under a separate branch of knowledge known as Ethics.  
We may conclude the discussion in the words of Gilchrist, "The individual moral life manifests itself in manifold ways. The state is the supreme condition of the individual moral life, for without the state no moral life is possible.  
The state, therefore, regulates other organizations in the common interest. The state, however, has a direct function in relation to morality."

### **Points to Remember**

Laws may be defined as external rules of human conduct backed by the sovereign political authority. Law and morality are intimately related to each other.

### **Laws are generally based on the moral principles of a particular society. Some points of distinction may be brought out as follows:**

- (a) Laws regulate external human conduct whereas morality mainly regulates internal conduct.
- (b) Laws are universal; morality is variable.
- (c) Laws are definite and precise while morality is variable.
- (d) Laws are upheld by the coercive power of the state; morality simply enjoys the support of public opinion or individual conscience.
- (e) Laws are studied under Jurisprudence but morality is studied under Ethics.

### **Law and freedom**

Both law and morality imply human freedom. Clearly, without freedom one cannot speak of morality. But the same holds for law, for if it were automatically and not freely obeyed, men would be mere robots. Law is not a simple indication of what happens, such as the law of physics; it is an admonition to free persons about what they are required to do if they wish to live freely and responsibly in society; and it normally carries with it a sanction or punishment to be imposed on whoever is shown to have acted against given norms of conduct. Just law, properly understood, appeals to freedom.

Nevertheless one of the most generalized liberal ideas is that law is by nature the enemy of freedom. Servais Pinckaers holds that Catholic moralists have gone through many centuries under the influence of this mentality which has led, by reaction, to the anti-law approach of much of contemporary moral theology. In this view, law and freedom were seen as "two opposed poles, law having the effect of limitation and imposing itself on freedom with the force of obligation. Freedom and law faced each other as two proprietors in dispute over the field of human actions. The moralists

commonly said, "Law governs this act, freedom governs that one..." The moralists were traditionally the representatives of the moral law, and their mission was to show to conscience how to apply it in a particular situation, in a "case of conscience". Today we witness a strong tendency to invert the roles; the moralists now regard themselves as defenders of freedom and of personal conscience" [as against the law].

## **Law and justice**

Law cannot attempt to regulate the purely interior sphere of personal conduct; morality can. Human or civil law is connected with external actions, precisely insofar and because they impinge on the rights or lawful actions of others. Hence the necessary connection of law with justice. For the regulation of interpersonal relations must work from the basic principle of justice: "to each his due". Hence arises the fundamental question of what is due to each one, and from this the further question of human rights.

To each his due. Something is due to each. This is the sense of equality before the law. "The possibility of giving his or her due not only to a relative, friend, citizen or fellow believer, but also to every human being simply because he is a person, simply because justice requires it, is the honor of law and of jurists. If there is an expression of the unity of the human race and of equality between all human beings, this expression is rightly given by the law, which can exclude no one from its horizon under pain of altering its specific identity".

Even for those who see law and freedom in mutual opposition, the whole concept of law is essentially connected with that of justice. The ancient principle *lex iniusta non est lex* (an unjust law is not a law), is at the basis of so many modern protests in the name of freedom. "This law is discriminatory, therefore it is not just". But justice is a moral concept; so these protests bear out the intrinsic connection between law and morality, "There is another crucial link between the virtues and law, for knowing how to apply the law is itself possible only for someone who possesses the virtue of justice".

'The law must respond to "living situations"...' Very good, but not in the sense that it must take the situation as its norm. Justice must remain the norm, and sometimes the law must regain ground for justice.

## **Influence of Morals on Law**

Law and Morals act and react upon and mould each other. In the name of 'justice', 'equity', 'good faith', and 'conscience' morals have in-filtered into the fabrics of law. In judicial law making, in the interpretation of legal precepts, in exercising judicial discretion (as in awarding punishment) moral considerations play a very important role. Morals work as a restraint upon the power of the legislature because the legislature cannot venture to make a law which is completely against the morals of the society. Secondly, all human conduct and social relations cannot be regulated and governed by law alone. A considerable number of them are regulated by morals. A number of action and relations in the life of the community go on very smoothly without any intervention by law. Their observance is secured by morals. So far as the legal rules are concerned, it is not the legal sanction alone that ensure their obedience but morals also help in it. Thus, morals perfect the law. 'In marriage, so long as love persists, there is little need of law to rule the relations of the husband and wife – but the solicitor comes in through the door, as love flies out of the window.'

## Growing Importance of Morals

Now, sociological approach has got its impact upon the modern age. This approach is more concerned with the ends that law has to pursue. Thus, recognized values, or, in other words, morals (of course the morals of the modern age) have become a very important subject of study for good law making. On international law also morals are exercising a great influence. The brutalities and inhuman acts in World Wars made the people to turn back to morals and efforts are being made to establish standards and values which the nations must follow. Perhaps there is no other so forceful ground to justify the Nuremberg Trials as morals. If the law is to remain closer to the life of the people and effective, it must not ignore morals.

## Legal Obligation and Authority

Whatever else they do, all legal systems recognize, create, vary and enforce obligations. This is no accident: obligations are central to the social role of law and explaining them is necessary to an understanding of law's authority and, therefore, its nature. Not only are there obligations *in* the law, there are also obligations *to* the law. Historically, most philosophers agreed that these include a moral obligation to *obey*, or what is usually called "political obligation." Voluntarists maintained that this requires something like a voluntary subjection to law's rule, for example, through consent. Non-voluntarists denied this, insisting that the value of a just and effective legal system is itself sufficient to validate law's claims. Both lines of argument have recently come under intense scrutiny, and some philosophers now deny that law is entitled to all the authority it claims for itself, even when the legal system is legitimate and reasonably just. On this view there are legal obligations that some of law's subjects have no moral obligation to perform.

## Obligations In the Law

Every legal system contains obligation-imposing laws, but there is no decisive linguistic marker determining which these are. The term "obligation" need not be used, nor its near-synonym, "duty." One rarely finds the imperative mood. The Canadian Criminal Code imposes an obligation not to advocate genocide thus: "Every one who advocates or promotes genocide is guilty of an indictable offence and liable to imprisonment for a term not exceeding five years." The English Sale of Goods Act says that, "Where the seller sells goods in the course of a business, there is an implied condition that the goods supplied under the contract are of merchantable quality." That these laws create obligations follows from the way "offence" and "implied condition" function in their respective areas of law, not from the language in which they are expressed.

On the face of it, some laws have other functions. A requirement that "a will must be signed" generally imposes no duty—not a duty to make a will, and not even a duty to have it signed if you do—it sets conditions in the absence of which the document simply does not count as a valid will. Nonetheless, some philosophers, including Jeremy Bentham and Hans Kelsen, argue that the content of every legal system can and should be represented solely in terms of duty-imposing and duty-excepting laws. Bentham asks, "What is it that every article of law has in common with the rest? It commands and by doing so creates *duties* or, what is another word for the same thing, *obligations*". They think that analyzing laws this way reveals what legislators or subjects most need to know: under what conditions the coercive power of law will ultimately be met. Others argue that even if such a reduction were possible, it would be unwieldy, uninformative and unmotivated, concealing as it does the different social functions that laws fulfil (Hart 1994: 26–49) and the different kinds of reasons for action that they create (Raz 1990). Others still, despairing of any principled way of knowing what a law is, have abandoned the problem entirely and tried to develop a theory

of law that bypasses it. At a minimum, it does seem clear that whether or not all laws impose obligations, they can only be fully *understood* through their relations to those that do. Thus, a legal right is an interest that warrants holding others under an obligation to protect it, a legal power is the ability to create or modify obligations, and so forth.

What then are legal obligations? They are legal requirements with which law's subjects are *bound* to conform. An obligatory act or omission is something the law renders non-optional. Since people plainly *can* violate their legal obligations, "non-optional" does not mean that they are physically compelled to perform, nor even that law leaves them without any eligible alternative. On the contrary, people often calculate whether or not to perform their legal duties. Could it be then that obligations are simply weighty reasons to perform, even if sometimes neglected or outweighed? This cannot be a sufficient condition: high courts have important reasons not to reverse themselves too frequently, but no legal obligation to refrain. Nor is it necessary: one has an obligation, but only a trivial reason, not to tread on someone's lawn without his consent.

If their content does not account for the stringency of obligations, what does? An historically important, though now largely defunct, theory explained it in terms of penalty. Following Hobbes and Bentham, the English jurist John Austin says that to have a legal obligation is to be subject to a sovereign command to do or forbear, where a command requires an expression of will together with an attached risk, however small, of suffering an evil for non-compliance. "When I am talking *directly* of the chance of incurring the evil, or (changing the expression) of the liability or obnoxiousness to the evil, I employ the term *duty*, or the term *obligation*..." (Austin 1832, 18). Others conceived an indirect connection between duty and sanction. Hans Kelsen holds that what is normally counted as the content of a legal duty is in reality only part of a triggering condition for the mandatory norm which commands or authorizes officials to impose a sanction: "[A] norm: 'You shall not murder' is superfluous, if a norm is valid: 'He who murders ought to be punished'" (Kelsen 1967, 55). And thus, "Legal obligation is not, or not immediately, the behavior that ought to be. Only the coercive act, functioning as a sanction, ought to be" (Kelsen 1967, 119).

None of these versions of the sanction theory survived H.L.A. Hart's criticisms (Hart 1994, 27–42; cf. Hacker 1973). First, they misleadingly represent a range of disparate legal consequences—including compensation and even invalidation—as if they all function as penalties. Second, they render unintelligible many familiar references to duties in the absence of sanctions, for example, the duty of the highest courts to apply the law. Third, they offer an inadequate explanation of non-optionalness. "You have an obligation not to murder" cannot merely mean "If you murder you will be punished," for the law is not indifferent between people, on the one hand, murdering and being jailed, and on the other hand not murdering at all. "The right to disobey the law is not obtainable by the payment of a penalty or a licence fee". Such dicta are commonplace and reflect familiar judicial attitudes. Most important, the normal function of sanctions in the law is to reinforce duties, not to constitute them. It is true that *one* reason people are interested in knowing their legal duties is to avoid sanctions, but this is not the only reason nor is it, contrary to what Oliver Wendell Holmes supposed, a theoretically primary one. Subjects also want to be *guided* by their duties—whether in order to fulfil them or deliberately to infringe them—and officials invoke them as *reasons for*, and not merely consequences of, their decisions.

Sensitivity to such matters led Hart to defend a *rule-based* theory. He says that while sanctions might mark circumstances in which people are *obliged* to conform, they have an *obligation* only when subject to a practiced social rule requiring an act or omission. The fact that subjects use it as a rule marks it as normative. Three further features distinguish obligation-imposing rules: they

must be reinforced by serious or insistent pressure to conform; they must be believed important to social life or to some valued aspect of it; and their requirements may conflict with the interests and goals of the subject (Hart 1994, 85–88). This account of the *nature* of obligations is not an account of their *validity*. Hart does not say that a legal duty is binding whenever there is a willingness to deploy serious pressure in its support, etc. He holds that a duty is legally valid if it is part of the legal system (i.e., if it is certified as such by the tests for law in that system), and a legal duty is morally valid only if there are sound moral reasons to comply with it. But, at least in his early work, he offers the practice theory as an explanation of duties generally—legal duties are the creatures of legal rules, moral duties of moral rules and so on.

The constitutive role of social pressure is sometimes considered an Austinian blemish on Hart's theory, but there are in any case more serious problems with it as a general account of obligations. People readily speak of obligations when they are well aware that there are no relevant social practices, as might a lone vegetarian in a meat eating society. And Hart's practice conditions may be satisfied in cases where there is no obligation but only generally applicable reasons, as when victims are regularly urged to yield their wallets to a mugger. At best, Hart's theory will apply only to a special class of obligations in which the existence of a conventional practice is an essential part of the reasons for conformity, though even here, the theory is open to doubt.

A third account is *reason-based*. On this view, what constitutes obligations is neither the social resources with which they are enforced, nor the practices in which they may be expressed, but the kind of reasons for action that they offer. Legal obligations are content-independent reasons that are both categorical and pre-emptive in force. The mark of their content-independence is that their force does not depend on the nature or merits of the action they require: in most cases, law can impose an obligation to do *X* or to refrain from doing *X*. That they are pre-emptive means that they require the subject to set aside his own view of the merits and comply nonetheless. That they are categorical means that they do not condition their claims on the subject's own goals or interests.

This view is foreshadowed in both Hobbes and Locke, but its most influential contemporary version is due to Joseph Raz. He argues that obligations are categorical reasons for action that are also protected by *exclusionary* reasons not to act on some of the competing reasons to the contrary. Obligations exclude *some* contrary reasons—typically at least reasons of convenience and ordinary preference—but they do not normally exclude all: an exclusionary reason is not necessarily a conclusive reason. The stringency of an obligation is thus a consequence not of its weight or practice features, but of the fact that it supports the required action by special normative means, insulating it from the general competition of reasons. Or at any rate this is what obligations do when they have the force the claim, i.e., when they are binding. The theory does not assume that all legal obligations actually are binding from the moral point of view, but it does suppose that the legal system puts them forth as if they were—a consequence that some have doubted. (Hart 1982, 263–67; Himma 2001, 284–97) And while this account is invulnerable to the objections to sanction-based and practice-based theories, it does need to make good the general idea of an 'exclusionary reason', and some philosophers have expressed doubts on that score also (Perry 1989, Regan 1987): is it ever reasonable to exclude *entirely* from consideration an otherwise valid reason? The account has, nonetheless, been adopted by legal philosophers with otherwise starkly contrasting views of the nature of law.

## Authority, Obligation, and Legitimacy

A competitive market is not a legal system, even though people adjust their behaviour in response to relative prices and the whole constitutes a form of social order. Neither was the system of mutual nuclear deterrence, though it guided behaviour and generated norms that regulated the Cold War. Many philosophers and social scientists agree that a social order is a legal system only if it has effective *authority*. An effective (or *de facto*) authority may not be justified, but it does stand in a special relation to justified (*de jure*) authority. Justified authority is what effective authorities claim, or what they are generally recognized to have.

What is legal authority, and how is it related to obligations? It is a kind of practical authority, i.e. authority over action. On one influential view, "To claim authority is to claim the right to be obeyed" (Wolff 1970, 5). There are, of course, authorities that make no such claim. Theoretical authorities, i.e., experts, are not characterized by claims to obedience—they need not even claim a right to be believed. And there are weaker forms of practical authority. To give someone authority to use your car is merely to permit him. But political authority, of which legal authority is one species, is normally seen as a right to rule, with a correlative duty to obey. On this account law claims the right to obedience wherever it sets out obligations. And to obey is not merely to comply with the law; it is to be *guided by* it. Max Weber says it is "as if the ruled had made the content of the command the maxim of their conduct for its very own sake" (Weber 1963, 946). Or, as Robert Paul Wolff somewhat more perspicuously puts it: "Obedience is not a matter of doing what someone tells you to do. It is a matter of doing what he tells you to do *because he tells you to do it*" (Wolff 1970, 9). This is not to say that one obeys only in treating the authority's say-so as an indefeasible reason for action; but one must treat as a binding content-independent reason. The question whether there is an obligation of obedience to law is a matter of whether we should act from the legal point of view and obey the law as it claims to be obeyed.

It is an interesting feature of this account that it supposes that one can tell what the authority requires independent of whether the requirement is justified on its merits. Richard Friedman argues: "[I]f there is no way of telling whether an utterance is authoritative, except by evaluating its contents to see whether it deserves to be accepted in its own right, then the distinction between an authoritative utterance and advice or rational persuasion will have collapsed" (Friedman 1973, 132). An idea of this sort is developed by Raz into one of the leading arguments for the "sources thesis", the idea that an adequate test for the existence and content of law must be based only on social facts, and not on moral arguments. Authority's subjects "can benefit by its decisions only if they can establish their existence and content in ways which do not depend on raising the very same issues which the authority is there to settle" (Raz 1994, 219). If law aims to settle disputes about moral issues, then law must be identifiable without resolving these same disputes. The law is therefore exhausted by its *sources* (such as legislative enactments, judicial decisions, and customs, together with local conventions of interpretation). This kind of argument has been generalized (see Shapiro 1998), but also subjected to criticism. It is uncertain what sort of constraint is posed by the idea that it should not involve "the very same issues"—perhaps if morality is a necessary condition only there could be moral tests for authority that leave the relevant dependent reasons untouched (Coleman 2001, 126–7). And while law does indeed serve as a scheme for guiding and appraising behaviour, it may also have other functions, such as educating its subjects about right and wrong, and this may be ill-served the attitude that the rules are to be obeyed in part because they are the rules (Waluchow 1994).

The obligation-correlative view of authority is not universally accepted. Some argue that legal authority involves no claim right, but only a set of liberties: to decide certain questions for a society

and to enforce their decisions. The liberty conception must answer two questions. First, is it not a feature of a right to decide that it requires subjects to refrain from acting on competing decisions? If the law says that abortion is permissible and the Church says that it is not, what does the denial of the Church's right to decide amount to if not that public policy should be structured by the former decision and not the latter, even if the latter is correct? Second, does the right to enforce include a duty of subjects to pay the penalty when required? If it does, then this is only a truncated version of the obligation-correlative theory—one that holds that punitive and remedial obligations, but not primary obligations, are binding. If not, it is starkly at variance with the actual views of legal officials, who do not think that subjects are at liberty to evade penalties if they can.

This reaches a methodological issue in the philosophy of law. Some consider that the character of law's authority is a matter for descriptive analysis fixed by semantic and logical constraints of official language and traditions of argument. Others maintain that such analysis is impossible or indeterminate, and that we are therefore driven to normative arguments about what legal authority should be. Crudely put, they think that we should understand law to claim only the sort of authority it would be justifiable for law to have. Such is the motivation for Friedrich Hayek's suggestion that 'The ideal type of law ... provides merely additional information to be taken into account in the decision of the actor' (Hayek 1960, 150). Hayek favours the free market, and concludes that the nature of legal authority should be understood analogically. The most radical position of this sort is Ronald Dworkin's. He prefers what he calls a "more relaxed" understanding of legal authority (Dworkin 1986: 429). Others have argued that the pre-emptive notion of authority is unsatisfactory because it is too rigid (e.g., Perry 1989). Dworkin's objection runs much deeper. His position is not that law communicates only a weaker form of guidance; it is that law is not to be understood as trying to communicate anything at all. A subject considering his legal duties is not listening to the law; he is engaged in "a conversation with oneself," and is "trying to discover his own intention in maintaining and participating in that practice" (Dworkin 1986, 58). On this view there is no fact of the matter about what law claims that is independent of what each does well to regard it as claiming.

However we resolve the methodological question, there are two parallel normative questions:

- The problem of obligation: What if anything justifies the duty to obey the law, and how far does that obedience properly extend?
- The problem of legitimacy: What if anything justifies the coercive power of law, and how far may that power properly extend?

What is the relationship between these? Some maintain that obligation comes first: "[T]hough obligation is not a sufficient condition for coercion, it is close to a necessary one. A state may have good grounds in some special circumstances for coercing those who have no duty to obey. But no general policy of upholding the law with steel could be justified if the law were not, in general, a source of genuine obligations" (Dworkin 1986, 191). The idea is that merely having justice on one's side is an inadequate ground for coercing others; one also needs a special title flowing from the moral status of the law. (Contrast, for example, Locke's view that everyone has an "executive power of the law of nature," at least outside political society (§ 13).)

Others contend that this gets the relationship backwards. First, it is doubtful whether one could have an obligation to obey an illegitimate regime. As Rawls says, "[A]cquiescence in, or even consent to, clearly unjust institutions does not give rise to obligations". If so, at least some conditions of legitimacy precede an obligation of obedience. Second, there are substantive reasons for think-

ing we would not have obligations to obey if the law were not *already* justified in upholding its requirements “with steel.” A legal system that could not justifiably coerce could not assure the law-abiding that the recalcitrant will not take them for suckers. Without being able to solve this assurance problem it would be unjust to impose obligations on them, and unjust to demand their obedience. Underlying this suggestion is that idea that familiar idea that effectiveness is a necessary—but certainly not sufficient—condition for justified authority.

### 3. Obligations to the Law

It may affirm our confidence in the obligation-correlative view to know that from earliest times philosophical reflection on political authority has focussed on the obligation to obey. The passive obligation of obedience is certainly not all we owe the law (Parekh 1993, 243; Green 2003, 543–47) but many have taken it to be law's minimum demand. This gives rise to a puzzle. As Wolff puts it: “If the individual retains his autonomy by reserving to himself in each instance the final decision whether to co-operate, he thereby denies the authority of the state; if, on the other hand, he submits to the state and accepts its claim to authority then ... he loses his autonomy”. Wolff resolves the dilemma in favour of autonomy, and on that basis defends anarchism.

Some of Wolff's worries flow from the “surrender of judgement” itself—how can it ever be rational to act against reason as one sees it? Others flow from the fact that it is a surrender *to the law*. On the first point, it is relevant to notice that promises and contracts also involve surrender of judgement and a kind of deference to others, yet a rational anarchist needs such voluntary commitments to substitute for authoritative ordering. A principled objection to every surrender of judgement is thus self-defeating. Moreover, there seem to be cases in which by surrendering judgement on some matters one can secure more time and resources for reflection and decision on things that are more important, or with respect to which one has greater capacity for self-direction. A partial surrender of judgment may therefore enhance the agent's autonomy overall.

This suggests that Wolff's concern is better understood as scepticism about whether it is justifiable to surrender one's judgment wholesale to the law. Some philosophers have queried the intelligibility of this doubt; they say that it is of the *nature* of law that there is an obligation to obey it, at least in its central case. Some go so far as to conclude that it is therefore absurd to ask for any *ground* of the duty to obey the law: law is that which is to be obeyed (McPherson 1967, 64). We need a way into this circle, and the best entrance is in specifying the nature of law in a way compatible with various theories of its nature. Three features are especially important (drawing on Hart 1994, 193–200; Raz 1990, 149–54; and Lyons 1984, 66–68.) First, law is *institutionalized*: nothing is law that is not connected with the activities of institutions such as legislatures, courts, administrators, police, etc. Second, legal systems have a *wide scope*. Law not limited to the affairs of small face-to-face groups such as families or clans, nor does it only attend to a restricted domain of life such as baseball. Law governs open-ended domains of large, loosely structured groups of strangers and it regulates their most urgent interests: life, liberty, property, kinship, etc. But although law necessarily deals with moral matters, it does not necessarily do so well, and this is its third central feature: law is *morally fallible*. This is acknowledged by both positivists and natural lawyers, whose slogan “an unjust law is not a law” was never intended to assert the infallibility of law.

The question of political obligation, then, turns on whether there are moral reasons to obey the mandatory requirements of a wide-ranging, morally fallible, institutionalized authority. This obliga-

tion purports to be comprehensive in that it covers all legal obligations and everyone whose compliance the law requires. It is not assumed to bind come what may, though it is to be one genuine obligation among others. Some philosophers also consider that it should bind people particularly to their own states, i.e., the states of which they are residents or citizens, and that an argument that could not show that one had more stringent duties to obey one's own country than a similarly just foreign one would be in that measure deficient (Simmons 1979, 31–35; Green 1988, 227–28). Finally, it is common ground the obligation exists only when a threshold condition of justice is met.

## **Legal Validity**

Legal validity governs the enforceability of law, and the standard of legal validity enhances or restricts the ability of the political ruler to enforce his will through legal coercion. Western law adopts three competing standards of legal validity. Each standard emphasizes a different dimension of law (Berman 1988, p. 779), and each has its own school of jurisprudence.

Legal positivism emphasizes law's political dimension. Legal positivism recognizes political rulers as the only source of valid law and adopts the will of the political ruler as its validity standard. Leading legal positivists include Jeremy Bentham, John Austin, and H.L.A. Hart.

Natural law theory emphasizes law's moral dimension. Natural law theory recognizes universal moral principles as the primary source of valid law. These moral principles provide a standard of legal validity that imposes moral limits on the ruler's coercive powers. Leading natural law theorists include Aristotle, Cicero, Justinian, and Thomas Aquinas.

The historicist school emphasizes law's historical dimension. The historicist school recognizes legal custom as the primary source of valid law. Legal custom provides a standard of legal validity that imposes customary limits on the political ruler's coercive powers. Leading historicists include Sir Edward Coke, John Selden, Sir Matthew Hale, and Sir William Blackstone.

Legal positivism recognizes positive law as the only real law and rejects law's moral and historical dimensions as sources of valid laws. Natural law theory and the historicist school, on the other hand, often integrate law's three dimensions. They recognize each dimension as a potential source of valid law but emphasize a particular dimension through their validity standard. Blackstone's unique jurisprudence adopts two validity standards, one from law's historical dimension, and one from law's moral dimension.

Standards of legal validity are historically cyclical. A society typically adopts a standard of legal validity based on moral principles, custom, or both. This validity standard restricts the ruler's ability to enforce his will through legal coercion. Then, intellectual challenges to moral principles and legal custom minimize their esteem. A new validity standard is adopted based on the will of the political ruler. Abuses of coercive powers by political rulers eventually stimulate renewed restrictions on those powers. The society adopts a revived standard of legal validity based on moral principles, custom, or both. The revived validity standard will typically endure until the memory of abuse fades, when the cycle begins again.

This cycle began with Hesiod in 700 B. C. E. and continued into the 21st Century. In common law jurisprudence, judicial acceptance of Hart's legal positivism eroded Blackstone's validity standards based on moral principles and custom. In civil law jurisprudence, Soviet and Nazi abuses of positivist legal systems revived validity standards based on moral principles.

## The Sophists

The first standard of legal validity in the Western legal tradition appears in Hesiod's religious poem *Works and Days*, circa 700 B. C. E. Hesiod presents an archetypal jurisprudence that integrates law's three dimensions. Dikê, the goddess of human justice, personifies law's moral dimension. Dikê's father Zeus personifies law's political dimension. Dikê's mother Thetis, the Titan embodiment of custom and social order, personifies law's historical dimension.

Justice "sets the laws straight with righteousness" and distinguishes men from beasts. Divinely decreed moral principles establish the validity standard for human law and customs, and conforming laws and customs establish the *nomoi* (law). Just men obey the *nomoi*, and obedience brings peace and prosperity. Disobedience brings punishment to the individual and his city through famine, plague, infertility, and military disaster.

The Sophists, wandering teachers of the fifth century B. C. E., challenged Greek conventions in religion, morality, and political conduct. They rejected Hesiod's moral dimension by rejecting the existence of divine lawgivers and universal moral principles. They rejected Hesiod's historical dimension by denying any normative authority to custom. Might was right, and law functioned only in the political dimension as the will of the strongest.

The Sophist Protagoras of Abdera (b. circa 481 B. C. E.), rejected law's moral dimension. As an agnostic, Protagoras rejected the divine lawgiver. As a moral relativist, Protagoras rejected the existence of universal moral principles. Unlike later Sophists, however, Protagoras accepted the validity of custom in law's historical dimension.

Protagoras based his moral relativism on the argument that a shared factual knowledge of the world is impossible. The foundation of Protagoras' relativism is the "man-measure" of the *Aletheia* (Truth). "Man is the measure of all things, of those that are that they are, of those that are not that they are not."

Sense perception forms the basis of all knowledge, Protagoras believed, and every sense impression that a person receives is securely true. The data of sense perception, however, are private, subjective states. The wind is truly warm to the man who perceives it as warm, but the same wind is truly cold to the man who perceives it as cold. Perceived objects therefore have contradictory properties and there are no public facts.

Protagoras maintained that all knowledge claims are thus equally true. Furthermore, their truth endures regardless of conflicting claims. Protagoras therefore claimed "it is equally possible to affirm and deny anything of anything."

Protagoras extended his doctrine that all *knowledge* claims are equally true to claim that all *virtue* claims are equally true. Virtue claims are relative to the claimant because virtue is only another form of knowledge. (Plato, *Protagoras*, 323a-328d). There are no universal moral principles, and law's moral dimension does not exist.

Although Protagoras rejected law's moral dimension, he embraced law's historical dimension. Although all knowledge and virtue claims are equally *true*, Protagoras argued they are not all equally *sound*. Only the ignorant equated truth with soundness. One set of thoughts can therefore be "better than another, but not in any way truer." The same is true of laws. All laws are equally true, but not all laws are equally sound.

Protagoras accepted a duty to obey the law. Since no moral or legal code is truer than any other, no individual should assert his moral or legal judgments over those advanced by the state. Society is required to preserve humanity. The perpetuation of society, in turn, requires respect for law and custom. Men should obey the state's laws and customs so long as they function soundly.

The Sophist Callicles (b. *circa* 484 B. C. E.), rejected law's historical dimension and denied any duty to obey the law. Using "nature" to mean the antithesis of mind, Callicles argued that nature's normative authority (*phusis*) supersedes the normative authority of man's laws and customs (*nomoi*). Man's laws and customs violate "nature's own law" and "natural justice." Nature's law, not man's, should govern our actions.

Callicles said that what men call "right" merely expresses what men believe to be to their advantage. Legal conventions in democracies wrongfully elevate the weak over the strong. The majority of weaker folk frame the laws for their advantage to prevent the stronger from gaining advantage over them. The true nature of right is established by nature, not men, and nature's law establishes right in the strong.

Natural justice provides that the better and wiser man should rule over and have more than the inferior. Might, therefore, makes right. All animals and races of man recognize right as the sovereignty and advantage of the stronger over the weaker.

The Sophist Thrasymachus (b. *circa* 459 B. C. E.) argued for disobeying laws and customs. Defining justice as obedience to the laws, Thrasymachus argues that justice is nothing but the advantage of the stronger. Obedience furthers the advantage of others and reduces the obedient to a form of slavery. Only disobedience to law profits a man and leads to his advantage. Injustice is therefore "a stronger, freer, and more masterful thing than justice."

Solon's constitution created an archetypal positivist legal system in Athens in 594 B. C. E. Solon reposed political and judicial authority in the heliastic courts. The courts enforced undefined laws with no standard of legal validity other than the unrestrained will of the jurors. Pericles' introduction of payments for jurors in 451 B. C. E. enthroned Athens' poorest and least educated class as *dikasts* in the heliastic courts. The Athenian courts became infamous for injustice and gullibility. Xenophon writes that Athenian courts often acted on emotion to put innocent men to death and acquit wrongdoers. Eighty *dikasts* who found Socrates innocent voted for his death.

Athenian ostracism (*ostrakismos*) permitted the conviction, exile, and execution of any Athenian without charges, hearing, or defense. Originally intended for removing tyrants, Plutarch records that ostracism quickly became a way of pacifying jealousy of the eminent. Ostracism breathed out malice in exile and death. Everyone was liable to it whose reputation, birth, or eloquence rose above the common level.

Athens ostracized its greatest heroes from envy of their honors. Athens ostracized Aristides, the hero of the Battle of Marathon, in 483 B. C. E. Athens ostracized Themistocles, savior of Athens at the Battle of Salamis, in 471 B. C. E. Both men were exiled for ten years without charges or a hearing.

Lack of procedural safeguards encouraged frivolous public prosecutions (*graphai*) and impeachments (*eisangeliai*), giving free reign to Athens' gullible and imprudent *dikasts*. Frivolous political prosecutions destroyed Athens' leadership, spawning bloody regime changes and military disasters. The frivolous prosecution of Pericles in 443 B. C. E. precipitated the Peloponnesian War with

Sparta. The frivolous prosecution of Alcibiades in 415 B. C. E. caused Athens' ablest general to switch sides and lead Sparta against Athens.

The greatest ignominy involves the Arginusae generals in 404 B. C. E. Six Athenian naval commanders won a great naval victory against Sparta at Arginusae. A violent storm prevented their recovering the dead and shipwrecked. The generals were nevertheless impeached and executed for failing to do so. Deprived of her best generals, Athens lost the war the next year in a devastating naval defeat at Aegospotami.

Political prosecutions wreaked political havoc as well. Five regime changes rocked Athens between 411 B. C. E. and 403 B. C. E. These regimes included the reign of terror by the Thirty Tyrants in 404 B. C. E.

Athenian positivism criminalized thought and expression in frivolous prosecutions against philosophers. Anaxagoras *circa* 430 B. C. E., Protagoras *circa* 415 B. C. E., and Socrates in 399 B. C. E. were all convicted on manufactured charges of impiety (*asebeia*). Impiety was undefined by Athenian law. Every juror defined it anew in every case as he pleased.

Athens often regretted its decisions. Socrates' lead accuser Anytus was stoned for his role in Socrates' death. Athens honored Socrates with a bronze statue by Lysippus. Athens thus gained "the indelible reproach of decreeing to the same citizens the hemlock on one day and statues on the next."

## 2. Plato

Plato described Socrates as the bravest, wisest, and most upright man of his time. Plato planned a career in politics but "withdrew in disgust" after observing how Athenian courts "corrupted the written laws and customs." (Plato, *Letter VII*, 325a-c). Plato reacted to Socrates' death by repudiating the Sophists, reviving law's moral and historical dimensions, and formulating a natural law standard of legal validity based on principles of universal justice.

Plato begins his revival of law's historical dimension by emphasizing the autonomy of law, which he considered the most important aspect of government. Autonomous laws wield supremacy over political rulers. Political rulers are subject to the same laws as other citizens, and they may not alter the laws to suit their will.

Plato wrote that the preservation or ruin of a community depends on the autonomy of laws more than anything else. Respecting law's autonomy preserves the entire community. Disregarding it brings destruction. Autonomy is so important that "the man who is most perfect in obedience to established law" should receive the highest post in government. The second most obedient man should receive the second highest post, and so on for all the posts.

Plato begins his revival of law's moral dimension by persuasively refuting Protagoras' moral relativism in the *Theaetetus*. Protagoras claimed that all sense perceptions are equally true. Since knowledge is perception, all knowledge claims are equally true. Since moral claims are a species of knowledge claims, all moral claims are equally true. Therefore, no one set of moral principles has authority to guide the laws.

Plato offers eleven objections to Protagoras' arguments in the *Theaetetus*. Three are recounted here. First, Plato denies that knowledge is perception. If knowledge were perception, we would understand anyone speaking to us in a foreign tongue. This is clearly not the case. Second, remem-

bered knowledge refutes Protagoras' claim that knowledge is perception. Remembered knowledge involves no perception, but it is knowledge nonetheless.

Third, moral relativism is self-refuting. Assume, as Protagoras claims, that "all beliefs are true." Assume also that another man exists who believes that "not all beliefs are true." If Protagoras is correct, then the second man's belief must be true. Protagoras' belief that "all beliefs are true" is thus refuted.

Plato continues his revival of law's moral and historical dimensions in the *Crito*. The *Crito* considers whether a duty exists to obey the law. Socrates' friend Crito argues for Socrates to escape and avoid his unjust execution.

Socrates replies that the soul is more precious than the body. Good actions benefit our souls, but wrong actions mutilate them. The important thing is not living, but living well. This means living honorably. Socrates utilizes three principles in determining whether to escape. First, circumstances never justify wrong action. Second, one should not injure others, even when they injure you. Third, one "ought to honor one's agreements, provided they are right."

Plato defines law's moral dimension through these principles. Justinian's *Corpus Juris Civilis* defines its moral dimension by these same principles in the sixth century. (Justinian, *Digest*, 1.1.10). Blackstone's *Commentaries* does the same in the eighteenth century.

Plato next refutes Thrasymachus' claim in the *Republic* that disobeying the law "is a stronger, freer, and more masterful thing" than obeying the law. In the *Crito's* "Speech of the Laws," the Laws present two arguments for obedience. The first is the "argument from agreement." Socrates has undertaken to live his life in obedience to Athens' laws. Athens did not force Socrates to live in its precincts. Socrates was free to leave at any time. By choosing to stay in Athens with full knowledge of how the laws functioned, Socrates promised obedience to the laws.

The Laws' orders are "in the form of proposals, not savage commands." Socrates can either obey the Laws or persuade (the personification of) the Law that they are at fault. If Socrates escapes without persuading the personification of the Laws that they were at fault, he would dishonor his agreement to obey the laws. Dishonoring a just agreement violates the ethic of "living well" and damages the soul.

The Laws' second argument is the "argument from injury." Disobedience destroys both the Laws and the city, which cannot exist if legal judgments are ignored. Socrates concludes that "both in war and in the law courts and everywhere else you must do whatever your city and your country command, or else persuade them in accordance with universal justice" that they are at fault.

The Laws' second argument implies a natural law standard of validity based on principles of universal justice. The Laws insist they operate as "proposals, not savage commands." Socrates' duty to obey the Laws is contingent on the Laws' compliance with principles of universal justice. By implication, there is no duty to obey the Laws if they violate principles of universal justice.

### 3. Aristotle

Aristotle designs his legal philosophy to avoid the catastrophes described in his *Athenian Constitution*. Aristotle accepts the necessity of law's political dimension because laws cannot enforce themselves. Nevertheless, the Athenian legal history proves the political dimension is not

sufficient to preserve a society or achieve its happiness.

Human nature demands more than political power from law. Law must accomplish justice and foster virtue. Justice is required to prevent revolution, and virtue is required for human happiness. Man separated from justice is “the worst of animals,” and man without virtue “is the most unholy and the most savage of animals.”

Aristotle writes in the *Politics* that securing justice is the state’s most important function. Justice is more essential to the state than providing the necessities of life. Governments must be founded on justice to endure. Governments that rule unjustly and give unequal treatment to similarly placed subjects provoke revolutions. Justice maintained, however, forms a bond between the members of society that preserves the state. (Aristotle, *Politics* 1328b, 1332b, 1253a).

Aristotle’s *Nicomachean Ethics* defines justice as lawfulness concerned with the common advantage and happiness of the political community. Aristotle distinguishes between *legal justice* (*to nomikon dikaion*) and *natural justice* (*physikon dikaion*). *Legal justice* involves positive laws and custom enacted by man, such as conventional measures for grain and wine. These “are just not by nature but by human enactment” and “are not everywhere the same.” Aristotle secures *legal justice* by granting autonomy to law and by utilizing custom to encourage obedience.

*Natural justice*, on the other hand, involves principles of natural law that originate in nature. Such principles do not arise in the minds of men “by people’s thinking this or that.” Natural law principles apply with equal force everywhere, just as fire burns both in Greece and in Persia. Aristotle secures natural justice by adopting natural law precepts as the standard of legal validity. Positive laws that violate natural law precepts are nullified.

Aristotle secures *legal justice* by restricting the will of the political ruler through autonomous laws. The *Politics* teaches that unrestrained power produces tyranny, even in democracies. Aristotle considers whether societies function best under the “rule of men” or the “rule of law.” He concludes that laws, when good, should be supreme. Political rulers should merely complement the law by acting as its guardians and ministers. They should only regulate those matters on which the laws are unable to speak with precision owing to the difficulty of any general principle embracing all particulars.

Aristotle gives four reasons for emphasizing law’s autonomy over the will of the political ruler. First, law frees the state from the desires and passions that afflict political rulers. “The law is reason unaffected by desire. Desire ... is a wild beast, and passion perverts the minds of rulers, even when they are the best of men.” (Aristotle, *Politics*, 1287a). Second, tyranny results when political rulers exercise autonomy over law, even in democracies. Third, the orderly rotation of political offices requires autonomous laws. Equality, liberty, justice, and expediency mandate that every mature citizen participates in governing the state. Fourth, the orderly rotation of political offices preserves the state by assuring evenhanded administration by magistrates.

Aristotle utilizes law’s historical dimension to secure *legal justice* through custom. Aristotle uses the term *nomos* for law, and *nomos* includes custom and convention as components of the social norm. Aristotle writes in the *Politics* that legal custom is itself a form of justice. Custom and convention maintain social stability by encouraging obedience to the law. The law has no power to command obedience except that of habit, which can only be given by time. Aristotle urges caution in changing the law because changes enfeeble the power of the law. If the advantage of a change is small, it is wiser to leave errors in the law. The citizens usually lose more by the habit of disobe-

dience than they gain by changing the law.

Aristotle utilizes law's moral dimension to secure *natural justice* in two ways. The first is by nullifying positive laws that subvert natural law precepts. Aristotle formulates a natural law standard of legal validity. Aristotle's *Rhetoric* describes natural law as an unwritten law, based on nature, and common to all people. "There is in nature a common principle of the just and unjust that all people in some way divine."

Natural law provides immutable and universal standards of justice. Natural law constitutes a separate body of binding law that exceeds positive law in authority. Human actions should complete nature rather than subvert it, and natural law nullifies positive laws that subvert natural law precepts.

Like Plato, Aristotle argues that the universal standards of natural law justify disobeying positive laws. Aristotle's *Rhetoric* provides two examples invalidating positive law for violating natural law precepts. The first is the case of Sophocles' *Antigone*, where Antigone disobeys Creon's order and provides funeral rites to her brother Polyneices. The second is Aristotle's guide to jury nullification of written law by appealing to higher principles of natural law.

Aristotle never explains why natural law wields supremacy over positive law. The supremacy of natural law is consistent, however, with Aristotle's view in the *Physics* that the ultimate causes of nature are divine.

The second way that Aristotle secures *natural justice* is by fostering virtue. Aristotle believed that human happiness depended on virtue more than liberty. The government is thus responsible for producing a virtuous state, and this is best accomplished through law. Although virtue encompasses more than mere conformity to law, virtue will only develop and flourish in a state that supports the legal enforcement of virtue. The state must provide moral education through its laws to make its citizens just and good. Failing to do so undermines the state's political system and harms its citizens.

#### **4. Cicero**

Marcus Tullius Cicero (106-43 B. C. E.) was a politician, philosopher, orator, and attorney. Cicero's *De Legibus* (*The Laws*), *De Officiis* (*On Duties*), and *De Re Publica* (*The Republic*) greatly influence the natural law tradition. Cicero esteemed Plato and Aristotle. Although not a Stoic, Cicero adopted Stoicism's divine Nature as the source of natural law precepts that dictate legal validity. The histories of Herodotus, Thucydides, Xenophon, and Polybius persuaded Cicero that natural law imposes justice on human events.

Cicero's signature contribution to jurisprudence is his explication of Nature as divine lawgiver. Law and justice originate in Nature as a divinely ordained set of universal moral principles. Cicero describes Nature as the omnipotent ruler of the universe, the omnipresent observer of every individual's intentions and actions, and the common master of all people. Belief in divine Nature stabilizes society, encourages obedience to law, and leads to individual virtue.

Law's moral dimension dominates Cicero's jurisprudence. Cicero defines natural law as perfect reason in commanding and prohibiting. These principles are the sole source of justice and provide the sole standard of legal validity. "True law is right reason in agreement with Nature."

The precepts of natural law are eternal and immutable. They apply universally at all places, at all

times, and to all people. Natural law summons to duty by its commands, and averts from wrongdoing by its prohibitions. Nature serves as the enforcing judge of natural law precepts, and Nature's punishment for violating natural law precepts is inescapable. (Cicero, *De Re Publica*, 3.33).

Natural law provides the *naturae norma*, the standard of legal validity for positive law and custom. The *naturae norma* provides the only means for separating good provisions from bad. Justice entails that laws and customs comply with the *naturae norma* and preserve the peace, happiness, and safety of the state and its citizens. Positive laws and customs that fail to do so are not regarded as laws at all.

Regarding Cicero's political dimension of law, the magistrate's limited role is to govern and to issue orders that are just and advantageous in keeping with the laws. Although the magistrate has some control of the people, the laws are fully in control of the magistrate. An official is the speaking law, and the law is a nonspeaking official.

Political rulers cannot alter, repeal, or abolish natural law precepts. Furthermore, political rulers have no role in interpreting or explaining natural law precepts. Every man can discern the precepts of natural law for himself through reason.

Political rulers must issue just commands as measured by natural law precepts. Individuals are protected against unjust coercion. Although rulers may use sanctions to enforce legitimate commands, every affected subject has the right to appeal to the people before enforcement of any sanction. Furthermore, no ruler can issue commands concerning single individuals. Any significant sanction against an individual, such as execution or loss of citizenship, is reserved to the highest assembly of the people. As a further protection, all laws must be officially recorded by the censors.

Like Aristotle, Cicero requires that magistrates be subject to the power of others. Successive terms are forbidden, and ten years must pass before the magistrate becomes eligible for the same office. Every magistrate leaving office must submit an account of his official acts to the censors. Misconduct is subject to prosecution. No magistrate may give or receive any gifts while seeking or holding office, or after the conclusion of his term.

Regarding Cicero's historical dimension of law, Cicero agrees with Aristotle that custom maintains social stability by encouraging obedience to law. Custom can even achieve immortality for the commonwealth. The commonwealth will be eternal if citizens conduct their lives in accordance with ancestral laws and customs.

## **5. Justinian's Corpus Juris Civilis**

The *Corpus Juris Civilis* (Body of Civil Law) codified Roman law pursuant to the decree of Justinian I. Completed in A.D. 529, the four works of the *Corpus* became the sole legal authorities in the empire. The *Institutes* was a law school text. The *Codex* contained statutes dating from A.D. 438. The *Digest* contained commentaries by leading jurists, and the *New Laws* were supplemented as new laws became necessary.

The *Corpus* is the direct ancestor of modern Western civil law systems. Its influence on canon law is seen in the medieval maxim *Ecclesia vivit lege romana* (the Church lives on Roman law). Common law jurisprudence never accepted the *Corpus* as binding authority. Nevertheless, its twelfth century revival profoundly influenced the formation of common law jurisprudence through the works of the father of the common law, Henry de Bracton.

The *Corpus* divides law into public law involving state interests and private law governing individu-

als. Private law is a mixture of natural law, the law of nations, and municipal law. The *Corpus* establishes a clear hierarchy among law's three dimensions. The moral dimension occupies the highest position and provides the standard of legal validity. The historical dimension of legal custom occupies the second position, and the political dimension of Roman municipal law occupies the lowest position.

The *Corpus'* moral dimension resides in two bodies of law, natural law and the law of nations. Like Cicero, the *Corpus* originates natural law in a divine lawgiver. "The laws of nature, which are observed by all nations alike, are established by divine providence." The precepts of natural law are universal, eternal, and immutable.

Natural law governs all land, air, and sea creatures, including man. "The law of nature is that which she has taught all animals; a law not peculiar to the human race, but shared by all living creatures." The *Corpus* extends natural law to "all living creatures" to repudiate the Sophist arguments that law is merely a human convention with no basis in nature, justice does not exist, and there is no duty to obey law. The *Corpus'* rebuttal focuses on the highly socialized behavior of such animal species as ants, bees, and birds. Although animals cannot legislate or form social conventions, they nevertheless follow norms of behavior. These norms affirm the existence of natural law.

The *Institutes* and the *Digest* state three precepts of natural law: "*Honeste vivere, alterum non laedere, suum cuique tribuere.*" Live honorably, injure no one, and give every man his due. . These precepts track the *Crito's* admonishments to live well, harm no one, and honor agreements so long as they are honorable. Blackstone's *Commentaries* adopts these exact precepts.

The law of nations is the portion of natural law that governs relations between human beings. (Justinian, *Digest*, 1.4). Its rules are "prescribed by natural reason for all men" and "observed by all peoples alike." The law of nations is the source of duties to God, one's parents, and one's country. It recognizes human rights to life, liberty, and self-defense, and its recognition of property rights enables contracts and commerce between peoples.

The precepts of natural law provide the standard for legal validity. This standard voids any right or duty violating natural law precepts. The *Institutes* provides illustrative examples: Contracts created for immoral purposes, such as carrying out a homicide or a sacrilege, are not enforceable. (Justinian, *Institutes*, 3.19.24). Immorality invalidates wrongful profits. Anyone profiting from wrongful dominion over another's property must disgorge those profits. (Justinian, *Digest*, 5.3.52).

Immorality invalidates agency relationships. Agents are not obliged to carry out immoral instructions from their principals. If they do, they are not entitled to indemnity from their principals for any liability the agents incur. (Justinian, *Institutes*, 3.26.7). Immorality even invalidates bequests and legacies if the bequest is contingent upon immoral conduct. (Justinian, *Institutes*, 2.20.36).

The *Corpus'* historical dimension provides custom as a source of enforceable law. The *Corpus* defines legal custom as the tacit consent of a people established by long-continued habit. Since custom evidences the consent of the people, it is a higher source of law than positive or statutory law. Statutory provisions, if customarily ignored, are treated like repealed legislation. (Justinian, *Digest*, 1.1.3).

Legal custom establishes the autonomy of law over political rulers. Custom binds judges. A judge's first duty is "to not judge contrary to statutes, the imperial laws, and custom." Legal custom even controls statutory interpretation. "Custom is the best interpreter of statutes."

The *Corpus*' political dimension resides in its six categories of Roman municipal law, the "statutes, plebiscites, senatusconsults, enactments of the Emperors, edicts of the magistrates, and answers of those learned in the law." In contrast to natural law and the law of nations, Roman municipal law was unique to Rome. Its provisions were also "subject to frequent change, either by the tacit consent of the people, or by the subsequent enactment of another statute."

## **Philosophical Counseling: Managing everyday problems The Basic Premise**

Our ways of thinking influence our ways of feeling, desiring, choosing, acting, creating, relating, and being in the world. But most of the time we don't even notice our patterns of thinking. They run on auto-pilot, fueled by old habits and operating assumptions. If we could slow down and reflect on our ways of thinking, we might better understand our orientation on the world, and have a chance to ask questions about it, find out how it serves us, and how it trips us up at times. If we could examine our ways of thinking, we might cultivate greater clarity, coherence, breadth and depth in our worldview. This worldview can have a big impact on our future actions, reactions, and general experience of life. If we can learn how to apply a worldview that we've developed carefully and reflectively to our actions in a deliberate way, we can live with a much greater sense of empowerment and authenticity.

A regular practice of self-examination and deliberate action – the cornerstone of a philosophical life, and the very thing we pursue together in philosophical counseling – has the power to increase our sense of understanding, meaning, purpose, freedom, and fulfillment in our lives. It also has the power to transform many of the emotional culprits that cause us suffering – fear, dread, angst, anger, sadness, excessive attachment, jealousy, resentment, and guilt.

Philosophical counseling is, thus, a process that is educative, empowering, and therapeutic.

## **What do we do in Philosophical Counseling?**

In philosophical counseling, we embark on an inquiry into your life. Philosophical counseling is a collaborative and conversational activity between a trained philosopher and a client in which the client's life-problems are worked through by identifying, examining, and revising as necessary the operating beliefs, values, and habits of action that inform those problems.

- (1) The process of identifying the client's implicit "truths" and values, and making them explicit, improves self-awareness and puts the client in a position to clarify and critically examine the fundamental principles that have been guiding their lives.
- (2) The process of critically examining the client's core truths and values helps them to analyze the reasons and evidence that support their beliefs, discover the strengths and weaknesses as well as the benefits and challenges of their ways of thinking, and compare them with alternative perspectives. It also helps them to become aware of inconsistencies between beliefs, and conflicts between beliefs and habits of action (what they say and do). These revelations help the client to become aware of instances in which they might be working at cross-purposes with themselves.
- (3) The revision stage is one of creative re-building, in which the client's core truths and values shift, expand, and sharpen, with the consideration of various perspectives from philosophical wisdom traditions. It is also a stage of application, in which the client experiments with putting new ideas into practice, and works to direct their actions, relationships, and ways of com-

municating with intentional choice.

In counseling, the three stages tend to move in a circular manner, rather than a linear one. As new insights emerge, it can be valuable to circle back to earlier stages with new ideas for deeper examination.

The ultimate goal of philosophical counseling is to help the client to conduct an inquiry into their own life, to develop their own coherent, empowered, and fulfilling philosophy of life, and to live it! Minimally, what a client can expect to get out of philosophical counseling is greater self-knowledge and understanding of their own problems. Maximally, they can become empowered to solve those problems, relieve suffering, and create greater fulfillment in their lives. **The Role of the Philosophical Counselor.**

A philosophical counselor approaches their client as a fully functioning individual with the courage to deal with the perplexities and struggles central to the human condition.

A philosophical counselor does not diagnose or treat emotional or behavioral disorders, and if problems arise of a medical nature, the philosophical counselor will help the client to seek an appropriate health care professional.

A philosophical counselor works collaboratively with their client to solve life-problems by activating and cultivating the powers the client already possesses -- like critical thinking, imagination, empathy, desire, self-discipline, and creativity. A philosophical counselor acts as a navigation partner on the client's own journey to gain awareness, find direction, create solutions, and develop a fulfilling life.

The philosophical counselor does not tell the client what to think or what to do, but instead asks questions, uses tools of critical examination, offers fresh perspectives, draws connections, and gives encouragement. Most importantly, a philosophical counselor listens carefully to their client, works to understand the client's problems and their operating worldview, and works with the client to develop a coherent philosophy of life that will serve their own well-being.

### **An old role**

It may seem that philosophical counseling is a new invention. Actually, it is as old as philosophy itself. The Ancient Greeks – Socrates, Plato, Aristotle, the Stoics, the Epicureans – saw philosophy as not only an educational activity, but as a kind of therapy for the soul that eased suffering, developed personal integrity, encouraged self-mastery, created justice, and cultivated the good life. Even in the era of academic philosophy, this ancient vision of philosophy has survived in the philosophical traditions of ethics, political philosophy, existentialism, pragmatism, feminism, and hermeneutics (among others). Modern day philosophical counselors revive the ancient art of philosophy, and put it to work in a one-on-one setting.

### **What kinds of problems are philosophical problems?**

We might wonder whether or not we've got any philosophical problems. Most of the time we characterize our problems in terms of a particular relationship we're struggling with, a big life change, or a feeling of sadness, loss, confusion, loneliness, frustration, powerlessness, burn-out, or worry. But, quite often these very problems are signs of broader philosophical problems that deserve attention.

Common philosophical problems include questions or difficulties with:

- Core beliefs and truths
- Critical thinking and questioning assumptions
- Creative thinking and trying out alternative perspectives
- Clear reasoning and consistency
- Ethics and values
- Meaning, purpose, and fulfillment
- Happiness
- Identity, self-discovery, self-improvement
- Change, loss, death
- Moderating emotional life
- Existential Angst
- Alienation
- Self-discipline
- Decision Making
- Power and Justice
- Communication and relationships
- Conflict resolution
- Freedom, responsibility, and self-determination
- Authenticity

It's important to recognize that not all life-problems are medical in nature. Not every instance of struggle, suffering, or unhappiness is a sign of a mental illness. There are times when it is appropriate to seek a health care professional with training in psychology for treatment of an emotional or behavioral disorder. There are instances in which a problem in one's brain-chemistry exists and it is appropriate to get the help of a psychiatrist who can prescribe medication. But when problems are not medical in nature, one needs a different kind of counsel.

Sometimes non-medical problems are narrow in scope, requiring legal, financial, business, or academic counsel. And sometimes the problems are more general, at their root having to do with questions like:

- What's true?
- What's right?
- What's good?
- What should I care about most?
- What are my responsibilities?
- What does it all mean?
- What should I do?
- Who am I, and who do I want to be?
- How do I fit into the bigger world?
- Why am I here?
- How can I best relate with others?

- How can I best deal with change?
- How should I live?
- How can I take better control of my life?
- How can I be happy?
- and how can I come to know the answers to any of these questions and cope with uncertainty about them?

These are classic questions of philosophy.

Most everyday problems dealing with ethics, values, meaning, purpose, truth, certainty, justice, power, freedom, and happiness are not medical in nature and cannot be resolved with medical intervention. They are best approached through philosophical dialogue.

### **Differences between philosophical dialogue and psychotherapy**

Philosophical dialogue is a unique kind of dialogue. In it, we take our time to slowly and thoroughly clarify the meaning of our terms, examine lines of reasoning with critical thinking tools, compare our ways of thinking with other perspectives and worldviews, and consider the relationship between our ways of thinking and our ways of feeling, choosing, communicating, and acting.

Unlike psychotherapy, philosophical dialogue is not diagnostic. A philosopher does not treat their interlocutor as a patient, nor assume that there is a disorder or illness present (beyond the challenges with the human condition that we all face). A philosopher does not presume causal explanations for their interlocutor's behaviors, feelings, or thoughts: He or she does not view their interlocutor as one who is "determined" to feel, act, or think in a certain way because of internal or external conditions.

Whereas many psychotherapists tend to approach problems by focusing on their interlocutor's emotional life, eliciting affect, tracing a personal history of trauma, and identifying childhood origins of current difficulties (a retrospective approach focused heavily on emotion); philosophical counselors approach ways of feeling as a starting point for understanding and examining our ways of thinking, our world views, judgments, and values, which influence the way we experience the world and the choices we make. Philosophical counselors work to elicit reasons and evidence for the ways one thinks, ask questions about what is true, good, and fair, open up different perspectives for discussion, and help their clients to consider their future trajectory and range of possibilities (a prospective approach connecting thinking, feeling, and choosing).

Philosophical counselors also consider the ways in which one's personal history takes place within a wider context of social-political structures. There are times when one's distress has much to do with the power relations in which one exists or the state of injustice in the world, and the remedy is not so much about turning inward and learning to adapt to that injustice, but learning how to engage politically, and resist in active, creative, and fruitful ways that bring a sense of meaning, purpose, and agency to our lives.

There are a number of psychotherapeutic methods that are not in tension with, but have a strong kinship with philosophical approaches, as their strategies' theoretical roots can be traced back to Socratic, Stoic, Buddhist, and Existential philosophies, among others.

In summary, philosophical counseling takes a holistic approach to the thinking- feeling-choosing-doing of the individual in a social-political world, and considers the individual's powers of examination, creative exploration, and reflective choice to be vehicles of movement and change.

### **A philosopher's training**

Philosophers have a kind of training that makes them well suited for the kind of dialogue-work described above. It is probably well known that philosophers have a knack for asking questions, clarifying ideas, challenging popular opinions, drawing connections, offering fresh perspectives, and getting involved in painstakingly careful inquiries into big questions. There are some other skills philosophers have that are particularly useful in a one-on-one counseling relationship.

- Philosophers have a trained ability to understand others' worldviews, to learn them inside and out, to explain them, compare them, evaluate their strengths and weaknesses, to analyze their benefits and challenges, and to think through their concrete implications in practice.
- Philosophers have a trained ability to listen carefully for an argument in what another person says, and to identify assumptions, implicit truth claims, and implicit values. They can trace carefully another's line of reasoning, and ask the questions needed to examine it.
- Philosophers carry around with them a toolbox of well-used critical thinking tools that allow them to recognize and remedy faulty reasoning, fallacies, and contradictions.
- Philosophers have experience with uncertainty and exploring uncharted territories of thinking without a map. They are accustomed to working without a formula, and dealing creatively with open-ended questions.
- Philosophers know how to inspire learning, activate and awaken the inner philosopher in others (Socrates' gadfly effect), and empower people to think for themselves and choose reflectively.
- Philosophers know how to learn from others, take what they say seriously, interpret their meaning, and engage in an ongoing practice of self-critique and revision of their own understanding, providing a helpful model to others who are on their own philosophical journey for the first time.
- Philosophers know how to recognize relativism, nihilism, solipsism, and other "tail-spin" positions.
- Philosophers have been trained in, and can discuss, a broad array of wisdom traditions (ancient and modern, eastern and western). They are also experts in a few of their favorite theories, about which they have usually taught, debated publicly with other experts, and published in a deep and thorough manner.

So, here's the punchline. A philosopher can make an excellent co-traveler on your journey into the big questions of life. A philosopher can offer a unique inquiry- experience that opens up distinct dimensions of thought, and that complements and moves beyond other forms of "talk-therapy."

# MCQs

1. Ethics is a-----science.
  - a. Positive
  - b. Negative
  - c. Normative
  - d. Theoretical
  
2. is the domain of ethics that includes professional ethics and practical ethics.
  - a. Positive ethics
  - b. Applied ethics
  - c. Normative ethics
  - d. Metaethics
  
3. Analysis about the nature and status of ethical theories is the subject matter of:
  - a. Positive ethics
  - b. Applied ethics
  - c. Normative ethics
  - d. Metaethics
  
4. is the philosophical examination, from a moral standpoint, of particular issues in private and public life which are matters of moral judgment.
  - a. Positive ethics
  - b. Applied ethics
  - c. Normative ethics
  - d. Metaethics
  
5. is the method of resolving moral problems by the application of theoretical rules.
  - a. Casuistry
  - b. Analysis
  - c. Research
  - d. Heuristic
  
6. The method for jurisprudence and Applied ethics is:
  - a. Analysis
  - b. Research
  - c. Heuristic
  - d. Casuistry
  
7. In ethics Casuistry means:
  - a. Case-based analysis
  - b. Case-based reasoning
  - c. Case-based investigation
  - d. Case-based explanation

8. The word casuistry derives from the Latin noun:
- Case
  - Casue
  - Cassu
  - Casus
9. Identify the ethical position which accepted casuistry as a useful method.
- Absolutism
  - Prescriptivism
  - Utilitarianism
  - None of these.
10. Who among the following criticized utilizing casuistry as a method for applied ethics?
- Pope Francis
  - G. E. Moore
  - C. J. S. Mill
  - Bentham
- Answers 1-10: 1-c, 2-b, 3-d, 4-b, 5-a, 6-d, 7-b, 8-d, 9-c, 10-a,
11. \_\_\_\_\_ is a branch of applied ethics that studies the philosophical, social and legal issues arising in medicine and the life sciences.
- Medical ethics
  - Bio-ethics
  - Legal ethics
  - Practical ethics
12. \_\_\_\_\_ used the term Bio-ethics to describe the relationship between the biosphere and growing human population.
- Fritz Jahr
  - Peter Singer
  - Van R. Potter
  - Sargent Shriver
13. The notion Corporate Social Responsibility is related to:
- Medical ethics
  - Business ethics
  - Media ethics
  - Bio ethics
14. Business ethics is also called:
- Organizational ethics
  - Capital ethics
  - Industrial ethics
  - Corporate ethics
15. \_\_\_\_\_ is the ethical theory proposed maximum happiness for maximum number.
- Ethical absolutism
  - Utilitarianism

- c. Egoism
- d. Ethical Naturalism

16. The name Peter Singer is related to:

- a. Inclusive Legal Positivism does not completely discount the possibility of interface between law and morality
- b. There's no difference as such between the two
- c. The former rejects conventional morality while the latter rejects critical morality
- d. The former rejects critical morality while the latter rejects conventional morality
- e. Both c and d are true

Answer:A

308. The functional approach to understanding Law is best explained as:

- a. A key to morality of law
- b. an evolution of the society by social and economic circumstances
- c. Divine infallibility of the law-maker
- d. a code of conduct that man has devised
- e. None of the above

Answer:D

309. The Natural Law School, as propounded by Salmon, claims that positive law derives its standard from

- a. Consensus
- b. An objective norm that has to be followed in the interest of order in society
- c. Superior moral standards
- d. Command of the sovereign

e. None of the above  
Answer: D

**Social and Political Philosophy:  
Indian**

## **Mahabharata**

The great epic Mahabharata represents the attempt of Vedic Brahmanism to adjust itself to the new circumstances reflected in the process of the Sanskritization (integration of Vedic beliefs, practices, and institutions) of the various non-Vedic communities. Many diverse trends of religious and philosophical thought have thus been synthesized in this work.

### **“Mokshadharma” Proto-Samkhyan texts**

In its philosophical views, the epic contains an early version of Samkhya (a belief in real matter and the plurality of individual souls), which is prior to the classical Samkhya of Ishvarakrishna, a 3rd-century-CE philosopher. The chapter on “Mokshadharma” in Book 12 of the Mahabharata is full of such proto-Samkhya texts. Mention is made of four main philosophical schools: Samkhya-Yoga, taught by Kapila (a sage living before the 6th century BCE); Pancharatra, taught by Vishnu; the Vedas; and Pashupata (“Lord of Creatures”), taught by Shiva. Belonging to the Pancharatra school, the epic basically attempts to accommodate certain presystematic Samkhya ideas into the Bhagavata faith. Samkhya and Yoga are sometimes put together and sometimes distinguished. Several different schemata of the 25 principles (tattvas) of the Samkhya are recorded. One common arrangement is that of eight productive forms of prakriti (the unmanifest, intellect, egoism, and five fine elements: sound, smell, form or colour, taste, and touch) and 16 modifications (five organs of perception, five organs of action, mind, and five gross elements: ether, earth, fire, water, and air), and purusha (person). An un-Samkhyan element is the 26<sup>th</sup> principle: Ishvara, or the supreme lord. One notable result is the identification of the four living forms (vyuhas) of the Pancharatra school with four Samkhya principles: Vasudeva with spirit, Samkarshana with individual soul, Pradyumna with mind, and Aniruddha with ego-sense.

### **Non-Samkhyan texts**

Beside the Samkhya-Yoga, which is in the foreground of the epic’s philosophical portions, there are Vedanta texts emphasizing the unity of spirits and theistic texts emphasizing not only a personal deity but also the doctrine of the avatar (avatara), or incarnation. The Vasudeva-Krishna cult characterizes the theistic part of the epic.

### **Early theories of kingship and state**

In the Shanti Parvan (“Book of Consolation,” 12th book) of the Mahabharata, there is also a notable account of the origin of kingship and of rajadharma, or the dharma (law) of the king as king. Bhishma, who is discoursing, refers with approval to two different theories of the origin of kingship, both of which speak of a prior period in which there were no kings. According to one account, this age was a time characterized by insecurity for the weak and unlimited power for the strong; the other regards it as an age of peace and tranquillity. The latter account contains a theory of the fall of humankind from this ideal state, which led to a need for institutionalized power, or kingship; the former account leads directly from the insecurity of the pre-kingship era to the installation of king by the divine ruler for the protection and the security of humankind. Kingship is thus recognized as having a historical origin. The primary function of the king is that of protection, and dandaniti, or the art of punishment, is subordinated to rajadharma, or dharma of the king. Though it recognizes a quasi-divinity of the king, the Mahabharata makes the dharma, the moral law, superior to the king.

### **Concepts of Danda, Dandaneethi, Dharma and Raja Dharma**

It is, in fact, difficult to understand the ancient Indian political thought without a prior knowledge

about certain concepts like Danda, Dandaneethi, Dharma and Raja Dharma. These concepts are drawn from Sanskrit languages.

### **The following is a brief explanation of each concept:**

#### **Danda:**

The term Danda is derived from the words Dam and Dand, which refer to tame, subdue, to conquer or to restrain and the like. This term also means a stick.

Danda, in fact, is one of the elements of a state. The main reason for institution of Danda is to bring about discipline in the lives of human beings who by nature are evil and corrupt. According to Manu, it is only the king who can protect the entire mankind and for this protection, the king uses Danda as a means or as an instrument.

In the ancient Indian political system, it was the responsibility of the king to maintain Dharma by means of Danda. It was widely believed that it is only through fear of punishment that the mankind can be made more disciplined. It is this punishment that keeps a check on their actions consciously or subconsciously.

However, this punishment should be inflicted only when necessary after much consideration. Otherwise, the concept of Danda is lost. Further, ancient Indian thinkers were of the opinion that Danda should not be used as per the whims and fancies of the rulers, but only when there is presence of any anti-social elements in the society.

They further stated that Danda is a code given to the humanity by God to follow a righteous life. This code should bind Danda against his subjects for their wrongdoings. Even the people can collectively take an action against the king if he commits any wrong.

#### **Dandaneethi:**

This ancient Indian concept deals with the totality of social, political and economic relationships and indicates how they have to be properly organized and integrated with one another. It indicates the rules that one needs to adhere to while punishing others.

Ancient political thinkers suggested that for the sanctity of the concept, Danda should be used carefully. Excessive use would distress the people and light usage of the same will lose its importance. Through Dandaneethi, it becomes easier to bring about proper progress and balanced system of social and economic needs.

Sometimes transliterated as: Dandaniti, DaNDaniti, Dandaniti Daṇḍaniti literally means 'that which helps to lead people by the power of punishment'.

Any civilized society needs a government and someone to head it and run it properly. In the ancient and medieval days, the king (called 'rājā') was the pivot of the governmental system.

The science and art of governance was given several appellations. Out of all these appellations, the words 'rājadharmā' and 'daṇḍaniti' were most common.

The Arthaśāstra of Kauṭilya (300 B. C.) deals with the two subjects as one unit. These subjects are:

1. Vārtā - Economics

## 2. Daṇḍaniti - Statecraft

### **Dharma:**

This is a Sanskrit term, which means law and can be understood in various ways. Broadly speaking, the term has two connotations. Firstly, it means religious convictions and secondly, a set of duties or a code of conduct. It is stated that one who adopts Dharma would derive money, happiness and success. It also refers to a code of moral principles relating to the daily lives and following these rules ensures peace, prosperity and happiness.

Dharma is one of the values of an individual. As per the ancient Indian thought, it is dharma that sustains the universe and both the king as well as the people must adhere to it. Only the sages had the power to interpret this dharma or the Sacred Law.

### **Rajadharma:**

The concept of Rajadharma was introduced by one of the greatest epics of India, the Mahabharata. It refers to the laws or rules set for the rulers in the context of ensuring proper administration of the entire kingdom. Manu also mentioned about the concept of Rajadharma and prescribed certain rules called Dharma Sutras while discussing the rights and duties of a king with reference to his administration.

The duties that are laid down by the Rajadharma were described to be ideal for the highest good and a kingly conduct. The Manusmriti dealt with the concept of Rajadharma in a detailed manner than any other scriptures. It specified the duties of a king vis-a-vis the state, and not in his personal capacity. In ancient India, the entire discipline of political science was called Rajadharma. This concept was considered important in social practice. Failure to carry the rules diligently was considered dangerous to the existence of society itself. According to the Mahabharata, as per the rules, the king must be ready to dispose even the smallest of matters.

The king should be like a mother to his subjects and should be willing to make any sacrifices in their interest. He should possess all the qualities of a mother, father, preceptor, protector and also the attributes of Gods like fire, wealth and death towards his subjects. It was stated in the Mahabharata that a king who does not protect his subjects, is a thief and that he would attain hell after his death.

As regards the appointment of officials to cater to the administration, the Mahabharata stated that a king must appoint four Brahmins, three Kshatriyas, 21 Vyshyas, three Shudras and one Sutha. Thus, by this appointment, it is clear that even the so-called outcastes were also represented in the administrative body. The Mahabharata further stated that a king should be far-sighted like a vulture, patient like a crane, vigilant like a dog, and penetrate into the territories of the enemies like a snake without any anxiety. He should also be able to align with not only clever and powerful men but also a coward. The epic also advised king in matters related to war, diplomacy and in dealing with various kinds of people. With the above description, the following is a brief description of two of the most celebrated ancient Indian political thinkers, namely, Kautilya and Manu.

### **Mahabharata: foundations**

The **Mahabharata** is an ancient Indian epic where the main story revolves around two branches of a family - the **Pandavas** and **Kauravas** - who, in the Kurukshetra **War, battle** for the throne of Hastinapura. Interwoven into this narrative are several smaller stories about people dead or living, and philosophical discourses. **Krishna**-Dwaipayana Vyasa, himself a character in the epic, composed it; as, according to tradition, he dictated the verses and **Ganesha** wrote them down. At

100,000 verses, it is the longest epic poem ever written, generally thought to have been composed in the 4th century BCE or earlier. The events in the epic play out in the Indian subcontinent and surrounding areas. It was first narrated by a student of Vyasa at a snake-sacrifice of the great-grandson of one of the major characters of the story. Including within it the **Bhagavad Gita**, the Mahabharata is one of the most important texts of ancient Indian, indeed world, literature.

### **The prelude**

Shantanu, the king of Hastinapur, was married to **Ganga** (personification of the **Ganges**) with whom he had a son called Devavrat. Several years later, when Devavrat had grown up to be an accomplished prince, Shantanu fell in love with Satyawati. Her father refused to let her marry the king unless the king promised that Satyawati's son and descendants would inherit the throne. Unwilling to deny Devavrat his rights, Shantanu declined to do so but the prince, on coming to know of the matter, rode over to Satyawati's house, vowed to renounce the throne and to remain celibate throughout his life. The prince then took Satyawati home to the **palace** so that the king, his father, could marry her. On account of the terrible vow that he'd taken that day, Devavrat came to be known as Bheeshm. Shantanu was so pleased with his son that he granted to Devavrat the boon of choosing the time of his own **death**.

In time, Shantanu and Satyawati had two sons. Soon thereafter, Shantanu died. Satyawati's sons still being minors, the affairs of the kingdom were managed by Bheeshm and Satyawati. By the time these sons reached adulthood, the elder one had died in a skirmish with some gandharvas (heavenly beings) so the younger son, Vichitravirya, was enthroned. Bheeshm then abducted the three princesses of a neighbouring kingdom and brought them over to Hastinapur to be wedded to Vichitravirya. The eldest of these princesses declared that she was in love with someone else, so she was let go; the two other princesses were married to Vichitravirya who died soon afterwards, childless.

Dhritarashtra was the strongest of all princes in the country, Pandu was skilled in warfare & archery, & Vidur knew all the branches of learning, politics, & statesmanship.

### **Dhritarashtra, Pandu & Vidur**

So that the family line did not die out, Satyawati summoned her son Vyasa to impregnate the two queens. Vyasa had been born to Satyawati of a great sage named Parashar before her marriage to Shantanu. According to the laws of the day, a child born to an unwed mother was taken to be a step-child of the mother's husband; by that token, Vyasa could be considered Shantanu's son and could be used to perpetuate the Kuru clan that ruled Hastinapur. Thus, by the Niyog custom, the two queens each had a son of Vyasa: to the elder queen was born a blind son called Dhritarashtra, and to the younger was born an otherwise healthy but extremely pale son called Pandu. To a maid of these queens was born a son of Vyasa called Vidur. Bheeshm brought up these three boys with great care. Dhritarashtra grew up to be the strongest of all princes in the country, Pandu was extremely skilled in warfare and archery, and Vidur knew all the branches of learning, politics, and statesmanship. With the boys grown, it was now time to fill up the empty throne of Hastinapur. Dhritarashtra, the eldest, was bypassed because the laws barred a disabled person from being king. Pandu, instead, was crowned. Bheeshm negotiated Dhritarashtra's marriage with Gandhari, and Pandu's with Kunti and Madri. Pandu expanded the kingdom by conquering the surrounding areas, and brought in considerable war booty. With things running smoothly in the country, and with its coffers full, Pandu asked his elder brother to look after the state affairs, and retired

to the forests with his two wives for some time off.

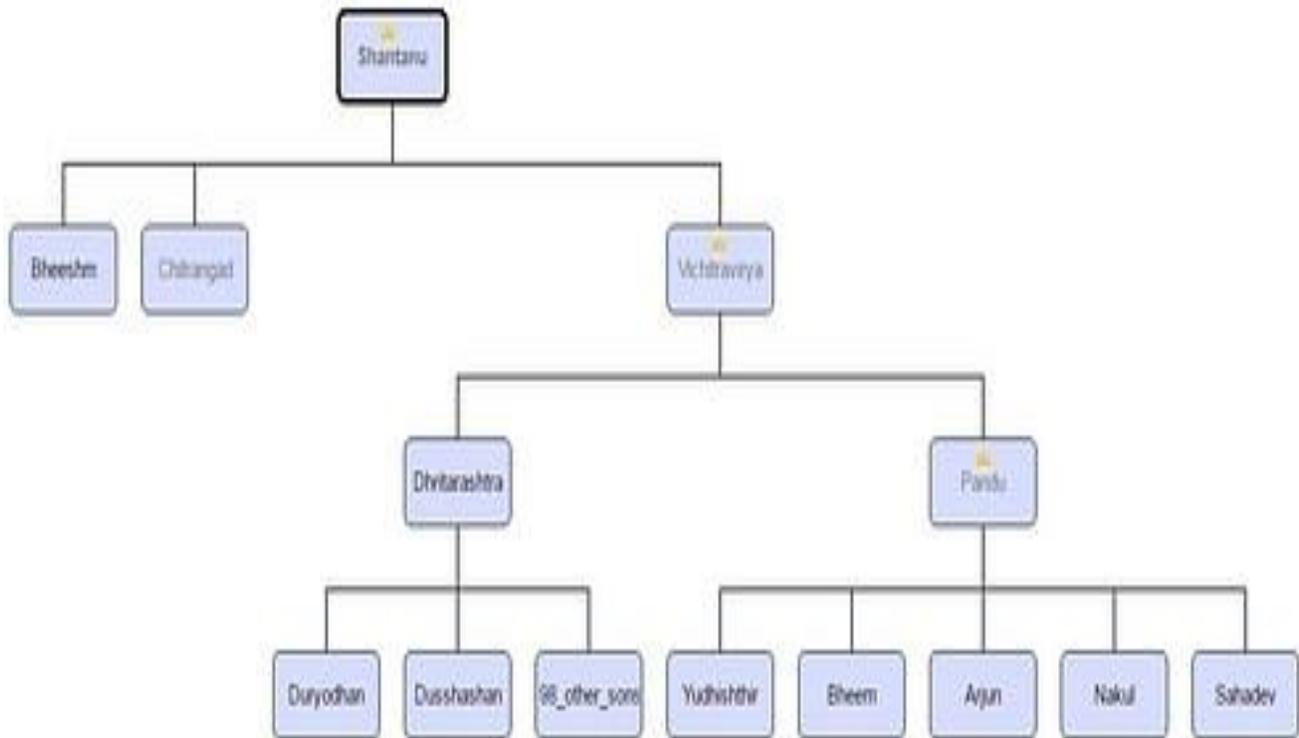

## Kauravas & Pandavas

A few years later, Kunti returned to Hastinapur. With her were five little boys, and the bodies of Pandu and Madri. The five boys were the sons of Pandu, born to his two wives through the Niyog custom from gods: the eldest was born of Dharma, the second of Vayu, the third of **Indra**, and the youngest - twins - of the **Ashvins**. In the meanwhile, Dhritarashtra and Gandhari too had had children of their own: 100 sons and one daughter. The Kuru elders performed the last rites for Pandu and Madri, and Kunti and the children were welcomed into the palace.

## Pandavas

All of the 105 princes were subsequently entrusted to the care of a teacher: Kripa at first and, additionally, Drona later. Drona's school at Hastinapur attracted several other boys; Karna, of the Suta clan was one such boy. It was here that hostilities quickly developed between the sons of Dhritarashtra (collectively called the Kauravas, patronymic of their ancestor Kuru) and the sons of Pandu (collectively called the Pandavas, patronymic of their father). Duryodhana, the eldest Kaurava, tried - and failed - to poison Bheem, the second Pandava. Karna, because of his rivalry in archery with the third Pandava, **Arjuna**, allied himself with Duryodhan. In time, the princes learnt all they could from their teachers, and the Kuru elders decided to hold a public skills exhibition of the princes. It was during this exhibition that the citizens became plainly aware of the hostilities between the two branches of the royal family: Duryodhan and Bheem had a mace fight that had to be stopped before things turned ugly, Karna - uninvited as he was not a Kuru prince - challenged Arjuna, was insulted on account of his non-royal birth, and was crowned king of a vassal state on the spot by Duryodhan. It was also around this time that questions began to be raised about Dhritarashtra occupying the throne, since he was supposed to be holding it only in trust for Pandu, the crowned king. To keep peace in the realm, Dhritarashtra declared the eldest Pandava, Yudhishtir, as the crown prince and heir apparent.

The Kuru Family Tree

## The first exile

Yudhishtir's being the crown prince and his rising popularity with the citizens was extremely distasteful to Duryodhan, who saw himself as the rightful heir since his father was the de facto king. He plotted to get rid of the Pandavas. This he did by getting his father to send the Pandavas and Kunti off to a nearby town on the pretext of a fair that was held there. The palace in which the Pandavas were to stay in that town was built by an agent of Duryodhan; the palace was made entirely of inflammable materials since the plan was to burn down the palace - together with the Pandavas and Kunti - once they'd settled in. The Pandavas, however, were alerted to this fact by their other uncle, Vidur, and had a counter plan ready; they dug an escape tunnel underneath their chambers. One night, the Pandavas gave out a huge feast which all of the townsfolk came to. At that feast, a forest woman and her five sons found themselves so well-fed and well-drunk that they could no longer walk straight; they passed out on the floor of the hall. That very night, the Pandavas themselves set fire to the palace and escaped through the tunnel. When the flames had died down, the townsfolk discovered the bones of the forest woman and her boys, and mistook them for Kunti and the Pandavas. Duryodhan thought his plan had succeeded and that the world was free of the Pandavas.

## Arjuna & Draupadi

Meanwhile, the Pandavas and Kunti went into hiding, moving from one place to another and passing themselves off as a poor brahmin family. They would seek shelter with some villager for a few weeks, the princes would go out daily to beg for food, return in the evenings and hand over the day's earnings to Kunti who would divide the food into two: one half was for the strongman Bheem and the other half was shared by the others. During these wanderings, Bheem killed two demons, married a demoness, and had a demon child called Ghatotkach. They then heard about a swayamvar (a ceremony to choose a suitor) being organised for the princess of Panchal, and

went at Panchal to see the festivities. According to their practice, they left their mother home and set out for alms: they reached the swayamvar hall where the king was giving away things most lavishly to almsseekers. The brothers sat themselves down in the hall to watch the fun: the princess Draupadi, born of fire, was famed for her beauty and every prince from every country for miles around had come to the swayamvar, hoping to win her hand. The conditions of the swayamvar were difficult: a long pole on the ground had a circular contraption spinning at its top. On this moving disc was attached a fish. At the bottom of the pole was a shallow urn of water. A person had to look down into this water-mirror, use the bow and five arrows that were provided, and pierce the fish spinning on top. Five attempts were allowed. It was evident that only an extremely skilled archer, such as the now-presumed-dead Arjuna, could pass the test.

### **Arjuna at the Draupadi Swayamvar**

One by one, the kings and princes tried to shoot the fish, and failed. Some could not even lift the bow; some could not string it. The Kauravas and Karna were also present. Karna picked up the bow and strung it in a moment, but was prevented from taking aim when Draupadi declared she would not marry anyone from the Suta clan. After every one of the royals had failed, Arjuna, the third Pandava, stepped up to the pole, picked up the bow, strung it, affixed all of the five arrows to

it, looked down into the water, aimed, shot, and pierced the fish's eye with all of the five arrows in a single attempt. Arjuna had won Draupadi's hand. The Pandava brothers, still in the guise of poor brahmins, took Draupadi back to the hut they were staying at and shouted for Kunti, "Ma, Ma, come and see what we've brought back today." Kunti, saying, "Whatever it is, share it among yourselves", came out of the hut, saw that it wasn't alms but the most beautiful woman she had ever set her eyes on, and stood stock still as the import of her words sank in on everybody present.

Meanwhile, Draupadi's twin Dhrishtadyumna, unhappy that his royal sister should be married off to a poor commoner, had secretly followed the Pandavas back to their hut. Also following them secretly was a dark prince and his fair brother - Krishna and Balaram of the Yadava clan - who had suspected that the unknown archer could be none other than Arjuna, who had been presumed dead at the palace-burning incident several months ago. These princes were related to the Pandavas - their father was Kunti's brother - but they had never met before. By design or happenstance, Vyasa also arrived at the scene at this point and the Pandava hut was alive for a while with happy cries of meetings and reunions. To keep Kunti's words, it was decided that Draupadi would be the common wife of all of the five Pandavas. Her brother, Dhrishtadyumna, and her father, the king Drupad, were reluctant with this unusual arrangement but were talked around to it by Vyasa and Yudhishtir.

## Places in the Mahabharata

### Indraprastha & the dice game

After the wedding ceremonies at Panchal were over, the Hastinapur palace invited the Pandavas and their bride back. Dhritarashtra made a great show of happiness on discovering that the Pandavas were alive after all, and he partitioned the kingdom, giving them a huge tract of barren land to settle in and rule over. The Pandavas transformed this land into a paradise. Yudhishtir was

crowned there, and he performed a sacrifice that involved all of the kings of the land to accept - either voluntarily or by force - his suzerainty. The **new kingdom**, Indraprastha, prospered. Meanwhile, the Pandavas had entered into an agreement among themselves regarding Draupadi: she was to be wife of each Pandava, by turn, for a year. If any Pandava was to enter the room where she was present with her husband-of-that-year, that Pandava was to be exiled for 12 years. It so happened that once Draupadi and Yudhishtir, her husband of that year, were present in the armoury when Arjuna entered it to take his bow and arrows. Consequently, he went off in exile during which he toured the entire country, down to its southernmost tip, and married three princesses he met along the way.

The prosperity of Indraprastha and the power of the Pandavas was not something that Duryodhan liked. He invited Yudhishtir to a dice game and got his uncle, Shakuni, to play on his (Duryodhan's) behalf. Shakuni was an accomplished player; Yudhishtir staked - and lost - step by step his entire wealth, his kingdom, his brothers, himself, and Draupadi. Draupadi was dragged into the dice hall and insulted. There was an attempt to disrobe her, and Bheem lost his temper and vowed to kill each and every one of the Kauravas. Things came to such a boil that Dhritarashtra intervened unwillingly, gave the kingdom and their freedom back to the Pandavas and Draupadi, and set them off back to Indraprastha. This angered Duryodhan, who talked his father around, and invited Yudhishtir to another dice game. This time, the condition was that the loser would go on a 12-year exile followed by a year of life incognito. If they were to be discovered during this incognito period, the loser would have to repeat the 12+1 cycle. The dice game was played. Yudhishtir lost again.

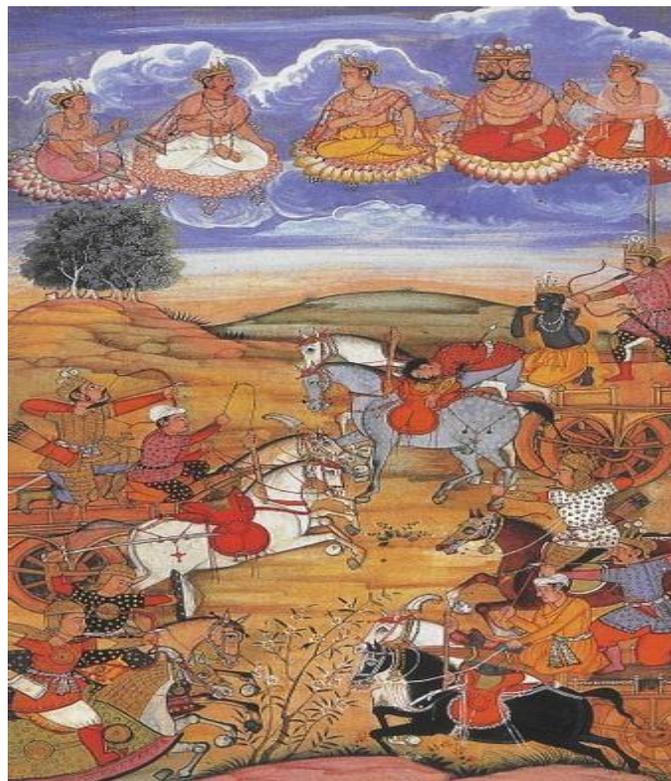

Draupadi Humiliated, Mahabharata

### The second exile

For this exile, the Pandavas left their ageing mother Kunti behind at Hastinapur, in Vidur's place. They lived in forests, hunted game, and visited holy spots. At around this time, Yudhishtir asked Arjuna to go to the heavens in quest of celestial weapons because, by now, it was apparent that their kingdom would not be returned to them peacefully after the exile and that they would have to

fight for it. Arjuna did so, and not only did he learn the techniques of several divine weapons from the gods, he also learnt how to sing and dance from the gandharvas. After 12 years, the Pandavas went incognito for a year. During this one-year period, they lived in the Virat kingdom. Yudhishtir took up employment as a king's counsellor, Bheem worked in the royal kitchens, Arjuna turned himself into a eunuch and taught the palace maidens how to sing and dance, the twins worked at the royal stables, and Draupadi became a handmaiden to the queen. At the end of the incognito period - during which they were not discovered despite Duryodhan's best efforts - the Pandavas revealed themselves. The Virat king was overwhelmed; he offered his daughter in marriage to Arjuna but he declined since he had been her dance teacher the past year and students were akin to children. The princess was married, instead, to Arjuna's son Abhimanyu.

At this wedding ceremony, a large number of Pandava allies gathered to draw out a war strategy. Meanwhile, emissaries had been sent to Hastinapur to demand Indraprastha back but the missions had failed. Krishna himself went on a peace mission and failed. Duryodhan refused to give away as much land as was covered by the point of a needle, let alone the five villages proposed by the peace missions. The Kauravas also gathered their allies around them, and even broke away a key Pandava ally - the maternal uncle of the Pandava twins - by trickery. War became inevitable.

Arjuna During the Battle of Kurukshetra

### **The Kurukshetra war & aftermath**

Just before the war bugle was sounded, Arjuna saw arrayed before him his relatives: his great-grandfather Bheeshm who had practically brought him up, his teachers Kripa and Drona, his brothers the Kauravas, and, for a moment, his resolution wavered. Krishna, the warrior par excellence, had given up arms for this war and had elected to be Arjuna's charioteer. To him Arjuna said, "Take me back, Krishna. I can't kill these people. They're my father, my brothers, my teach-

ers, my uncles, my sons. What good is a kingdom that's gained at the cost of their lives?" Then followed a philosophical discourse that has today become a separate book on its own - the **Bhagavad Gita**. Krishna explained the impermanence of life to Arjuna, and the importance of doing one's duty and of sticking to the right path. Arjuna picked up his bow again. If you proceed to war treating equally joy and sorrow, gain and loss, victory and defeat, you do not sin. [2.38] You have a right only to work; you have no claim to the fruits thereof. Do not let an expected result dictate your actions; do not sit idle either. [2.47] The battle raged for 18 days. The army totalled 18 akshauhinis, 7 on the Pandavaside and 11 on the Kaurava (1 akshauhini = 21,870 chariots + 21,870 elephants + 65,610 horses + 109,350 soldiers on foot). Casualties on both sides were high.

When it all ended, the Pandavas had won the war but lost almost everyone they held dear. Duryodhan and all of the Kauravas had died, as had all of the menfolk of Draupadi's family, including all of her sons by the Pandavas. The now-dead Karna was revealed to be a son of Kunti's from before her marriage to Pandu, and thus, the eldest Pandava and the rightful heir to the throne. The grand old man, Bheeshm, lay dying; their teacher Drona was dead as were several kinsfolk related to them either by blood or by marriage. In about 18 days, the entire country lost almost three generations of its men. It was a war not seen on a scale before, it was the Great Indian war, the Mahabharat.

After the war, Yudhishtir became king of Hastinapur and Indraprastha. The Pandavas ruled for 36 years, after which they abdicated in favour of Abhimanyu's son, Parikshit. The Pandavas and Draupadi proceeded on foot to the Himalayas, intending to live out their last days climbing the slopes heavenwards. One by one, they fell on this last journey and their spirits ascended to the heavens. Years later, Parikshit's son succeeded his father as king. He held a big sacrifice, at which this entire story was recited for the first time by a disciple of Vyasa called Vaishampayan.

## legacy

Since that time, this story has been retold countless times, expanded upon, and retold again. The Mahabharata remains popular to this day in **India**. It has been adapted and recast in contemporary mode in several films and plays. Children continue to be named after the characters in the epic. The Bhagvad Gita is one of the holiest of **Hindu** scriptures. Beyond India, the Mahabharata story is popular in south-east Asia in cultures that were influenced by **Hinduism** such as Indonesia and Malaysia.

## Rajdharma

As stated earlier, the purpose of governance is to ensure the people 'protection from fear, for there is nothing more degrading to human worth than living in fear.' The Mahabharata then goes on to enquire the limits to use of governance and the legitimacy of opposing it when it creates conditions of oppression and violence. Hence, given the fundamental importance of governance against anarchy, also the fundamental place of the philosophy of governance, 'the raja-dharma', the Mahabharata reiterates again that in all the acts of governance, the goal of the king, or of the state, is the protection of all living beings with kindness towards them and that is the highest dharma The Rajdharma of the king (state). Maharshi Vyas enjoins, therefore, Let the king protect his subjects from their fear of him; from their fear of others; from their fear of each other; and from their fear of things that are not human.

The main purpose of the state, according to Mahabharata, is to create conditions for freedom from fear, including the fear of violence. In other words, its purpose lies in 'protecting the small fish from the big fish', keeping in mind that in the process the state does not itself become the

'big fish'. That will lead to oppression and terror resulting in adharma by the state.

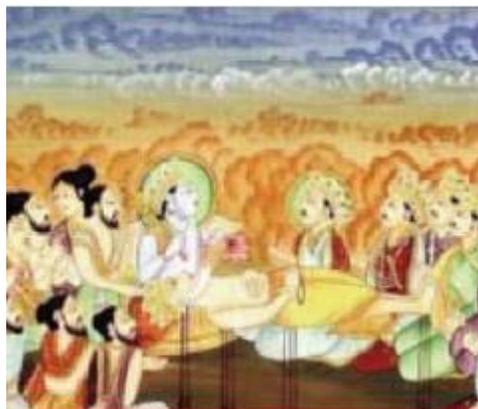

The king to create social and economic conditions not only of freedom from fear but, more positively, of human flourishing, where the individual is enabled to come into the fullness of his, or her, being. Ahimsa can be realized only in a society where trust, friendship, and caring - the elements of human bonding, individual and social - exist. Protection has, in the Mahabharata, the wider meaning of creating conditions of personal and social bonding. That is the function of the king, or of the state.

The state according to Mahabharata, was created to protect the weak, the poor, the exploited, the helpless, and the oppressed from the strong. That large class of the weak is only able to survive because of the power of the king and this is an important aspect of Rajadharma.

The Mahabharata further warns the king, 'Beware, the weak are, in actual fact, much stronger than the strong, for nothing is left of the strong that have been burnt by the weak'. And further, "When the king wipes the tears of the poor, the dispossessed, and the old. And creates happiness among the people thereby, such conduct on his part is called the king's dharma (Rajdharma)."

According to Mahabharata, Law and governance are the instruments for protection. The importance and meaning of protection requires a set of laws and governance which create social and economic conditions where one lives in a society without fear. Thus, there is a wider meaning of protection and the Mahabharata enjoins upon the king to create social and economic conditions not only of freedom from fear but, more positively, of human flourishing, where the individual is enabled to come into the fullness of his, or her, being. Ahimsa can be realized only in a society where trust, friendship, and caring - the elements of human bonding, individual and social - exist. Protection has, in the Mahabharata, the wider meaning of creating conditions of personal and social bonding. That is the function of the king, or of the state. In Mahabharata principles of governance require the state to be committed to social concerns which need to be attended for creating an ahimsa society. The institutions of the state have to be continuously vigilant for keeping order and curbing violence.

## The discipline of dharma

The discipline of the king is to be derived from the purpose for which he was invested with the power of governance, and Mahabharata asks the king (state) to exercise power subject to certain disciplines. The king should first discipline himself and then only try to discipline his subjects and subordinates. If he does so without realizing his own defects, he becomes an object of ridicule and should always remember that The interest of his subjects alone is his interest, their well-

being his well-being; and in their good lies his own good.

The Mahabharata says that power is never considered its own justification, for the state is not an end in itself and further, the power without dharma is as much the way to tyranny as dharma left unprotected is the way to anarchy. In other words, the power 'of the state has to exercise disciplines upon itself most of all, the discipline of dharma. Power is not to be exercised arbitrarily but in accordance with the dharma' exhorts Mahabharata.

## Social concerns

The Apastamba Dharmasutra proclaims with such finality, it is the primary duty of the king to ensure that none within his domain suffers from hunger, want or deprivation. Sage Apastamba lays down the discipline of the kings in this context, thus: let no one suffer from hunger and disease, or from extremes of heat and cold. No one in the kingdom ought to suffer thus, either because of general scarcity or because of specific design against him. Under such circumstances, people may become angry and the state might be lost to the enemies of the country.

And, Bhisma, in a particularly intense yet short chapter in the Anusasanaparvan, warns Yudhisthira that the hunger of even one person in a kingdom renders the life of the king meaningless; and if there be a king in whose kingdom young children eagerly watch the delicious meals of others and are not offered the same food with all ceremony and care, what indeed would be the fate of such a king? What indeed can be a sin greater than that. The king must protect the wealth of the old, the young, the blind and the poor. And he must not take away anything from the helpless women, or from the cultivators who have created their own irrigation system. The wealth that is taken away from the poor takes away the prosperity of the king and destroys the country. Therefore, instead of depriving the poor, offer them great comfort and gratification, and relieve the people of

all fear of hunger. And further, the king should not extinguish the opportunities of livelihood. The protection of the life and dignity of women is the primary aim of governance and the Mahabharata in unequivocal terms states, 'A king in whose kingdom crying and wailing women are forcibly carried away in front of their sons and husbands who cry and wail in vain, one feels that there is no governance. And Bhisma adds, having given his promise to protect the people and the state fails to protect then such a state is as good as non-existent.

### **Conduct during abnormal times**

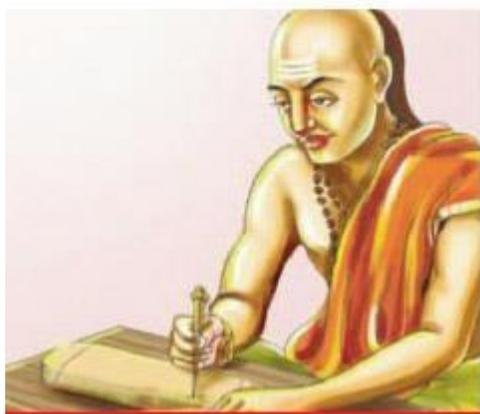

If there is a situation which suddenly leads towards chaos and anarchy and the very existence of the state is in danger and it is no longer able to preserve and protect dharma, Mahabharata, under the circumstances allows the state to waive the normal ethical behaviour, only and only, till the duration such circumstances exist. This is known as conduct during distress - Apadh-Dharma. The state can take measures, though unethical, for collecting resources by force or even coercion. The Mahabharata says if the state exists then alone dharma can be protected and order can be restored when the very existence of the state becomes doubtful, the material resources required to counter the threat have to be collected.

The protection of the life and dignity of women is the primary aim of governance and Mahabharata in unequivocal terms states, 'A king in whose kingdom crying and wailing women are forcibly carried away in front of their sons and husbands who cry and wail in vain, one feels that there is no governance. And Bhisma adds, having given his promise to protect the people and the state fails to protect then such a state is as good as non-existent.

But the king is also warned that anything acquired by adharma ultimately leads to resentment and anger leading to violence in the society. Resources acquired by unethical means would never prove beneficial to the state and the people. In times of distress, it is the duty of both the state and the people to protect each other. Therefore, as soon as normalcy is restored the state should return back to the people whatever was acquired to save the existence of the state. Mahabharata warns that distressful times should not become an excuse for doing wrong things.

### **Capital punishment**

Perhaps for the first time anywhere, it is in the Mahabharata that an argument against capital punishment was advanced. It develops in answering the question of Yudhishtira, put to Bhishma: 'How should the king protect the people in a way without causing violence to anybody? Bhishma narrates an old conversation between Satyavan and his father, Dhyumatsena who says, 'One should use only that system of punishment that does not dismember the body. Neither should anybody be punished without first carefully examining the alleged offence of a person and applying to it the established principles of law.' On putting a criminal to death, the king renders his family without any means of sustenance, which is like putting them to death as well. Therefore, the king must think carefully. The purpose of governance is not to kill the wicked, but to create conditions in which the people can be good. One should use only that system of punishment that does not dismember the body. Neither should anybody be punished without first carefully examining the alleged offence of a person and applying to it the established principles of law.

The Mahabharata continues to stress that the power of governance must be exercised without anger and intolerance, the king must keep away from darpa (arrogance) and should be free from deviousness and cunning. The king should also be free from likes and dislikes. He should keep preferences, anger, greed and vanity far away and treat all beings with a sense of equality. Because the king holds power he is not authorized to oppress people and violate dharma. The king is placed more than anyone else under the fear of danda, law and governance. On putting a criminal to death, the king renders his family without any means of sustenance, which is like putting them to death as well. Therefore, the king must think carefully. The purpose of governance is not to kill the wicked, but to create conditions in which the people can be good.

The Mahabharata has narrated a story of a frightfully terrible war and its resultant consequences on either side and declares that nothing worthwhile has ever been achieved through war. The king should preserve and expand whatever he (state) possesses without recourse to war. Victories must be achieved by enhancing all areas of knowledge and not by cunningness and arrogance. In other words, Mahabharata proposes reconciliation as a process for resolving the two opposite view points. The crux of the foundation of governance is dharma based on truth and ahimsa. In other words, the state should also be accessible and transparent. The assembly or the sabha, that declares whether a law or an order is in accordance with the Dharma must have the trust of the people. Mahabharata prescribes that, 'An assembly without elders is no assembly. The elders who don't speak according to dharma are no elders. Dharma not based on truth is adharma. Finally truth full of cunning is no truth.

## **Spiritual Model of Good Governance and Sustainable Administration in Mahabharata**

A spiritual touch is essential for good and sustainable governance, as it gives a holistic approach that widens the scope of thinking. Money, time and human resources are scarce and can never be replenished. But effective use of these resources should be with a final objective of contributing towards the best interests of the society. Sustainable development includes the four interconnected domains of ecology, economics, politics and culture. Governance is "the process of decision-making and the process by which the decisions are implemented". For smooth functioning of the corporate there is an innate need for spirituality. We could definitely turn back to pages of history where we have found tried and trusted methods of successful governance which has contributed for sustainable development. Mahabharata is one such resource where, time and again, we have found out many answers to the perennial requirement of managerial skills.

Governance in Indian scriptures is called Rajadharma i.e. righteous duty of the king. Thus, as defined above, the conduct of those involved in governance requires adhering to righteousness which calls for exhibiting the highest standards of morality and ethical behaviour. The Hindu scriptures suggest that askings have been bestowed divine authority they are duty bound to rule only under God's command and by providing clean and ethical administration.

Moreover, a king is obligated to do justice to the public by treating them as if they were his own children, and punish any corrupt behaviour in the society. Unethical conduct, therefore, amounts to doing disservice to God, because the king acts only as His viceroy or a deputy. In a nutshell, the Indian philosophy lays emphasis on the premise that inner spirituality and character must govern the conduct and behaviour of the leaders in the society.

According to the Mahabharata there are a few important elements of a successful model for governance. They are Spirituality, goal setting, planning based on potential, persistence, competency mapping, rationality, value system or ethics, consolidating the strengths, reward system and most important of all, the coordination between various functions in the organization coupled with transparency and accountability in workplace. These are proven and specific elements which have similar prominence even in the administration of today's corporate houses where the elements and priorities have taken a paradigm shift into commercialization, lack of values etc.

Vidura Neeti and Shanti Parva are two parts of Mahabharata that have good and substantial material for managerial skills, leadership skills, skills requires for running high level administrative and government mechanisms. Apart from that the Book II of Mahabharata, otherwise known as "The Book of the Assembly Hall", also contains necessary instructions for carrying out a good governance where Narada came there to meet Pandavas affectionately and to witness the divine consecration ceremony of King Yudhistira.

### **Principles of Good Governance as Propounded by Narada**

Yudhishtira, accompanied by his brothers honoured Narada and pleased him. Narada felt very happy and asked Dharmaraja about matters regarding Dharma, Artha and Kama. He enquired him whether he had divided his time judiciously and following Dharma, Artha and Kama accordingly; whether, after considering his and foe's relative strengths, he was taking proper care of the fourteen possessions (such as country, forts, cars, elephants, cavalry, foot-soldiers. etc.) with the help of the six royal attributes (viz, cleverness of speech, readiness in providing means, intelligence in dealing with the foe, memory, and acquaintance with morals and politics), and the seven means

(viz., sowing dissensions, chastisement, conciliation, gifts, incantations, medicine and magic); whether he was employing a singly learned man by giving in exchange thousand foals. He advised that if rations and salary are delayed, the troops become angry which causes great misfortune. He asked whether the king was taking care of the families of those who died or faced great dangers for his sake; whether every day his accountants put before him in the forenoon the income and expenditure statement; whether the farmers in his kingdom were satisfied; whether he slept only in the first two quarters of night, and got up in the third quarter to reflect on Dharma and Artha. On hearing the words of Narada, Yudhishtira bowed to him and promised that he would act on his word only. His wise counsel had indeed enlightened him. He then followed the words of Narada and his kingdom spread up to the ocean. Thus this section of Mahabharata presents the principles of polity.

### **Importance of king as ruler & Role of citizens**

In the "Shanti Parva", Book XII of Mahabharata, Yudhishtira asked Bhishma: Please tell me what is main duty that the country (meaning citizens) must do? Bhishma explained: Main duty of citizens is to enthrone a worthy person as king, because, a country without a king becomes weak. Such a country will be regularly troubled by wicked elements like thieves and robbers. In a country without king dharma will not be sustainable. People will be trying to 'swallow' each other. Therefore, condemnation to a country without a king!. There is a shruti-vakya that when a nation chooses a king, they choose Indra himself. Therefore a citizen who desires good of all should worship the king. I do not like to live in a country without a king. Even agni does not carry havya to devatas in such a country.

### **What should the citizens do if another powerful king attempts to take over?**

In case a powerful king desirous of expanding attacks a country which either does not have a king or has a weak king, it is better for the citizens to come forward and welcome him. This is the best suggestion that can be given to citizens who do not have an efficient king, because, there is no sin greater than having a sinful anarchy. There is another advantage of welcoming a powerful king where there is none. It is possible that the attacking king will be pleased by the welcome and honour of the people and may look upon them with affection. Then the whole kingdom will enjoy happiness. In case these people were to oppose him and anger him, then that king being mighty and angry may destroy the kingdom. Therefore welcoming him is a better neeti.

### **Risks of Anarchy**

Therefore a nation which desires progress should enthrone a capable king; this will be their main duty. There is no use of money or wife in a kingdom without a king, because, in a country with anarchy neither can be protected. In a country with anarchy, the sinners will happily keep snatching the properties/assets of others. But if other mightier wicked persons snatch his assets, he will also desire the existence of a powerful king. Therefore in a country with anarchy there is no safety to sinners also. In an anarchic country even those who are free will be made slaves. Women will be snatched away by force. It is for this reason that devatas created king to govern & protect people. If there were no king with powers to punish, the mighty would have swallowed the weak just as bigger fish eat up the smaller ones.

If a king is defeated by the enemies it is not merely a defeat of the king. It is the defeat of citizens of the kingdom. Therefore the citizens should do everything to increase the might of the king. A king who is thus strengthened by the citizens becomes difficult to defeat and becomes efficient in governing them (Shanti parva; Rajadharmanushasana; 67).

## **Conclusion:**

It is evident that Dhritrashtra failed in giving good and clean governance to his citizens of Hastinapur despite suggestions by his minister Vidura. On the other hand, Yudhishtira was effective as a king and an able administrator as he took inputs both from Vidura and Bhishma, on the duties of a king (administrator). The quality of administration and the legal system during the period of Yudhishtira was one of the best in the history. When we compare the current governance in many corporates with the governance of Yudhishtira, we find that there is lack of value system and less coordination between various elements causing friction and low productivity. The current models of governance fail to identify the human touch that is required to handle employees, colleagues and competition alike to succeed and sustain in the industry for long term benefits. A close observation of the contemporary models of governance indicates a biased or one sided approach where success is momentary. We see the concentration on either the shareholders' wealth maximization or the accountability of the directors discussed by such models. But businesses are in pursuit of a sustainable model for governance that can come only through a holistic approach where the interests of all stakeholders are taken care of. There is an innate need for a multi-dimensional model that considers variety of factors empowering the management for a powerful tool of comprehensive and transparent governance.

## **Narada's Questions to King Yudhishtira**

Before taking charge of the sabha made for him by the danava Maya, king Yudhishtira pays homage to ten thousand brahmins with garments, garlands and eatables. We again see how every grand event among the kshatriyas – even one involving an exchange between kshatriyas and a danava – becomes a rent-seeking opportunity for the brahmins. The epic, certainly written by the priest class, does not miss many opportunities to show the kshatriyas as making deep obeisance to the brahmins.

At any rate, the upkeep of the varna system is an attitude central to the Mahabharata, and in as much as evidences of this attitude today rightly attract criticism, the Mahabharata also cannot save itself from the same. The impulse to rewrite the epic, to alter the shlokas where the epic reinforces the caste system, stems from identifying the text as a text of its times, from seeing it as a political tool more than it is.

Saying that the original text needs to be criticised in places does not mean that the epic, in and of itself, has no value for our times. There is a lot of wisdom that can be drawn from it. For one, the text alludes to, and promotes, strict principles of governance and proper conduct for kings. Perhaps the best example of this is seen in Narada rishi's visit to king Yudhishtira's sabha, in which the sage interrupts the revelries in the court and then poses a flurry of questions to the king. Note, here, that it is Narada's second visit to the Pandavas. In the first visit, he had advised them to establish a protocol of exclusivity with Draupadi and set up rules for punishment in case that protocol was breached.

Narada asks Yudhishtira many questions, one after the other, never waiting to get an answer to any one question. This method implies that the questions are rhetorical, their purpose not to see if Yudhishtira knows the answer but only to remind him of their relevance and complexity. Narada is giving a lecture. Narada asks Yudhishtira if he uses "the six royal qualities to judge the seven means?", or does he "follow the eight duties before concluding an alliance?", or are his "six chief officers" devoted to him? The usage of numbers in Narada's speech tells the reader that the details about royal qualities and means and duties, et cetera, have been enumerated in other texts

which are available for the king to study. Particularly interesting are the instances when Narada asks Yudhishthira about his mental health and personal habits. Eg. "Do you find happiness without making your mind suffer?" Or, "In the dead of night, do you think about what should be done and what should not?" Such questions suggest that while the ruler is expected to stay awake with the concerns of good governance, his (it's always a 'he' here) mental health is clearly seen as a crucial element in the overall structure. Narada's questions thus provide valuable insights into the persistent issues of governance and jurisprudence.

### **Kautilya: Sovereignty**

The sole leader of the entire territory or the kingdom was the monarch or the sovereign who has an absolute control over the entire state. Kautilya favored hereditary monarchy as it ensured continuity. He had great faith in the law of primo-geniture, that is, the eldest son taking over the reigns from the father or the king. Kautilya emphasized on the need for proper upbringing of the prince in order to avoid future problems.

Kautilya also explained the plausible dangers that a king can encounter with reference to his sovereign power. Kautilya made it very clear that dangers to the sovereignty come from three quarters, viz., from the enemy, within the territory and sometimes the wrong policy of the king himself. In some cases, even the ministers might be a part of the trouble when they feel neglected. It is for this reason that the king must always respect the ministers all the time. Further, weak fortification of the territory can be a serious threat to the sovereignty of the king. Similarly, lack of enough funds can also be a danger and efforts have to be made for the constant flow of funds to the treasury. It is also stated that a well-equipped and prepared army would ward off any dangers to the sovereign power of the king. Finally, if the king lacks enough number of allies or friends, then again his power would be in danger.

As regards the internal troubles, these are considered much more dangerous than the external troubles. In order to make sure that there is less likelihood of trouble within the kingdom, a king must be able to control the army as well the finances of the kingdom. It is for his own good that he must follow the policy of divide and rule. It is also important for the king to strictly audit the national income and sources of expenditure. Kautilya suggested that the construction of more forts on the borders and friendlier relations with the neighbours saves the sovereign power of the king or the monarch.

### **Six main impact of Globalisation on the Sovereignty of the State are as follows:**

#### **1. Lessened Role of State in Economic Relations:**

The acceptance and march of the process of liberalisation-privatisation has acted as a source of limitation on the role of the state in the economic sphere. The failure of the public sector to deliver the desired goods and services, the decline of faith in the ability of the state to organize and manage production of goods and services for the people have together led to a decline in the economic functions of the state.

#### **2. Regional Functionalism and Binding Decisions for Member States:**

The emergence of free trade, market competition, multinational corporations and international economic organisations and trading blocs like European Union, NAFTA, APEC, ASEAN and others, have limited the scope of the operations of state sovereignty in the sphere of international eco-

conomic relations. The member states of the European Union, for example, have to abide by the rules and policies made by this organisation.

### **3. Limitations of Decisions of International Instructions:**

Increasing international inter-dependence has compelled the state to accept limitations on its external sovereignty. Each state now finds it essential to accept the rules of international economic system, the WTO, the World Bank and the IMF.

### **4. Emergence of Global People Movements:**

Globalisation has encouraged and expanded people-to-people socio-economic cultural relations among all the people of the world. IT revolution and development of fast means of transport and communications have been together making the world a real Global Community which, now appears to be developing towards a global village. The people of each state now deal with people of other states as members of the World Community. The loyalty towards their respective states continues, but now they do not hesitate to oppose those policies of their states which, they feel, are not in tune with the demands of globalisation. Even the movement for opposing globalisation has tended to bring the people of world on one platform and instill among them a feeling of community living at the global level.

### **5. Lessening Importance of Military Power:**

The state continues to maintain its military power as an important dimension of its national power. However, the strength being gained by movement for international peace and peaceful coexistence as the way of life has tended to reduce the importance of military power of the state.

### **6. Treaty Obligations of Each State:**

Several international conventions and treaties have placed some limitations upon all the states. All the states are today bound by the rules and norms laid down by several such conventions. The need to fight the menace of terrorism and rogue nuclear proliferation as well as the shared responsibilities to protect the environment and guarantee all human rights of all have compelled all the states to accept such rules and regulations as are considered essential for the securing of these objectives.

Thus, Globalisation and several other factors have been together responsible for putting pressure on the sovereignty of the state. The role of the state in the economic relations has undergone a big change. It has got reduced. The operation of the new international economic system with globalisation as its objective has been further reducing the role of the state sovereignty. Several scholars hold that Globalisation has essentially limited the concept of state sovereignty. While some of them, the 'die-hard pluralists' accept it as useful and ideal, some others, the 'die-hard nationalists' regard it as an undesirable and harmful development. Neither of these two views is however fully valid.

State sovereignty continues to be intact in its internal and external dimensions. The state continues to be sovereign state and its sovereignty continues to be comprehensive, permanent and absolute. While its functions have undergone a change, the world has now 193 sovereign independent and equal sovereign nation-states. People continue to live and enjoy their lives as citizens of their respective states. The new needs for global level economic and trade integration, protection of environment, protection and security of all human rights of all, the need to collectively fight the

menace of international terrorism and the need to fight a collective war against poverty, hunger, disease and under- development have changed the role of state in the 21st century. It does not, however, mean either the end of sovereignty or a serious limitation on the sovereignty of state.

### **Kautilay's View on War and Peace!**

No state can afford to live in a state of continuous war. Kautilya was of the opinion that when a particular issue can solve the problem from peace and war, one should prefer the former. Peace must be according to the circumstances and in the interests of the state. Kautilya described at length conditions under which a king must be ready to wage war. In his opinion, by being a king, it is his responsibility to protect and for this purpose he should be always prepared to wage a war. According to Kautilya, a king must attack enemy or an ally's enemy and should not be given any opportunity to attack him. As regards the neutral states, he was of the opinion that the king must respect their stance.

The king must attack, when he is financially in a better position compared to others. On the other hand, a superior enemy must be attacked at a time when he is embroiled in internal troubles. A king must also take into consideration bravery, energy and the personal drive of himself and also when the people are materially and morally in a better place than the enemy country's people. Kautilya also stated that a king must make use of spies and through methods like giving high inducements; he must ensure that the spies remain in their positions and assist him in espionage. Kautilya very clearly stated that the king must engage in wars at a time when there is less likelihood of monsoons.

### **Kautilya, in fact, categorized wars into the following three types:**

#### **1. Open Fight:**

Where the place and time indicated.

#### **2. Concealed Fighting:**

Involving the use of tactics on the battlefield.

#### **3. The Silent Fight:**

By using secret agents and killing the officials of the enemy. Kautilya, however, was very clear that a king cannot always keep waging wars and conquering territories. In fact, no state can afford to live in a state of continuous war. Kautilya was of the opinion that when a particular issue can solve the problem from peace and war, one should prefer the former. Peace must be according to the circumstances and in the interests of the state.

### **Seven Pillars of State-craft**

The Mauryan era of ancient India gave the world a significant treatise, the Arthashastra of Kautilya. It offers deep insights into political statecraft. Kautilya is known as the Indian Machiavelli because of his ruthless and shrewd tactics and policies reflecting an approach to statecraft including warfare.

## Nature of State

### Kautilya Saptang Theory of State

The state of 'nature' is imagined to be one of total anarchy, in which 'might was right'. When people were oppressed by **Matyanyaya**, the law of the fish, according to which the bigger fish swallows the smaller ones they selected Manu—son of Vivasvat the king. It was settled that the king should receive one-sixth of the grain and one-tenth of merchandise and gold, as his due. It was the revenue which made it possible for the king to ensure the security and prosperity of his subjects. People agreed to pay taxes and he ruled by one person in order that they might be able to enjoy well-being and security. In Kautilya's Arthashastra, there is no explicit theory of social contract as laid down by the contractualist. Neither does Kautilya use the contract to make the king allpowerful.

### Elements of State

Kautilya enumerated seven prakritis or essential organs of the state. They are as follow:

- (i) Swami (The Ruler)
- (ii) Amatya (The Minister)
- (iii) Janapada (The Population)
- (iv) Durga (The Fortified Capital)
- (v) Kosha (The Treasury)
- (vi) Danda (The Army)
- (vii) Mitra (Ally and Friend) Swami (The Ruler)

It is the first and the most important element. Swami means the monarch. He should be a native of the soil and born in a noble family. He should be brave and well learned. He makes all the important appointments and supervises the government. He has to be virtuous and should treat his subjects like his own children. Kautilya has given extensive powers to the monarch but those powers are meant for the welfare of them subjects. In the welfare and happiness of his subjects, lies his own happiness.

### Amatya (The Minister)

It refers to the council of ministers as well as the supporting officials and subordinate staffs.

They are meant for assisting the monarch in day to day affairs of the state. Amatya gives suggestions to king, collects taxes, develops new villages and cities, ensures defense of the state and all other tasks as assigned by the king.

### **Janpada (The Population)**

It refers to territory and people of the state. The territory of the state should be fertile and should have abundance of forest, rivers, mountains, minerals, wild life etc. It should have good climate. People should be loyal to their king, hard working, disciplined, religious, ready to fight for their motherland, should pay taxes regularly and happily.

### **Durga (The Fortified Capital)**

It refers to forts. The state should have sufficient number of forts across its territory at strategic locations for ensuring defense against foreign invasions. Forts should be built near hills/mountains, deserts, dense forests and big water bodies. They garrison soldiers, store food grains for emergency and also serve as a hideout for the king when his life is in danger.

### **Kosha (The Treasury)**

This means treasury of the state. Finance is life blood of any state without which it is almost impossible to run it. Money is needed for paying salaries, building new infrastructure, etc. The treasury should be full of money and valuable metals and gems. It can be increased through taxation and plundering enemy states in war.

### **Danda (The Army)**

It refers to military. The state should have a regular, large, disciplined and well trained military. It is crucial for the security of the state. The soldiers should be recruited from those families which are traditionally associated with military. The soldiers should be paid well and their families should be taken care of in most suitable way. Proper training and equipment should be made available. Well fed and well trained soldiers can win any battle. The king should take care of the soldiers and the soldiers will be ready to sacrifice even their life for him.

### **Mitra (Ally and Friend)**

It refers to friends of the king. The monarch should maintain friendly relationship with traditional friends of his forefathers. He should also make new friendships. He should send gifts and other pleasantries for his friends. They should be helped in times of emergency. They should be loyal. Friends add to the power of the state. They are also important from foreign trade view point.

### **Role of king**

Kautilya gives extensive powers to the kings and attaches an element of divinity. His foremost duty is protection of the subjects and their property. King's sources of power revolving around three sources – **Prabhu Shakti** (the power of the army and the treasury), **Manta Shakti** (advice of wise men, specially the council of ministers) and **Utsah Shakti** (charisma). Duties of Kings Kautilya's Arthashastra does not believe in the '**Theory of Divine**' origin of the Monarch. According to him, state is a human institution and it should be manned by a human being. So, the king should be the protector of the dharma of whole society. Arthashastra pointed out duties of kings are :

- Should follow his rajya dharma.
- Should exhibit attributes, i.e. Atma Vrata (self-control) | Should ease the six enemies – Kama

(lust), Krodha (anger), Lobh (greed), Mana (vanity), Mada (haughtiness), and Harsh (overjoy).

## **System of Law**

Although, Kautilya's state theory states the monarchical democracy, but the sole authority vested under the king to make law and that it derived from four sources **Dharma** (sacred law), **Vyavhara** (evidence), **Charita** (history and custom) and **Rajasasana** (edicts of the king).

Arthashastra represents a system of civil, criminal and mercantile law. For instance, the following were codified a procedure for interrogation, torture, trial, the rights of the accused, Constitution of permissible evidence, a procedure for autopsy in case of death in suspicious circumstances, Constitution of (deformation) and procedure for claiming damages, invalid and invalid contract.

## **Machinery of Government**

The Arthashastra catalogues a phalanx of officers called superintendents, lower in importance than the ministerial officers and much below them, belonging to the sixth order, according to remuneration. They are not heads of departments. The superintendents might be as chiefs of sections dealing with various economic and other activities of the government. Most of these sections are the modern business departments. A dual control is exercised over the superintendents. As far as control of the services of the personal and collection of revenue are concerned, they are under the Collector-General.

## **Conclusion**

The Arthashastra is a textbook of practical politics and statecraft. One of the outstanding contributions of Kautilya's Arthashastra to statecraft and governance in a monarchical state. Hence, Kautilya's theory of state envisages a rational approach to governance and state craft which conceptualizes the state and the office of the kingship to be human artifacts.

## **Kautilya Society**

**Kautilya Society for intercultural dialogue** is a non-profit organization, based in Varanasi, India. It aims at promoting dialogue and partnerships among people and cultures across the world and supports development cooperation actions and initiatives.

## **Concept of Better Society**

Kautilya Society is an Indian Non-governmental organization with an internationally open membership and worldwide operation. KS was originally founded in Varanasi, India (1998) by a group of students and scholars of Indian philosophy to promote Indian studies and interfaith dialogue. From a mainly academic concern, the Society gradually expanded its scope to include social action and media production. KS promotes partnership amongst people using electronic media platforms for knowledge exchange and manages a study centre cum residency in Varanasi for on-site personal interactions.

## **Kautilya Society Mission and Values**

In the 1980s, the group, that later created the Society, was composed of scholars that had come to learn and experience in Varanasi, the traditional hub of Indian studies. Initially, it was a group for reciprocal assistance in addressing the challenges of the city (both intellectual and organisational); later on, it became a network amongst those who had gone through "the Banaras" experience.

The first concrete actions of the newly created association was the publication of a book on Indian philosophy and the preparation of a documentary film for the Indian television (Doordarshan). In 2000, the KS started the "hospitality project", i.e. the utilisation of a building in the Varanasi historical city centre as a meeting ground, study centre and residence. The Kautilya Society centre was neither a hotel, where individuals are isolated and the environment is commercial, nor an ashram, where there is an uniform ideology and a "guru" centred hierarchy, but something in between, with some discipline and some autonomy, some community sentiment and essentially a respect for diversity and reciprocal privacy.

Later on, the Kautilya Society became an NGO acting as an "umbrella institution" under which members can undertake different projects in coherence with the organisational bye laws, each managed autonomously, all coordinated within the "Kautilya programme", with the overall objective of promoting dialogue amongst civilisations and traditions. At the centre in Varanasi, KS members independently carry out their studies, travels and social projects; however all Society members are invited to create occasions for peer-to-peer learning and for dissemination of the knowledge created through dialogue. The frequency and the intensity of such occasions depends on the generosity and brightness of the members who reside in the logistic hub at Varanasi or contribute to the community spaces in the Internet.

## **The name Kautilya**

Kautilya is the name of a historical figure from the 4th century B.C. (also called "Chanakya", i.e. "the Cunning") and the author of the *Arthashastra*. However it was not the historical figure but the myth around him, that inspired the founders of the Society. The myth narrates that Kautilya was a brahmin who rebuked a king, declaring in a public assembly that he was behaving without intelligence for the state and without ethical responsibility for the people. The king publicly offended Kautilya as a "talkative impotent" claiming that what gives real political power is the concrete force of the warriors and not the abstract intellectuality of the Brahmins. Kautilya challenged the king and claimed, in the public assembly, that he would have proved that intelligence and discipline are the source of all forms of power. He is generally represented with a long braid because he is believed to have promised not to cut his "choti" (braid) until he removed the king from the throne and put the crown on someone not born in the Kshatriya (warriors) caste, but was ready to learn from Kautilya the art of governance. If Kautilya was really, as is commonly believed in India, the guru of Chandragupta Maurya he really did it!! And he overthrew the king to reinstate one whom he had taught the art of governance! The founders of the Kautilya Society liked the myth and the idea of knowledge as the real "empowering factor": they wanted a name that referred to the classic culture of India without using the smoky connotations of asceticism and transcendentalism.

## **Kautilya Society Activities**

The Kautilya Society members value traditions but contrast bigotry and ethnocentrism (including the modern Western biases). They value difference and therefore do not accept any form of denigration of the others. They contrast all forms of oppression on other persons, especially when motivated by the desire to disempower certain groups or categories. In all activities, the KS requires that women are respected and empowered at all levels, be they members, guests, employees or friends; and that in all external communication, women rights are promoted and violence against women is contrasted. In all dialogues and research, KS requires that the authority of opinions is based on the degree to which it is freely accepted by the counterparts and that it leads to reciprocal understanding. We contrast any sort of absolutism and any attempt to undermine the

credibility of others.

## **Promoting Intercultural Dialogue**

In the study centre of Ram Bhawan in Varanasi, the Society animates occasions of personal and group interaction, seminars and cultural events; it maintains a library and a support cell for those who want to learn more about Varanasi culture and for newsmakers who want to cover events in India. On the terrace of Ram Bhawan, the KS hosts Filocafè, a space to study, read, network, converse, that has become popular among the younger generations of Varanasi that want to gather in a more international and multicultural context. So, communication now moves through both channels, towards foreigners that want to better understand local India and towards local Indians that want to have a more global horizon of thought.

## **Promoting Responsible Tourism**

Responsible Tourism is tourism that uses, in a responsible manner, the social and environmental assets that travellers are interested in visiting. This kind of tourism minimises negative economic, environmental and social impacts, generates greater economic benefits for local people, enhances the well being of host communities, involves local people in decisions that affect their lives and livelihoods, and makes positive contributions to the conservation of the local natural and cultural heritage.

Religious tourism in Varanasi has given to the city, for centuries, enormous economic benefits while maintaining the development of spiritual, philosophical and artistic knowledge. Temples, royal palaces, and ashrams have been the focal points for such tourism. Foreign tourism, interested in observing such traditions, was begun by the British and developed outside the cultural and religious centres of towns, usually in the cantonment areas. These have contributed to increasing the wealth of the area and to the success of large chains of hotels like the Clarks, Taj, etc. However, utilising these models to unsettle existing patterns of hospitality and tourism, especially in the old city area, is dangerous for the tourism industry itself.

Vrinda Dar - Destroying the ancientness of Varanasi is in fact destroying its potentiality for development. At KS, we believe that the construction of large hotels in the Varanasi heritage zone does not contribute to sustainable development in the city. Large chains of hotels usually bring their own personnel, managers, shops, etc. and employ the local labour only as their lower staff. They don't use the local boatmen, local shops, Brahmins, masseurs, etc. and their luxury tourists don't venture out to see the tiny and congested lanes that are the beauty of an old town like Varanasi. This not only has a negative economic impact on the local people but also contributes to killing local jobs and sustained employment patterns: it burdens the carrying capacity of the local infrastructure, traffic, water and electricity usage, pollutes the already congested areas with CFCs from air conditioners and poisonous fumes and noise from generators.

Ashrams, maths and small guest houses are undoubtedly much more integrated and in harmony with the existing social, religious and cultural dynamics of the town, the Ghat and the river w:Ganges. KS claims that tourism development should be managed in such a way that has a positive impact on human and physical environment. Construction of tourism infrastructures must not be dictated by large economic interests but must follow de-centralised patterns. This is also what Mahatma Gandhi advocated in his philosophy of khadi and swadeshi, an economic model that preserves local identities.

## **Protecting the Varanasi Heritage**

Hindu culture, have attributed supreme importance to the preservation of tradition. Classical civilizations, and especially the Indian one, have attributed supreme importance to the preservation of tradition. Its central idea was that social institutions, scientific knowledge and technological applications need to use "heritage" as a "resource". Using contemporary language, we would say that ancient Indians considered, as social resources, both economic assets (like natural resources and their exploitation structure) and factors promoting social integration (like institutions for preserving knowledge and maintaining civil order). Ethics considered that what had been inherited should not be consumed, but should be handed over, possibly enriched, to successive generations. This was a moral imperative for all, except in the final life stage of the sannyasa.

The KS members strongly feel, like many other citizens of the world, that India has a responsibility towards the world and towards herself to develop in harmony with her spiritual and cultural identity. Varanasi is a universal heritage city and not just for urban Indian or foreign tourists. Its architectural heritage is the frame of a natural Sun Temple, that rises on the banks of Ganges in the form of an amphitheater, where the Ghats form the platforms, the water the altar and the sun is the epiphany of God. In Varanasi, the river Ganges, that normally flows eastward, takes a sudden turn towards the North; where the sun rises perpendicularly to the river creating, at dawn, a burning line of refracting light that cuts across the river and allows the bathing devotee to pour the Ganges waters directly into the "yoni" of light. To betray Varanasi and allow its environmental and social decadence or unsustainable commercial exploitation of its unique heritage would be a betrayal to Indian tradition and to the patrimony of future generations.

In 2002, the KS prepared a draft dossier, commissioned by the Varanasi Development Authority, for proposing the enlistment of the Varanasi riverfront Ghats in the list World Heritage sites of Unesco. The Indian Government could not forward this proposal because one of UNESCO's requirements is that the site is protected by policies, plans and legislations made by local Governments. It was not enough that the Varanasi Development Authority declared it a "heritage zone"; nor that the UP Government had issued an order (no. 320/9-A-3-2000-127 of February 5, 2000, and 840/9-A-3-2001 of April 11, 2001) prohibiting new constructions within 200 meters from the Ganges river front: because these were not implemented! And there was a widespread pessimism about whether they would ever be really implemented in the near future.

Vrinda Dar - Awareness, documentation, legislation, implementation, monitoring are the processes required in order to protect the cultural heritage. In order to react against such pessimistic sloth, the KS started conducting an awareness creation campaign to sensitise the population and to advocate with the Public Authorities that they implement existing laws and constitute a Heritage Committee that proposes new laws and adequate management plans.

Vrinda Dar, the General Secretary of KS, had been personally leading the KS activities for heritage protection. She believes that the only way forward for sustainable development is to involve local communities, build their awareness about the cultural and economic value of local resources, build on local resources and hold governments accountable for their policies and actions. She maintains a blog where she informs about the progress on heritage preservation in Varanasi.

## **CONCEPT OF LAW, JUSTICE**

Kautilya deals with subject of law in the book- III of his Arthashastra. The basic objective of kau-

Kautilya's law has been to provide intellectual and spiritual freedom to man. In ancient India, law was the creation of divine revelations. During Dharmasatra period, the king had no law making power. But according to Kautilya, there are four sources of law like Dharma (sacred law), Vyavahara (evidence), Charitra (History) and Rajasasana Edicts of the king. Kautilya gives importance to rational law or king's law.

Kautilya talked of seventeen types of laws such as marriage and allied topics, division of inheritance, building, non-performance of agreements, recovery of debts, concerning deposits, rules regarding slaves and labourers, Cooperative undertakings, rescission of purchase and sale, resumption of gifts and sale without ownership law concerning ownership, robbery, defamation, assault, gambling and betting and miscellaneous.

Kautilya gives a detailed account of law. Kautilya says it is essential duty of government to maintain law. The ultimate source of all law is dharma. He appealed in the name of 'Dharma' to the sense of honour and duty and to humandignity, to moral responsibility and to enlightened patriotism. The judge in the Arthashastra was called 'dharmashta' or upholder of dharma. The judge was appointed by the king. The judges were appointed, controlled and removed by the executive, but were appointed, controlled and removed by the executive, but were independent in their imparting of justice. Kautilya makes a distinction between civil law and criminal law.

### **Civil law:**

Kautilya in his Arthashastra in detail, civil laws concerning marriage, the duty of marriage, the property of a woman and compensation for remarriage. He was quite liberal in his concept of marriage. According to him, any kind of marriage is approvable provided it pleases all those who are concerned in it. He gives the woman the right to remarry if a husband is of bad character or has long one abroad or has become a traitor of his king or is likely to endanger the life of his wife or has fallen from his caste or has lost virility.

Regarding the law of inheritance, Kautilya says a father distributing his property shall make no distinction in dividing it among his sons. If daughters are unmarried they will be given adequate property payable to them on the occasion of their marriage. Regarding the slaves and labourers, Kautilya suggested law prohibiting the selling of a Sudra who is not a born slave and Arya in birth. In case it is done by his kinsmen, the latter will be fined. If persons other than kinsmen do the same, they shall be liable to capital punishment. Purchaser as well as the abettors shall be punished. However, it is no crime for the mlechhas to sell or mortgage the life of their own offspring. But an Arya shall never be subjected to slavery.

### **Criminal law:**

Criminal law deals with matters of serious crimes and capital punishment. It includes robbery, theft, defamation, assault etc. On robbery, he says, sudden and direct seizure of articles lead to the act of robbery, fraudulent or indirect seizure is theft. Fine for direct seizure of articles shall be proportional to the gravity of the crime. On defamation, he says, character assassination, contemptuous, talk or intimidation constitutes defamation. If a person of superior rank is abused, the amount of the fines shall be doubled, if of lower rank, it shall be halved. If any of a lower caste abuses the habits of one of the higher castes, the fine imposed shall increase from 3 panas up to 100 panas. If any of the higher castes abuses one of the lower castes, the fine imposed shall decrease from 2 panas. Defamation of one's own nation and village shall be punished with first amercement, that of one's own caste with middle most and that of gods or temples, with highest amercement.

Kautilya does not condemn gambling outrightly nor does he prescribes punishment for gamblers. He suggests a state control or gambling. It to be centralized in places provided by the state and officers in-charge of such places are to control revenues from the gamblers on behalf of the state. Kautilya prescribed different types of laws.

## **JUSTICE**

Justice is the bedrock of society. Kautilya emphasises the need of justice, particularly in one direction. Taxation must be just and equitable. Law becomes meaningless if it is not enforced by judiciary. Law in the hands of ignorant people gets tempered and become partial. Kautilya deals with law and the process of giving justice to the people. The king was the fountain of justice. The king appoints the judges and also sees that justice is administered impartially. It was the duty of the king to protect his citizens with impartial justice as this would lead him to heaven.

## **ORGANISATION OF JUDICIARY**

Kautilya prescribes for three members acquainted with sacred law and three ministers to the king to carry on the administration of justice. Judges are to be guided by Dharma, they are known as Dharmasthas. The judges are to be appointed at different head quarters of 400 villages and at the chief city with 800 village around it. The purpose of arranging the judiciary in his way to make that doors of the judiciary very much nearer to the people. The Judicial system suggested by Kautilya is quite scientific and very well planned. He has laid down rules and regulations about the procedure for holding the court, acquiring evidence, listening to the witness, appointment of Judges, their control and punishment etc. The ultimate power of controlling the judges lay entirely in the hands of the king. There were two types of courts called Dharmastiya (Civil Court) and Kantakaso-dhana (Criminal Court). The courts should hold their sessions in the big towns. There were also village tribunals. In certain important cities justice was administered by three ministers and three other judges well acquainted with sacred law. The whole judicial administration was presided over by the Chief Justice. Above him there was the king assisted by his ministers and lawyers.

## **JUDICIAL PROCEDURE**

Kautilya has given complete Judicial procedure. Kautilya says before the trial starts, the year, month, season, the date, the nature and place of the deed, the residence, the caste, the gotra the name and occupation of both the plaintiff and the defendant both of whom must be registered first. Then the statement of the parties shall be taken down in such order as is required by the case. Both the plaintiff and the defendant are required to deposit the money so that the case can start. The judges will interrogate the parties as well as the witness who are called in if the defendant contests the claim. Only those persons who are present at the time of transactions can be placed as witness. Such witness are called hearers. Secondly the witnesses must be trustworthy and honest. In case a witness gives false statement, he has to be fined twenty-four panas.

Kautilya suggests five conditions to be followed by the judge to arrive at a decision. Such conditions are: a distinctly seen offence, a voluntary admission straight-forwardness in questions and answers put in the court, reasoning and oath. But he warns the Judges to be careful and impartial while delivering the judgement when a judge does not inquire into the necessary circumstances, makes unnecessary delay in his duty, helps witness, he shall be punished with highest amersement. If he repeats the offence, he shall both be punished with double the above fine and dismissed.<sup>60</sup> Kautilya was the first ancient law giver who gave every man and woman the right to move to court. He suggested for a system of immediate Justice, equity and natural justice.

## Principles of Public Administration

Kautilya attempts to elaborate on general principles for the running of public administration in a state. These principles can be grouped in two sets; one embodying the essential attributes of the state and the other linked to the operational principles of administration. **The principle of authority:** is the essence of administration along with obedience and discipline. People consisting of four castes and four orders of religious life will keep to their occupations and duties when the king guides them with due authority. Authority is obeyed by the people on account of sanctions backed by a series of punishments. The principle of unity of command: Unity of command and direction is maintained because of the king's authority. This is not merely for the purpose of security of the King's person, but also for the purpose of maintaining the integrity and stability of administration against internal dissension and external aggression. Kautilya outlines an elaborate system of spying and allurements. All members of the bureaucracy derive their authority from the King, stand before the people as representatives of royal authority, and are ultimately responsible to the king. This is evident from the reference in Arthshastra to the enforcement of orders, the sending of writs and the procedure of forming royal writs. As for the stability of command, Kautilya's preference is clearly towards a hereditary monarchy which he believes also helps in the continuity of the principles of governance and administration.

**Principles of motivation:** Arthshastra identifies four different methods of motivation, viz, sama, dama, danda and bheda. Sama is the persuasion method, dama is the incentive method, bheda is the internal competition method and danda is the punishment method of motivation. The bureaucracy can be enthused by any one method or a mix of various combinations of these methods. Government servants are to be enthused to activity by a sense of responsibility towards the people. The state motivates them with adequate salary, pension and permanent service. He underlines a series of qualities, for officers holding different positions of responsibility.

**Other Principles:** The second set of principles – division of labour, coordination of administration, hierarchy – governs the machinery of administration. All are needed for the smooth running of government. The principle of coordination automatically evolves out of the principle of division of labour. Unless coordination is effected between the parts divided for the sake of efficiency, the smooth working of division of labour would be futile. The principles of division of labour and coordination are affected at several levels of the hierarchy of government. The principle of hierarchy is followed to make coordination and execution possible. Authority would be diluted if it is not channelized through hierarchical organization and if it does not reach the lowest levels to oversee the implementation of orders from the top.

Kautilya identifies five elements of good administration, viz, the appropriate means to start undertakings, the excellence of men and materials, allocation of place and time, provision against failure and accomplishment of work. Fear, duty and interest, are among a number of motives behind the act of obedience to the orders of an administrator. Kautilya believes that good governance is only possible with the cooperation of the people as well as of the bureaucracy.

## Central Administrative Machinery

The King is the chief executive and the ministers are selected by the King on the basis of their qualities and they are individually responsible only to the monarch. The King, the Prime Minister, the High Priest and a chosen few form the Inner Cabinet whereas there is a larger body known as the Council of Ministers. Kautilya categorises the *amatyas*, *mantrins* and heads of departments

into 18 tirthas. They are:

- Mantrin – Minister
- Purohita – Priest
- Senapati – Commander of the Army
- Yuvaraja – Prince
- Dauvarika – Chief of Palace Attendants
- Antarramsika – Chief of the King's Guards
- Prasastr – Magistrate
- Samahatr – Collector General
- Samnidhatr – Chief Treasurer
- Pradestr – Commissioner
- Nayak – Town Guard
- Paur – Chief of the Town
- Karmanta – Superintendent of Mines
- Mantri Parishad Adhyaksa – Chief of the Council of Ministers
- Dandpala – Officer of the Army Department
- Durgapal – Guardian of the Forts
- Antapala – Officer-in-charge, Boundaries
- Ativanika – Officer-in-charge, Forests

In the hierarchy of Officers, Kautilya attaches importance to the superintendent, lower in position than the minister and belonging to the sixth order according to remuneration. He is not head of any department; he is the chief of the section dealing with varied economic and administrative activities of the government. e.g. the superintendent of commerce is under the dual control of the Collector General (for collection of revenue) and Treasurer General (Supply of produced and collected commodities).

The functions of the government have been arranged horizontally according to public service delivery needs. Under the Collector General are the Commissioner, the District officer and the Circle Officer, in charge of a division, a district and a circle of villages respectively. The major departments of administration were Revenue, Exchequer, Stores, Armoury, Prisons, Accounts, Agriculture, Mines, Metals, Forest, Cattle, Shipping, Commerce, Customs, Intelligence, Religious Institutions, Excise, Weights and Measures etc.

### **Local Administration – Urban and Rural**

Another distinctive feature of the administrative system is the marked preference for a decentralized polity. There are indications that a Janapada is to contain 800 gramas with a sthanika at its centre. It is also mentioned that a Samahatr (Collector General) should divide the Janapada into four divisions for revenue and administrative purposes. Under the sthanika, there are junior officers called gopaseach in charge of five or ten villages. With their help, the samahrta is to maintain a record of all towns and villages. The gopa is responsible for maintaining a record of all agricultural and other holdings in the village, census etc. For maintaining order, the samahrta has the pradestr who are stationed at the headquarters of the gopa and sthanikas. They operate both as revenue and police officers.

Next down the hierarchy is the village headman who is referred to as the gramika. Power in the ru-

ral areas was to be centred in the hands of the samaharta with subordinates spread over the country side. Decentralization in Arthshastra was for administrative convenience and efficiency alone. One cannot deduce a notion of village democracy from a reading of the scheme. Cities should be kept neat and clean. Kot-Palla was the officer-in-charge of the city and the Administrator was called Nagaradhyaksha. Each city was divided into 4 parts and each one was headed by a Sthanik assisted by a junior officer called gopa. Each looked after 20 houses. Nagarakas were to maintain peace and keep an eye on the income & expenditure of residents and foreigners. They were to take possession of unclaimed property and see that epidemics don't spread, maintain sanitary conditions and keep record of births and deaths. They could setup committees to take care of separate things like, collect taxes, maintain market standards, export and import of goods from cities etc. The affairs of the village were looked after by the Sangrahana. Every 200 villages constituted a Kharwatika, 400 constituted a Dronamukha and 800 constituted a sthania. Villages had maximum autonomy. Villages were run by Gramiks and gopas. They negotiated with the central government for getting development plans approved. Both gramiks and gopas were state employees posted in the village.

### **Personnel Administration**

Arthshastra gives great attention to the education and training of the King and the princes. Kautilya lays down a series of qualities, differing in number and order of officers holding different positions in the administrative hierarchy. The important competencies can be broadly classified as i) technical competence ii) decision making skills particularly during times of emergency iii) communication skills iv) interpersonal behavioral competence v) strength of character. Though the word 'recruitment' is not really used, Kautilya prescribes qualifications for each post which goes to prove that certain basic qualifications were made mandatory for entry into government service e.g. a prince is asked by Kautilya to study science and to observe its precepts under the authority of specialist teachers. All major appointments were made by the King himself or assisted by the Inner Cabinet and only persons having prajna (intelligence) and vakyasakti (power of expression) were to be considered suitable for state services.

He also prescribed tests such as dharmopadha, arthopadha, bhayopadha and kamopadha. Those who passed the dharma test were to be appointed as judges and magistrates, those who passed the artha test were to be appointed as revenue officers, those who passed the bhaya test would work in proximity to the King and those who passed the kama test would help in entertainment. Ministers were expected to be conversant with the teachings of the Shastras. Though Arthshastra places great importance to the training of the prince and the men in army there is very little discussion on the training of the personnel manning the civil departments. Superintendents were given the power to regulate the salaries, wages, transfer and appointments of the personnel under them (with salaries ranging from 100 to 1000 panas per annum). There are no definite rules about promotion. But the government servants who are loyal and doing good work should be rewarded according to their contribution. Every government servant is subject to punishment or transfer if he is found corrupt, slack or insensitive to public grievances. No transfer of officers were allowed in guarding royal buildings and forts. Salaries were liberal - from the highest 8000 panas for ministers to 60 panas for attendants. Pension was not allowed except to the dependents of those who died in harness. A strict code of conduct for civil servants was specified in Arthshastra.

### **Legal Administration**

Administrative courts consisting of three persons proficient in Dharmshastras and three ministe-

rial officers in the administration of law are mentioned in Arthshastra. A hierarchy of courts - from the court catering to a group of ten villages rising upto the King's court are to be maintained. Arthshastra contains references to a Code of Law. The code is set forth under 17 heads, including marriage, property, slaves, theft, injury and assault. There are four bases of law – dharma (sacred law) vyavahara (evidence) charitra (history) and rajasasana (King's edicts). In case of conflict, edicts override other bases. Judges should be knowledgeable, discerning, kind, balanced and incorruptible. Courts are of 2 types, civil and criminal. Arthshastra contains an elaborate scheme of punishment for all kinds of officers to be followed in courts of law.

## **Financial Administration**

A great deal of attention has been paid to financial administration in the Arthshastra. All undertakings depend on finance, hence foremost attention was paid to matters relating to the Treasury. Revenue generation and enhancement of the wealth of the nation were the primary tasks of the king. Loan, fabrication of accounts, self enjoyment, barter and defalcation are the causes that tend to deplete the Treasury. Increasing revenue was essential in retaining the support of the King's army and preventing it from going over to the enemy. The details of a modern budgeting system as a means to monitor the performance of various departments is given in Arthshastra. The concerned officer shall communicate the real nature of the work of his department together with the income and expenditure in detail and in the aggregate. In case the expenditures exceeds the budgeted grants, the official is personally liable to bear the excess expenditure.

Both revenues and expenditures were classified according to various parameters such as heads of income, source, period, quantity etc. This is geared towards monitoring of the revenues and expenditures as well as the other details associated with them. In addition to the financial information and control system, there is a very detailed audit and internal control system. A separate office of records and accounts and audit is assigned for this purpose. Arthshastra classified 67 sources of revenue, based predominantly on land, and grouped them under seven heads, resting essentially on the location of the activities and individuals concerned subject to taxation; e.g. those found in fortified and urban areas and those found in rural situations, those found at sites of minerals, or in pastoral, forest, or intensely cultivated areas and those situated along traffic carrying roads and waterways. Kautilya also named seven forms of revenue by type. He divided the kingdom into four districts, distinguished the urban centres from the villages, and classified the villages according to size and nature of tax liability.

## **Other aspects of administration**

Kautilya's Arthshastra is a comprehensive text attempting to detail every possible aspect of governance and administration – duties of the King, the structure and functions of the administrative machinery, municipal government, legal and financial administration, diplomacy and foreign policy, trade and commerce and social welfare administration. The king is to provide for the maintenance of the orphans, the aged, the sick and the unemployed. Special attention is to be given to town planning, housing in villages, maintenance of state buildings and forts. He also paid special attention to the use of statistics and the census. The district and circle officers were asked to collect a variety of statistics regarding land, property, families and persons, social customs and work habits. State intervention was recommended to regulate markets, fix prices and prevent unfair trade practices.

## **A Critical Appraisal**

One of the basic reasons for Kautilya's emphasis on a strong state capable of creating order and

providing good governance to his subjects is his acute awareness of the dangers of anarchy and being witness to the malady of his times - the prevalence of a number of small states constantly at war with one another. He was the first thinker who reached the pivot of realpolitik by stressing on a strong political centre in India and propounding a theory of politics which dealt with the practical concerns of administration and governance. He strongly believed that anarchy is worse than the highest tyranny. Although he was in favour of a powerful ruler, he made it very clear that this power is to be used only for the welfare of the ruled. The monarch's powers were to be hedged in with many restrictions. He was to work 18 hours a day and all questions of political importance would be discussed in the two houses of parliament (pura-janapada), a powerful instrument to curb the King's absolute authority. He also refers to the authority of canon law, customary law, usage and logical principles. Despite these restrictions on his absolute authority; the king is given the last say in all important matters of governance. This emphasis on the principle of kingship became the basis of consolidating perhaps the first centralized government in India.

The seeds of a welfare state are sown into Arthshastra with as much emphasis as an elaborate discussion on the state structure and the administrative machinery. There was nothing more important to the king than the welfare of his subjects. The idea of a welfare state is taken up and the King is authorized to create conditions for a good life by digging wells, canals, constructing dams, planting trees, providing impetus to trade and industry road construction and providing navigation facilities. A good state must have right laws and institutions besides honest and good administrators devoted to public welfare. If a king is to become a chakravartin, he must have all three assets, namely military power, financial prudence and wisdom. In his tasks the king must first use right means, but, if they fail, he may use intrigue and treachery. It is the duty of the king to reward the meritorious and punish the corrupt and in all his roles he should be a model for others. He was convinced that an unrighteous King who ignores the welfare of his subjects would fall a victim to popular revolt and become vulnerable to enemies.

For the preservation of the state, Kautilya was convinced that governance rules had to ignore the ordinary concepts of morality and utilize evil (spies, deceit, treachery, sex, violence and murder) if necessary for the good of society and the stability of the state. Kautilya often confused the preservation of the state with the preservation of the King, a stand which cannot be condoned from a modern democratic standpoint. However, Kautilya's famous definition of politics is worth quoting even today:

Politics is the acquisition of what has not been gained, the preservation of what has been acquired, the increase of what has been preserved, and the bestowal of the surplus upon the deserved.

His chief concerns - presentation and development of the state in terms of a certain concept of distributive justice, security of subjects and stability of society have been clearly stated and these concerns have a modern futuristic vision of politics that is truly remarkable for his age and times. His administrative scheme is unsurpassed in every detail: central administrative machinery, provincial, local, legal and financial administration have all been dealt with in Arthshastra which remains to this day the oldest and the longest written text of public administration in the world.

## **Kautilya and Machiavelli**

Kautilya's Arthshastra is often compared to the Prince of Machiavelli, since the two books are perhaps the world's most famous treatises on the art of Kingship. Both writers were in favour of a

strong monarchy with absolute powers. Kautilya however lived and wrote at least a thousand years before Machiavelli. They lived in similar kind of times: in an age of anarchy, turbulence and civil war. Machiavelli wrote the Prince with the professed object of advising Lorenzo de Medici to adopt all kinds of means to become master of unified Italy, just as Kautilya's sole object was the expansion of the Mauryan Empire under the aegis of Chandragupta Maurya. Both approached the problem of politics as scientists who separated private morality from a public version of the same. To both ends justified the means i.e. the end being the stability of the Kingdom and the preservation of a strong King. The realist that Kautilya was he did not attribute the degeneration of state and society to destiny or divinity but he perceived it as the direct consequence of misrule, misgovernance and lack of a political vision. Thus he evolved such principles of political conduct and good governance that would cover all such contingencies. Though he did not theorize about the postulates of statehood and society, Kautilya was the first political thinker in history to discuss politics in administrative terms (in the vocabulary of good and bad administration) recognizing the former as mandatory to the maintenance of a good and just state. A good administration touches on citizen's lives and therefore needs to continue on a sound and permanent basis is the ultimate message of the Arthshastra.

### **The many "firsts" of Kautilya**

- Arthshastra is the first comprehensive text on public administration in world literature
- He was the first to make Political Economy an independent discipline
- He was the first thinker to emphasize on the need for a strong political centre in India making its administration a major concern.
- First political realist in ancient Indian political thought
- First Indian political thinker to separate religion from politics giving the outline of a secular polity
- He focused on a professional bureaucracy based on merit, rather than caste considerations.
- Departmental system and a detailed job classification scheme were the other innovations of Kautilya
- Recognized the needs of a strong military administration
- Saptanga theory is an original contribution to political science and practice

### **Economic Ideas of Kautilya (With Critical Estimate)**

**The following points highlight the top ten economic ideas of Kautilya. The economic ideas are:**

1. Wealth
2. Varta
3. Agriculture and Animal Husbandry
4. Labour
5. Trade
6. Value
7. Population
8. Slavery
9. Welfare State
10. Public Finance
11. Town Planning and Social Security

12. Private Property
13. Justification on Interest
14. Consumption and Production.

### **Economic Idea # 1. Wealth:**

The concept of wealth as held by Kautilya was very wide in its scope. To him, wealth included money, commodity, the acquired wealth, public or private property, precious metals, the accumulated wealth, negotiable and transferability and the power of appropriation.

He also included labour and forest produce in wealth. To him, "wealth is to be acquired grain by grain, as learning is to be acquired every moment. Acquisition of wealth is always beneficial if it is acquired for the sake of a good wife, a son or a friend, or for giving away charity". Thus Kautilya justified wealth which was earned through proper means, and also he thought that accumulation of wealth was a safe method for protecting the people against famines.

### **Economic Idea # 2. Varta:**

Ancient thinkers used the word Varta to mean the science of national economy. Kautilya included agriculture, animal husbandry and trade in Varta. According to Mahabharata, Varta was the roof of the world, a thing which was most essential for economic stability. It was necessary for the King to learn about the essentials of national economy from scholars and specialists in order to discharge his functions successfully as a ruler.

### **Economic Idea # 3. Agriculture and Animal Husbandry:**

Agriculture and Animal Husbandry formed the important components of Varta. These were regarded as the basic sources of new wealth. Agriculture was given the pride of place among the occupations adopted by the people. Shukracharya was of the firm belief that by birth nobody was a Brahmin or Kshatriya or Shudra. It was on the basis of their occupation that they are distinguished from one another. Agriculture occupies a place of first stage importance in Kautilya's Arthashastra.

The art of agriculture reached a high degree of perfection and our ancient scholars well understood the minutest details of agricultural techniques. They have mentioned in their books, rotation of crops, intensive and extensive cultivation, large and small scale farming, use of fertilizers, crop diseases and their eradication, irrigation by rivers and tanks, cattle farming, seed selection, evils of the fragmentation of holdings etc. To them the largest source of State income was land revenue.

In those days the state and the community were responsible for the development of agriculture for which the waste lands were to be cleared. The value of the land was determined on the basis of its fertility. The fair prices of agricultural produce were fixed by the state to save cultivators from the clutches of traders.

### **Economic Idea # 4. Labour:**

The ancient sages appreciated the dignity of labour for 100 years. Manu and Kautilya have dealt with the methods for the regulation of wages and for the settlement of disputes between employers and workers. Kautilya did not recommend slave labour. But hired labour was there. Kautilya had laid down a code of labour discipline. For instance, he suggested that a wage worker who abandoned his work before the term had expired, was to pay the whole amount of stipulated wag-

es to his employer and a fine to the King. On the other hand, if an employer dismissed a workman whom he had hired before the expiration of the term agreed upon, he must pay the full amount of wages stipulated and a fine to the King, unless the workman was to blame.

### **Economic Idea # 5. Trade:**

Gold and bullion was regarded as a means of producing wealth, and trade was the sum of industrialised capital. Kautilya devoted a good deal of attention to the problems of trade such as regulation and development of trade by the state and the different taxes to be levied on the commodities that entered into trade. He even advocated state trading in certain commodities through departmental agencies. Kautilya advised the state to build rest houses and store houses for the caravans of traders for whom police escorts were recommended. Also trade was approved only when the supplies of commodities were left over after satisfying local needs.

### **Economic Idea # 6. Value:**

Regarding value, the ancient thinkers of India seemed to have some ideas on value which are relevant to modern times. We should take the value of each commodity according to time and place but there can be no value (price) of that which is incapable of being exchanged. Again whatever one pays for obtaining a thing must be taken to be the cost. The value is determined by the easiness, or otherwise of obtaining, and also by the inherent utility of it (Shukracharya).

### **Economic Idea # 7. Population:**

The ancient thinkers had no fear of growing population. The Vedas were for more married couples. Population could not grow beyond a reasonable limit owing to the high death rate due to constant wars between small states and loss of life due to the inadequate medical facilities. Kautilya recommended that the king should establish colonies for facilitating immigration.

### **Economic Idea # 8. Slavery:**

In Ancient India, a slave was treated as a member of family, and was not asked to do a degrading work. A slave was a hereditary domestic servant who could not use his personal earnings and could not own property. But economically he was better than a hired labourer. Slaves could not be employed by Buddhist monks. In ancient India all slaves were as good as others and hence Megasthenes wrote that slavery was unknown in ancient India.

### **Economic Idea # 9. Welfare State:**

The ancient Indian writers had a clear idea of the welfare state. According to Shukracharya, the state is a tree of which the king is the root and the counselors are the main branches, the commanders are the lesser branches, the armies are blossoms and flowers, the people are the fruits and the land is the seed". The same idea has been echoed by Kautilya, "In the happiness of his (king's) subjects lies his happiness, in their welfare, his welfare". To Kautilya, the state was to promote the economic welfare of the people and fully regulate its economic life. The state had to give subsidies for the development of trade; agriculture/ irrigation, mines, cattle welfare etc.

### **Economic Functions of State:**

Kautilya's concept of state is founded on industrial edifice. According to him, there are guiding principles for the state, first, the state should undertake those industries which help directly in making the nation self-sufficient and self-reliant, and e.g., gold, silver, diamonds and iron and other metals should be in the charge of the state. Secondly, the activities related to farming, spinning

and weaving, arts and crafts should be left to the individuals and the right of the ownership should be recognised.

Finally, the state should see that the activities relating to production, distribution and consumption are carried out efficiently and in accordance with the rules framed by it. The duties of men, women, saints and sages, lords and the kings used to be clearly defined so that their observance may help in achieving the objective. The private people can also undertake the production of goods under the supervision of the State. In addition to the above function, the State regulated the wages and working condition of workers, and helped the farmers in times of calamities.

### **Economic Idea # 10. Public Finance:**

Taxation was one of the most important sources of revenue of the state. It was known as 'rajkar'. The rate of tax was determined in accordance with the dictates of Hindu religion. Land Revenue was an important source of taxation in ancient India.

The early writers have described the features of a good tax system. "The tax system should be such as not to prove a great burden to the public. The king should act like the bee which collects honey without inconveniencing the plant". Taxes were the remuneration for the services rendered by the king as a public functionary for providing internal security to his subjects. Kautilya suggested forced loans for meeting deficit budgets.

### **He divided income from taxes into the following three kinds:**

- (a) Income from taxes on commodities produced in the country.
- (b) Income from taxes on commodities produced in the capital and
- (c) Income from taxes imposed on imports and exports.

The usual import tax was 20 per cent which varied from time to time in case of precious stones and rare commodities. Heavy taxes were imposed on the importation of luxury goods. The policy of the state was to discourage the import of luxury goods and those which were harmful for the welfare of the State. Kautilya suggested an efficient machinery for audit.

### **Two principals were followed in connection with the realisation of taxes:**

- (i) A tax should be levied once a year, and should not prove burdensome and
- (ii) Taxes should be levied according to the ability to pay.

Sources of Revenue included taxes on land, forests, monopoly and property, customs and excise duties, fines, profits of state, factories and crown monopolies, from manufacture and sale of saffron, salt, intoxicants, trade in horses, fine wool and elephants and port dues, road tolls, fruit and tree tax etc. Similarly public expenditure included public administration, defence, salaries of ministers, Government departments, maintenance of national store houses and granaries and acquisition of valuable ornaments, gems and precious stones. Whatever amount was left unused, was deposited either with the treasury or the war chest.

### **Economic Idea # 11. Town Planning and Social Security:**

Town planning included the re-orientation of main roads and streets and the subdivision of city

areas. The villages were grouped together from the point of view of economic necessities and for national defence. The metropolitan city was established after a detailed and careful planning, and due emphasis was laid on the maintenance of sanitation and prevention of fire. Kautilya believed that it was the prime duty of the state to set up charitable institutions and poor houses. Further, the state should protect the weak and the aged, to provide jobs to the unemployed.

### **Economic Idea # 12. Private Property:**

Ancient economic thinkers supported the institution of private property, both movable and immovable. The right in land was transferable and saleable. As revealed by ancient law books, the following eight sources of property were recognised in those days—gift, conquest, inheritance, partition, purchase, gain of agriculture and trade, discovery and seizure. The owner of land on which a treasure was discovered, could get the large share of it, not the whole of it.

### **Economic Idea # 13. Justification on Interest:**

Though interest was justified in ancient India, no interest was allowed on the mortgaged property. The rate of interest was also varied from class to class depending upon the purpose for which money was borrowed, economic resources of the borrower etc. The same were the considerations for charging compound rate of interest. Thus, interest in those days was part of profit. If a loan made in kind or money was to be returned in kind, interest did not exceed half of the money value of the original capital.

### **Economic Idea # 14. Consumption and Production:**

For consumption purposes, family was regarded as an economic unit. Consumption should have four ideas, namely, Dharma, Artha, Kama, and Moksha. The individual was subordinate to the family or the community. As far as production was concerned, the four agents of production namely, land, labour, capital and organisation were recognised. Land was considered as the main source of wealth.

The importance of labour was also duly recognised. "An employer not-taking work from his labourer, or an employee not doing his employer's work, should be fined". The ancient writers believed that the accumulated wealth, earned through hard labour was sufficient for a man's life. The high rate of interest prevailed in the economy was due to shortage of private capital. So the state was asked to provide cash and kind to the farmers and cash to the industrialists.

### **Critical Estimate of Economic Ideas by Kautilya:**

The ancient thinkers did not regard economics as a separate discipline. The study of economics was combined with the study of religion, ethics, philosophy, law, politics and public administration. According to Kautilya, the study of four sciences namely, philosophy, ethics, economics and politics was combined together and was essential for the salvation of individual. The economic teaching emphasised a moral life.

Secondly, the concept of welfare state was the kernel of the ancient Indian economic thought. The state was responsible for the economic prosperity of the people. Finally, economic life as well as thought in ancient India was governed by moral sanctions and religious ideals. The social equilibrium was maintained by the system of 'Varna ashram' a system of mutual checks and balances emphasizing the virtues of hard work.

## Internal Security

What prescriptions does Kautilya offer for internal security? He starts the chapter on “internal and external dangers” by noting that these dangers arise due to wrongly concluded “treaties and other settlements”. He places threats into four categories. The most serious one arises from internal originators and internal abettors and is like the “fear from a lurking snake”. Second to this is the purely external threat, both originated and abetted by foreigners. Third comes the internally originated but externally abetted threat, followed by the externally originated, internally abetted threat. So how should the king deal with these? For the purely internal threat—when originators and abettors are locals—he advises a policy of conciliation and coercion. He may employ the policy of conciliation with regard to those who keep the appearance of contentment, or who are naturally discontented or otherwise. Gifts may be given under the pretext of having been satisfied with a favoured man’s steadfastness... or under the plea of anxious care about his weal or woe. [Arthashastra IX:5] In addition, he advocates the use of spies split the ranks of the conspirators and their sympathisers. Kautilya is ruthless when it comes to coercive tactics against leaders of the conspiracy—the punishment is usually death, including what might today be termed “extra judicial killings”. In fact, taking out the leaders is Kautilya’s central prescription for handling discontented and disaffected people.

Disaffection or disloyalty (viraga) can be got rid of by putting down the leaders; for in the absence of a leader or leaders, the people are easily governed (bhogya) and they will not take part in the intrigues of enemies. [Arthashastra VII:5] When the threat is purely external, Kautilya advocates a policy of sowing dissension and coercion—essentially through the use of covert means. This entails the use of double agents to create splits among the conspirators and assassins to kill them. In the other two contexts involving a combination of internal and external actors, Kautilya proposes the use of the dissension and coercion against the foreign element, and conciliation to suppress the local.

When local persons are abetting (with foreigners), the means to be employed to suppress them are conciliation (sama) and gifts (dana). The act of pleasing a man with a high rank and honour is conciliation; favour and remission of taxes or employment to conduct state-works is what is termed gifts. [Arthashastra IX:5] Kautilya’s approach makes a clear distinction between leaders and sympathisers of internal threats. Leaders are to be neutralised, either by co-opting them or by eliminating them. Sympathisers, on the other hand, are to be offered conciliation. The foreign element relies heavily on the use of spies and assumes that the state has the requisite covert action capability to execute disinformation, defections and assassinations.

## Attributes of Internal Security, Threats to Internal Security Internal Security:

- It is the act of keeping pace with the borders of a sovereign State or other self-governing territories by upholding National laws and defending against internal threats. Article 21 of the Constitution of India, which deals with protection of life and personal liberty, reads that no person shall be deprived of his life or personal liberty except according to procedure established by law
- The right to life enshrined by Article 21 has been literally interpreted more than survival and mere existence or animal existence. Thus the security of an individual is of paramount importance along with the assurance for better enjoyment of life with dignity.
- Subsequently, the question arises about the ecosystem of the person where he lives. If the ter-

territory, locality or the ecosystem of the person is disturbed, the concept of the existence is jeopardized. This capitulate the concept of security which is interwoven and interlinked with safety.

## **Attributes of Internal Security**

The main attributes of internal security are:

- Social, political and economic stability
- Prevalence of law and order and domestic peace
- Secure territorial integrity and protect internal sovereignty
- Rule of law and equality before law-law of land should protect everyone irrespective of status
- Peaceful co-existence and communal harmony and cultural cohesiveness Further, all the dimensions discussed under dimensions of national security can also be added under attributes of internal security.

## **Threats to Internal Security**

Kautilya or Chanakya in Arthashastra wrote about internal and external dangers of the State by configuring that these arise due to wrongly concluded treaties and settlements. He classified four types of threats to security of a country:

- Internal: Most serious and fearful threats are internal which arise from internal originators or internal abettors. Chanakya compared the fear similar to that from a lurking snake.
- External: Purely external which are originated and abetted by foreigner
- Internally originated but externally abetted threats.e.g:When internal terror groups aid hostile nations like Pakistan
- Externally originated but internally abetted threats.e.g: When hostile nations like China support the Maoists of the country.

India's internal security threat perceptions are a mix of all four shades of threats defined above.The changing external environment also impacts our internal security.Events in neighbouring countries like Pakistan, Srilanka, Banglades, Nepaletc have direct or indirect influence on our internal security.Therefore in today's information and digital age, both internal and external security threats are inter-related and cannot be seen in isolation from each other.

Furthermore, Kautilya has also attributed the measures of coercion and conciliation to cope with challenges of internal security.

## **Welfare and External affairs**

Introduction The historical process of tradition of Indian Politics is primeval and traced back to the period of Vedas. The deliberations regarding politics are found in 'Smritis' and 'Puranas' by the name 'dandaniti'. References to various political texts are available which studied and discovered the concept of 'dandaniti'. The study of ancient Indian political thought is considered incomplete without the knowledge of Arthashastra written by Kautilya. Arthashastra is one of the most persuasive and comprehensive treatises in political science in the Indian Vedic civilization [1] . Kautilya made politics a scientific study in ancient India, and attempted to test the political ideas on scientific lines with empirical orientation.Many stated Kautilya as the first political realist in the world. Kautilya was the minister in the Kingdom of Chandragupta Maurya during 317-293 B.C. He has been considered as one of the shrewdest ministers of the times. Kautilya's Arthashastra is a masterwork which includes an array of topics like statecraft, politics, strategy, selection and training of employees, leadership skills, legal systems, accounting systems, taxation, fiscal policies,

civil rules, internal and foreign trade etc. After alexander left India, The Mauryan Empire was the most powerful Kingdom in India and kautilya was minister who advised the king.

Chanakya (C.350- C.275BC) also known as Kautilya or Vishnugupta. He was the man to envision the first Indian empire by unification of the then numerous Kingdoms in the Indian sub-continent and provide the impetus for fights against the Greek conqueror Alexander. His foresight and wide knowledge coupled with politics of expediency helped found the mighty Mauryan Empire in India. Kautilya is perhaps less well known outside India compared to other social and political philosophers of the world like Confucius and Machiavelli, but is definitely considered to be the first genuine political theorist in Indian history.

Kautilya's Arthashastra is a draft constitution of an ideal state. Due to his political wisdom and diplomatic skills in empire building, Chanakya is called 'Machiavelli of India'. Kautilya several times more clever and superior political thinker. If we compare statesman on the four dimension framework of war and peace, Human Rights, International Economic Justice and World order Kautilya had a strong opinion on all the four aspects. In fact people like Bismark and Woodrow Wilson in recent history had been able to demonstrate their views only on two of the four dimensions. Kautilya's work is primarily a book of political realism where State is paramount and king shall carry out duties as advised in his book to preserve his state. Kautilya's work differed from existing political theory in that it talked about ways of running the administration which were based more on self-interest than on morality.

Kautilya was far more successful as he first taught his realist philosophy to Chandra Gupta right from his childhood and then helped him to become an emperor. In this way, Kautilya was a successful King-maker or he was successful in making a philosopher king. Kautilya was a proponent of a welfare state but definitely encouraged war for preserving the power of the state. He thought that the possession of power and happiness in a state makes a king superior hence a king should always strive to augment his power. This actually coincides with the Weber's view that there is no moral in international politics which means that states must be at war all the times.

Kautilya though did not state this explicitly but we can infer that he did presume to be at war is natural for a state. A war in certain cases is unavoidable, hence, preparation and maintenance of the army, the right moves in the battle field and warfare strategies all are essential in the defence of a country, subjects which Kautilya tackles with the extra sensory precision. Kautilya's goal remained to enable the king to achieve complete power. In his opinion, the king had to be disciplined and hardworking, sleeping only four hours a night. A king also had to avoid anger and lust, because a kingdom was at stake. Kautilya advocated three types of war – Open war, Concealed war and the Silent war. Open war he describes as the war fought between states, Concealed war as one which is similar to guerilla war and silent war which is fought on a continued basis inside the Kingdom so that the power of the king does not get diluted. War fighting tactics. Kautilya was also very harsh in narrating the exact methods of fighting a war and use of various tools to reduce the strength of a state. He believed that there were three types of Kings who go into warfare and it is important to understand the distinction between the types of Kings and the appropriate warfare strategy to be selected.

Kautilya wrote in detail explaining the war strategy because he was a strong proponent of social structure. He vehemently defends the state and believes that religion and morals are supposed to serve the state. Kautilya believes that war is a means to an end for wealth and stability. Kautilya

believed that nations acted in their political, economic and military self-interest. According to Kautilya, foreign policy or diplomacy will be practiced as long as the self-interest of the state is served because every state acts in a way to maximize the power and self-interest. He thought that diplomacy is a series of actions taken by a kingdom such that it gains strength and eventually conquers that nation with which diplomatic ties were created. He also thought that treaties should be made in such a way that king benefits and serves the self-interest of the kingdom. Kautilya described three types of political system such as rule making, rule application and rule adjudication and has been recognized for his contributions to bringing diplomacy at the helm of state's affairs. To understand Kautilya's concept of diplomacy it is important to understand the Mandala concept, six types of foreign policy and four solutions. "Your neighbour is your natural enemy and the neighbour's neighbour is your friend" – this was the basic thought behind Kautilya's Mandala theory.

According to this theory foreign rules are classified into four groups. Ari, Mitra, Madhyama and Udasina. Inimical and friendly rulers are divided into two kinds natural and artificial. Kautilya thought that the king and his immediate neighbours are the natural enemies to each other. A king who attempted to give trouble to another king without reasonable cause was an artificial enemy of that king. Kautilya believed that the best kind of friend who was constant, noble, straightforward and whose friendship is inherited from father or grandfather. A ruler whose friendship was courted for the sake of protection of life and property was the artificial friend. According to Kautilya, the ruler whose territory was situated close to that of a king and his wicked enemy and who was capable of helping both the kings or of resisting either of them was a Mediator and the ruler whose territory was situated between the territories of two rival kings and who was powerful enough to help or resist either of them or a mediating king was Neutral. The neighbouring king belong to either of four classes, Parshnigraha, Akaranda, Parshnigrahasana and Akarandasara.

According to Kautilya, a powerful king should always try to make himself Nabhi of the Mandala. Depending on the situation the king should adopt any of Asana, Yana, Samsraya and Dvaidhibhava. A ruler should adopt his foreign policy by deploying the well-established four-fold policy of Sama (persuasion, conciliation), Dana (monetary and other gainful incentives), Bedhna (divide and rule policy) and Danda (Punishment). Kautilya's Arthashastra is mainly a work on the art of government. In his political and administrative ideas, the focus of attention was the king. According to Kautilya, the state is made of seven constituent elements the king, ministers, fort, rural area, treasury, army and friend. Of all the seven elements, the king is the most important as he provides leadership, dynamism and energy to other six elements. 'Artha' is the dominant matter in this world and politics is also subjected to it. This view is largely similar to materialist philosophy of Marx. In modern terminology, Kautilya's Arthashastra can be dubbed as a book on political economy. Economic power precedes the political power. Kautilya's Arthashastra is, in essence, a book on science of government whose base is economic.

According to Kautilya, Artha implies vocation of man. The earth, on which humans inhabit and depend for their livelihood, is also called Artha. Arthashastra is science of "acquisition and maintenance of (inhabited) earth." Kautilya has said, "This science brings into beings and preserves spiritual good, material well-being and pleasures and destroys spiritual evil, material loss and hatred [7]. He thinks that politics must be treated as an independent science. Only it needs to be fitted into general scheme of knowledge. According to Kautilya's beliefs, for the smooth functioning of administration and for the welfare of the people, the king had to be acquainted in the four Vedas and four sciences of government.

First Anviksiki or philosophy including the materialistic Lokayata system which sharpens the intellect opens the heart and opens the gate to all knowledge and virtue. Secondly, the Trayi or the triple Vedas, Rig, Sam and Yjur. To these might be added the Atharvaveda and historical lore. Thirdly, Varta or economics was concerned with agriculture, Cattle – breeding and trade. Lastly, Dandaniti or politics was the science of government, of the enforcement of law and order. According to Kautilya, politics was the supreme science and supreme art. It lay at the root of all. The welfare of all sciences depended on the well - being of politics. Kautilya is exceptional Indian political philosopher who was both thinker and statesman. He contributed in various social and political revolutions of his age and abstracted from his study of conflicts some general principles capable of universal application and effective in all times and ages. With more and more studies in the field of politics and economics and with a modern outlook and understanding of world affairs, the significance and indebtedness of Kautilya's 'Arthashastra' is incontrovertible. In India today, the Arthashastra is considered analogous to Aristotle's Politics and Machiavelli's The Prince.

## **Conclusion**

Kautilya is one of the most renowned Indian political philosophers. Though, he lived a long time ago, Certain philosophies from his theory are still applicable in modern political frame work. The book, written in Sanskrit elucidates theories and principles of governing a state. Kautilya established an extremely vital imperative - governance, polity, politics and progress have to be linked to the welfare of the people. Covering various topics on administration, politics and economy. It is a book of law and a treatise on running a country which is pertinent even today. His philosophies remain prevalent today in India.

## **Welfare State:**

Arthashastra sets the conceptual groundwork for making India the first welfare state. He backed welfare in all spheres. He did not talk only about human welfare but paid attention to animal welfare also. He states that "In the happiness of his subjects lies the king's happiness, in their welfare lays his welfare. He shall not consider as good as only that which pleases him but treat as beneficial to him whatever pleases his subjects" He supported the protection of livelihood, of weaker section, consumer protection and even the welfare of prisoners also. The King's dharma is to be just, fair and liberal in protecting his people. His boldness to his people should be like attitude of a father towards his children. Kautilya demarcated the model ruler as one "who is ever active in promoting the welfare of the people and who endears himself by enriching the public and doing well to them."

Kautilya is not principally concerned with broad political speculation on the origin and nature of the state (India provides no philosophical text that can be compared with the major theoretical works of Europe), and his originality is not to be found in the monarchy of abstraction. The treatise is a collection and summary of earlier Arthashastra writings. Of the three ends of human life, virtue, wealth, and enjoyment, Kautilya allocates first importance to wealth, but he is always aware of the instrumental value of religion and principled norms in preserving the structure of society. He permitted the king to determine for himself what shall have the sanction of law, although the Vedas are accepted as sources of dharma, and statute law must be well-matched with the sacred texts. Despite the importance he ascribed to the role of the king, Kautilya is practical in his approach and would give importance to that component of dominance which happens to be of most consequence at any particular time.

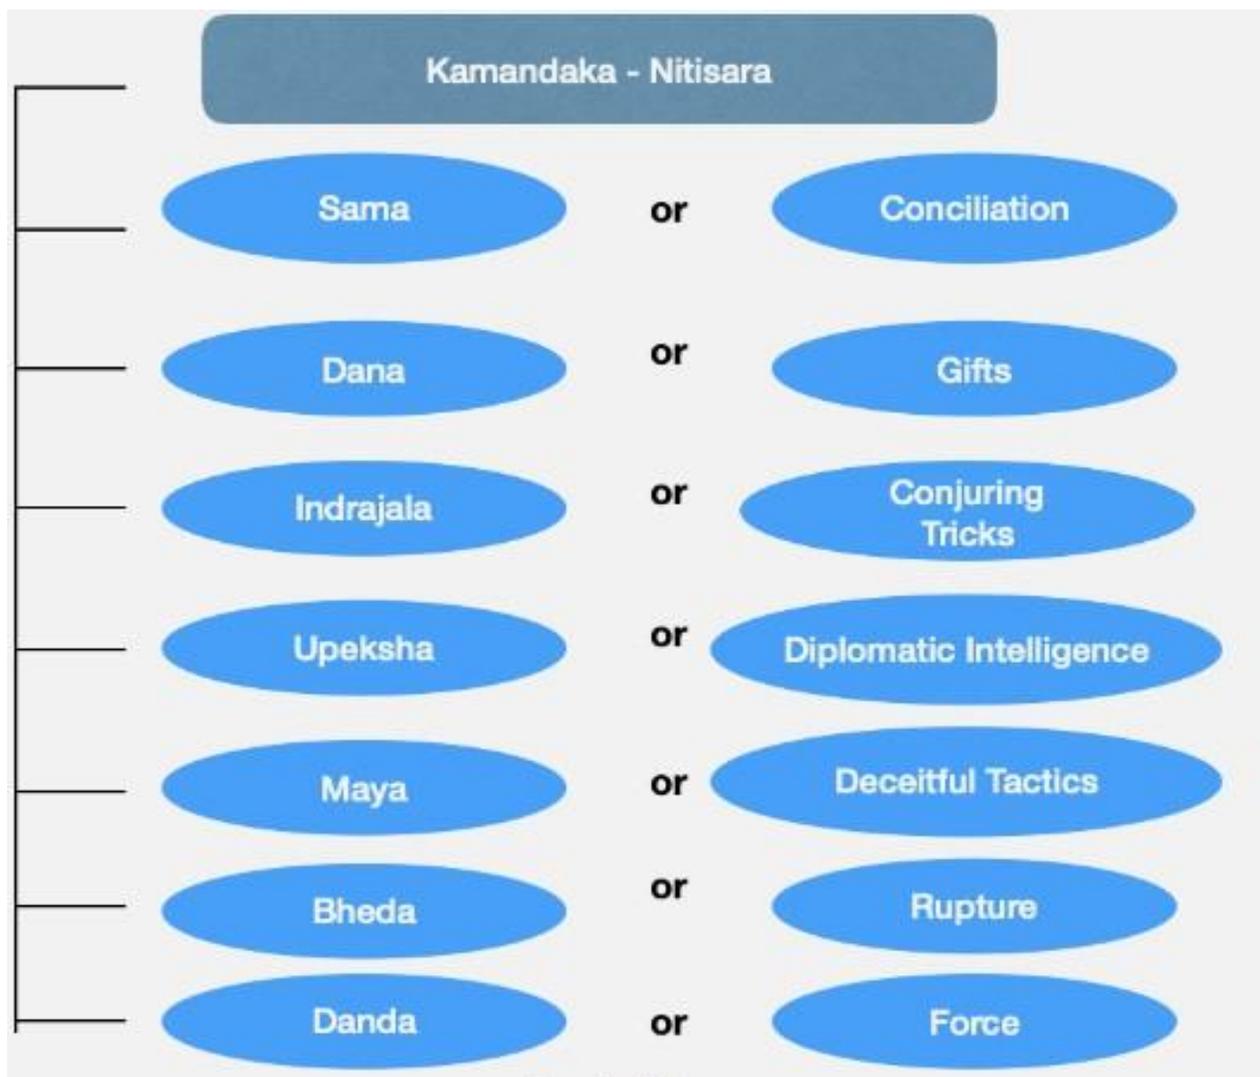

In Indian theory, independence was usually thought to cover seven elements:

1. The king
2. The ministers
3. The populace
4. The fort
5. The treasury
6. The army
7. The ally

The theory, in which diplomacy is made an integral part of politics, is intended to show the necessary conditions for the effective functioning of the state.

**Kamandaki: Social Order and State Elements:** Niti-Sara, Varna System, Ashram-Dharma, Brahmacharya, Grihastha, Vanaprashtha, Sanyasa, Prakriti-Sampat, the Concept of Upayas.

**Niti-sara:**

Niti-sara or Niti-satra means the elements of polity, it is a work of literature by Kamandaka (also written as Kamandaki). It deals with general maxims of Niti. It is a work which comprises of di-

dactic maxims and it is influenced by Kautilya's Arthashastra. The major premise of the book highlights the importance of the king and the qualities a king must possess in-order to run the state in prosperity. It accepts some of Arthashastra's theories for example.

### **The Nitisara or the Elements of Polity by Kamandaka Major Arguments**

Since India is one of the longest surviving civilisations, there is likelihood that principles of statecraft are continuing through ages. This paper probes this possibility and argues that many concepts and principles of statecraft in India have not changed and that continuity is embedded in the vocabulary and concepts in the Indian tradition. They have survived due to their own enduring logic. This paper compares Arthashastra and Nitisara and analyses the enduring continuities in statecraft, diplomacy and aspects of warfare. It seeks answers to the following questions:

- (a) What are the continuities and changes in the vocabulary and concepts from Kautilya's Arthashastra to Nitisara?;
- (b) What is the vocabulary of Kamandaka in a stand-alone mode?; and,
- (c) What is the contemporary relevance of the answers to these findings?

The author found both texts are ahistorical, dealing with the acquisition of wealth and its distribution and emphasising on war as the last resort. Some common aspects adhered to in both the texts are: mastering of control over the senses including non-violence; the need to ensure that the state of matsyanyaya does not prevail; anvikshiki; maintaining balance among dharma, artha and kama; importance of intelligence; the seven prakrits and twelve vijigishus in a circle of kings or mandala theory; six measures of foreign policy; the upayas in which there is no war mongering and use of force is the last resort; issues of disasters (vysanas) that may afflict the constituent elements (prakrits) and how to overcome them prior to the execution of a policy; duties of diplomats and intelligence gathering; and, aspects of war and use of power by sticking to the priorities of mantra-shakti (counsel or diplomacy), prabhav-shakti (economic and military power), and utsah-shakti (leadership).

The paper also points out the dissimilarities in concepts employed by the two texts. To begin with, while Kautilya's work is inspired by statesmanship and is of a complex nature often questioning earlier scholars, Kamandaka's is a lucid and academic work and an abridged version of the Arthashastra. In terms of uniqueness, Kamandaka stands out for deliberating at length not only on the four upayas (as mentioned in the Arthashastra) of sama, dana, bheda and danda but also the powerful concept of Upeksha (a combination of neglect or diplomatic indifference and the supreme virtue of patience) which was the strategy adopted by the Indian freedom movement. The impact of Kamandaka can be further seen on the Hitopadesa by Narayana, which has 90 verses of Kamandaka including sixteen types of alliances.

In the end, the paper argues that India's geo-cultural space extends beyond the Himalayas up to Central Asia. This has also been highlighted by the History Division of the Ministry of External Affairs in the second White Paper published in 1959 "Historical Background of the Himalayan Frontier of India," in which the Raghuvamsha of Kalidas is mentioned. In both this White Paper and in the text of Kamandaka, there is mention of the Kushan empire and Kanishka.

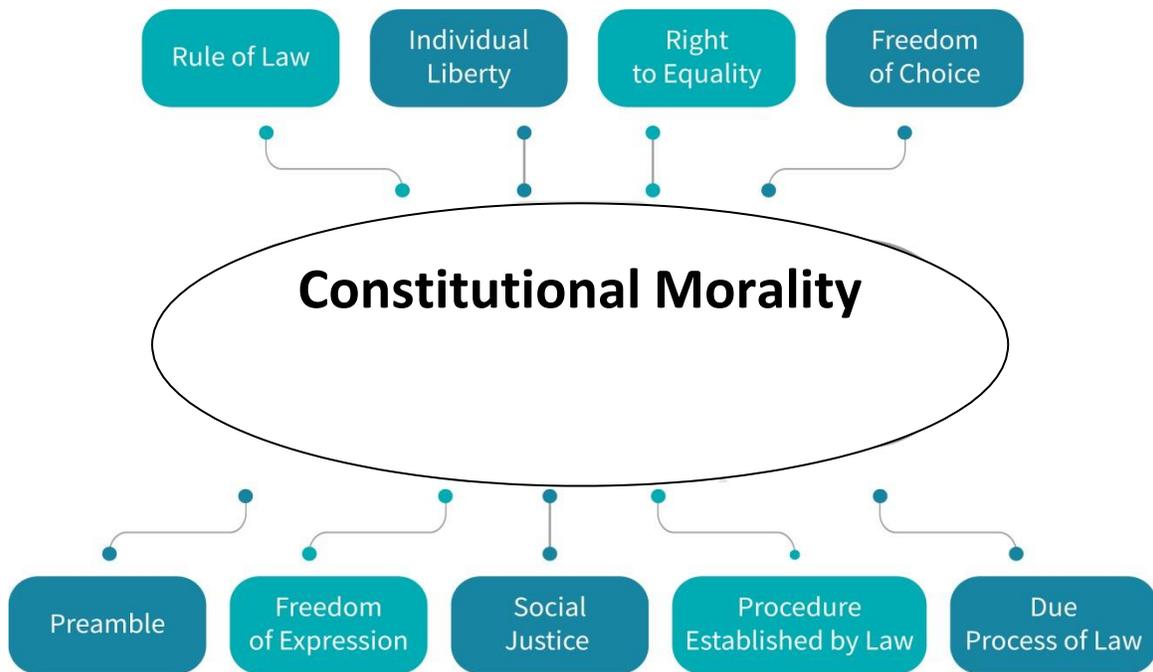

### **Major points of discussion and suggestions to the author**

- The time frame of both the Arthashastra and Nitisara as well as the context in which they were written forms a significant background for the comparison process. Further, the Buddhist influence on Kamandaka and Kautilya can enrich the paper by providing another dimension.
- Thematic structuring of the paper can be done on the basis of Kamandaka's notions on war, tactics, ethics, dharma, etc., and an overall idea can be given about what is distinctive about Indian texts as compared to western texts.
- When one approaches a non-western text, the method adopted should be devoid of an interpretative orientation and frames of comparison. Further, the techniques of communication should be picked carefully focusing on the inclusive macro tradition over multiple micro traditions.
- Methodology adopted by these texts can be discussed in the paper along with historical similarities and dissimilarities as well as political situation of that time while explaining the central themes of both, mentioning their categorization along with the reason for dissimilarities and commonalities.
- The difference between Nitisara and Arthashastra lies in the idea of legitimacy which changed over time. While Arthashastra was dependent on deliverance of kingly duties, Nitisara focuses on valour and the military qualities of the ruler.
- Author's personal opinion should come out more strongly amongst the commendable literature survey and referencing. And, to extend its reach to the masses, the paper can be made more lucid.

## **Constitutional Morality Introduction**

- According to Dr. Ambedkar, Constitutional morality would mean effective coordination between conflicting interests of different people and the administrative cooperation to resolve them amicably without any confrontation amongst the various groups working for the realization of their ends at any cost.
- Constitutional morality has been regarded as a paramount reverence for the constitution.
- Constitutional morality provides a principled understanding for unfolding the work of governance. It specifies norms for institutions to survive and an expectation of behaviour that will meet not just the text but the soul of the Constitution. It also makes the governing institutions and representatives accountable.
- Constitutional Morality is scarcely a new concept. It is written largely in the Constitution itself like in the section of **Fundamental Rights** (Article 12 to 35), **Directive Principle of State Policy** (Article 36 to 51), **Preamble** and **Fundamental duties**.

## **Elements of constitutional morality**

### Supreme Court's Judgements and Constitutional Morality

- Constitutional morality is not limited only to following the constitutional provisions literally but is based on values like individual autonomy and liberty; equality without discrimination; recognition of identity with dignity; the right to privacy.
- Constitutional morality means adherence to the core principles of constitutional democracy.
- For Example: In **Supreme Court's Sabarimala verdict** religious freedom, gender equality and the right of women to worship guaranteed **under Article 14, 21 and 25** of the Constitution was reinstated which struck down the practice of banning entry of women of a certain age to the Sabarimala temple in Kerala as unconstitutional.
- Constitutional morality here went against social morality that discriminates against women based on biological reasons like menstruation.
- Other Judgments by the Supreme Court defining Constitutional Morality:
  - In **Kesavananda Bharati Case**, the Supreme Court restricted the power of the Parliament to violate the Basic Structure of the Constitution.
  - In the **Naz Foundation case**, the Supreme Court opined that only Constitutional Morality and not Public Morality should prevail.
  - In **Lt Governor of Delhi case**, SC proclaimed constitutional morality as a governing idea that "highlight the need to preserve the trust of people in the institution of democracy."
  - In Sabarimala case, the Supreme Court bypassed the "**doctrine of essentiality**" to uphold the Constitutional morality

### Significance

- Constitutional morality **ensures the establishment of rule of law in the land** while integrating the changing aspirations and ideals of the society.

- Constitutional morality as a governing ideal that **highlights the need to preserve the trust of the people in institutions of democracy**. As such an ideal, it allows people to cooperate and coordinate to pursue constitutional aspirations that cannot be achieved single-handedly.
- Constitutional morality **can use laws and forms to impact and change the persisting social morality**. For example, by abolishing the practice of Sati by legislation, the right to dignity and life was passed on to the widows which later on affected the perception of the practice in the society.
- Constitutional morality **recognises plurality and diversity in society and tries to make individuals and communities in the society more inclusive** in their functioning by constantly providing the scope for improvement and reforms. For example in Navtej Singh Johar v. Union of India, the SC provided a framework to reaffirm the rights of LGBTQ and all gender non-conforming people to their dignity, life, liberty, and identity.

## Concerns

- The term has not been clearly defined by the SC, which leaves the scope of its subjective interpretation by the individual judges.
- This top-down approach to morality can affect the possibility of organic emergence of the solutions to the persisting ethical problems in society.
- Violates the principle of separation of powers: It establishes judicial supremacy over parliamentary supremacy. Against the very principle of democratic government.
- It is claimed that the application of this doctrine amounts to judicial overreach and are thereby pitting **“constitutional morality”** against **“societal/popular morality”** Need to Uphold Constitutional Morality
- The central elements of constitutional morality are **freedom and self-restraint**. Self-restraint was a precondition for maintaining freedom under a proper constitutional government.
- To uphold constitutional morality, the constitutional methods must be used for achieving social and economic objectives.
- Commitment to the **ideals and aspirations of the Constitution**.
- **Awareness creation** among the common public regarding their rights which are protected by the Constitution.
- Following the Fundamental Duties while exercising Fundamental Rights.

## Conclusion

- Constitutional Morality is a sentiment to be cultivated in the minds of a responsible citizen. Upholding constitutional morality is not just the duty of Judiciary or state but also of individuals.
- The preamble of the constitution explicitly mentions the type of society we wish to establish; it is only through constitutional morality it can become reality.
- The progressive and monumental precedents have been set-up by the judiciary in the past few years, where this doctrine has been applied especially in relation to the cases of gender-justice, institutional propriety, social uplift, checking majoritarianism and other such evils.

## Secularism

- The term “Secular” means being “separate” from religion, or having no religious basis.

- A secular person is one who does not owe his moral values to any religion. His values are the product of his rational and scientific thinking.
- Secularism means separation of religion from political, economic, social and cultural aspects of life, religion being treated as a purely personal matter.
- It emphasized dissociation of the state from religion and full freedom to all religions and tolerance of all religions.
- It also stands for equal opportunities for followers of all religions, and no discrimination and partiality on grounds of religion.

## Secularism in the History of India

- Secular traditions are very deep rooted in the history of India. Indian culture is based on the blending of various spiritual traditions and social movements.
- In ancient India, the **Santam Dharma (Hinduism)** was basically allowed to develop as a holistic religion by welcoming different spiritual traditions and trying to integrate them into a common mainstream.
- The development of four **Vedas** and the various interpretations of
- the **Upanishads** and the Puranas clearly highlight the religious plurality of Hinduism.
- **Emperor Ashoka** was the first great emperor to announce, as early as third century B.C. that, the state would not prosecute any religious sect.
- In his **12<sup>th</sup> Rock Edict**, Ashoka made an appeal not only for the toleration of all religion sects but also to develop a spirit of great respect toward them.
- Even after the advent of **Jainism, Buddhism** and
- later **Islam** and **Christianity** on the Indian soil, the quest for religious toleration and coexistence of different faiths continued.
- In medieval India, the **Sufi and Bhakti movements** bond the people of various communities together with love and peace.
- The leading lights of these movements were **Khwaja Moinuddin Chisti, Baba Farid, Sant Kabir Das, Guru Nanak Dev, Saint Tukaram and Mira Bai** etc.
- In medieval India, religious toleration and freedom of worship marked the State under **Akbar**. He had a number of Hindus as his ministers, forbade forcible conversions and **abolished Jizya**.
- The most prominent evidence of his tolerance policy was his promulgation of '**Din-i-Ilahi**' or the Divine Faith, which had elements of both Hindu and Muslim faith.
- That this was not imposed upon the subjects is obvious from the fact that there were few adherents to it. Along with this he emphasized the concept of '**sulh-i-kul**' or peace and harmony among religions.
- He even sponsored a series of religious debates which were held in the '**Ibadat Khana**' of the Hall of Worship, and the participants in these debates included theologians from amongst Brahmins, Jains and Zoroastrians.
- Even before Akbar, Babar had advised Humayun to "shed religious prejudice, protect temples, preserve cows, and administer justice properly in this tradition."
- The spirit of secularism was strengthened and enriched through the Indian freedom movement too, though the British have pursued the **policy of divide and rule**.
- In accordance with this policy, the British **partitioned Bengal** in 1905.

- Separate electorates were provided for Muslims through the Indian Councils Act of 1909, a provision which was extended to Sikhs, Indian Christians, Europeans and Anglo-Indians in certain provinces by the Government of India Act, 1919.
- Ramsay MacDonald Communal Award of 1932, provided for separate electorates as well as reservation of seats for minorities, even for the depressed classes became the basis for representation under the Government of India Act, 1935.
- However, Indian freedom movement was characterized by secular tradition and ethos right from the start.
- In the initial part of the Indian freedom movement, the liberals like Sir Feroz Shah Mehta, **Govind Ranade, Gopal Krishna Gokhale** and **large** pursued a secular approach to politics.
- The constitution drafted by Pandit Moti Lal Nehru as the chairman of the historic **Nehru Committee in 1928**, had many provision on secularism as: 'There shall be no state religion for the commonwealth of India or for any province in the commonwealth, nor shall the state, either directly or indirectly, endow any religion any preference or impose any disability on account of religious beliefs or religious status'.
- **Gandhiji's secularism** was based on a commitment to the brotherhood of religious communities based on their respect for and pursuit of truth, whereas, **J. L. Nehru's secularism** was based on a commitment to scientific humanism tinged with a progressive view of historical change.
- At present scenario, in the context of Indian, the separation of religion from the state constitutes the core of the philosophy of secularism.

## Philosophy of Indian Secularism

- The term 'secularism' is akin to the **Vedic concept of 'Dharma nirapekshata'** i.e. the indifference of state to religion.
- This model of secularism is adopted by western societies where the government is totally separate from religion (i.e. separation of church and state).
- **Indian philosophy of secularism is related to "Sarva Dharma Sambhava"** (literally it means that destination of the paths followed by all religions is the same, though the paths themselves may be different) which means equal respect to all religions.
- This concept, embraced and promoted by personalities like Vivekananda and Mahatma Gandhi is called '**Positive secularism**' that reflects the dominant ethos of Indian culture.
- India does not have an official state religion. However, different personal laws - on matters such as marriage, divorce, inheritance, alimony varies with an individual's religion.
- Indian secularism is not an end in itself but a **means to address religious plurality** and sought to achieve peaceful coexistence of different religions.

## Secularism and the Indian Constitution

- There is a clear incorporation of all the basic principles of secularism into various provisions of constitution.
- The term 'Secular' was added to the preamble by the **forty-second constitution Amendment Act of 1976**, (India is a sovereign, socialist, secular, democratic, republic).
- It emphasise the fact that constitutionally, India is a secular country which has no State religion. And that the state shall recognise and accept all religions, not favour or patronize any

particular religion.

- While **Article 14** grants equality before the law and equal protection of the laws to all, **Article 15** enlarges the concept of secularism to the widest possible extent by prohibiting discrimination on grounds of religion, race, caste, sex or place of birth.
- **Article 16 (1)** guarantees equality of opportunity to all citizens in matters of public employment and reiterates that there would be no discrimination on the basis of religion, race, caste, sex, descent, place of birth and residence.
- **Article 25** provides 'Freedom of Conscience', that is, all persons are equally entitled to freedom of conscience and the right to freely profess, practise and propagate religion.
- As per **Article 26**, every religious group or individual has the right to establish and maintain institutions for religious and charitable purposes and to manage its own affairs in matters of religion.
- As per **Article 27**, the state shall not compel any citizen to pay any taxes for the promotion or maintenance of any particular religion or religious institution.
- **Article 28** allows educational institutions maintained by different religious groups to impart religious instruction.
- **Article 29** and **Article 30** provides cultural and educational rights to the minorities.
- **Article 51A** i.e. Fundamental Duties obliges all the citizens to promote harmony and the spirit of common brotherhood and to value and preserve the rich heritage of our composite culture.

## Indian vs. Western Model of Secularism Threats to Secularism

- While, the Indian Constitution declares the state being absolutely neutral to all religion, our society has steeped in religion.
- Mingling of **Religion and Politics** that is mobilisation of votes on grounds of primordial identities like religion, caste and ethnicity, have put Indian secularism in danger.
- **Communal politics** operates through communalization of social space, by spreading myths and stereotypes against minorities, through attack on rational values and by practicing a divisive ideological propaganda and politics.
- Politicisation of any one religious group leads to the **competitive politicisation** of other groups, thereby resulting in inter-religious conflict.
- One of the manifestations of communalism is **communal riots**. In recent past also, communalism has proved to be a great threat to the secular fabric of Indian polity.
- Rise of Hindu Nationalism in recent years have resulted into mob lynching on mere suspicion of slaughtering cows and consuming beef.
- In addition with this, forced closure of slaughterhouses, campaigns against 'love jihad', reconversion or ghar-wapsi (Muslims being forced to convert to Hinduism), etc. reinforces communal tendencies in society.
- Islamic fundamentalism or revivalism pushes for establishing Islamic State based on sharia law which directly comes into conflict with conceptions of the secular and democratic state.
- In recent years there have been stray incidences of Muslim youth being inspired and radicalized by groups like ISIS which is very unfortunate for both India and world.

## Way Forward

- In a pluralistic society, the best approach to nurture secularism is to expand religious freedom rather than strictly practicing state neutrality.
- It is incumbent on us to ensure value-education that makes the younger generation understands and appreciates not only its own religious traditions but also those of the other religions in the country.
- There is also a need to identify a common framework or a shared set of values which allows the diverse groups to live together.
- The prerequisites to implement the social reform initiative like Uniform Civil Code are to create a conducive environment and forging socio-political consensus.

## **Fundamental Rights**

Articles 12-35 of Indian Constitution deal with Fundamental Rights. These human rights are conferred upon the citizens of India for the Constitution tells that these rights are inviolable. Right to Life, Right to Dignity, Right to Education etc. all come under one of the six main fundamental rights.

6 fundamental rights of India:

### **Right to Constitutional Remedies**

1. Right to Equality
2. Right to Freedom
3. Right against Exploitation
4. Right to Freedom of Religion
5. Cultural and Educational Rights

### **What are the Fundamental Rights?**

Fundamental rights are the basic human rights enshrined in the Constitution of India which are guaranteed to all citizens. They are applied without discrimination on the basis of race, religion, gender, etc. Significantly, **fundamental rights are enforceable by the courts**, subject to certain conditions.

### **Why are they called Fundamental Rights?**

These rights are called fundamental rights because of two reasons:

1. They are enshrined in the Constitution which guarantees them
2. They are justiciable (enforceable by courts). In case of a violation, a person can approach a court of law.

### **List of Fundamental Rights**

There are six fundamental rights of Indian Constitution along with the constitutional articles related to them are mentioned below:

1. Right to Equality (Article 14-18)
2. Right to Freedom (Article 19-22)
3. Right against Exploitation (Article 23-24)
4. Right to Freedom of Religion (Article 25-28)
5. Cultural and Educational Rights (Article 29-30)

## 6. Right to Constitutional Remedies (Article 32) Why Right to Property is not a Fundamental Right?

There was one more fundamental right in the Constitution, i.e., the right to property. However, this right was removed from the list of fundamental rights by the 44th Constitutional Amendment. This was because this right proved to be a hindrance towards attaining the goal of socialism and redistributing wealth (property) equitably among the people.

**Note: The right to property is now a legal right and not a fundamental right.**

Introduction to Six Fundamental Rights (Articles 12 to 35) Under this section, we list the fundamental rights in India and briefly describe each of them.

### 1. Right to Equality (Articles 14 – 18)

Right to equality guarantees equal rights for everyone, irrespective of religion, gender, caste, race or place of birth. It ensures equal employment opportunities in the government and insures against discrimination by the State in matters of employment on the basis of caste, religion, etc. This right also includes the abolition of titles as well as untouchability.

### 2. Right to Freedom (Articles 19 – 22)

Freedom is one of the most important ideals cherished by any democratic society. The Indian Constitution guarantees freedom to citizens. The freedom right includes many rights such as:

- Freedom of speech
- Freedom of expression
- Freedom of assembly without arms
- Freedom of association
- Freedom to practise any profession
- Freedom to reside in any part of the country

Some of these rights are subject to certain conditions of state security, public morality and decency and friendly relations with foreign countries. This means that the State has the right to impose reasonable restrictions on them.

### 3. Right against Exploitation (Articles 23 – 24)

This right implies the prohibition of traffic in human beings, begar, and other forms of forced labour. It also implies the prohibition of children in factories, etc. The Constitution prohibits the employment of children under 14 years in hazardous conditions.

### 4. Right to Freedom of Religion (Articles 25 – 28)

This indicates the secular nature of Indian polity. There is equal respect given to all religions. There is freedom of conscience, profession, practice and propagation of religion. The State has no official religion. Every person has the right to freely practice his or her faith, establish and maintain religious and charitable institutions.

### 5. Cultural and Educational Rights (Articles 29 – 30)

These rights protect the rights of religious, cultural and linguistic minorities, by facilitating them to preserve their heritage and culture. Educational rights are for ensuring education for everyone

without any discrimination.

## 6. Right to Constitutional Remedies (32 – 35)

The Constitution guarantees remedies if citizens' fundamental rights are violated. The government cannot infringe upon or curb anyone's rights. When these rights are violated, the aggrieved party can approach the courts. Citizens can even go directly to the Supreme Court which can issue writs for enforcing fundamental rights.

### Features of Fundamental Rights

- Fundamental rights are different from ordinary legal rights in the manner in which they are enforced. If a legal right is violated, the aggrieved person
- cannot directly approach the SC bypassing the lower courts. He or she should first approach the lower courts.
- Some of the fundamental rights are available to all citizens while the rest are for all persons (citizens and foreigners).
- Fundamental rights are not absolute rights. They have reasonable restrictions, which means they are subject to the conditions of state security, public morality and decency and friendly relations with foreign countries.
- They are justiciable, implying they are enforceable by courts. People can approach the SC directly in case of violation of fundamental rights.
- Fundamental rights can be amended by the Parliament by a constitutional amendment but only if the amendment does not alter the basic structure of the Constitution.
- Fundamental rights can be suspended during a national emergency. But, the rights guaranteed under Articles 20 and 21 cannot be suspended.
- The application of fundamental rights can be restricted in an area which has been placed under martial law or military rule.

### Fundamental Rights Available Only to Citizens

The following is the list of fundamental rights that are available **only to citizens** (and not to foreigners):

1. Prohibition of discrimination on grounds of race, religion, caste, gender or place of birth (Article 15).
2. Equality of opportunity in matters of public employment (Article 16).
3. Protection of freedom of: (Article 19)
  - Speech and expression
  - Association
  - Assembly
  - Movement
  - Residence
  - Profession

Protection of the culture, language and script of minorities (Article 29).

Right of minorities to establish and administer educational institutions (Article 30).

## Importance of Fundamental Rights

Fundamental rights are very important because they are like the backbone of the country. They are essential for safeguarding the people's interests. According to Article 13, all laws that are violative of fundamental rights shall be void. Here, there is an express provision for judicial review. The SC and the High Courts can declare any law unconstitutional on the grounds that it is violative of the fundamental rights. Article 13 talks about not just laws, but also ordinances, orders, regulations, notifications, etc.

## Amendability of Fundamental Rights

Any changes to the fundamental rights require a constitutional amendment that should be passed by both the Houses of Parliament. The amendment bill should be passed by a **special majority** of Parliament.

## As per the Constitution, Article 13(2) states that no laws can be made that take away fundamental rights.

The question is whether a constitutional amendment act can be termed law or not. In the Sajjan Singh case of 1965, the Supreme Court held that the Parliament can amend any part of the Constitution including fundamental rights. But in 1967, the SC reversed its stance taken earlier when in the verdict of the Golaknath case, it said that the fundamental rights cannot be amended.

In 1973, a landmark judgement ensued in the **Kesavananda Bharati case**, where the SC held that although no part of the Constitution, including Fundamental Rights, was beyond the Parliament's amending power, the "basic structure of the Constitution could not be abrogated even by a constitutional amendment." This is the basis in Indian law in which the judiciary can strike down any amendment passed by Parliament that is in conflict with the basic structure of the Constitution. In 1981, the Supreme Court reiterated the Basic Structure doctrine. It also drew a line of demarcation as April 24th, 1973 i.e., the date of the Kesavananda Bharati judgement, and held that it should not be applied retrospectively to reopen the validity of any amendment to the Constitution which took place prior to that date.

## Doctrine of Severability

This is a doctrine that protects the fundamental rights enshrined in the Constitution. It is also known as the Doctrine of Separability.

It is mentioned in Article 13, according to which all laws that were enforced in India before the commencement of the Constitution, inconsistent with the provisions of fundamental rights shall **to the extent of that inconsistency** be void. This implies that only the parts of the statute that is inconsistent shall be deemed void and not the whole statute. Only those provisions which are inconsistent with fundamental rights shall be void.

## Doctrine of Eclipse

This doctrine states that any law that violates fundamental rights is not null or void ab initio, but is only non-enforceable, i.e., it is not dead but inactive. This implies that whenever that fundamental right (which was violated by the law) is struck down, the law becomes active again (is revived).

Another point to note is that the doctrine of eclipse applies only to pre- constitutional laws (laws that were enacted before the Constitution came into force) and not to post-constitutional laws. This means that any post-constitutional law which is violative of a fundamental right is void ab initio.

## Constitutionalism

The concept of constitutionalism is a mechanism that provides legitimacy to a democratic government. It cannot and should not be confused with the legality of the acts of the officials in a government setup. Constitutionalism is far more important than having a written Constitution. With some exceptions most of the countries have Constitutions but it in no way means that they practice constitutionalism. Some of the basic principles developed over time that embody the concept of constitutionalism are separation of powers, judicial control and accountable government.

- In India, constitutionalism is considered to be a natural corollary to the fundamental governance of the country.
- The Constitution of India with the aid of various legislations has developed a detailed and robust mechanism to put into place administrative mechanisms for the smooth functioning of the machinery of governance.
- However, due to a variety of factors, the distance between the government and the governed has been growing with every passing year. The rich are getting richer and the poor have resigned to their fates, areas which were backward sixty years ago remain as such.

The concept of constitutionalism has been recognised by the Supreme Court in *Rameshwar Prasad v. Union of India*. The Court stated, "The constitutionalism or constitutional system of Government abhors absolutism – it is premised on the Rule of Law in which subjective satisfaction is substituted by objectivity provided by the provisions of the Constitution itself." In *IR Coelho v. State of Tamil Nadu*, the Court held that Constitutionalism is a legal principle that requires control over the exercise of governmental power to ensure that the democratic principles on which the government is formed shall not be destroyed. Chandrachud, CJ, in *Minerva Mills* case observed, – "The Constitution is a precious heritage and, therefore, you cannot destroy its identity".

## Principles of Constitutionalism

Constitutionalism is an amalgamation of the following underlying principles:

## **Separation of Powers**

Separation of powers divides the mechanism of governance into three branches i.e., Legislature, Executive and the Judiciary. This not only prevents the monopolization of power, but also creates a system of checks and balances. As this division of powers is in the Constitution itself, this becomes an effective tool for ensuring Constitutionalism.

## **Responsible and Accountable Government**

In a democratic setup, the government is elected so that it can serve the people who help elect it. It is in this sense that the electors have a right to demand accountability and answers from their government. Therefore, when the government fails the expectations of the electorate, the authorization to govern is revoked by voting them out.

## **Popular Sovereignty**

The concept of popular sovereignty lays down that the government derives its legitimacy from the people. No corporate body, no individual may exercise any authority that does not expressly emanate from it. Even though there is a certain sovereign entity that is empowered to govern, ultimate sovereignty resides in the nation. The power of such a sovereign entity emanates from the public.

## **Rule of Law**

The presence of rule of law means that the government does not belong to men but to the laws. Dicey lays down three essential components of Rule of Law:

- Nobody is to be punished except for a specific breach of law that is established in an ordinary legal manner before ordinary courts of law.
- No one is above the law.
- Courts play a vital role in protecting the rights and freedoms of an individual.

## **Independent Judiciary**

The independence of the Judiciary is the essence of any liberal democracy and the foundation of a free society. The Judiciary is the upholder of Rule of law and if its independence is taken away, it puts the entire rule of law in jeopardy. The Constitution also envisages the separation of the judiciary from the Executive under Article 50.

## **Individual Rights**

The rights of the individual shall be at the highest pedestal for constitutionalism to thrive. The constitutional setup in India gives these rights the importance that they deserve by engraving them in Part III of the Constitution. These individual rights have not only been protected by the courts but have also been interpreted in a manner where their effect and implementation has broadened. The enforcement of these rights is ensured by the Constitutional Courts i.e. the Supreme Court and the High Courts.

## **Civilian control of the military**

Apart from these features, constitutionalism envisages that the control of the military should be in the hands of a civilian government so that the military does not interfere in the democratic decision making or attempt a military coup.

## **Police Accountability**

Constitutionalism also envisages that police while performing its duties shall uphold the rights, freedoms and dignity of the individuals, the same can be ensured by bringing the police under the control of laws and courts.

## **Conclusion**

The concept of constitutionalism has existed and thrives in all functioning democracies. However, over the years the Governments have learned to use government apparatus for their own benefits instead of benefitting the citizens. The government by giving backdoor entries to corporate interests in policy-making has vitiated the policymaking process whose primary aim is the welfare of the larger population. The very document that was adopted to ensure the rights of individuals is being used to suppress and disenfranchise them. The problem is that the Constitution cannot interpret itself and has to be interpreted by the men who hold power. The institutions that were the bulwark of Constitutionalism are either crumbling or have been effectively rendered weak and incapable. Checks and balances have been diluted to a point where their importance is merely academic. The criminalisation and influence of money power into the corridors of politics and governance have worsened an already volatile system. The frustrations that are building up due to the apathy of the government in utter disregard of constitutionalism are extremely dangerous and this slide needs to be stopped.

## **The Idea of 'Total Revolution'**

Jayaprakash Narayan (1902-1979), the great Gandhian socialist leader, raised his famous slogan, Sampurn Kranti (Total Revolution), in a speech at a huge rally in Patna on June 5, 1974. (The rally is said to have been seven kilometres long).

Two weeks later, the "gist" of this speech made in Hindi appeared in English in *Everyman's*, a weekly edited by Jayaprakash Narayan (JP). Earlier in 1974, JP had accepted the leadership of the student movement in Bihar. He had initially wanted to work with the students as an advisor; but they had not listened. The high moral stature of seventy-one-year-old JP, who had chosen to work, after India's independence, as a social activist, outside electoral politics, had already convinced the students that he was their leader. Their choice had proved wise: the JP Movement, as we now know it, found great support across the country.

The translation of JP's speech titled, *Towards Total Revolution*, which has retained its spontaneous, spoken form, affords a glimpse of his political passions. It also lets us guess the electric appeal the speech must have had on the listeners. At the very beginning, JP clarifies that their struggle was not a "movement," but "a total revolution" for which the protestors had "to make sacrifices, undergo sufferings, face lathis and bullets, fill up jails."

Although the Patna rally sought the dissolution of the Bihar Assembly, the work required to "achieve that freedom for which thousands of the country's youth made sacrifices," was larger in scope, and needed more time. JP summed up the situation facing them: "Educational institutions are corrupt. Thousands of youth face a bleak future. Unemployment goes on increasing. The poor get less and less work. Land ceiling laws are passed, but the number of landless people is increasing. Small farmers have lost their lands."

While “a new programme for the future” was expected from him, he could only offer its “main points” now, which had emerged from his discussions with “students, intellectuals and (his) colleagues.” Before sharing these points, JP dismissed the frequent accusations of communists that his student days in the US had made him an agent of that capitalist country. His dismissal began with a stirring glimpse of his student life in the US: “In America I worked in mines, in factories and slaughter houses. I worked as a shoe shine boy and even cleaned commodes in hotels. During vacations, I worked and then three or more boys lived in a single room and we cooked our own food.” (Between 1922 and 1929, he had moved between five universities in the US. While financial hardship drove his decisions, his transfers also reveal a shift in intellectual interests. He studied science briefly at the University of California, Berkeley, before shifting to the study of chemical engineering at the University of Iowa. He then moved to the University of Wisconsin, Madison, where he studied sociology with leading scholars.

Close involvements with radical student groups in Madison and the works of Marx, Lenin, Trotsky, Plekhanov, MN Roy and Rosa Luxemburg, among others, cultivated his passion for Marxism.

After getting a BA degree from the University of Ohio, where an American friend arranged for financial support, JP completed his MA from Ohio State University and returned to India soon after.)

JP clarified that he became a Marxist, and not a Stalinist. Sharing Lenin’s view that communists in colonial countries had to work with the freedom struggle, even if it was led by bourgeois leaders, he had joined the Congress on returning to India: “They (the Indian communists) said Gandhi is an agent of the capitalists...But they forgot Lenin.” During his work in the freedom struggle and after, Gandhi’s ideals of sarvodaya came to matter more for his political thought. His selfless, honest activism earned him admirers throughout India. JP found it hard to accept Indira Gandhi’s unwillingness to understand the seriousness of his struggles. He had in fact expected cooperation from her. Instead, she had indirectly accused him, two months before the Patna rally, of taking money from “capitalists” and losing therefore the moral authority to fight corruption. A deeply pained JP responded in *Everyman’s* that it was morally permissible for social workers without an independent means of income to seek the assistance of friends.

If that was corruption, he continued, then Gandhi, who had depended on the support of rich patrons, would be the most guilty. JP’s speech tacitly engaged Indira Gandhi’s accusation. His manner of engaging it exemplifies a depth of experience, political seriousness and oratorical style that have become rare to find: “There is fire in the hearts of the people. Countless children in Bihar go to sleep without food. I see numerous people getting emaciated. There is a barber from my own village. I was appalled to see how thin he has grown. When I asked Ramsujha Thakur why he was so reduced, he replied that there was nothing for him to eat. I don’t know how people manage to live. What do they eat. After the death of my wife, I have to keep account of my expenses and I am amazed at the amount I have to spend on food alone. Without the interest from the Magsaysay Award money and the help of some generous friends, I too would have possibly had to starve.” (To be concluded)

## **Terrorism**

Terrorism is a term that is seen in the news very regularly. It is a broad term and encompasses a wide variety of events and concepts. Terrorism affects the world deeply and India, particularly, has been a victim of various terror acts perpetrated by different groups.

## Definition of Terrorism

The term terrorism is very broad and there is no one definition of the term. Different people and organisations have come up with their own definition of what constitutes terrorism.

- Generally, the term terrorism indicates a criminal and violent activity performed by an individual or group of individuals or an organisation in order to strike terror among the general public and send messages to the public and governments, to fulfil a goal.
- Although the victims of the terror act may be a few people (depending upon the event), the intended target is usually larger than the number of victims alone.
- The terrorists' purpose is to send a strong message to the larger public and the government. They generally claim responsibility after conducting a violent act so as to let people know of their power and capabilities and thus, inflict terror upon the people.

### Some commonly-used definitions of terrorism are listed below:

**UN Definition:** Criminal acts intended or calculated to provoke a state of terror in the general public, a group of persons or particular persons for a particular purpose are in any circumstance unjustifiable, whatever the considerations of a political, philosophical, ideological, racial, ethnic, religious or any other nature that may be invoked to justify them.

**US Department of State Definition:** Terrorism means premeditated, politically motivated violence perpetrated against noncombatant targets by subnational groups or clandestine agents.

A definition according to the lapsed **Terrorist and Disruptive Activities (Prevention) Act** is very inclusive and exhaustive:

"Whoever with intent to overawe the Government as by law established or to strike terror in the people or any section of the people or to alienate any section of the people or to adversely affect the harmony amongst different sections of the people does any act or thing by using bombs, dynamite or other explosive substances or inflammable substances or lethal weapons or poisons or noxious gases or other chemicals or by any other substances (whether biological or otherwise) of a hazardous nature in such a manner as to cause, or as is likely to cause, death of, or injuries to, any person or persons or loss of, or damage to, or destruction of, property or disruption of any supplies or services essential to the life of the community, or detains any person and threatens to kill or injure such person in order to compel the Government or any other person to do or abstain from doing any act, commits a terrorist act." In 2002, the European Union described terrorism as having the "aim of destabilizing or destroying the fundamental political, constitutional, economic or social structures of a country".

## Terrorist Activities

Terrorists indulge in a variety of activities for primarily three things:

1. Generate fear among people.
2. Create publicity for their goals/causes.
3. Try to convince people that the government is powerless against them.

Terrorists and/or terror groups engage in random killings/assassinations, bomb blasts in public places, suicide attacks, kidnappings, extortion, destroy public property/infrastructure, hijacking, cyber-attacks, etc. They also indulge in chemical, biological, radiological and nuclear warfare. Many terror groups also engage in an armed insurgency against governments. The aim of politi-

cal terror groups varies from toppling the established government of a country to having better representation for a group of people, to seceding from a country and forming another country, to acquiring a share in the government, etc. Many other groups of terror exist solely for making illicit money and expanding their own illegal criminal empires. Many groups of organised crime are also labelled terrorist groups.

### **Terrorism: Origin of the term**

The term 'terrorism' has been derived from the French 'terrorisme', which is in turn, taken from the Latin word, 'terreo' meaning 'I frighten'.

- The word was first used in the context of the French Revolution in France, especially in reference to the 'Reign of Terror'.
- Many cite the Irish Republican Brotherhood (1858 – 1924) as the first organisation to use modern terrorist techniques.

### **Types of Terrorism**

Although there are several types of terrorism, we can classify terrorism into the following broad types:

1. **Dissent Terrorism:** Groups that rebel against the government of a country. For example, the LTTE in Sri Lanka.
2. **Left-wing/right-wing terrorism:** Terror groups that adhere to ideological leanings on the extreme end of the left-right political spectrum. Read more on left-wing extremism in India.
3. **Religious terrorism:** Terror groups based on religious ideologies. For example, ISIS.
4. **Criminal terrorism:** Terror groups engaged in terror acts for criminal profit.

Terrorism can also be classified on the basis of the mode of operation such as cyber-terrorism, bioterrorism, etc.

### **Cross-border Terrorism**

Cross-border terrorism is when the soil of one country is used to create terror or engage in terrorism against its neighbouring countries across the border. India is a victim of cross-border terrorism, whose source is Pakistan.

### **Factors favouring cross-border terrorism**

- **Porous borders:** These indicate borders which are not highly protected. India's borders with most of her neighbours cannot be physically sealed or wired due to difficult terrain, and other factors. Terror groups take advantage of such porous borders and infiltrate into another country.
- **Support from non-state actors:** India's troubled relationship with Pakistan fuels the latter's support for secessionist groups, which are provided financial support, weapons and training by the establishment in Pakistan.
- **Internal support:** Many times, terrorists find support from the local population due to varying reasons like ideological or ethnic affinity, fear, monetary lure, etc.
- **Corrupt officials:** Unfortunately, many officials in the establishment of a country can abet terrorists and allow their illegal entry for terrorist activities purely for financial benefits.

## Terrorism in India

The current law in India enacted to tackle terrorism of all kinds is the **Unlawful Activities (Prevention) Amendment Act**. Click on the linked article for a detailed description and also watch a video lecture on the same.

- India faces terrorism from secessionists in Kashmir, the north-east and to an extent in Punjab, from left-wing extremist groups in central, east-central and south-central India.
- India is one of the countries most affected by terrorism in the world. According to the **Institute for Economics and Peace**, India was the seventh-most affected country in 2018.
- It reported that from 2001 till 2018, more than 8000 people have died in terror attacks in India. Jammu & Kashmir is the region most affected by terrorist activities in the country.

**The Global Terrorism Index 2019** also places India on the 7th rank in terms of the most-affected country by terrorism. It was after the 26/11 attacks on Mumbai by terrorist groups that the government formed the National Investigation Agency (NIA). India is trying to push a global intergovernmental convention called the Comprehensive Convention on International Terrorism (CCIT) to counter-terrorism since the late 90s. India is also a member of the FATF (Financial Action Task Force), an organisation that works towards establishing global standards for combating money laundering and terrorist financing. India has a network of intelligence agencies such as the Research and Analysis Wing (RAW), the Intelligence Bureau (IB), etc. which are involved in fighting terrorism emanating both inside and outside the country. There is also a National Intelligence Grid (NATGRID) that is an integrated intelligence framework connecting the databases of security agencies of the Indian Government to gather inclusive patterns of intelligence that can be accessed by intelligence agencies of India. The National Security Guard (NSG) is a paramilitary force that is primarily responsible for counterterrorism and anti-hijacking operations.

## Swadeshi

**Swadeshi** The word swadeshi derives from Sanskrit and is a conjunction of two Sanskrit words. 'Swa' means self or own and 'desh' means country. So swadeshi means one's own country. Swadeshi, the adjectival form, means of one's own country, but can be loosely translated in most contexts as self-sufficiency.

- Swadeshi is the focus on acting within and from one's own community, both politically and economically.
- It is the interdependence of community and self-sufficiency.
- Gandhi ji believed this would lead to independence (swaraj), as British control of India was rooted in control of her indigenous industries. Swadeshi was the key to the independence of India, and was represented by the charkha or the spinning wheel, the "center of the solar system" of Mahatma Gandhi's constructive program.

## Swadeshi Movement (1905-19011)

1. This was a **comprehensive movement** that lasted 6 years.
2. Although this was regarded as a cultural movement celebrating the rich harvest of history- the rich traditions like folk music, paintings, the culture of Bengal was highlighted. But very soon, it got integrated with the political upheavals that followed after the partition of Bengal. **Krishna**

**Kumar Mitra**, in his newspaper, '**Sanjivani**' highlighted the prospects of national education and 'Economic Swadeshi'.

3. Very soon, this movement started gaining momentum with the help of the entire Bengali middle-class intelligentsia.
4. After the partition of Bengal, the Swadeshi movement got a big boost, because of the integration of the boycott movement with the Swadeshi movement.
5. **Tilak** called this movement "**Bahishkar Yoga**" and most of the Bengali intelligentsia that was initially not in favour of the boycott movement got integrated with the Swadeshi movement.
6. This was primary learning for the national movement. According to Bal Gangadhar Tilak, and Lala Lajpat Rai, it was **training in 'self-determination', 'self-help', and 'self-reliance'**.
7. In fact, the Swadeshi movement can be called as a nursery of the further course that the Indian National Movement was to take. The programmes and ideas that were practised during the Swadeshi movement became the hallmark of the Gandhian movement as well.
8. Surendranath Bannerjee said that it is a '**protectionist movement**'. And that it 'generates the material prosperity of the masses'.
9. Very soon, the Swadeshi movement spread to different parts of India, like Bihar, U.P., C.P., Bombay and Madras.
10. Radicalism also became a part of the Swadeshi movement after the partition of Bengal. After the partition of Bengal, industrial strikes became the hallmark of the Swadeshi movement.
11. There were strikes carried out in various cotton and jute factories of Bengal. Railway workers also went on strike. The Burnpur mill also went on strike.
12. But, the context of the anti-partition movement made it a very aggressive movement.

## Problems with the Swadeshi Movement

1. But the problem with the Swadeshi movement was that it was not properly directed and it failed to unite the Hindus and Muslims because of the work of **Nawab Salimullah** of Dhaka and the establishment of the Muslim league.
2. The demand of separate electorates became an issue to seek political mileage for the Muslims. Thus, the Swadeshi movement lacked having a large mass-base. The grievances of the peasants were not at all taken into consideration- such as lack of uniformity of the land revenue system, rights of the tenants, prevention of land grabbing, were not taken up by the Swadeshi movement, and thus the peasants did not become a part of the Swadeshi movement.
3. But, overall, the period of 1903-1908, the partition of Bengal served as a catalyst for the Swadeshi Movement.

## Context of various Scholars:

1. **Surendranath Bannerjee** said that it is a '**protectionist movement**'. And that it 'generates the material prosperity of the masses'.
2. **R.C. Majumdar** opined that the Swadeshi Movement brought the realm of the national movement from 'theory to absolute practicality'.
3. **Sumit Sarkar**, a modern historian, said that one of the remarkable features of the Swadeshi movement was to 'shape the life of the people' which directed till 1947.

## Note:

1. The **Swadeshi Movement** anticipated the movements which were later started by Gandhi.
2. The Non-cooperation movement, the Civil Disobedience movement which was labelled as a 'constructive boycott', had its genesis in the Swadeshi movement itself.
3. **Even G.K. Gokhale** who had firm opposition to the ideas of boycott accepted the programmes of Swadeshi in the Swadeshi Movement. Thus the Swadeshi movement brought many streams of nationalism together under one political platform. This, later on, found expression in the mass-politics of Gandhi. Therefore, the Swadeshi movement was very short-lived, it had a great impact on Indian Nationalism.

## Impact of the movement

- People from all walks of life participated in the movement with the greatest contribution coming from students and women.
- It resulted in significant decline in the foreign imports during 1905-1908.
- It led to building of self-reliance or Atma Shakti asserting on national dignity, honor and confidence.
- The Swadeshi movement led the people to learn to challenge and disobey the British government explicitly without fearing the atrocities of the police and imprisonment.
- Movement received wide coverage through newspapers and got attention at national level highlighting the true nature of British rule.
- The movement however also set the undertones for communal disharmony by invoking religious sentiments, setting foundation for Muslim League.
- Movement resulted in growth of extreme nationalism amongst youth which took to violence and wanted to bring an instant end to British dominance.
- It forced British dispensation to offer some concession to Indians in forms of Morley-Minto reforms in 1909.
- Most of all its concept of constructive swadeshi and boycott was actively used by Gandhi in later nationalist movements.

## Satyagrah

The idea of satyagraha basically emphasised the power of truth and the demand to search for truth. It suggested that if the cause was true, if the struggle was against injustice, then the physical force was not necessary to fight the oppressor. Without asking vengeance or being aggressive, a satyagrahi could win the battle through nonviolence. This could be done by appealing to the conscience of the oppressor. The common people – including the oppressors – had to be persuaded to see the truth, rather than being forced to accept truth with the help of violence. By this huge and great struggle, the truth was bound to ultimately triumph. Mahatma Gandhi had a strong faith that this dharma of non-violence could unite all Indians.

**Satyagraha:** Gandhi called his overall method of nonviolent action Satyagraha. It means the exercise of the purest soul-force against all injustice, oppression and exploitation.

- It is a method of securing rights by personal suffering and not inflicting injury on others.
- The origin of Satyagraha can be found in the Upanishads, and in the teachings of Buddha, Mahavira and a number of other greats including Tolstoy and Ruskin.

## Gandhiji's Satyagrah movements

- After returning to India, Mahatma Gandhi successfully organised satyagraha movements in a number of places.
- In the year 1917, he travelled to Champaran in Bihar to inspire the peasants to struggle against the oppressive plantation system.
- Later in the year 1917, he organised another satyagraha movement to support the peasants of the Kheda district of Gujarat who were affected by crop failure and a plague epidemic. The peasants of Kheda place were not able to pay the revenue, and were demanding for the revenue collection to be relaxed.
- In the year 1918, Mahatma Gandhi went to Ahmedabad to organise a satyagraha movement amongst the cotton mill workers at the mill.

## Gandhian Philosophy of Sarvodaya & Its Principles

**Sarvodaya**- Sarvodaya is a term meaning 'Universal Uplift' or 'Progress of All'. The term was first coined by Gandhi ji as the title of his translation of **John Ruskin's** tract on political economy, "**Unto This Last**". 21st century is the era of globalization. New economic policy of globalization moves on to make the world a global village. New challenges and problems have emerged before youth. The belief that all emergent problems - ecological, social, economical, political and moral-could be resolved by discoveries and technological innovations persists, failures in the past notwithstanding. What is happening today is in line with what Gandhi almost predicted in Hind Swaraj as he prepared its manuscript in 1908. Gandhi put forward four main goals before youth for humanity, so as to move towards its destiny. These are Swaraj, Non-violence, Swadeshi and Sarvodaya. These are the main pillars of the thesis he has propounded in the Hind Swaraj. In this paper an attempt is made to focus on Sarvodaya as one of the pillars to bring Hind Swaraj. Objectives of this research paper are to know Gandhian philosophy of Sarvodaya for changing attitude of youth & aware youth for their rights & duties. Primary & secondary resources are used for this paper.

### Meaning of Sarvodaya:

Sarvodaya is a term meaning 'Universal Uplift' or 'Progress of All'. The term was first coined by Mohandas Gandhi as the title of his 1908 translation of John Ruskin's tract on political economy, "Unto This Last", and Gandhi came to use the term for the ideal of his own political philosophy.<sup>1</sup> Later Gandhian, like the Indian nonviolence activist Vinoba Bhave, embraced the term as a name for the social movement in post-independence India which strove to ensure that self-determination and equality reached all strata of India society.

### Inspirations from Ruskin's Book:

Gandhi received a copy of Ruskin's "Unto This Last" from a British friend, Mr. Henry Polak, while working as a lawyer in South Africa in 1904. In his Autobiography, Gandhi remembers the twenty-four hour train ride to Durban (from when he first read the book, being so in the grip of Ruskin's ideas that he could not sleep at all: "I determined to change my life in accordance with the ideals of the book."<sup>2</sup> Gandhi advances the concept of Sarvodaya, which were based on three basic principles:

- That the good of the individual is contained in the good of all.
- That a lawyer's work has the same value as the barber's in as much as all have the same right of earning their livelihood from their work.

- That is a life of labour, i.e., the life of the tiller of the soil and the craftsman is the life worth living.

The first of these I knew. The second I had dimly realized. The third have never occurred to me. 'Unto This Last' made it clear as daylight for me that the second and third were contained in the first. I arose with the dawn, ready to reduce these principal to practice."<sup>3</sup>

### **Simple Living & High Thinking:**

Mahatma Gandhi was of the firm view that the earth provides enough to satisfy every man's needs, but not for every man's greed. In the Sarvodaya society of his dream, therefore, every member will be free from any greed for limitless acquisition of material wealth and more and more luxurious living and they will follow the motto of simple living and high thinking. Everyone will, thus, get ample opportunity to produce and earn sufficiently through honest work for decent and dignified living. Consequently there will be no problem of unemployment. Of course, obviously, income of different people may be different, depending on their talent, ability and effort. But those who will earn more will use the bulk of their greater earnings for the good of the society as a whole. In such a society, all wealth, including land, will be assumed as common property to be utilized for the welfare of all. If an individual has more than his proportionate portion, he becomes a trustee of the excess wealth for the benefit of the less fortunate members of the society. As regards use of machinery in economic activity, Gandhi said that "If we feel the need of machines, we certainly will have them. But there should be no place for machines that concentrate power in a few hands and turn the masses into mere machine-minders, if, indeed, they do not make them unemployed." In order, therefore, to minimize use of machines in a Sarvodaya society, Gandhi strongly advocated that everyone should do some productive physical work at least to earn his/her daily bread as was also advocated by Leo Tolstoy – the great Russian thinker and writer and everyone should uphold the dignity of labour irrespective of the type of honest labour performed by an individual.<sup>4</sup>

### **Objects of Sarvodaya Movement:**

The Sarvodaya Movement has as its target the establishment of a whole network of such self-supporting village communities. The family relationships which are confined at present to the blood group will be extended to cover the whole village where distinctions based on race, creed, caste, language and so forth will completely be eliminated. Agriculture will be so planned that all the people will have enough to consume. Industry will be conducted on a cottage basis till all the people in the village are gainfully employed. The needs of the village will be determined by the people of the village themselves, through Village Council, representative of the whole village.

### **Principles of the Sarvodaya:**

- There is no centralized authority, and there is political and economic atmosphere in the villages.
- Politics will not be the instrument of power but an agency of service and Rajniti will yield place to Lokniti.
- All people will be imbued with the spirit of love, fraternity, truth, non-violence and self-sacrifices. Society will function on the basis on the non-violence.
- There will be no party system and majority rule and society will be free from the evil of the tyranny of the majority.

- The sarvodaya society is socialist in the true sense of the term. All calling will be the same moral, social and economical values. The individual personality has the fullest scope for development.
- The sarvodaya society is based on equality and liberty. There is no room for unwholesome competition, exploitation and class-hatred.
- Sarvodaya stands for the progress of the all. All individual should do individual labour and follow the ideal of non possession. Then it will be possible to realize the goal of: from each according to his work and to each according to his needs.
- There will be no private property, the instrument of exploitation and the source of social distinctions and hatred. Similarly, the profit motive will disappear, rent and interest will go.
- The Sarvodaya Movement is based on Truth, Non-violence and Self-denial.
- The Sarvodaya Movement makes a sincere and bold attempt to create the necessary atmosphere to bring together such individuals with an unwavering faith in the Welfare of All
- The gain to the individual would be small. The development of each quality depends upon every other. If all the qualities are improved a little, then the individual would gain more.

### **Sarvodaya Movement:**

Gandhi's ideals have lasted well beyond the achievement of one of his chief projects, Indian independence (Swaraj). His followers in India (notably, Vinoba Bhave) continued working to promote the kind of society that he envisioned, and their efforts have come to be known as the Sarvodaya Movement. Anima Bose has referred to the movement's philosophy as "a fuller and richer concept of people's democracy than any we have yet known." Sarvodaya workers associated with Vinoba, J. P. Narayan, Dada Dharmadhikari, Dharendra Mazumdar, Shankarrao Deo, K. G. Mashruwala undertook various projects aimed at encouraging popular self-organization during the 1950s and 1960s, including Bhoodan and Gramdan movements. Many groups descended from these networks continue to function locally in India today.<sup>5</sup>

### **Agency of Common Welfare:**

That Sarvodaya is an agency of Service for Common Welfare Sarvodaya sets its face squarely against the politics of power and exploitation. It lays great emphasis on moral and spiritual values. It seeks to create new social and economical values. The concept of possession yields place to the concept of trusteeship. People will work for the good of all and family feeling will animate the entire community. There will be fullest scope for freedom, fellowship and equality.

The state is to be an agency of power. Gramrajya is a base of non-violence. Sarvodaya stands for good of all and not for the good of any particular individual or class. Bhoodan at the early stage, Gramdan at a later stage and Sampattidan will bring about a change of heart. The rich and poor will give up their ideas of attachment to private property and will strive to work for the good of all.

### **Conclusion**

So, lastly we can conclude that Sarvodaya ideals are not practicable. Though the ideals of sarvodaya will be noble. Nobody can find fault with them, in the actual world. They will be found wanting. It will be almost impossible to establish a society strictly on the basis of great principles by Mahatma Gandhi and others. Sarvodaya doctrines are soaring and it is doubtful whether they can rest on the earth. The poor record of Panchayat Raj in India bears testimony to the backward condition in which people are. In the highly competitive world, one country can not succeed in having Gramraj. Unless all states in the world accept the Sarvodaya idea. The chances of having it is a par-

ticular country like India are bleak. As well as, it is difficult to bring a change of the heart in the youth, who is given to selfishness. People donated useless land in response to the Bhoodan. So, need of the present era for youth is 'Think Globally and Act Locally'.

## **Social democracy**

Here in India, much has been made of the fact that the economy has gracefully survived the recession. Both the Indian government and our corporate managements responded nimbly, and the companies are now well placed to take advantage of new opportunities. That is all to the good. Yet the language of crisis can also be a means of manipulation. Over the last two years, it's been used to eliminate competition and consolidate sectors of the economy in the form of a few, massive players. After the global shake-out among investment banks, airlines and the automobile industry, the surviving players are not just big. They're secure in the knowledge that they're far too big to fail.

Meanwhile they've parlayed the uncertainty about the financial climate into a trumping argument against worker concerns. They've pared costs, shed labour, reduced employment security. And now the citizen as consumer has less choice, the citizen as worker has more uncertainty, and a paradox has been laid bare. Today, as government feels for the optimum moment to take its foot off the stimulus pedal, it's important to remember that risk in the modern world takes a variety of forms. As work is casualized and benefits eliminated, as capital becomes still more focused on profit opportunities, as the state semi-privatizes in its striving for fiscal efficiency, social risk for working populations has increased.

Unemployment remains endemic and among those who do have some sort of job, worker protections fall by the wayside. Consider the migrant who leaves the coal-mining infernos of Jharia, a landscape literally aflame and collapsing. Travelling to the city to pursue new opportunities, he loses his family safety net while entering a new world of uncertainty and risk. As Mint documented in a brilliant series of articles last year, worker safety in India's dynamic industrial sector is a black hole in our growth story. Medical costs persist as an immovable barrier to moving up the social and economic ladder, while rapid development in urban areas creates laboratories for contagious disease. Other growing economies such as China, Brazil, and South Africa offer their citizens basic health and welfare protections. Here in India, we expect our migrants from Jharia, all our poor citizens, to go it alone in the brave new economic world.

## **Ours is a leaner capitalism—and a meaner one.**

Historically, crises in the form of external shocks have spurred reforms that societies need but habitually resist. The British welfare state, for instance, came out of the jolt of World War II, while the oil price hike of the early 1970s forced European economies to sharpen their energy efficiency. Yet, this most recent crisis, global in scale, seems to have passed gently into the night. This has much to do with the lack of critical alternatives, and a Left that seems worn out. It's telling that at this recent, vulnerable moment in the history of capitalism, Left parties are being rejected by voters across the West—in France, in Germany, in Italy, and most likely soon in Britain. In their heartlands, social democratic traditions and politics are in retreat.

In India, we have a chance—and a need—to create our own alternative: an Indian social democracy. Even as we prepare to resume our impressive growth path, we have to recognize that high growth itself brings insecurities and social risks. We might take this pause in our giddy progress

to ask a pointed question: Do rapid growth and widespread inequality necessarily go hand in hand? Or are there ways to lessen the latter without hampering the former? Neither our political leaders nor our intelligentsia have worked out a convincing answer to the basic question of how to reconcile economic growth with worker and citizen security. Is there a fairer way to distribute social risk?

Left intellectuals, airily dismissive of globalization, the market and the profit motive—the very elements that have created our growth—claim a monopoly of wisdom over how to distribute the benefits of growth. But they have no idea about how to sustain it. The corporate world, for its part, likes to talk about social responsibility: We make profits, yes, but we engage in philanthropy too. This is fine as far as it goes, but it frankly doesn't go very far. Given the scale and complexity of India's redistributive problem, corporate or private giving—often capricious, rarely accountable—will not be decisive in its effects.

Governments can, of course, be decisive, and successive ones have initiated a stupefying number of social welfare policies. Named after great leaders and immediately acronym-ized (can you tell your PMAGY from your RGVVY from your SGSY?), many of these programmes are aimed not at the citizenry as a whole, but at groups identified as disprivileged. There are legitimate reasons for such policies that seek to repair inequalities long ingrained in the social order. Yet such an approach also replicates a pattern that runs back to the colonial period—the dispensation of handouts that may set group against group. At worst, such policies become political strategies for delivering votes, not a way of thinking about social justice. It is an approach that does damage to the possibilities of solidarity and equality in one go.

Without a social democratic vision as an electoral option, the desire for redistribution will be pursued in other ways. Already in rural India, Maoist unrest marks a sharp rejection of electoral politics. At industrial plants, labour activism is on the rise, with management the target of physical attacks. Unless India's internal security is understood in the broadest sense—as being based on social security for the poorest, Balram Halwai, The White Tiger's grinning, psychopath anti-hero, may yet prove a case of reality catching up with fiction. The inequities of our current growth path indeed have even wider implications for our future. China's phenomenal economic surge over the past three decades traded on the build-up of massive global imbalances—its governing elites muzzled consumption by their own citizens, and commanded their factories to produce for America and the West. That Chinese strategy is unrepeatable for India: Western electorates and their governments will make sure of that. Our economy will have to grow by different means. In essence, our future growth will depend in very large part on domestic consumption; for that to increase, we will have to increase the purchasing power of most Indians, which involves some redistribution of income and entitlements. As part of that, social risk will have to be shared—we all have a stake in reducing it.

Obviously, an Indian social democracy will not look like the social democracy that emerged in northern Europe, in relatively small, homogeneous, highly educated and wealthy countries with export-oriented economies. India differs on every one of those counts, and the challenge of specifying an Indian social democracy is in every respect greater than Europe's politicians and intellectuals ever faced. The economic basis of an Indian social democracy cannot be based on nostalgia for public ownership. In scope, it will need to create both social protections as well as social opportunities. But, as India's tax base and takings grow, the resources for such a project will accrue; and an essential tool for delivering benefits to our citizens, in the form of a national identity

system, is being built.

The social contract that founders of the Indian republic such as Ambedkar and Nehru hoped to establish was one based on social democracy—not on socialism. They were committed to the values of democracy and social justice—and viewed both markets as well as the state as instrumental means towards achieving those values. These founding impulses, however, were fossilized and corrupted—in the form of reservations and in “socialist” economic policies that prescribed punitive taxation and stifling regulation. Fortunately, some of those negative legacies are being dismantled, the result of economic reforms over the past two decades.

The challenge now is to prune the rest of the policy jungle and move towards establishing certain minimal universal provisions for all Indians—targeted where necessary, but targeted at universal categories, like the poor, and not at caste groups. Our current obsession with pragmatism, with what “works” narrowly construed, has obscured our larger vision. Spreading capitalism’s risks more equitably across our society would protect our most vulnerable citizens. It would be good for social solidarity. And it might be good as well for the political party willing to risk espousing it. Sunil Khilnani is the author of *The Idea of India* and is currently working on a new book, *The Great Power Game: India in the New World*.

## **Socialism**

While the original Constitution did not mention any particular ideology, it did give expression to the resolve of securing to the citizen’s economic justice and equality of opportunity. This is the essence of socialism. The word ‘socialist’ was introduced in the Preamble by the 42<sup>nd</sup> Amendment. The term, however, is not defined in the Constitution. It may be pointed out that the socialism envisaged in India does not mean the abolition of private property or nationalization of all means of production. Thus a ‘mixed economy’ was envisaged, along with the provision of equal opportunity, the abolition of vested interests, and the elimination of inequality in income and status and standards of living. In the present context of economic liberalization, however, the socialist credentials of our State may well be questioned. Socialism is acknowledged as the cherished goal of the Indian political system in its constitution. Socialism lays emphasis on the welfare of the people, it seeks to ensure economic and political equality to the people and tries to remove exploitation of one class by the others.

- However, despite aiming for the same goals, India adopted socialism which drew inspiration from Gandhi and Nehru rather than Marxian socialism.
- Whereas Gandhian socialism was based on satya, ahimsa, trusteeship and decentralisation and Nehru’s socialism was a liberal and a type of Fabianist socialism, Marxian socialism emphasised on class wars and the dictatorship of the proletariat.

## **Body**

- Indian socialism was not an ideological dogma, but a broad guide to the development and social change and accommodated a lot of other ideas, apart from core socialism, which were necessary for the development of India.
- Moreover, challenges like resource crunch for the free market, apathy to capitalism due to colonial experience, challenges of inequality, and a newly independent nation already on fringes further made adoption of socialism or capitalism in its absolute form impractical.

- India in its modified socialist pursuit relied on three pillars of development strategy–
- **planning for rapid industrial and agricultural growth** which was not under the absolute control of State.
- **a public sector to develop strategic industries**, which was to progressively become a self-sustained profit-making sector.
- **a mixed economy**- Mixed economy was preferred earlier due to lack of adequate resources, but the private sector was to work under a broad framework of planning.
- It **differed from core socialism** as it went for a mixed economy rather than complete government control, the public sector had hold on only core industries, industrialists participated in planning (Bombay Plan), emphasis was on industrialisation along with agriculture and the aim was to make the public sector a profit-generating sector rather than being just a welfare tool for income redistribution.
- However, India also **imbibed core socialism spirit** through planned economic development, initiation of land reforms, labor laws, progressive taxation, expansion of education and health and rapid expansion of the public sector.

## Conclusion

- Despite its contributions to Indian economy and society through welfare policies, cooperative societies, planned growth, land reforms etc., socialism in India is yet to achieve all its intended objectives.
- Sluggish economic growth till the 1990s, mounting corruption, red-tapism and license raj of bureaucracy prevented industries and markets to grow to their full strengths and restricted foreign investment and competition due to inward-looking policies, a loss-making public sector and failure of trickle-down growth.
- Consequently, while retaining socialism as a principal constitutional value, as declared in Preamble, Fundamental Rights and DPSP, India didn't shy away from approaching a more liberal economy and means of distributive justice when needed. It smoothly transitioned to LPG reforms in the 1990s, opened its sectors and markets to global opportunities and competition, to continue its growth story keeping up with the changing times and needs.

## Affirmative Action

Affirmative action refers to a set of policies that support members of disadvantaged groups that have previously suffered discrimination in any form.

### Nature of Affirmative Action

The nature of affirmative action policies varies from region to region and exists on a spectrum from a hard quota to merely targeting encouragement for increased participation. Some countries use a quota system, whereby a certain percentage of government jobs, political positions, and school vacancies must be reserved for members of a certain group; an example of this is the reservation system in India. Historically and internationally, support for affirmative action has sought to achieve goals such as bridging inequalities in employment and pay, increasing access to education, promoting diversity, and redressing apparent past wrongs, harms, or hindrances.

### How is Affirmative Action Categorized in India

Affirmative actions in India can be categorized into 3 main dimensions, which are given below.

1. Appointment and promotion in government services.
2. Reservations in public education institutions.
3. Reservation of seats in Central and State legislatures.

### **Who Does Affirmative Action apply to?**

Affirmative action refers to the set of policies of the Governments to support members of disadvantaged groups that have historically faced discrimination in the areas of education, employment, housing and respect in the society. The main goals of affirmative action are to bridge inequalities in access to education, employment, equal pay, better standards of living.

### **Example of Affirmative Actions**

In the Government-run education institutions, the Indian government provides reservations for SC, ST and OBC students. To give them better political representation, constituencies are reserved for SC and ST's in proportion to their population. Reservation is provided in Public Sector Undertakings (PSU's), civil services, statutory bodies. Reservation is not provided in defence and judiciary.

### **Implementation Issues of Affirmative Actions**

1. Quality of representation in legislature – Studies have indicated lower participation in the legislative proceedings.
2. Data on justice-related matters showed that they were facing discrimination.
3. There is no time limit on reservation policies.

### **Social Justice**

The Protection of Civil Rights (PCR) Act, 1955, and the SC and ST (Prevention of Atrocities) Act, 1989 (POA Act) are two important legislations to address the problems of social discrimination, the prevalence of social evils like untouchability and the increasing cases of exploitation and atrocities against disadvantaged groups. The POA Act provides for special courts/mobile courts for on-the-spot trials and prompt disposal of cases.

A Centrally sponsored scheme, Implementation of PCR Act and POA Act, was initiated in 1955 to ensure effective implementation of these Acts. Under the scheme, financial assistance is provided for strengthening the administrative, enforcement and judicial machinery related to these legislations, publicity and relief and rehabilitation of the affected persons. As the practice of untouchability still prevails, either directly or indirectly, there is a need for stringent enforcement of the existing legislations along with spreading awareness.

Top priority has been accorded to efforts for achieving the national goal of complete eradication of manual scavenging by the end of the Tenth Plan (2007). The programme has two components – conversion of dry latrines into water-borne latrines and training and rehabilitation of scavengers (whose number is estimated at 6,76,000) and to provide them alternative and dignified occupations.

The first component of the scheme is being implemented by the Ministry of Urban Employment and Poverty Alleviation. The National Scheme of Liberation and Rehabilitation of Scavengers and Their Dependents has been transferred to the Ministry of Urban Employment and Poverty Alleviation in 2003-04 to ensure its effective implementation.

## Below table gives a broad classification of Social Justice

Classification	Details
Low Human Development Index	<ol style="list-style-type: none"><li>1. Unemployment</li><li>2. Unequal distribution of wealth</li><li>3. Health status in India</li><li>4. Education status in India</li></ol>
Water, Sanitation and Hygiene	<ol style="list-style-type: none"><li>1. Swachh Bharat Abhiyan</li></ol>
Global Hunger Index	<ol style="list-style-type: none"><li>1. Poverty and Hunger in India</li></ol>
Community Level Healthcare	<ol style="list-style-type: none"><li>1. Health for All</li></ol>

### Human Development Index (HDI)

Human Development Index (HDI) is one of the indicators of social justice prevalent in a nation. The 2 best measurements are the United Nations Human Development Index and the World Bank's Human Capital Index. As per the United Nations Human Development Index, India is ranked very low at 130 out of 189 countries. These indicators take into account the life expectancy at birth, enrollment in schools etc. There are various reasons that contribute to lower rankings.

### Unemployment

1. India has a very huge population and the majority of the labour force lack the required skill sets.

### Unequal Distribution of Wealth

1. Richest 10% of Indians own 4 times more wealth than the remaining 90% of the population which has resulted in a high degree of inequality, non-inclusive growth and low development index.

### Health

1. India spends just 1.5% of its GDP on the health sector.
2. India has a very high percentage of deaths due to air pollution
3. India has a very high malnutrition rate, Maternal Mortality Rate (MMR), and Infant Mortality Rate (IMR).
4. Government is taking various measures to tackle the above problem.
5. The government must increase its public health expenditure to 2.5% of GDP as suggested in the National health policy 2017.
6. Ayushman Bharat Yojana was launched in 2018 by the Government to address the primary, secondary and tertiary health care systems in India.

### Education

1. India spends just 3% of its GDP on the Education Sector.
2. As per the Annual Status of Education Report (ASER) 2018, the quality of education in India is highly unsatisfactory.
3. High dropouts, low employability of graduates, low productivity, low wages are results of the poor education system.

4.

## **Water, Sanitation and Hygiene**

A huge number of Indians still don't have access to safe drinking water, and sanitation facilities.

### **Swachh Bharat Abhiyan**

1. The objective of this mission is to make India open defecation free through the construction of household-owned toilets and community-owned toilets.
2. A UNICEF report shows that this mission has helped in improving sanitation coverage to 90%.

## **Social Institutions**

Social institutions have been created by man from social relationships in society to meet such basic needs as stability, law and order and clearly defined roles of authority and decision making. Every organisation is dependent upon certain recognised and established set of rules, traditions and usages. These usages and rules may be given the name of institutions. These are the forms of procedure which are recognised and accepted by society and govern the relations between individuals and groups.

### **Social Institutions: Marriage**

Sociologists define marriage as a socially supported union involving two or more individuals in what is regarded as a stable, enduring arrangement typically based at least in part on a sexual bond of some kind.

### **Key Takeaways: Marriage**

1. Marriage is considered by sociologists to be a cultural universal; that is, it exists in some form in all societies.
2. Marriage serves important social functions, and social norms often determine the role each spouse takes in a marriage.
3. Because marriage is a social construct, cultural norms and expectations determine what a marriage is and who can marry.

## **Overview**

Depending on the society, marriage may require religious and/or civil sanction, although some couples may come to be considered married simply by living together for a period of time (common law marriage). Though marriage ceremonies, rules, and roles may differ from one society to another, marriage is considered a cultural universal, which means that it is present as a social institution in all cultures. Marriage serves several functions. In most societies, it serves to socially identify children by defining kinship ties to a mother, father, and extended relatives. It also serves to regulate sexual behavior, to transfer, preserve, or consolidate property, prestige, and power, and most importantly, it is the basis for the institution of the family.

### **Social Characteristics of Marriage**

In most societies, a marriage is considered a permanent social and legal contract and relationship between two people that is based on mutual rights and obligations among the spouses. A marriage is often based on a romantic relationship, though this is not always the case. But regardless, it typically signals a sexual relationship between two people. A marriage, however, does not simply exist between the married partners, but rather, is codified as a social institution in legal, economic, social, and spiritual/religious ways. Because a marriage is recognized by law and by

religious institutions, and involves economic ties between the spouses, a dissolution of marriage (annulment or divorce) must, in turn, involve a dissolution of the marriage relationship in all of these realms.

Typically, the institution of marriage begins with a period of courtship that culminates in an invitation to marry. This is followed by the marriage ceremony, during which mutual rights and responsibilities may be specifically stated and agreed to. In many places, the state or a religious authority must sanction a marriage in order for it to be considered valid and legal. In many societies, including the Western world and the United States, marriage is widely considered the basis of and foundation for family. This is why a marriage is often greeted socially with immediate expectations that the couple will produce children, and why children that are born outside of marriage are sometimes branded with the stigma of illegitimacy.

### **The Social Functions of Marriage**

Marriage has several social functions that are important within the societies and cultures where the marriage takes place. Most commonly, marriage dictates the roles that spouses play in each other's lives, in the family, and in society at large. Typically these roles involve a division of labor between the spouses, such that each is responsible for different tasks that are necessary within the family. American sociologist Talcott Parsons wrote on this topic and outlined a theory of roles within a marriage and household, wherein wives/mothers play the expressive role of a caregiver who takes care of socialization and emotional needs of others in the family, while the husband/father is responsible for the task role of earning money to support the family. In keeping with this thinking, a marriage often serves the function of dictating the social status of the spouses and the couple, and of creating a hierarchy of power between the couple. Societies in which the husband/father holds the most power in the marriage are known as patriarchies. Conversely, matriarchal societies are those in which wives/mothers hold the most power.

Marriage also serves the social function of determining family names and lines of familial descent. In the U.S. and much of the Western world, a common practice is patrilineal descent, meaning the family name follows that of the husband/father. However, many cultures, including some within Europe and many in Central and Latin America, follow matrilineal descent. Today, it is common for newly married couples to create a hyphenated family name that preserves the named lineage of both sides, and for children to bear the surnames of both parents.

### **Different Types of Marriages**

In the Western world, monogamous marriage between two spouses is the most common form of marriage. Other forms of marriage that occur around the world include polygamy (a marriage of more than two spouses), polyandry (a marriage of a wife with more than one husband), and polygyny (the marriage of a husband with more than one wife). (In common usage, polygamy is often misused to refer to polygyny.) As such, the rules of marriage, the division of labor within a marriage, and what constitutes the roles of husbands, wives, and spouses generally are subject to change and are most often negotiated by the partners within the marriage, rather than firmly dictated by tradition.

### **Expanding the Right to Marry**

Over time, the institution of marriage has expanded, and more individuals have won the right to marry. Same-sex marriage is increasingly common and in many places, including the United States, has been sanctioned by law and by many religious groups. In the U.S., the 2015 Supreme

Court decision Obergefell v. Hodges struck down laws banning same-sex marriage. This change in practice, law, and cultural norms and expectations for what a marriage is and who can participate in it reflects the fact that marriage itself is a social construct.

## Family

Family is a key social institution in all societies, which makes it a cultural universal. Similarly, values and norms surrounding marriage are found all over the world in every culture, so marriage and family are both cultural universals. Statuses (i.e. wife, husband, partner, mom, dad, brother, sister, etc.) are created and sanctioned by societies. While marriage and family have historically been closely linked in U.S. culture with marriages creating new families, their connection is becoming more complex, as illustrated in the opening vignette and the subsequent discussion of cohabitation. Sociologists are interested in the relationship between the institution of marriage and the institution of family because families are the most basic social unit upon which society is built but also because marriage and family are linked to other social institutions such as the economy, government, and religion. So what is a family? **Family** is a socially recognized group (usually joined by blood, marriage, cohabitation, or adoption) that forms an emotional connection and serves as an economic unit of society. Sociologists identify different types of families based on how one enters into them. A **family of orientation** refers to the family into which a person is born. A **family of procreation** describes one that is formed through marriage. These distinctions have cultural significance related to issues of lineage. Generally the family is recognised as an element of a broader kinship network that links ancestors and descendants of a person. It is the most permanent and most persistent of all social institutions which exerts constant influence in life of the members from the moment of birth to the moment of death.

## Elements of Family

- It is formed by robust companionship of husband, wife, father, mother, children and other members in it.
- Family propagates and up bring children, nurture them, fulfil their needs (Economic or Biological).
- There is sense of togetherness, love, emotional attachment and protection among the family member.
- Family is configured as a large or small by size, large family constitute family members of several generation whereas small family has limited members.
- All the family members reside in common residence.
- It is an institute where social norms and customs are taught to the family members in order to build a society and contribute for its wellbeing.

## Characteristics of the Family

The characteristic of family depicts the need of human whether biological that is sexual and affection or sociological that is every member of family has responsibility towards each other.

Family is said to be complete when there is permanent relationship between the members and this is possible only when they are psychologically attached to each other. There is no such social institution which can be compared with family that forms a permanent relationship with its members that are bonded to each other psychologically and sociologically.

## Main characteristics Universality

Family is universal social unit. There is no human society in which some form of the family does not appear. It is present throughout the communities whether barbarians or in civilized world.

### **Emotions**

Members of the family is emotionally attached to each other based on desires of maternal and fraternal love, parental care, mating and procreation. The base of family is built upon sentiments of love, compassion, cooperation and friendship.

### **Limited size**

Being a primary social unit its size is necessarily limited, as it is a smallest social unit.

### **Formative influence**

It is the family that creates an environment that surrounds trains and educates the members in it. It plays an important role in shaping the personality and help to mould the character of the member on it.

### **Central position in the social structure**

Family is the nucleus of all other social organizations as the whole social structure is built on family units.

### **Responsibility of the members**

Each member of the family has responsibilities and obligations towards each other and also towards society.

### **Structure of family**

The structure of the family is mainly based on the three pillars the nature of residence, the authority in the family and the size of the family.

### **Nature of Residence**

It can be broadly described in three types:

#### **Patrilocal**

Practiced commonly in India, where the bride resides with the groom's family or house.

#### **Matrilocal**

Here the groom resides with the bride's family. This is seen in few clans of India like the Khasis of Meghalaya and Nayar taravad of Kerala.

#### **Neolocal**

In this the family is individualistic that resides separately in newly constructed house. It is commonly practiced in urban industrial society.

### **Nature of authority in the family Patriarchial**

Here, father has the highest status in the family. He is the head of the family who controls the social life of the family. It is commonly practiced throughout India.

## **Matriarchial**

Here mother has the highest status in the family. She is the head of the family who controls the other members of the family. This system is seen very rarely in India, the Khasi clan of Meghalaya, the Nair clan of Kerala.

## **Based on the size**

Family is mainly constituted in two types

### **Nuclear family**

It is smallest family in size which has only a husband, wife and their children living together. The current industrial urban system has reduced the size of the family due to economic and social reason. It is further divided into two types.

1. The family of orientation: Here in this family the individual is born and resides with his parents and brothers and sisters.
2. The family of procreation: Here an individual gets married and procreates children with its companion to form a separate individual family.

### **Joint family**

In a joint family more than two generations resides together who has common ancestors following common duties and have common property. They also has common kitchen and probably follows same traditional occupation.

### **Advantages of Joint family:**

- In a joint family all members comes together to solve any social or economical problems on its member.
- This family gives moral support to its members in difficult times.
- Since the family members are large in numbers their strength and weightage is more in the society they live.
- Here more importance is given to all members rather than the individual member.
- The festivals and rituals are carried away all together thus distributing the task among each other minimises the time and efforts.
- In joint family the blood relation is given more relevance over the marital relationship.

### **On the basis of Ancestors:**

The family is classified into two types

#### **Patrilineal**

This family line is traced from its male ancestors. Here the new generations inherits the name or title, rights, property from their male ancestors.

#### **Matrilineal**

It is traced from their female ancestors. Here the new generations inherits the name or title, property and rights from their female ancestors.

## **Functions of family**

The family as a social institution performs several functions which is categorised into primary and secondary.

### **Primary functions:**

#### **Biological functions**

- It regulates and satisfies the sexual behaviour of Husband and wife through the marriage.
- It fulfills the desire of human to procreate children and thus regulates the perpetuation of human race.
- It is the family that rears the child, protects it, trains it and creates personality thus it performs a function of maintenance of its members.

### **Socialization of family members:**

- Family socialises its members through cultural continuity of the society of which it is a part.
- The social norms, moral values, beliefs and ideals of society are indoctrinated into its child to help the child to shape its personality and make it a civilized adult to build a better society.

### **Psychological Function**

- Affection – Family provides emotional satisfactions to its members through love, sympathy and affection.
- Mental Security: It is the family which provides the most intimate and the dearest relationship for all its members that makes them mentally secure.

### **Secondary functions Economic function:**

- The family fulfills the basic economic needs of its members and supports them in financial crisis.
- There is no other institute than family where the members feel free to ask for support during financial crisis.

### **Educational Functions**

- The child gets its basic and formal learning within the family. It provides training in social attitudes and habits which are important for an adult in its social life.

### **Religious functions**

- The child gets the knowledge of the religion it follows. Family is the centre for the religious training to its members as it inherits the religious teaching to the next generation.
- It teaches its members all religious values, way of worship, morals precepts.

### **The Recreational Functions**

- Family always aims to bring its member together and this is possible through the recreational activities. It is foster by various family functions such as reunions, hoisting relatives, playing indoor games, social gatherings, sport etc.

## **Structural and functional changes in the system of family**

The traditional system of family has undergone qualitative changes till the date. The following are the driving factors responsible for the changes witnessed in system of family.

### **Influence of Industrialization**

- Industrialization separated the home from the work and now the working members themselves bear the entire burden connected with their job. Earlier their families used to lend support in this regard.
- Family members have been disintegrated in search of jobs. Earlier the family workers worked together in an integrated economic enterprise.
- The traditional skills and crafts of household industries associated with the joint family have declined.
- It was a principal unit of production now has been transformed in the consumption unit.

### **Influence of urbanization.**

- Due to costly life style in urban areas small nuclear families are preferred and this has weakened the joint family pattern and has strengthened nuclear family patterns.

### **Changes in children status**

- Children's demands have been increased. They are considered as a liability as earlier they were the economic assets to the family.

### **Changes in Marriage System.**

- The freedom granted to individuals in mate-selection, change in age of marriage and change in the attitude towards marriage have also affected family system.
- Modern marriage has diminished the role of parents in mate-selection, marriage is now considered as social ceremony earlier it was a religious affair.
- Marriage contract today is entered into more autonomously by both men and women

### **Legislative Measures.**

- Legislative changes in certain laws like child marriage Restraint Act, 1929 and the Hindu Marriage Act, 1955 that prohibits early marriage have lengthened the period of education.
- Through the special Marriage Act, 1954 there is freedom of mate-selection and marriage in any caste and religion without the Parent's consent after
- certain age is permitted, has modified the composition and traditions of the family.
- The Widow Remarriage Act, 1856, Hindu succession Act, 1956 and Hindu Marriage Act, 1955 have modified inter personal relations within the family and the stability of the joint family.

### **Influence of western values:**

- There has been tremendous change in Indian family system due to the influence of western

values that relates to modern science, equality, rationalism, democracy, individualism, free life, freedom of women etc.

## **Modern education**

Hinduism is the oldest religion in the world. Hinduism is world's third largest religion after Christianity and Islam. Hinduism is the dominant religion in India, where Hindus form about 84 per cent of the total population. Hinduism is also known as "Sanatan Dharma" or the everlasting religion.

One of the prominent religions of India, Islam forms about 14 per cent of India's population. Though India's contact with Islam had begun much earlier, the real push came in the 8th century when the province of Sindh was conquered. Though the Muslims form only 14 per cent of the total population of India but the influence of Islam on Indian society is much stronger.

At present Buddhism is one of the major world religions. The philosophy of Buddhism is based on the teachings of Lord Buddha, Siddhartha Gautama (563 and 483 BC), a royal prince of Kapilvastu, India. After originating in India, Buddhism spread throughout the Central Asia, Sri Lanka, Tibet, Southeast Asia, as well as the East Asian countries of China, Mongolia, Korea, Japan and Vietnam.

Modern education has brought about change in ideology of joint family system in India. It has changed the attitude, values, beliefs and ideologies of the people and has created individualistic feelings amongst the females.

Christianity is one of the prominent religions in India. At present there are about 25 million Christians in India. It is interesting to note that the Christian population in India is more than the entire population of Australia and New Zealand or total population of a number of countries in Europe.

Sikhs form about 2 per cent of Indian population. In comparison to other religions, Sikhism is a younger religion. The word 'Sikh' means a disciple and thus Sikhism is essentially the path of discipleship. The true Sikh remains unattached to worldly things.

Though the total number of Zoroastrians in Indian population is very less yet they continue to be one of the important religious communities of India. According to the 2001 census, there were around 70,000 members of the Zoroastrian faith in India. Most of the Parsis (Zoroastrians) live in Maharashtra (mainly in Mumbai) and the rest in Gujarat.

## **Religion**

India is a land of diversities. This diversity is also visible in the spheres of religion. The major religions of India are Hinduism (majority religion), Islam (largest minority religion), Sikhism, Christianity, Buddhism, Jainism, Zoroastrianism, Judaism and the Bahá'í Faith. India is a land where people of different religions and cultures live in harmony. This harmony is seen in the celebration of festivals. The message of love and brotherhood is expressed by all the religions and cultures of India. Whether it's the gathering of the faithful, bowing in prayer in the courtyard of a mosque, or the gathering of lamps that light up houses at Diwali, the good cheer of Christmas or the brotherhood of Baisakhi, the religions of India are celebrations of shared emotion that bring people together. People from the different religions and cultures of India, unite in a common chord of brotherhood and amity in this fascinating and diverse land.

Jains form less than one percent of the Indian population. For centuries, Jains are famous as community of traders and merchants. The states of Gujarat and Rajasthan have the highest concentration of Jain population in India. The Jain religion is traced to Vardhamana Mahavira (The Great Hero 599-527 B.C.).

## **Religion and the Indian Constitution**

Checking political tyranny, protecting the basic interests of dissenting minorities, and saving all citizens from taking decisions now that they might regret later are important objectives of all liberal-democratic constitutions. But the Indian Constitution goes further – it attempts a comprehensive social transformation, to effect a social revolution. Religion appears to be the main target of this attempted transformation. If so, how does this transformative potential of the Constitution impact a society saturated by religion? To answer this question, I begin with a distinction between individual ethics of self-fulfilment and social norms of everyday conduct. By the first, I mean a framework for meaningful living and dying, say, a full life in this world, swarga (heaven) in another world, or freedom from recurrent births and deaths (moksha or nirvana), or obeying the commands of God.

By social norms of everyday conduct, I mean rituals and ceremonies of social interaction, but primarily norms governing interpersonal relations – with whom one should or should not interact, who one should or should not marry, with whom one should or should not dine, who is to perform which job in society, etc. Ethics of self-fulfilment and norms of social conduct may be so tightly connected that they form one single system. Or the connection between them may be so loose that they are seen to constitute two separate systems.

### **Ethics and social norms**

In the Abrahamic traditions, the connection between ethics and social norms was forged so tightly that they became part of a single deeply connected system. And the term 'Religion' was invented to refer to this whole. Thus, if a person chose to be, say, a Latin Christian, he instantly became part of this entire system. Adopting a particular set of Christian beliefs on salvation went hand in hand with taking part in specific Christian rituals and ceremonies, and entering a web of unequal social relations with non-Christians. It would be wrong and impermissible for a person with Christian beliefs to participate in non-Christian social rituals or tolerate pagans.

For this reason, a religion-centred social revolution in Europe meant (a) breaking the monopoly of Christianity, presenting options other than dominant Christian ideas of self-fulfilment – pluralisation of ethics; (b) loosening the connection between ethics and social norms, freeing social norms from Christian ethics, building norms of social equality that transcended religious identities – secularisation; and (c) fighting a church that blocked secularisation and pluralisation.

By contrast, the connection between ethics and social norms remained very loose in the Indian tradition. Because social norms and power hardly ever dictated the choice of ethics, there was greater innovation, and so ethical frameworks proliferated. There were always many ethical frameworks to choose from. People could move freely from one framework to another and sometimes, without any discomfort, participate in several. And yet, precisely because social norms existed independently of ethics, this very ethical flexibility went hand in hand with great rigidity within social norms. This is so because hierarchical and fixed caste relations lay at the core of these norms. Ironically, they even complemented each other; as long as one remained within the caste system, one could choose any ethical framework, any path to self-fulfilment. A person could find fulfilment in a loving relationship with Krishna, in achieving swarga, or in liberation from the cycle of rebirth and at the same time follow common norms governing unequal social relations. A person may quit a this-worldly Vedic ethic in order to lead an ascetic Jain life but all the while continue to belong to the Vaishya caste, and therefore remain enmeshed in hierarchical caste relations.

This was true even for those who became Christians or Muslims; they chose a modified Abrahamic ethic but remained entrenched in the caste system.

## **'Religion' in India**

Given that the term 'religion' was invented to refer to a single system, it was not easily applicable in the subcontinent where ethics and social norms do not cohere into one single whole. Yet, such is the force and sway of the term 'religion' that it has been simultaneously used to refer to two relatively distinct and independent systems of ethics and social norms. This has generated many problems and much confusion.

Consider the following simple example from the natural sciences to grasp the absurdity of this profound misnaming. The term 'water' refers to a single entity composed of two distinct elements, oxygen and hydrogen. Where the two gases are deeply connected to form a single compound, the term 'water' is appropriate but we rightly use two distinct terms 'hydrogen' and 'oxygen' for each when the two remain disconnected from each other. How utterly erroneous to call them 'water' when they exist separately! Calling distinct systems of ethics and social norms in India by the common term 'religion' is equally insane. But then once a term grips the popular imagination, it is difficult to dislodge.

Some scholars have tried to get out of this hole by using 'religion' in two different senses – ethical religion and social religion. Though not entirely satisfactory, we might accept this and say that in India, a profound pluralism of ethical religions exists. Yet, followers of different ethical religions participate in much the same caste-ridden social religion.

How does all this help us understand the relationship of our Constitution to Indian religions? Unlike Europe, where people have to fight for pluralisation of ethics, here: (a) We strive to conserve our immense pluralism of ethical religions, to act against any attempt at religious homogenisation or exclusion. This conservative function the Indian Constitution performs. (b) By preventing a tight connection between social norms and ethical religion, the Indian Constitution also ensures that we do not have 'Religion' as originally conceived, something as totalising as Latin Christianity had been or Saudi Islam now is. (c) Finally, its main objective is to destroy what is at the core of India's dominant social religion – its deeply hierarchical caste system. This last feature alone marks it as an instrument for social revolution.

## **Property**

"Property may be described as the set of rights and obligations which define the relations between individuals or groups in respect of their control over material things (or persons treated as things). The essential point in the notion of property is that there is a recognised right of control over things vested in a particular person or persons, and within various limits, excluding interference by others. By saying that there is a recognised right, we mean that there are regular sanctions attached to it, that is, approved methods of dealing with infringements. The amount and nature of the control with which owners are endowed varies considerably in different legal systems, and there is not always precise correspondence between legal theory and economic usage". According to Kigsley Davis, property "consists of the rights and duties of one person or group (the owner) as against all other persons and groups with respect to some scarce good. It is thus exclusive, for it sets off what is mine from what is thine; but it is also social, being rooted in custom and protected by law". It appears from these two definitions that 'property' refers to the whole pattern of rights and obligations with respect to the possession, use, acquisition and disposal of

scarce valuable things. It is to be noted that the term 'property' is used both for rights and for the things in which rights are held. The context should always make it clear which reference is intended.

### **Characteristics of Property:**

**Understood in terms of rights, the following are the characteristics of property rights:**

- (i) Property can be transferred by its owner by way of sale, exchange or gift.
- (ii) The things in which an individual may hold property rights may be both tangible and intangible. Examples of the latter are copyrights of books or goodwill of a business.
- (iii) Property rights do not necessarily imply actual use and enjoyment of the relevant things by the owner. Law makes a distinction between ownership and possession. The many kinds of property right may be summarized as possession, use, alteration, using up, usufruct, income and disposition. These are explained *adseriatim*.

A tenant has the right of possession or occupation. The right of possession leads to various rights of use, depending on the nature of the object. Thus, the borrower of a book from a public library may use the book for his study. But rights of use do not include all rights of alteration.

For example, the book-borrower may not make marginal notes. Likewise, a tenant may not pull down a portion of the building in his occupation without prior permission of the owner. The right to use up is illustrated by the right of an oil company to take the oil from ground belonging to another. The owner may, of course, get some compensation in return. The right of usufruct may be discussed with reference to the following example. The right to the produce of land may be distinguished from ownership itself, and also from rights of use.

The owner of a mango garden may lease out the fruits of trees in a particular season to another. The lessee in this case has rights to the produce of mango trees without any rights whatsoever to the use of the land for other purposes. Such rights are called rights of usufruct. The rights to income may be explained with reference to royalties received by the author of a book from his publisher who publishes the book for profit. Rights of disposition include the right to destroy as well as the right to alienate—that is, the right of alienation by gift, sale or lease.

- (iv) The possession of property may mean possession of power over others. Money and such other tangibles as well as intangibles like one's good reputation may be bases of power. "The possession of exclusive rights to something that is scarce and valuable necessarily implies the possession of power over others who also desire the scarce and valuable things ... The amount of power which gives to the owner depends not only upon the definition of his rights but also on the intensity of others' needs for that which is owned".
- (v) The institution of property is, like all other institutions, a normative patterning of the relations between individuals and/or groups. Thus, property owners are under the obligation to use property according to social norms. Similarly, those who do not possess a particular property right are under the general obligation not to infringe upon the right of the possessor.

### **Stages in the Development of the Property System:**

The development of the property system has been a subject of speculation for a long time. Different writers have indicated the stages differently. We may consider some of these views.

Vinogradoff appears to distinguish four principal phases: First, the formation of property in tribal and communal surroundings. Second, the application to landed property of the notion of tenure. Third, the growth of individual appropriation. Fourth, the restrictions which are being imposed upon such appropriation by collectivist tendencies in modern times. Hobhouse speaks of three phases in the growth of property system. During the first phase, there is little social differentiation, little inequality. Economic resources are owned in common, or are strictly controlled by the community.

During the second phase, wealth increases, great inequalities appear and individual or collective ownership escapes from community control. During the third phase, a conscious attempt is made to diminish inequality and to restore community control. This scheme of Hobhouse has some resemblances to the Marxist distinction into three stages: that of primitive classless society, followed by class differentiation and the growth of inequality, and the final stage of a classless society at a higher level. Many recent writers have emphasized the complexity of property systems and have rejected the notion of a unilinear evolution. There have been a number of comparative studies of property in primitive societies which illustrate the difficulty of determining the character and extent of property rights.

Recent sociological studies of property in industrial societies have been largely concerned with two aspects: first, the distribution of property and its social effects; second, the separation between the ownership and the control of industrial enterprises in modern capitalist societies. Studies on distribution of property indicate that there has been some movement towards greater equality in many of the advanced industrialised societies since the beginning of the twentieth century, though it has been more marked in respect of incomes than in respect of property. The equalisation of incomes has proceeded more rapidly as a result of high progressive taxation and the expansion of social services.

The separation of ownership and control in industrial enterprises is a phenomenon which has attracted much attention from sociologists concerned with the development of modern capitalism. It has resulted from the extension of the joint stock principle. The industrial capitalists of the early nineteenth century were both owners and managers of their enterprises. But as the enterprises grew larger, more and more capital had to be drawn from outside. This was made possible by the sale of shares among innumerable shareholders.

### **Psychological and Social Aspects of Property:**

It is still not conclusively proved as to whether the desire to acquire and amass property has anything to do with the instinct of man. Some say that it is instinctive. Some dispute this contention and hold that it is a craze conditioned by circumstances. Morris Ginsberg argues that the interest in ownership of property is very complex and that it has its roots in several fundamental needs. To us, a commodity acquires value for two different reasons. When a commodity directly satisfies our need, it is naturally valuable to us. Our consumption articles and even consumer durables fall within this category.

There are, however, some commodities which do not satisfy our needs either directly or indirectly, but these are, nevertheless, considered to be valuable. For example, gold, diamond and many such stones are considered to be very precious and people are prepared to offer fancy prices in order to acquire these metals or stones. Apparently, these have nothing to do with the satisfaction of our needs, either directly or indirectly. Why, then, are these considered to be so valuable?

These have come to acquire value "through a process of conditioning or assimilation". Since these are scarce, those who acquire possession of these scarce commodities to the exclusion of many others find pleasure in, and feel proud of, such possessions. Disappointment sets in when we fail to acquire them, and we feel happy and proud when we have them. "In this way, habits of attachment may be formed in relation to objects which may have no intrinsic or prima facie attractiveness". Such objects "gather around them groups of emotional dispositions, including especially the prospective and retrospective emotions of desire, hope, fear, anxiety, disappointment, as well as pleasure in attainment, and joy in mastery".

Ginsberg argues that all these primary needs, which "may serve as nuclei for the sentiments of property", are "aided by the tendency to confuse means and ends". That which is essentially a means to an end, is accepted uncritically as an end in itself. In *One Dimensional Man* Herbert Marcuse points to this kind of distortion in perspective and says that an individual feels gratified by the satisfaction of 'false needs' which are largely imposed by the mass media. A feverish attempt to acquire various types of electronic gadgets even at a great personal sacrifice of many other essential goods is an example of pursuit of 'false needs'. It is, thus, obvious that "interest in ownership is very complex and has its roots in several fundamental needs".

Comparative jurisprudence teaches us that there are three original forms of acquiring property. First, goods; may be taken directly from nature. Second, goods may be obtained by the sweat of one's brow. Third, possession of goods may be obtained by the assertion of power over other people. "In all these forms of acquisition, but especially in the last, the self-assertive tendencies of man come into play. Men come to love things because they have put their energy into them, and because they are instruments of general satisfaction, but especially because they give them power over nature and other human beings.

It is not so much the direct use of things, as the exercise of power, which they at once embody and facilitate, that gives to property its tremendous drive, and makes it one of the roots of ambition" If, therefore, we look at the subject from a psychological point of view, property arises, not from a direct need to acquire and possess, but from the interweaving of myriad basic interests with self-regard and self-assertion. We may also look at property ownership from another angle. "Ethically, the function of property is to provide the material conditions of a free, secure, and purposeful life". In actual practice, however, this object remains unfulfilled in the case of a large majority of the population in all societies.

The reasons for this failure of the economic system to ensure carefree and meaningful life lie deep in the history and psychology of property. It is clear from the brief outline of the evolution of property that ownership of property has gradually passed on in the hands of a limited number of people, resulting in deprivation of the bulk of the population from ownership rights. Another parallel development has been the gradual institutionalization of the rights of property. Several consequences flow from this.

The owners of property have come to enjoy their property rights without any interference from others. They have also been able to exercise power and domination over those bereft of property. To make matters worse still, the bulk of the population are denied the opportunities, in the context of minute division of labour calling for specialisation, for making work a vehicle for "self-expression and self-fulfillment".

Ginsberg, therefore, concludes that "as far as the masses of workers are concerned, property cannot be said to have fulfilled its primary social functions of providing security and permanence, a basis of freedom and initiative, and an opportunity for the active expression of faculty". The solution to this intricate problem lies in devising appropriate methods for curbing and restricting within prescribed limits the opportunities of a few to establish domination over others. At the same time, conditions must be created so as to enable the vast majority of the population to release their creative talents and make their lives joyous and meaningful. Obviously, the institution of property must be suitably modified, so as to serve these twin purposes.

### **Principal Forms of the Institution of Property:**

Broadly, we may distinguish common, collective and individual property. Common property is that over which several individuals have rights. They, however, hold this property collectively as against the rest of the community. The rights of sharing this property are defined by customary rules of distribution and supervised by the community. There are numerous forms of collective property, the variation being based on the type of collective entity: that is, whether it is a private corporation, or a quasi-public corporation, or a public corporation. Finally, in private property the control of property is vested in an individual, subject, of course, to varying types of control imposed by the society in respect of its enjoyment, alienation and bequest?

It is difficult to make a reliable assessment as to when and among whom a particular ownership right was prevalent. However, the picture which emerges as a result of investigations conducted by social anthropologists among primitive people may be briefly indicated. Among primitive peoples, private property is recognized in such things as clothing, implements, dwelling huts or divisions within these huts. In respect of these sharing is governed by customary rules and by exchange of gifts. With regard to land, there are great variations. Common property prevails among hunters, pastoralists and early agriculturists.

With development and expansion of agriculture, the principle of common property is gradually given up. But the abandonment of common property does not, as can be generally expected, lead directly to the acceptance of the principle of private ownership. On the contrary, "the gainers are the chiefs and the nobles, and we find more and more cases in which the mass of the people become dependent cultivators: slaves, serfs, or tenants of a landed class". It should, however, be remembered that alongside the emergence of individual ownership, common property also exists in a modified form.

"The principle of private property is seen more closely at work among the pastoral people where communal restrictions are probably less effective and the chances for individual accumulation of property greater. At the stage in which 'barbarism' is beginning to pass into 'civilization', the different principles are found interwoven, and the seigniorial and the communal principles are still fairly balanced. Thereafter, the tendency is for the preponderance of power to pass to the nobles, leaving the commoners in an increasingly dependent position". Gradually, feudalism appears. There are varieties of feudal tenure which appear in different places according as circumstances demand. Eventually, industrial revolution demolishes the foundation of feudalism, paving the way for the establishment of the capitalistic order. Explanations about the nature and characteristic features of capitalism vary. Capitalism has also, like all other social institutions, undergone changes in response to environmental changes and historical conditions. Keeping this in view, we may consider a few definitions in order to find out the sociological significance of capitalism.

Sidney Webb defines capitalism as “that particular stage in the development of industry and legal institutions, in which the bulk of the workers find themselves divorced from the ownership of the instruments of production, in such a way as to pass into the position of wage-earners whose subsistence, security and personal freedom seem dependent on a relatively small proportion of the nation; namely, those who own, and through their ownership, control the organisation of the land, the machinery and labour force of the community, and do so with the object of making for themselves individual and private gains”.

Hobhouse defines it as **“the employment in the production of goods for sale of those who have not the means of production by some who have or can command this means”**. From a sociological point of view, the essence of capitalism lies in the relationship that develops between those who own the means of production and those who do not, between those who enrich themselves at the cost of the bulk of the population.

In course of time, the people press for removal of the inequities of the system by extending communal control over capitalist enterprises through legislative and administrative regulations. As a consequence, there has been an extension of the collective types of property in the forms of the co-operative systems and of public ownership, an increase in the public control of quasi-public bodies, and public ownership of ‘natural monopolies’. At the same time, the workers have organised themselves into trade unions and they seek thereby to check the attempts of owners to exploit the workers. Their attempts are, generally speaking, considerably successful.

It may also be noted that socialism as an ideal and as a programme of work has emerged as a reaction to the inequities of the capitalist system. Opinions differ as regards the meaning of socialism. Some socialists advocate social ownership of the means of production while some advocate merely social control and regulation of enterprises in private ownership. The form and extent of social control “belongs to the bitterest controversies of today”. Various alternative proposals are suggested, debated and even tried with an eye to the attainment of the twin objectives of distributive justice and economic growth.

“In all these forms of acquisition, but especially in the last, the self-assertive tendencies of man come into play. Men come to love things because they have put their energy into them, and because they are instruments of general satisfaction, but especially because they give them power over nature and other human beings. It is not so much the direct use of things, as the exercise of power, which they at once embody and facilitate, that gives to property its tremendous drive, and makes it one of the roots of ambition” If, therefore, we look at the subject from a psychological point of view, property arises, not from a direct need to acquire and possess, but from the interweaving of myriad basic interests with self-regard and self-assertion.

We may also look at property ownership from another angle. “Ethically, the function of property is to provide the material conditions of a free, secure, and purposeful life”. In actual practice, however, this object remains unfulfilled in the case of a large majority of the population in all societies. The reasons for this failure of the economic system to ensure carefree and meaningful life lie deep in the history and psychology of property. It is clear from the brief outline of the evolution of property that ownership of property has gradually passed on in the hands of a limited number of people, resulting in deprivation of the bulk of the population from ownership rights.

Another parallel development has been the gradual institutionalization of the rights of property.

Several consequences flow from this.

The owners of property have come to enjoy their property rights without any interference from others. They have also been able to exercise power and domination over those bereft of property. To make matters worse still, the bulk of the population are denied the opportunities, in the context of minute division of labour calling for specialisation, for making work a vehicle for "self-expression and self-fulfillment". Ginsberg, therefore, concludes that "as far as the masses of workers are concerned, property cannot be said to have fulfilled its primary social functions of providing security and permanence, a basis of freedom and initiative, and an opportunity for the active expression of faculty". The solution to this intricate problem lies in devising appropriate methods for curbing and restricting within prescribed limits the opportunities of a few to establish domination over others. At the same time, conditions must be created so as to enable the vast majority of the population to release their creative talents and make their lives joyous and meaningful. Obviously, the institution of property must be suitably modified, so as to serve these twin purposes.

### **Principal Forms of the Institution of Property:**

Broadly, we may distinguish common, collective and individual property. Common property is that over which several individuals have rights. They, however, hold this property collectively as against the rest of the community. The rights of sharing this property are defined by customary rules of distribution and supervised by the community. There are numerous forms of collective property, the variation being based on the type of collective entity: that is, whether it is a private corporation, or a quasi-public corporation, or a public corporation. Finally, in private property the control of property is vested in an individual, subject, of course, to varying types of control imposed by the society in respect of its enjoyment, alienation and bequest?

Gradually, feudalism appears. There are varieties of feudal tenure which appear in different places

according as circumstances demand. Eventually, industrial revolution demolishes the foundation of feudalism, paving the way for the establishment of the capitalistic order. Explanations about the nature and characteristic features of capitalism vary. Capitalism has also, like all other social institutions, undergone changes in response to environmental changes and historical conditions. Keeping this in view, we may consider a few definitions in order to find out the sociological significance of capitalism. Sidney Webb defines capitalism as "that particular stage in the development of industry and legal institutions, in which the bulk of the workers find themselves divorced from the ownership of the instruments of production, in such a way as to pass into the position of wage-earners whose subsistence, security and personal freedom seem dependent on a relatively small proportion of the nation; namely, those who own, and through their ownership, control the organisation of the land, the machinery and labour force of the community, and do so with the object of making for themselves individual and private gains".

Hobhouse defines it as "**the employment in the production of goods for sale of those who have not the means of production by some who have or can command these means**". From a sociological point of view, the essence of capitalism lies in the relationship that develops between those who own the means of production and those who do not, between those who enrich themselves at the cost of the bulk of the population. In course of time, the people press for removal of the inequities of the system by extending communal control over capitalist enterprises through legislative and administrative regulations. As a consequence, there has been an extension of the collective types of property in the forms of the co-operative systems and of public ownership, an increase in the public control of quasi-public bodies, and public ownership of 'natural monopolies'.

At the same time, the workers have organised themselves into trade unions and they seek thereby to check the attempts of owners to exploit the workers. Their attempts are, generally speaking, considerably successful.

It may also be noted that socialism as an ideal and as a programme of work has emerged as a reaction to the inequities of the capitalist system. Opinions differ as regards the meaning of socialism. Some socialists advocate social ownership of the means of production while some advocate merely social control and regulation of enterprises in private ownership. The form and extent of social control "belongs to the bitterest controversies of today". Various alternative proposals are suggested, debated and even tried with an eye to the attainment of the twin objectives of distributive justice and economic growth.

**Education:** is the process of socialisation, which begins informally at home and then formally in educational institutions. Education as an institution helps develop knowledge, skill, attitude and understanding of the people and strive to make them competent members of the society. Education widens the mental horizon of the people and make them receptive to new ideas.

### **Meaning of Education:**

The term education has different meanings. Each person interprets the word in terms of his past experience, his needs and purposes. The parents, the teachers, administrators, religious leaders, politicians and artists interpret the term education in their own ways. For example, to a student, education means acquisition of knowledge, receiving a degree or diploma. A statesman may claim that it means to train individuals as ideal citizens. A teacher may interpret education as means for creation a new man and new society. The meaning of education differs from place to place and from time to time. It has passed through many ages and stages of evolution. At every

stage it has had a different meaning according to existing social conditions.

The term education is derived from the Latin word 'educate' which means to 'educate', to 'bring up' or to 'draw out' the latent powers of child. Confirming to this meaning Durkheim defined education as "the action exercised by the older generations upon those who are not yet ready for social life. Its object is to awaken and develop in the child those physical, intellectual and moral states which are required of him both by his society as a whole and by the milieu for which he is specially designed". He conceives of education as "the socialisation of the younger generation". Hence, education may be broadly regarded as the way in which people learn to take part in the life of society in which they live. Education is the social process by which individual learns the things necessary to fit him to the social life of his society.

Education is primarily deliberate learning which fits the individual for his adult role in society. As Counts and Mead phrase it, education is an induction into the learner's culture. It is a deliberate instruction throughout which we acquire a large part of our social and technical skills. Accordingly says Lowie, "it is as old as organised social life. Schooling is merely a highly specialised form of education. According to Samuel Koenig, Education may also be defined as the process whereby the social heritage of a group is passed on from one generation to another as well as the process whereby the child becomes socialised, i.e. learns the rules of behaviour of the group into which he is born.

It is again believed that the term education is derived from the Latin word 'educatum' which means the act of teaching or training. Thus, education is both acquisition of knowledge or art of teaching and learning of values, norms and skills. The education a system, first of all, may be viewed as a part of the total social system. It both reflects and influences the social and cultural order of which it is apart. However, in modern society, education is viewed as formal training. As A.W. Green writes, Historically, it (education) has meant the conscious training of the young for the later adoption of adult roles.

By modern convention, however, education has come to mean formal training by specialists within the formal organisation of the school". Education, according Western scholars, is deliberate and organised activity through which the physical, intellectual, moral and spiritual potentialities of the child are developed, both in individual as an individual and also as a member of society. So that he may lead the fullest and richest life possible in this world. All practical aims such as the development of character, the attainment of knowledge both for use and enjoyment, the acquisition of skills, the making of worthy citizen and others that have been proposed from time to time are subordinate to the ultimate aim in life.

The educational system may be viewed as subsystem within social organisation of its own. It has a system of status and roles, a body of skills, values and traditions. Each schools and each classroom within the school forms an interacting group.

### **Aspects of Education:**

Now, we can indicate several sociological aspects of education. First, learning is a creative experience. When a man responds to stimuli, he acts in a creative manner. In other words, education is a creative act for the learner. Second, education is of two ways of learning such as informal education and formal education. The first serves continuously through life, as mechanism for learning as well as for reinforcing previous learning. Third, formal education is a socially devised technique, a highly elaborated procedure for creating situations in which the pupil may learn. Individu-

als go through formal education only a Short period of their life. Forth, education is both the living of life (in the network of social relationships, inthe classroom and outside) and a preparation for life. Preparation for life involves

- (a) capacity to earn a livelihood,
- (b) capacity to enrich one's life through enjoyment of the cultural heritage and of one's inner resources,
- (c) capacity to function efficiently and constructively as a member of society, as a citizen of the State. Fifth, education involves
  - (a) mastery of the tools of learning, such as reading, writing arithmetic and
  - (b) mastery of our relations to our inner self, to our neighbour, to the universe.

Education is interpreted in two senses, "narrow' and 'broader' sense. Education, in narrow sense, is a planned, organised and formalised process. It is imparted at a particular place (School, College, and University) and at a definite time. Its curriculum is also formal. In narrow sense education is limited to classroom. In broader sense education is not related to schooling or teaching. Each and every individual acquires some sort of education, even he has never spent a day in a school, because his acquired characteristics are the products of experiences and activities which are the products of experiences and activities which are educational in nature. Education, in wider sense, is used for the purpose of teaching people all characteristics which will enable them to live in the society. Education is a continuous 'process'. Education of human being begins at birth and it ends with his death. He leans throughout his life. There is no end to it. Education is much more than schooling. The child goes on reconstructing his experiences throughout the whole life. Instruction ends in the classroom, but education ends only with life.

### **Social Functions of Education:**

Education as social institution, plays a vital role in our society. The function of education is multi-dimensional within the school system and outside it. It performs the function of socialising the individual for a variety of social roles and development of personality. It is also an important part of the control mechanisms of society. Education is a necessity right from the simple society to modern complex industrial society.

#### **1. Socialisation:**

The most important function of education is socialisation. The people have no knowledge about the culture of their society. They must learn them and they must learn the way which their society is functioning. Hence, the children as they grow up must be introduced into the culture which they are going to face. Society, therefore, provides a conscious teaching programme to inculcate values, norms and social skills that will fit the individuals for their adult role in society. Society creates educational institutions such as school and colleges to perform certain functions in accomplishing this general end.

Besides, providing the children with tools of knowledge – how to write, spell and master arithmetic, the school also exposes them to social norms and values beyond those which are available for learning in the family and other groups. The learners acquire academic knowledge through schools and college which they will need later on and some will be practical or technical to fit him for some sort of job. At the same time the schools and colleges inculcate social values and norms among them.

Though people learn a great deal from their parents or in clubs and among groups of friends, they learn more of the culture of their society through educational system. For it is in the educational institutions that the young are exposed to social norms and values beyond those which are available for learning in the family and other social groups. History books tend to be written from an ethnocentric viewpoint and to inculcate nationalistic attitudes.

Through education, the child is able to develop reasoning in social relations, cultivates social virtues and thus becomes socially efficient as says Dewey. When he speaks about social efficiency, he refers to economic and cultural efficiency, and he calls it 'socialisation of individual'. Thus, education, may be only part of the process of socialisation, but it is a very important part.

## **2. Development of Personality:**

Education plays an important role in the development of personality. The object of education, as said Durkheim "is to awaken and develop in the child those physical, intellectual and moral states which are required of him both by his society as a whole and by the milieu for which he is specially designed". Education helps the development of the qualities of an individual, such as physical, mental and emotional make-up as well as his temperament and character.

The self, the core of personality, develops out of the child's interaction with other. Subsequently, the habits, traits, attitudes and ideals of an individual is patterned by the process of education. A learner's personality is also developed indirectly when he is encouraged to form his own attitudes and values by studying outstanding people in history and literature. Moreover, a learner is also influenced by the outlook and attitudes of fellow students and teachers.

## **3. Social Control:**

Education plays a vital role in regulating individual behaviour through transmitting a way of life and communicating ideas and values to the new generations. One way that education contributes to the regulations of social conduct, says Bottomore, "is in the early socialisation of the child". In order to transmit its social heritage and survive as a social order all societies develop educational systems to train its younger generations. The young must be consciously trained for their adult roles to maintain the society. Through the process of education society regulates the behaviour of its members and enforces conformity to its norms.

"Education in a broad sense", as says Bottomore, "From infancy to adulthood, is thus a vital means of social control". Formal education in modern societies communicate ideas and values which play a part in regulating behaviour. The new generations are instructed to observe the social norms, the violation of which may invite punishment.

## **4. Social Integration:**

Education, by imparting values, also integrates people into the broader society. The curriculum of the school, its 'extra-curricular' activities and the informal relationship among students and teachers communicate certain values and social skills such as cooperation or team-spirit, obedience, fair play.

## **5. Determination of Status:**

Determination of status of an individual is an important function of education. Amount of education is a good indicator of socio-economic status, from lower working class to upper class, educa-

tion leads to economic opportunity. It is through education young people secure higher status jobs than their parents. With higher incomes they come to associate with the persons of higher status. Thus, education provides the channel to better socio-economic status.

## **6. Provides Route for Social Mobility:**

Educational qualifications increasingly form the basis for the allocation of individuals to social statuses and social mobility. There has been steady move from one status to other due to educational attainment. An industrial society like United States or Great Britain places increasing emphasis on the attainment of both of the skills acquired in elementary, secondary and higher education and of the educational credentials that a person has acquired the skills for a job.

The educational system is expected to provide opportunity for social and economic mobility by selecting and training the most able and industrious youth for higher-status position in society. The educational system places those with the greater abilities and training in higher positions and those with the lesser abilities and training in lower ones. Thus, education tends to generate vertical social mobility by increasing their earning power and by preparing them for higher-status occupation than that of their parents.

The educational system whether industrial societies or in developing societies like India tend to create and maintain a broad division between elites and masses, between education for intellectual and for manual occupations. Such differentiation within the educational system is closely linked to the system of social stratification and mobility.

## **7. Social Development:**

Skills and values learned in education are directly related to the way to which the economy and the occupational structure operate. Education trains the individuals in skills that are required by the economy. In modern planned economy the output of skilled people must be consciously geared to the economic and social priorities of the society. That explains the vital role of education in social development. Literacy, for example, stimulates economic and social development and that is why all developing countries have undertaken large-scale literacy programmes.

Literacy increases political consciousness among poor people who now organize themselves into various forms of organization.

## **Colonialism**

Colonialism implies domination of people's life and culture. The main goal of colonialism is extraction of economic benefits from the colony. Colonialism results in control over life of natives in political, economic, cultural and social spheres. It is more subtle whereas Imperialism is more formal and aggressive.

### **Historically, two main types of the colonization can be differentiated.**

- **Settler colonialism** is that type of colonialism wherein a large number of the immigrants, often motivated by religious, political, or economic reasons, settle in a new place and dominate the local indigenous population in economic, political as well as social aspects.
- **Exploitation colonialism** involves relatively less number of immigrants and predominantly focuses on exploitation of the resources of the colonial country.

Thus colonialism denotes a set of unequal relationships between the colonial power and the

colony, and often between the colonists and the indigenous population; relationships in which the colonists acquire benefits (disproportionally), at the expense of the local population.

## **Colonialism, Imperialism And New Imperialism**

**Colonialism**, as said earlier, denotes a system in which a country conquers and rules over other regions. It involves exploiting the resources of the conquered country for the benefit of the conqueror.

**Imperialism** means the ability of a state (or empire) to exert its influence beyond its borders. This influence can be exerted in multiple manners, like colonialism, militarism, cultural hegemony etc. Thus it can be safely argued that **colonialism is a practice and imperialism is the idea driving that practice**.

**New Imperialism** refers to period of territorial expansion by European powers, the United States, and Japan during the late 19<sup>th</sup> and early 20<sup>th</sup> centuries, which resulted in subjugation of almost all of Africa and parts of Asia. It was distinct from the earlier phases of imperialistic expansion, known as old imperialism.

Historically speaking, **new imperialism started with the advent of industrial revolution**. In fact, it was a new strategy of imperialism which was devised by the industrialized countries for maximising their economic benefits. It contrasts with the old form of imperialism, in which Colonialism formed the main method of pursuing the imperialistic ambitions and goals.

## **Causes of Colonialism**

- **Discovery of New Lands And Trade Routes**
- **Economic Consideration:** The countries like England, France, Spain and Portugal established their colonies primarily for the economic benefits.
- **Mercantilism:** The policy of Mercantilism was based on the premise that the economic development of the mother country (Metropolis) was most important and the colonies should be governed in such a way that they lead to the benefit of the mother country.
- **European Rivalry:** The exploration and colonization was started by Spain and Portugal. Gradually, other countries like France and England also entered the race. Acquiring new colonies became a thing of national pride. Moreover, due to various economic benefits of colonization, a stage of 'competitive colonialism' started among the European powers.
- **To Spread Christianity:** During the Age of Discovery; the Catholic Church started a major effort to spread Christianity in the New World by converting indigenous peoples. As such, the establishment of Christian missions went simultaneously with the colonizing efforts of European powers such as Spain, France and Portugal.
- **Push Factors:** The enclosure movement, taking land out of cultivation and converting it into pastureland for sheep, was creating a surplus population. Sheep raising, more profitable than traditional agriculture, required fewer labourers. The new lands in America gave these unemployed a place to work.

In Asia, the Europeans met ancient and well populated societies, and hence direct colonization was not feasible. Rather, armed coastal trading posts along maritime trade routes (such as Goa, Malacca and Macau), were established. Nonetheless, in certain areas both Spanish and Portuguese became the effective rulers. On the contrary, in the Western Hemisphere, the European

colonization involved the emigration of large numbers of settlers, soldiers and administrators intent on owning land and exploiting the relatively pristine landscape. The result was that the colonization in Asia was indirect while the colonization of Americas was direct (i.e., actual settlement).

- **European Colonies In India:** Vasco da Gama's discovery of a new sea route to India in 1498 started the process of direct Indo-European commerce. The Portuguese soon set up trading posts in Goa, Daman, Diu and Bombay. The next to arrive were the Dutch, the English and finally the French. The internal conflicts among Indian Kingdoms, the technological superiority of Europeans and financial benefits of commerce enabled the European traders to gradually gain political and military influence and appropriate lands. Although all European powers controlled various regions of southern and eastern India, ultimately they lost all their territories in India to the British, with the exception of the few outposts, like French of Pondichéry, the Dutch port of Travancore, and the Portuguese colonies of Goa, Daman, and Diu.

## Impact of Colonialism

- **Columbian Exchange:** The term Columbian Exchange refers to the widespread exchange of plants, animals, culture, human populations, technology, and ideas that occurred between the new world (Americas) and the Old World (Eurasia) in the 15<sup>th</sup> and 16<sup>th</sup> centuries, as a result of European colonization and trade.
- **Slave Trade:** To effectively utilize the resources, colonizers needed immense amount of labour. During the initial years, the European settlers met labour requirements by enslaving the native populations. However, the decline in the native population led to importing slaves from Africa which emerged as a lucrative alternative.
- **Boost to Mercantilism:** Mercantilism, in a way, was both the cause as well as the effect of colonialism. Mercantile economic policies were definitely an impetus for the start of colonization. But subsequently, the benefits due to colonial exploitation further reinforced the ideology of mercantile capitalism and augmented its spread across Europe. As a result these countries saw very rapid increase in trade volume while colonies suffered proportionally.

# MCQs

1. Society symbolises the network of
  - (a) human relationships
  - (b) social relationships
  - (c) orientations
  - (d) inter-connectionsAns. (b)

- (c) Illicit Major
- (d) Illicit Minor

Answer: (C)

217. In categorical syllogism, the middleterm is the term that occurs in

- (a) Major premise only
- (b) Minor premise only
- (c) Both major and minor premises
- (d) Conclusion only

Answer: (C)

218. Match List – I with List – II and select the correct answer by using the code givenbelow:

List – I

List – II

(Philosopher)

(Doctrine)

- |                    |                              |
|--------------------|------------------------------|
| a. J.L. Austin     | i. Language Games            |
| b. L. Wittgenstein | ii. Speech Acts              |
| c. W.V. Quine      | iii. Theory ofIntentionality |
| d. John Searle     | iv. Two dogmas ofEmpiricism  |

Codes:

a b c d

(a) iv iii ii i

(b) iii iv i ii

(c) ii i iv iii

(d) iii iv ii i

Answer: (C)

219. Which one of the following does not come under the category of Vaishnavism?

(a) Ramanuja

(b) Samkara

(c) Madhva

(d) Vallabha

Answer: (B)

220. Who, among the following, advocates Pushti?

(a) Ramanuja

(b) Madhva

(c) Vallabha

(d) Samkara

Answer: (C)

221. Which one of the following makes provision for eternal hell?

(a) Samkara

(b) Madhva

(c) Nimbarka

(d) Vallabha

Answer: (B)

222. Which one of the following is the advocate of five differences (Panchabheda)?

(a) Samkara

(b) Ramanuja

(c) Madhva

(d) Vallabha

Answer: (C)

223. When anyone objected to non-violence as the creed of the coward, Gandhi

(a) Reproached the person

- (a) Paul Dason
- (b) Keith
- (c) Radhakrishnan
- (d) Shankar

Answer: (A)

229. The movements of stars and planets according to Vedic literature is guided by

- (a) The Will of God
- (b) The Will of the Devatas
- (c) \_\_\_\_\_ R.ta
- (d) Yajña

Answer: (C)

230. 'Ātmā is\_\_dehāparimāa 'this view is upheld by

- (a) Baudha
- (b) Cārvāka
- (c) Both Bauddha & Cārvāka
- (d) Jaina

Answer: (D)

231. Select the right order of five Skandhas according to Buddhism:

- (a) Roop, Saskār, Vijān, Samanya and Vednā
- (b) Roop, Samj ā, Vednā, Saskārand Vijān
- (c) Roop, Vednā, Samj ā, Saskārand Vijān

(d) Roop, Vijān, Samj ā, Saskārand Vednā

Answer: (C)

232. Jain Metaphysics is known as

(a) Idealistic Pluralism

(b) Realistic Pluralism

(c) Idealistic Monism

(d) Realistic Monism

Answer: (B)

233. According to Mimamsakas the following are included among the Śrutivākyas:

(a) Vidhi, Ni edha, Tarkavākya

(b) Vidhi, Tarkavākya, Arthavāda

(c) Vidhi, Ni edha, Arthavāda

(d) Tarkavākya, Arthavāda, Ni edha

Answer: (C)

234. Who among the following divided Veda into four?

(a) Ka

(b) Vyāsa

(c) Manu

(d) None of the above

Answer: (D)

235. According to Jaina Philosophy, which one of the following is not the characteristic of Reality?

(a) Origination

(b) Decay

(c) Permanence

(d) Impermanence

Answer: (D)

236. Kumaril accepts soul as

(a) Only partially un-conscious

(b) Only partially conscious

(c) Partially conscious and partially unconscious both

(d) None of these

Answer: (A)

237. The theory of causation as proposed by Sankaradwaita is corroborated by

(a) Experience

(b) Logic

(c) Scriptures

(d) All the above

Answer: (B)

238. The theory that the effect is only the apparent result of the cause is known as

- (a) Satkaryavada
- (b) Asatkaryavada
- (c) Parin.amavada
- (d) Vivartavada

Answer: (D)

239. Which one of the following is the most important quality of a good teacher ?

- (a) Punctuality and sincerity
- (b) Content mastery
- (c) Content mastery and reactive
- (d) Content mastery and sociable

Answer: (C)

240. The primary responsibility for the teacher's adjustment lies with

- (a) The children
- (b) The principal
- (c) The teacher himself
- (d) The community

Answer: (B)

241. Concept means

- (a) A mental image
- (b) A reality
- (c) An idea expressed in language form
- (d) All the above

Answer: (C)

242. The relation of Percept to Concept is

- (a) Positive
- (b) Negative
- (c) Reflective
- (d) Absolute

Answer: (C)

243. In the passage, the earth is taken as

- (a) The Globe
- (b) The Human Habitat
- (c) A Celestial Body
- (d) A Planet

Answer: (C)

244. Percept means

- (a) Direct observation through the senses

- (b) A conceived idea
- (c) Ends of a spectrum
- (d) An abstract image

Answer: (B)

245. Action research means

- (a) A longitudinal research
- (b) An applied research
- (c) A research initiated to solve an immediate problem
- (d) A research with socioeconomic objective

Answer: (C)

246. Which of the following is an example of circular argument?

- (a) God created man in his image and man created God in his own image.
- (b) God is the source of a scripture and the scripture is the source of our knowledge of God.
- (c) Some of the Indians are great because India is great.
- (d) Rama is great because he is Rama.

Answer: (B)

247. Lakshmana is a morally good person because

- (a) he is religious
- (b) he is educated
- (c) he is rich
- (d) he is rational

Answer: (D)

248. Two statements I and II given below are followed by two conclusions (a) and (b). Supposing the statements are true, which of the following conclusions can logically follow?

- I. Some religious people are morally good.
  - II. Some religious people are rational. Conclusions:
    - (a) Rationally religious people are good morally.
    - (b) Non-rational religious persons are not morally good.
- (a) Only (a) follows.
  - (b) Only (b) follows.
  - (c) Both (a) and (b) follow.
  - (d) Neither (a) nor (b) follows.

Answer: (C)

249. Certainty is

- (a) an objective fact
- (b) emotionally satisfying
- (c) logical
- (d) ontological

Answer: (B)

250. According to B.R. Ambedkar the ideal religion should:

- i be consistent with science
  - ii rationalize rituals and superstitious
  - iii support liberty, equality and fraternity
  - iv not glorify poverty

- (a) Samavāya
- (b) Samyoga
- (c) Svarūpa
- (d) None of the above

Answer: (B)

256. Who holds the theory of Saptaprajñāvāda?

- (a) Yoga Philosophy
- (b) Vedānta Philosophy
- (c) Sāṃkhya Philosophy
- (d) Vaiśeṣika Philosophy

Answer: (A)

257. Which one is the correct match? Answer by using the given code:

- |                 |                           |
|-----------------|---------------------------|
| a. Praśastapāda | i. Tattvopaplabsimha      |
| b. Nāgārjuna    | ii. Nyāya Kusumāñjali     |
| c. Vācaspati    | iii. Tattvakaumidi        |
| d. Udayana      | iv. Padārthadharmasagraha |

Codes:

a b c d

- (a) i ii iii iv
- (b) iv i iii ii
- (c) ii i iii iv
- (d) iii ii i iv

Answer: (B)

258. Select the correct option:

- (a) Kamalsila is the predecessor of Dharmakīrti and Jayanta Bhatta
- (b) Rāṅga Rāmanujācārya is the contemporary of Gauṇapādācārya and Madhvācārya
- (c) Saṃkarācārya is the predecessor of Gauṇapādācārya and Madhvācārya
- (d) Gauṇapādācārya is the predecessor of Saṃkarācārya and Rāmānujācārya

Answer: (D)

259. In the context of Sāṃkhya Philosophy consider the following:

Assertion (A): Purusa is ultimate reality.

Reason (R): Purusa is the substratum of all the pleasures and pains.

Options:

- (a) (A) is true and (R) is false and (R) does not provide correct explanation of (A).
- (b) (A) is false and (R) is true and (R) provides correct explanation of (A).
- (c) Both (A) and (R) are false and (R) provides correct explanation of (A).
- (d) All the above mentioned options are incorrect.

Answer: (A)

260. Which one among the following is not a means of Śaktigraha?

- (a) Āptavākya
- (b) Vrddhavyavahāra
- (c) Tarka
- (d) Vyākaraṇa

Answer: (C)

261. Followings are the three levels of Reality according to Advaita Vedanta:

- (a) Pārmārthika, Prātibhāsika, Vyāvahārika
- (b) Sāmv tika, Samvyāvaharika, Pārmārthika
- (c) Pārmarthika, Samprātibhāsika, Samvyāvaharika
- (d) Sāmvrttika, Loka-samvrtti, A-loka-samvrtti

Answer: (A)

262. Match correctly and answer with the help of the code given:

Idea Thinker

- |                |                |
|----------------|----------------|
| a. Shunyavāda  | i. Maddhva     |
| b. Advaitavāda | ii. Shankara   |
| c. Ajativāda   | iii. Gaudapāda |
| d. Dvaitavāda  | iv. Nagarjunā  |

i ii iii iv

- (a) a c b d
- (b) d b c a
- (c) a b c d
- (d) d c b a

Answer: (B)

263. The path of Rāja-yoga in modern period was propounded by

- (a) Swami Ram Tīrth
- (b) Mahātmā Gandhi
- (c) S. Rādhākṛishnan
- (d) Swami Vivekānand

Answer: (D)

264. The book My Experiments with Truth is written by

- (a) Jiddu Krishnamurty
- (b) Swami Yoganand
- (c) Shri Raman Maharshi
- (d) Mahātmā Gandhi

Answer: (D)

265. Which one of the following pairs is incorrectly matched?

- (a) Dr. M. Iqbal – Integral Intuition
- (b) Dr. B.R. Ambedkar - Removal of Casteism
- (c) Sri. K.C. Bhattacharya – The Subject as Freedom
- (d) Sri. R. Tagore - Jivana- Devatā

Answer: (A)

266. According to Sri. Aurobindo, the ascent from mind to supermind takes place through the fol-

Following order of steps:

- (a) Illumined mind, over mind, Intuition
- (b) Illumined mind, higher mind, Intuition, over mind
- (c) Higher mind, Illumined mind, Intuition, over mind
- (d) Intuition, over mind, Illumined mind

Answer: (C)

267. Who amongst the following thinkers gave prominent emphasis on the concept of 'Intellect and Intuition'?

- (a) Dr. K.C. Bhattacharya
- (b) Dr. S. Rādhākṛishnan
- (c) Dr. M. Iqbal
- (d) Dr. M.N. Roy

Answer: (B)

268. Which one of the following statements illustrates the theory of Akhyātivāda?

- (a) Error emerges due to amalgamation of perception and memory.
- (b) Error emerges due to incorrect perception.
- (c) Error emerges due to misapprehension of the object.

- (a) Dilthey
- (b) Heidegger
- (c) Schleiermacher
- (d) Gadamer

Answer: (C)

315. Consider List – I with List – II and select the code correctly matched:

- | List – I   | List – II (Praman) |
|------------|--------------------|
| a. Nyaya   | i. Two             |
| b. Bauddha | ii. Four           |

- c. Carvaka                      iii. Three  
d. Samkhya                    iv. OneCodes:  
a b c d  
a) ii i iv iii  
b) iii ii iv i  
c) iv i iii ii  
d) i ii iii iv

Answer: (A)

316. Brahmacharya is the means to meet

- a) R.i a  
b) Pit a  
c) Deva a  
d) Manusya na

Answer: (A)

## **UNIT – 8**

**Social and Political Philosophy:  
Western**

## Plato's Ideal State

"Until philosophers are kings or the kings and princes of this world have the spirit and the power of philosophy and political greatness and wisdom meet in one, cities will never rest from their evils." (Plato) The Republic of Plato is interpreted as Utopia to end all Utopias, not because it is a romance, but because he constructed an ideal state in it. He compares the construction of an ideal state with an act of an artist who sketches an ideal picture without concerning himself with the fact whether individual characteristic features of imaginative picture are to be found anywhere or not? In the same way, Plato never thought of the possibility of the institutions of his ideal state, being capable of ever becoming a reality. He never thought of the impracticability of this idea concerning his ideal state.

Plato built his state on the analogy of an individual organism. He believed that the virtues of an individual and of the state were identical. He was of the view that an individual presented almost the same features and qualities on a smaller scale as society on a bigger scale.

Parts of an organism	What it symbolizes	Its counter symbol in State
Belly	Appetite or desire	Laborers, agriculturists, industrialists, clerks, businessmen
Heart	Courage or Spirit	Soldiers and military officers
Brain	Reason or knowledge	Philosophers, thinkers and rulers

## Features of an Ideal State

### 1. Rule of Philosophy

Plato was of the view that in an ideal state the philosopher-ruler should be prominent. He should have a broad vision of unity of knowledge. Philosopher-kings are immune from the provisions of law and public opinion.

### 2. No unqualified absolutism

Though, neither, there is any restraint of law nor of public opinion over philosopher-rulers but that is not an unqualified absolutism. It is not all despotism, because rule of philosophy is not free from the basic articles of the constitution.

### 3. Control over the education system

Philosopher ruler should control the education system in an ideal state.

### 4. Justice in ideal state

Justice is the main feature of Plato's Republic and it is also present in his ideal state. Justice is the bond which binds every member of society together. It forms a harmonious union of individuals.

### 5. Censorship of art and literature

In ideal state, there should be a complete censorship of art and literature. It is necessary so that

nothing immoral things might fall into the hands of the young individuals.

## **6. System of Communism**

Plato was of the view that guardian class should live under the system of communism of property and family. The rulers and soldiers do not possess any property of their own.

## **7. Equality among men and women**

According to Plato, equal opportunities should be given to both men and women for their economic, social, intellectual and political uplift. We can say that Plato was the first feminist of his time.

## **8. Principle of Functional Specialization**

Plato was of the view that due to multiple wants, an individual could not fulfill all his desires by himself alone due to lack of capacity. Thus co-operation among individuals should be necessary to satisfy their mutual desires. Some people are specialized in performing some certain tasks.

## **Criticism**

1. Plato built his ideal state on the analogy of individual and this identification leads to confusion. He failed to distinguish ethics from politics. His ideal state is based not merely on analogy but almost identification between the individual and the state, which is quite wrong.
2. Plato fails to condemn the institution of slavery and regard it as fundamental evil.
3. Plato's system of communism of women and temporary marriage is detestable and unethical.
4. Plato is a moralist rather than a political idealist. His assumption that the state should control the entire lives of its citizens is false and contrary to human liberty.
5. By the system of functional specialization, Plato tends to dwarf the personality of the individual. There is no possibility of any full development of human personality in his ideal state.
6. Plato completely ignores the lower class in his ideal state which forms the great bulk of population. Such negligence may divide the society into two hostile groups.

## **Plato's Concept Of Justice**

Plato in his philosophy gives very important place to the idea of justice. He used the Greek word "Dikaisyne" for justice which comes very near to the work 'morality' or 'righteousness', it properly includes within it the whole duty of man. It also covers the whole field of the individual's conduct in so far as it affects others. Plato contended that justice is the quality of soul, in virtue of which men set aside the irrational desire to taste every pleasure and to get a selfish satisfaction out of every object and accommodated themselves to the discharge of a single function for the general benefit. Plato was highly dissatisfied with the prevailing degenerating conditions in Athens. The Athenian democracy was on the verge of ruin and was ultimately responsible for Socrates' death. Plato saw in justice the only remedy of saving Athens from decay and ruin, for nothing agitated him in contemporary affairs more than amateurishness, needlesomeness and political selfishness which was rampant in Athens of his day in particular and in the entire Greek world in general. In addition, Sophistic teaching of the ethics of self-satisfaction resulted in the excessive individualism also induced the citizens to capture the office of the State for their own selfish purpose and even-

tually divided "Athens in to two hostile camps of rich and poor, oppressor and oppressed. "Evidently, these two factors amateur needlessness and excessive individualism became main targets of Plato's attack. The attack came in the form of the construction of an ideal society in which "Justice" reigned supreme, since Plato found in justice the remedy for curing these evils. Thus, we are to inquire in this study the nature of justice as propounded by Plato as a fundamental principle of well-order society.

It is to be noted that before Plato many theories of justice were prevalent. The inquiry about justice goes from the crudest to the most refined interpretation of it. It remains therefore to inquire what were the reasons for which he rejected those views. Thus before discussing Plato's own concept of justice, it is necessary to analyze those traditional theories of justice were rejected by him.

Cephalus who was a representative of traditional morality of the ancient trading class established the traditional theory of justice. According to him 'justice consists in speaking the truth and paying one's debt. Thus Cephalus identifies justice with right conduct. Polemarchus also holds the same view of justice but with a little alteration. According to him "justice seems to consist in giving what is proper to him". The simple implication of this conception of justice may be that "justice is doing good to friends and harm to enemies." This is also a traditional maxim of Greek morality.

The views propounded by Cephalus and Polemarchus were criticized by Plato. The view point of Cephalus was criticised on the ground that there may be cases in which this formula may involve the violation of the spirit of right and his formula does not admit of being taken as a sound universal principle of life. It is not right to restore deadly weapons to a man after he has gone mad. And the contention of Polemarchus was condemned by Plato on the ground that it was only easy to speak of giving good to friend and evil to enemies. But if the friend only a friend in seeming, and an enemy in reality, then what will happen? Then under such circumstances whether we should rigidly follow the definition and do him good or we may use discretion and do him evil? But to do evil to anybody, including one's enemy was inconsistent with the most elementary conception of morality. Thus, this conception of justice regulated the relations between individuals on individualistic principles and ignores the society as a whole. Thrasymachus who represented the new and critical view, propounded the radical theory of justice. He defines justice as "the interest of the stronger". In other words, might is right. For while, every man acts for himself and tries to get what he can, the strongest is sure to get what he wants and as in a state the Government is the strongest, it will try to get and it will get, whatever it wants for itself. Thus, for Thrasymachus justice means personal interest of the ruling group in any state or we can further define it as "another's good". Laws are made by the ruling party in its own interest. Those who violate such laws are punished because violation of such laws is treated as violation of justice. Socrates criticises the definition of justice given by Thrasymachus and he says just as a physician studies and exercises his power not in his interest but in the interest of a patient, the Government of any kind shall do what is good for the people for whom it exercises its art. But Thrasymachus advances some more arguments in support of his concept of justice and injustice. An unjust is superior to a just in character and intelligence. Injustice is a source of strength. Injustice brings happiness. Socrates attacks these points of Thrasymachus and throws light on the nature of justice.

Justice implies superior character and intelligence while injustice means deficiency in both respects. Therefore, just men are superior in character and intelligence and are more effective in action. As injustice implies ignorance, stupidity and badness, It cannot be superior in character and intelligence. A just man is wiser because he acknowledges the principle of limit.

Unlimited self-assertion is not a source of strength for any group organized for common purpose, Unlimited desire and claims lead to conflicts. Life of just man is better and happier. There is always some specific virtue in everything, which enables it to work well. If it is deprived of that virtue, it works badly. The soul has specific functions to perform. When it performs its specific functions, it has specific excellence or virtue. If, it is deprived of its peculiar virtue, it cannot possibly do its work well. It is agreed that the virtue of the soul is justice. The soul which is more virtuous or in other words more just is also the happier soul. Therefore, a just man lives happy. A just soul, in other words a just man, lives well; an unjust cannot.

At this juncture the new point of view is stated by Glaucon and he put Forward a form of what was later to be known as a social contract theory, arguing we are only moral because, it pays us or we have to be. Glaucon describes the historical evolution of the society where justice as a necessity had become the shield of the weaker. In the primitive stage of society without law and government, man was free to do whatever he likes. So the stronger few enjoyed the life at the sufferance of the weaker many. The weaker, however, realised that they suffered more injustice. Faced with this situation they came to an agreement and instituted law and government through a sort of social contract and preached the philosophy of just. Therefore, justice in this way something artificial and unnatural. It is the "product of convention". It is through this artificial rule of justice and law that the natural selfishness of man is chained. A dictate of the weaker many, for the interest of the weaker many, as against the natural and superior power of the stronger few.

Plato realises that all theories propounded by Cephalus, Thrasymachus and Glaucon, contained one common element. That one common element was that all the them treated justice as something external "an accomplishment, an importation, or a convention, they have, none of them carried it into the soul or considered it in the place of its habitation." Plato prove that justice does not depend upon a chance, convention or upon external force. It is the right condition of the human soul by the very nature of man when seen in the fullness of his environment. It is in this way that Plato condemned the position taken by Glaucon that justice is something which is external. According to Plato, it is internal as it resides in the human soul. "It is now regarded as an inward grace and its understanding is shown to involve a study of the inner man." It is, therefore, natural and no artificial. It is therefore, not born of fear of the weak but of the longing of the human soul to do a duty according to its nature.

Thus, after criticising the conventional ideas of justice presented differently by Cephalus, Polymarchus, Thrasymachus and Glaucon, Plato now gives us his own theory of justice. Plato strikes an analogy between the human organism on the one hand and social organism on the other. Human organism according to Plato contains three elements-Reason, Spirit and Appetite. An individual is just when each part of his or her soul performs its functions without interfering with those of other elements. For example, the reason should rule on behalf of the entire soul with wisdom and forethought. The element of spirit will sub-ordinate itself to the rule of reason. Those two elements are brought into harmony by combination of mental and bodily training. They are set in command over the appetites which form the greater part of man's soul. Therefore, the reason and spirit have to control these appetites which are likely to grow on the bodily pleasures. These appetites should not be allowed, to enslave the other elements and usurp the dominion to which they have no right. When all the three agree that among them the reason alone should rule, there is justice within the individual. Corresponding to these three elements in human nature there are three classes in the social organism-Philosopher class or the ruling class which is the representative of reason; auxiliaries, a class of warriors and defenders of the country is the representative of spirit; and the appetite instinct of the community which consists of farmers, artisans and are the lowest

rung of the ladder. Thus, weaving a web between the human organism and the social organism, Plato asserts that functional specialization demands from every social class to specialize itself in the station of life allotted to it. Justice, therefore to Plato is like a manuscript which exists in two copies, and one of these is larger than the other. It exists both in the individual and the society. But it exists on a larger scale and in more visible form in the society. Individually "justice is a 'human virtue' that makes a man self consistent and good: Socially, justice is a social consciousness that makes a society internally harmonious and good."

Justice is thus a sort of specialization. It is simply the will to fulfill the duties of one's station and not to meddle with the duties of another station, and its habitation is, therefore, in the mind of every citizen who does his duties in his appointed place. It is the original principle, laid down at the foundation of the State, "that one man should practice one thing only and that the thing to which his nature was best adopted". True justice to Plato, therefore, consists in the principle of non-interference. The State has been considered by Plato as a perfect whole in which each individual which is its element, functions not for itself but for the health of the whole. Every element fulfils its appropriate function. Justice in the platonic state would, therefore, be like that harmony of relationship where the Planets are held together in the orderly movement. Plato was convinced that a society which is so organized is fit for survival. Where man are out of their natural places, there the co-ordination of parts is destroyed, the society disintegrates and dissolves. Justice, therefore, is the citizen sense of duties.

Justice is, for Plato, at once a part of human virtue and the bond, which joins man together in society. It is the identical quality that makes good and social. Justice is an order and duty of the parts of the soul, it is to the soul as health is to the body. Plato says that justice is not mere strength, but it is a harmonious strength. Justice is not the right of the stronger but the effective harmony of the whole. All moral conceptions revolve about the good of the whole-individual as well as social.

## **Social Contract Theory**

Social contract theory, nearly as old as philosophy itself, is the view that persons' moral and/or political obligations are dependent upon a contract or agreement among them to form the society in which they live. Socrates uses something quite like a social contract argument to explain to Crito why he must remain in prison and accept the death penalty. However, social contract theory is rightly associated with modern moral and political theory and is given its first full exposition and defense by Thomas Hobbes. After Hobbes, John Locke and Jean- Jacques Rousseau are the best known proponents of this enormously influential theory, which has been one of the most dominant theories within moral and political theory throughout the history of the modern West. In the twentieth century, moral and political theory regained philosophical momentum as a result of John Rawls' Kantian version of social contract theory, and was followed by new analyses of the subject by David Gauthier and others. More recently, philosophers from different perspectives have offered new criticisms of social contract theory. In particular, feminists and race-conscious philosophers have argued that social contract theory is at least an incomplete picture of our moral and political lives, and may in fact camouflage some of the ways in which the contract is itself parasitical upon the subjugations of classes of persons.

## **Thomas Hobbes: Social Contract Theory**

Thomas Hobbes, 1588-1679, lived during the most crucial period of early modern England's history: the English Civil War, waged from 1642-1648. To describe this conflict in the most general of terms, it was a clash between the King and his supporters, the Monarchists, who preferred the tra-

ditional authority of a monarch, and the Parliamentarians, most notably led by Oliver Cromwell, who demanded more power for the quasi-democratic institution of Parliament. Hobbes represents a compromise between these two factions. On the one hand he rejects the theory of the Divine Right of Kings, which is most eloquently expressed by Robert Filmer in his *Patriarcha or the Natural Power of Kings*, (although it would be left to John Locke to refute Filmer directly). Filmer's view held that a king's authority was invested in him (or, presumably, her) by God, that such authority was absolute, and therefore that the basis of political obligation lay in our obligation to obey God absolutely. According to this view, then, political obligation is subsumed under religious obligation. On the other hand, Hobbes also rejects the early democratic view, taken up by the Parliamentarians, that power ought to be shared between Parliament and the King. In rejecting both these views, Hobbes occupies the ground of one who is both radical and conservative. He argues, radically for his times, that political authority and obligation are based on the individual self-interests of members of society who are understood to be equal to one another, with no single individual invested with any essential authority to rule over the rest, while at the same time maintaining the conservative position that the monarch, which he called the Sovereign, must be ceded absolute authority if society is to survive.

Hobbes' political theory is best understood if taken in two parts: his theory of human motivation, Psychological Egoism, and his theory of the social contract, founded on the hypothetical State of Nature. Hobbes has, first and foremost, a particular theory of human nature, which gives rise to a particular view of morality and politics, as developed in his philosophical masterpiece, *Leviathan*, published in 1651. The Scientific Revolution, with its important new discoveries that the universe could be both described and predicted in accordance with universal laws of nature, greatly influenced Hobbes. He sought to provide a theory of human nature that would parallel the discoveries being made in the sciences of the inanimate universe. His psychological theory is therefore informed by mechanism, the general view that everything in the universe is produced by nothing other than matter in motion. According to Hobbes, this extends to human behavior. Human macro-behavior can be aptly described as the effect of certain kinds of micro-behavior, even though some of this latter behavior is invisible to us. So, such behaviors as walking, talking, and the like are themselves produced by other actions inside of us. And these other actions are themselves caused by the interaction of our bodies with other bodies, human or otherwise, which create in us certain chains of causes and effects, and which eventually give rise to the human behavior that we can plainly observe. We, including all of our actions and choices, are then, according to this view, as explainable in terms of universal laws of nature as are the motions of heavenly bodies. The gradual disintegration of memory, for example, can be explained by inertia. As we are presented with ever more sensory information, the residue of earlier impressions 'slows down' over time. From Hobbes' point of view, we are essentially very complicated organic machines, responding to the stimuli of the world mechanistically and in accordance with universal laws of human nature.

In Hobbes' view, this mechanistic quality of human psychology implies the subjective nature of normative claims. 'Love' and 'hate', for instance, are just words we use to describe the things we are drawn to and repelled by, respectively. So, too, the terms 'good' and 'bad' have no meaning other than to describe our appetites and aversions. Moral terms do not, therefore, describe some objective state of affairs, but are rather reflections of individual tastes and preferences. In addition to Subjectivism, Hobbes also infers from his mechanistic theory of human nature that humans are necessarily and exclusively self-interested. All men pursue only what they perceive to be in their own individually considered best interests – they respond mechanistically by being drawn to that which they desire and repelled by that to which they are averse. This is a universal claim: it is meant to cover all human actions under all circumstances – in society or out of it, with regard to

strangers and friends alike, with regard to small ends and the most generalized of human desires, such as the desire for power and status. Everything we do is motivated solely by the desire to better our own situations, and satisfy as many of our own, individually considered desires as possible. We are infinitely appetitive and only genuinely concerned with our own selves. According to Hobbes, even the reason that adults care for small children can be explicated in terms of the adults' own self-interest (he claims that in saving an infant by caring for it, we become the recipient of a strong sense of obligation in one who has been helped to survive rather than allowed to die).

In addition to being exclusively self-interested, Hobbes also argues that human beings are reasonable. They have in them the rational capacity to pursue their desires as efficiently and maximally as possible. Their reason does not, given the subjective nature of value, evaluate their given ends, rather it merely acts as "Scouts, and Spies, to range abroad, and find the way to the things Desired" (139). Rationality is purely instrumental. It can add and subtract, and compare sums one to another, and thereby endows us with the capacity to formulate the best means to whatever ends we might happen to have. From these premises of human nature, Hobbes goes on to construct a provocative and compelling argument for why we ought to be willing to submit ourselves to political authority. He does this by imagining persons in a situation prior to the establishment of society, the State of Nature.

According to Hobbes, the justification for political obligation is this: given that men are naturally self-interested, yet they are rational, they will choose to submit to the authority of a Sovereign in order to be able to live in a civil society, which is conducive to their own interests. Hobbes argues for this by imagining men in their natural state, or in other words, the State of Nature. In the State of Nature, which is purely hypothetical according to Hobbes, men are naturally and exclusively self-interested, they are more or less equal to one another, (even the strongest man can be killed in his sleep), there are limited resources, and yet there is no power able to force men to cooperate. Given these conditions in the State of Nature, Hobbes concludes that the State of Nature would be unbearably brutal. In the State of Nature, every person is always in fear of losing his life to another. They have no capacity to ensure the long-term satisfaction of their needs or desires. No long-term or complex cooperation is possible because the State of Nature can be aptly described as a state of utter distrust. Given Hobbes' reasonable assumption that most people want first and foremost to avoid their own deaths, he concludes that the State of Nature is the worst possible situation in which men can find themselves. It is the state of perpetual and unavoidable war.

The situation is not, however, hopeless. Because men are reasonable, they can see their way out of such a state by recognizing the laws of nature, which show them the means by which to escape the State of Nature and create a civil society. The first and most important law of nature commands that each man be willing to pursue peace when others are willing to do the same, all the while retaining the right to continue to pursue war when others do not pursue peace. Being reasonable, and recognizing the rationality of this basic precept of reason, men can be expected to construct a Social Contract that will afford them a life other than that available to them in the State of Nature. This contract is constituted by two distinguishable contracts. First, they must agree to establish society by collectively and reciprocally renouncing the rights they had against one another in the State of Nature. Second, they must imbue some one person or assembly of persons with the authority and power to enforce the initial contract. In other words, to ensure their escape from the State of Nature, they must both agree to live together under common laws, and create an enforcement mechanism for the social contract and the laws that constitute it. Since the sovereign is invested with the authority and power to mete out punishments for breaches of the contract which are worse than not being able to act as one pleases, men have good, albeit self-interested, reason

to adjust themselves to the artifice of morality in general, and justice in particular. Society becomes possible because, whereas in the State of Nature there was no power able to “overawe them all”, now there is an artificially and conventionally superior and more powerful person who can force men to cooperate. While living under the authority of a Sovereign can be harsh (Hobbes argues that because men’s passions can be expected to overwhelm their reason, the Sovereign must have absolute authority in order for the contract to be successful) it is at least better than living in the State of Nature. And, no matter how much we may object to how poorly a Sovereign manages the affairs of the state and regulates our own lives, we are never justified in resisting his power because it is the only thing which stands between us and what we most want to avoid, the State of Nature.

According to this argument, morality, politics, society, and everything that comes along with it, all of which Hobbes calls ‘commodious living’ are purely conventional. Prior to the establishment of the basic social contract, according to which men agree to live together and the contract to embody a Sovereign with absolute authority, nothing is immoral or unjust – anything goes. After these contracts are established, however, then society becomes possible, and people can be expected to keep their promises, cooperate with one another, and so on. The Social Contract is the most fundamental source of all that is good and that which we depend upon to live well. Our choice is either to abide by the terms of the contract, or return to the State of Nature, which Hobbes argues no reasonable person could possibly prefer. Given his rather severe view of human nature, Hobbes nonetheless manages to create an argument that makes civil society, along with all its advantages, possible. Within the context of the political events of his England, he also managed to argue for a continuation of the traditional form of authority that his society had long since enjoyed, while nonetheless placing it on what he saw as a far more acceptable foundation.

## **John Locke: Social Contract Theory**

For Hobbes, the necessity of an absolute authority, in the form of a Sovereign, followed from the utter brutality of the State of Nature. The State of Nature was completely intolerable, and so rational men would be willing to submit themselves even to absolute authority in order to escape it. For John Locke, 1632-1704, the State of Nature is a very different type of place, and so his argument concerning the social contract and the nature of men’s relationship to authority are consequently quite different. While Locke uses Hobbes’ methodological device of the State of Nature, as do virtually all social contract theorists, he uses it to a quite different end. Locke’s arguments for the social contract, and for the right of citizens to revolt against their king were enormously influential on the democratic revolutions that followed, especially on Thomas Jefferson, and the founders of the United States.

Locke’s most important and influential political writings are contained in his Two Treatises on Government. The first treatise is concerned almost exclusively with refuting the argument of Robert Filmer’s Patriarcha, that political authority was derived from religious authority, also known by the description of the Divine Right of Kings, which was a very dominant theory in seventeenth-century England. The second treatise contains Locke’s own constructive view of the aims and justification for civil government, and is titled “An Essay Concerning the True Original Extent and End of Civil Government”.

According to Locke, the State of Nature, the natural condition of mankind, is a state of perfect and complete liberty to conduct one’s life as one best sees fit, free from the interference of others. This does not mean, however, that it is a state of license: one is not free to do anything at all one

pleases, or even anything that one judges to be in one's interest. The State of Nature, although a state wherein there is no civil authority or government to punish people for transgressions against laws, is not a state without morality. The State of Nature is pre-political, but it is not pre-moral. Persons are assumed to be equal to one another in such a state, and therefore equally capable of discovering and being bound by the Law of Nature. The Law of Nature, which is on Locke's view the basis of all morality, and given to us by God, commands that we not harm others with regards to their "life, health, liberty, or possessions" (par. 6). Because we all belong equally to God, and because we cannot take away that which is rightfully His, we are prohibited from harming one another. So, the State of Nature is a state of liberty where persons are free to pursue their own interests and plans, free from interference, and, because of the Law of Nature and the restrictions that it imposes upon persons, it is relatively peaceful.

The State of Nature therefore, is not the same as the state of war, as it is according to Hobbes. It can, however devolve into a state of war, in particular, a state of war over property disputes. Whereas the State of Nature is the state of liberty where persons recognize the Law of Nature and therefore do not harm one another, the state of war begins between two or more men once one man declares war on another, by stealing from him, or by trying to make him his slave. Since in the State of Nature there is no civil power to whom men can appeal, and since the Law of Nature allows them to defend their own lives, they may then kill those who would bring force against them. Since the State of Nature lacks civil authority, once war begins it is likely to continue. And this is one of the strongest reasons that men have to abandon the State of Nature by contracting together to form civil government.

Property plays an essential role in Locke's argument for civil government and the contract that establishes it. According to Locke, private property is created when a person mixes his labor with the raw materials of nature. So, for example, when one tills a piece of land in nature, and makes it into a piece of farmland, which produces food, then one has a claim to own that piece of land and the food produced upon it. (This led Locke to conclude that America didn't really belong to the natives who lived there, because they were, on his view, failing to utilize the basic material of nature. In other words, they didn't farm it, so they had no legitimate claim to it, and others could therefore justifiably appropriate it.) Given the implications of the Law of Nature, there are limits as to how much property one can own: one is not allowed to take more from nature than one can use, thereby leaving others without enough for themselves. Because nature is given to all of mankind by God for its common subsistence, one cannot take more than his own fair share. Property is the linchpin of Locke's argument for the social contract and civil government because it is the protection of their property, including their property in their own bodies, that men seek when they decide to abandon the State of Nature.

According to Locke, the State of Nature is not a condition of individuals, as it is for Hobbes. Rather, it is populated by mothers and fathers with their children, or families – what he calls "conjugal society" (par. 78). These societies are based on the voluntary agreements to care for children together, and they are moral but not political. Political society comes into being when individual men, representing their families, come together in the State of Nature and agree to each give up the executive power to punish those who transgress the Law of Nature, and hand over that power to the public power of a government. Having done this, they then become subject to the will of the majority. In other words, by making a compact to leave the State of Nature and form society, they make "one body politic under one government" (par. 97) and submit themselves to the will of that body. One joins such a body, either from its beginnings, or after it has already been established by others, only by explicit consent. Having created a political society and government

through their consent, men then gain three things which they lacked in the State of Nature: laws, judges to adjudicate laws, and the executive power necessary to enforce these laws. Each man therefore gives over the power to protect himself and punish transgressors of the Law of Nature to the government that he has created through the compact.

Given that the end of “men’s uniting into common-wealths”( par. 124) is the preservation of their wealth, and preserving their lives, liberty, and well-being in general, Locke can easily imagine the conditions under which the compact with government is destroyed, and men are justified in resisting the authority of a civil government, such as a King. When the executive power of a government devolves into tyranny, such as by dissolving the legislature and therefore denying the people the ability to make laws for their own preservation, then the resulting tyrant puts himself into a State of Nature, and specifically into a state of war with the people, and they then have the same right to self-defense as they had before making a compact to establish society in the first place. In other words, the justification of the authority of the executive component of government is the protection of the people’s property and well-being, so when such protection is no longer present, or when the king becomes a tyrant and acts against the interests of the people, they have a right, if not an outright obligation, to resist his authority. The social compact can be dissolved and the process to create political society begun anew. Because Locke did not envision the State of Nature as grimly as did Hobbes, he can imagine conditions under which one would be better off rejecting a particular civil government and returning to the State of Nature, with the aim of constructing a better civil government in its place. It is therefore both the view of human nature, and the nature of morality itself, which account for the differences between Hobbes’ and Locke’s views of the social contract.

## **Jean-Jacques Rousseau: Social Contract Theory**

Jean-Jacques Rousseau, 1712-1778, lived and wrote during what was arguably the headiest period in the intellectual history of modern France—the Enlightenment. He was one of the bright lights of that intellectual movement, contributing articles to the Encyclopedie of Diderot, and participating in the salons in Paris, where the great intellectual questions of his day were pursued. Rousseau has two distinct social contract theories. The first is found in his essay, *Discourse on the Origin and Foundations of Inequality Among Men*, commonly referred to as the *Second Discourse*, and is an account of the moral and political evolution of human beings over time, from a State of Nature to modern society. As such it contains his naturalized account of the social contract, which he sees as very problematic. The second is his normative, or idealized theory of the social contract, and is meant to provide the means by which to alleviate the problems that modern society has created for us, as laid out in the *Social Contract*.

Rousseau wrote his *Second Discourse* in response to an essay contest sponsored by the Academy of Dijon. (Rousseau had previously won the same essay contest with an earlier essay, commonly referred to as the *First Discourse*.) In it he describes the historical process by which man began in a State of Nature and over time ‘progressed’ into civil society. According to Rousseau, the State of Nature was a peaceful and quixotic time. People lived solitary, uncomplicated lives. Their few needs were easily satisfied by nature. Because of the abundance of nature and the small size of the population, competition was non-existent, and persons rarely even saw one another, much less had reason for conflict or fear. Moreover, these simple, morally pure persons were naturally endowed with the capacity for pity, and therefore were not inclined to bring harm to one another.

As time passed, however, humanity faced certain changes. As the overall population increased, the means by which people could satisfy their needs had to change. People slowly began to live together in small families, and then in small communities. Divisions of labor were introduced, both

within and between families, and discoveries and inventions made life easier, giving rise to leisure time. Such leisure time inevitably led people to make comparisons between themselves and others, resulting in public values, leading to shame and envy, pride and contempt. Most importantly however, according to Rousseau, was the invention of private property, which constituted the pivotal moment in humanity's evolution out of a simple, pure state into one characterized by greed, competition, vanity, inequality, and vice. For Rousseau the invention of property constitutes humanity's 'fall from grace' out of the State of Nature.

Having introduced private property, initial conditions of inequality became more pronounced. Some have property and others are forced to work for them, and the development of social classes begins. Eventually, those who have property notice that it would be in their interests to create a government that would protect private property from those who do not have it but can see that they might be able to acquire it by force. So, government gets established, through a contract, which purports to guarantee equality and protection for all, even though its true purpose is to fossilize the very inequalities that private property has produced. In other words, the contract, which claims to be in the interests of everyone equally, is really in the interests of the few who have become stronger and richer as a result of the developments of private property. This is the naturalized social contract, which Rousseau views as responsible for the conflict and competition from which modern society suffers.

The normative social contract, argued for by Rousseau in *The Social Contract* (1762), is meant to respond to this sorry state of affairs and to remedy the social and moral ills that have been produced by the development of society. The distinction between history and justification, between the factual situation of mankind and how it ought to live together, is of the utmost importance to Rousseau. While we ought not to ignore history, nor ignore the causes of the problems we face, we must resolve those problems through our capacity to choose how we ought to live. Might never makes right, despite how often it pretends that it can.

The *Social Contract* begins with the most oft-quoted line from Rousseau: "Man was born free, and he is everywhere in chains" (49). This claim is the conceptual bridge between the descriptive work of the *Second Discourse*, and the prescriptive work that is to come. Humans are essentially free, and were free in the State of Nature, but the 'progress' of civilization has substituted subservience to others for that freedom, through dependence, economic and social inequalities, and the extent to which we judge ourselves through comparisons with others. Since a return to the State of Nature is neither feasible nor desirable, the purpose of politics is to restore freedom to us, thereby reconciling who we truly and essentially are with how we live together. So, this is the fundamental philosophical problem that *The Social Contract* seeks to address: how can we be free and live together? Or, put another way, how can we live together without succumbing to the force and coercion of others? We can do so, Rousseau maintains, by submitting our individual, particular wills to the collective or general will, created through agreement with other free and equal persons. Like Hobbes and Locke before him, and in contrast to the ancient philosophers, all men are made by nature to be equals, therefore no one has a natural right to govern others, and therefore the only justified authority is the authority that is generated out of agreements or covenants.

The most basic covenant, the social pact, is the agreement to come together and form a people, a collectivity, which by definition is more than and different from a mere aggregation of individual interests and wills. This act, where individual persons become a people is "the real foundation of society" (59). Through the collective renunciation of the individual rights and freedom that one has in

the State of Nature, and the transfer of these rights to the collective body, a new 'person', as it were, is formed. The sovereign is thus formed when free and equal persons come together and agree to create themselves anew as a single body, directed to the good of all considered together. So, just as individual wills are directed towards individual interests, the general will, once formed, is directed towards the common good, understood and agreed to collectively. Included in this version of the social contract is the idea of reciprocated duties: the sovereign is committed to the good of the individuals who constitute it, and each individual is likewise committed to the good of the whole. Given this, individuals cannot be given liberty to decide whether it is in their own interests to fulfill their duties to the Sovereign, while at the same time being allowed to reap the benefits of citizenship. They must be made to conform themselves to the general will, they must be "forced to be free".

For Rousseau, this implies an extremely strong and direct form of democracy. One cannot transfer one's will to another, to do with as he or she sees fit, as one does in representative democracies. Rather, the general will depends on the coming together periodically of the entire democratic body, each and every citizen, to decide collectively, and with at least near unanimity, how to live together, i.e., what laws to enact. As it is constituted only by individual wills, these private, individual wills must assemble themselves regularly if the general will is to continue. One implication of this is that the strong form of democracy which is consistent with the general will is also only possible in relatively small states. The people must be able to identify with one another, and at least know who each other are. They cannot live in a large area, too spread out to come together regularly, and they cannot live in such different geographic circumstances as to be unable to be united under common laws. (Could the present-day U.S. satisfy Rousseau's conception of democracy? It could not. ) Although the conditions for true democracy are stringent, they are also the only means by which we can, according to Rousseau, save ourselves, and regain the freedom to which we are naturally entitled.

Rousseau's social contract theories together form a single, consistent view of our moral and political situation. We are endowed with freedom and equality by nature, but our nature has been corrupted by our contingent social history. We can overcome this corruption, however, by invoking our free will to reconstitute ourselves politically, along strongly democratic principles, which is good for us, both individually and collectively.

### **Isaiah Berlin, "Two Concepts of Liberty"**

Isaiah Berlin's "Two Concepts" is undoubtedly among the most influential of essays in the history of postwar political philosophy in the analytic tradition. Even critics of the essay – Quentin Skinner, for example – laud praise upon Berlin's clear articulation of a distinction between two opposed understandings of liberty or freedom.

In this post, I'll summarize Berlin's essay. Three points of note. First, although Berlin's paper was originally delivered in 1958, I'll be citing the following version of the text that appears in *Liberty* (ed. Henry Hardy), OUP: Oxford, 2002: 166-217. Second, I will only sketch the main lines of Berlin's essay, not some of the important, though not central details. Finally, though Berlin's essay is needs to be located within its cold-war context – Berlin was born in Riga, then in Russian, and was a fervent anti-communist – none of his arguments depend on that particular belief.

Berlin's essay contrasts two "central" (though perhaps not the only) senses of liberty or freedom (he uses the terms interchangeably): a negative and a positive sense. He begins with the negative idea.

## Negative Freedom Defining Negative Liberty

Negative liberty is opposed to interference or coercion. Berlin characterizes it as follows: Coercion implies the deliberate interference of other human beings within the area in which I could otherwise act. You lack political liberty...only if you are prevented from attaining a goal by human beings" (169). Or, as he puts it latter: negative liberty "means liberty

### Four features are of note here:

- Mere Incapacity Is Not Lack of Freedom: You are only free to do what you could otherwise do, but for interference (so, although you cannot fly, you are neither free nor unfree to do so).
- Only Human Violations Count, not unfavorable natural circumstances.
- The Definition is Incomplete: it depends on an analysis of interference or coercion.
- One can measure the 'width' of freedom by measuring the area of 'non- interference'.

## Economic Freedom

Berlin first applies this analysis to the idea of 'economic freedom'. He suggests that a worker who is too poor to buy bread can only be regarded as unfree if his inability is "due to the fact that other human beings have made arrangements" that prevent him from doing so.

## The Classical English Tradition

Then, he argues that this conception of freedom can be traced back to "the classical English philosophers"—originally to Hobbes, then to Locke, Mill and Bentham. All agreed: (1) freedom could not be unlimited: it could be curtailed for various ends—at least for the sake of freedom itself, perhaps for the interests of order, equality or justice; and (2) there ought to be a certain level of liberty—a minimum of liberty—which on no account be violated. Regarding (1), Berlin argues that, when do curtail freedom for the sake of (e.g.) liberty, we must nevertheless acknowledge that a loss of liberty occurs. Regarding (2), Berlin notes that, although meeting people's basic needs comes before freedom, the meaning of freedom is the same everywhere.

## Berlin on Mill

The difficult issues about negative freedom concern, Berlin then notes, concern "how wide [the area of freedom] could or should be" (170) or what "a minimum of personal freedom" amounts to. He examines J.S. Mill's work as illustrative of the liberal view. According to Mill, justice demands that all individuals be entitled to a minimum of freedom, and thus that other individuals must be restrained from depriving people of it. Mill confuses two liberal justifications for freedom—(a) Freedom as an intrinsic good and (b) freedom as necessary condition for developing certain perfectionist, individualist values (a certain kind of character). These two might be inconsistent

## Three Further Points

- Negative freedom, in Berlin's sense, is a 'comparatively modern' political idea, not present until (at the latest) the 1600s (176).
- Negative freedom is "not incompatible with...the absence of self- government" (176): a benevolent despot who does not interfere with his subjects does not impinge on negative liberty.
- Thus, negative freedom does not imply democracy: 'the answer to the question "Who governs me?" is logically distinct from the question 'How far does the government interfere with me?" (177).

- It is difficult to estimate the extent of negative freedom in any given case (see fn 1, 177).

## **Positive Freedom Defining Positive Freedom**

Positive freedom derives from 'the wish on the part of the individual to be his own master'. It concerns my desire to be self-directed, self-governing or self-realizing. Berlin has in mind here what often goes under the heading autonomy, and he links the idea to many historical figures: Hegel, Fichte, Kant, and Rousseau, for example.

## **Berlin's Argument**

Although positive and negative liberty might seem quite similar, Berlin will ultimately argue that certain understandings of positive freedom have led, at times, to "a specious disguise for brutal tyranny" (178) because of some of the peculiarity of the way in which the notion of positive freedom has "historically developed" (179). In this section, and several of the next, he begins to survey some of those directions (III-V). I won't go into the details of each, but only sketch the basic critique Berlin offers.

## **The Dangers of Positive Freedom Two Selves**

When talking about being 'one's own master', one can think of both external (a coercer) and internal obstacles (an insatiable desire or passion). Thus we arrive at a distinction of a 'real' or authentic and a less real or inauthentic self. This view takes two forms. A first view identifies one's 'real' self with reason. A second view widens the gap between the two selves, by identifying (as Berlin thinks Hegel and Fichte do) the 'real' self with society at large. In both cases, it is thus open to justify a kind of paternalism or coercion: "Once I take this view, I am in a position to ignore the actual wishes of men or society, to bully, oppress, torture them in the name...of their 'real' selves (180). Berlin then identifies several directions in which such 'two selves' views have developed.

## **Self-Abnegation**

Suppose I am autonomous. I have a set of desires I want to fulfill, but which cannot be realized. Then, my only option is to get rid of my desires (rather than wanting to be rich, I stop desiring money). But this way of making people 'realize' then ends – by expunging them—is in many cases hardly satisfactory.

## **Self-Realization**

Berlin then criticizes the metaphysical rationalist view, which equates freedom with the use of critical reason. The fundamental premise he disputes is that one I understand the necessity of X, I cannot rationally will otherwise. Thus, if X is a historical necessity, it is irrational for me to (and I am not truly free if I) resist it.

## **Social Freedom**

To be free is to accept certain rational principles. It is assumed that all rational agents would endorse the same principles, and to be free is incompatible with being irrational. If I know what these principles are, I may then impose them on others. Berlin then sums up the premises he takes to be problematic (200):

- All men have one true purpose—rational self direction
- The ends of all rational beings must fit a certain pattern which some may detect better than others

- All conflict is due to irrationality
- When men have been made rational, they will obey their own natures. Thus, from seemingly liberal premises, we arrive, perversely, at illiberal conclusions.

### **The Search for Status**

Before reconsidering his own view, Berlin points on one other “historically important approach” to the topic which confounds freedom with “her sisters, equality and fraternity” and thus “leads to similarly illiberal conclusions”. The idea here—again, Hegelian—is that human beings are social creatures in a deep sense, and require “proper recognition” (200-1) to be free.

Berlin makes two comments about the need for recognition:

First, although it might be important (204) and “in certain respects, very close to the desire to be an independent agent” (205), it should not be confused with liberty per se. Second, especially when applied to groups, the drive for recognition can be a source of illiberal oppression

### **The Liberal View Reconsidered**

In the final sections of the essay, Berlin reconsiders the liberal view of negative liberty. He makes several remarks:

- While any view of freedom must include ‘a minimum’ of negative liberty, liberals like Mill and Constant typically wanted to maximize the freedom (to the extent compatible with the demands of social life) (207).
- For such liberals, the important question was not who wields authority over me – whether I rule myself (e.g., through democracy), but how much authority should be placed in any set of hands (209).
- Liberalism involves a belief in the absolute inviolability of some minimum of individual liberty (210)
- Thus, a society is not free unless (a) no power, but only rights, can be regarded as absolute and (b) there are frontiers within which individuals are inviolably not to be interfered with.

### **Value Pluralism**

Berlin concludes (VIII) by making some general remarks about value and political philosophy.

First, he argues that there is a plurality of values – freedom, equality justice, and the like – and it is not possible for all these values to all be fully instantiated together. The thought that they can is dangerous, a prejudice, and in any case, not warranted by empirical observation or history (212-3). Conflict among values is inevitable. As he puts it, “If, as I believe, the ends of men are many, and not all of them are in principle compatible with each other, then the possibility of conflict – and of tragedy – can never wholly be eliminated from human life, either personal or social. The necessity of choosing between absolute claims is then an inescapable characteristic of the human condition” (214). Second, although freedom is valuable in itself, it is not the sole, or the most important value. There are sometimes grounds for curtailing it. It must be weighed against other goods (214-215). Third, negative liberty is nevertheless the ‘truer’ and ‘more humane’ meaning of freedom, when compared to positive liberty. It allows people to choose between ultimate values.

Finally, Berlin suggests that a kind of temporal relativism about values: although principles may hold absolutely in certain context, they may not be eternal. To want anything more is perhaps a metaphysical need, but is also a sign of immaturity.

## **Bernard Williams: Idea of Equality**

### **Two equality claims**

Williams begins by distinguishing two claims about equality: (Factual claim) Men are equal. (Normative claim) Men should be treated as equal. 'Men' here is intended to include women, but not people with severe psychological disorders.

### **A dilemma**

Williams considers a dilemma for someone who makes either the factual or the normative claim. The dilemma is that either the claim is too strong or too weak, depending on how it is interpreted. I shall focus on the factual claim to illustrate this dilemma. (A too weak interpretation) All men are men. This is true but trivial. It is not politically significant. (A too strong interpretation) All men are equal in their capacities. This would be politically significant if true, but it is obviously false. Williams rejects the dilemma because he thinks that the weak interpretation – that to say 'men are equal' is to say all men are men – is not too weak, because it is politically significant.

**Williams' argument for the political significance of saying, 'All men are men.'** According to Williams, saying all men are men is a way of drawing attention to certain important universal features of human beings: "That all men are human is, if a tautology, a useful one, serving as a reminder that those who belong anatomically to the species homo sapiens, and can speak a language, use tools, live in societies, can interbreed despite racial differences, etc., are also alike in certain other respects more likely to be forgotten. These respects are notably the capacity to feel pain, both from immediate physical causes and from various situations represented in perception and in thought; and the capacity to feel affection for others, and the consequences of this, connected with the frustration of this affection, loss of its objects, etc." Williams denies that this is politically trivial because there are social arrangements which neglect that some groups of men have these qualities, i.e. they treat these groups as if they did not have these qualities.

### **An objection Williams considers**

Williams considers an objection that is quite strange unless one is familiar with the doctrine that one cannot derive a claim about what one should do from only a claim about what is the case. According to this doctrine, even if it is the case that all men have the features Williams draws attention to, it does not follow that all men should be treated as equal. The objection Williams considers is that there could be a society in which a group of people are acknowledged by official bodies to have the universal features that Williams draws attention to yet are still treated as if they do not have these features, in the belief that it is morally permissible or morally required to treat them in this way. For example, the official bodies may say that it is morally required of them to treat black people as if they do not have these features.

### **Williams' response to the objection**

Williams' response is that a society whose official institutions operated in this way would be operating on an arbitrary principle and an arbitrary principle is not a moral principle. He thinks that those who recommend prejudiced behaviour generally acknowledge this point by trying to establish that there is a group that lacks some of the features that Williams regards as universal. (I think Williams needs to consider people who say, 'Even if the practices we encourage do not treat all groups as having these universal features, it is our tradition to engage in such practices and you should respect that, as we respect your traditions when in your territory.' Such a response does not involve trying to establish that those discriminated against lack the universal features.)

## **Williams on the too strong interpretation**

Williams agrees that it is too strong to claim that men are equal in their capacities. Some can run faster than others, some have greater numerical skills, and so on. What about the claim that, even if men vary in some capacities, they have equal capacity to be moral – equal capacity to recognize what is right and good and to live their lives in accordance with this recognition? Williams agrees with the following view: there are capacities that are not in themselves moral, because they can be used for bad as well as good, but they are of much value for being moral – ability to appreciate the point of view of others, impulse control, and more; since these capacities vary between people and are of much value for being moral, it is mistaken to think that people have equal capacity to be moral.

## **An objection to this view**

Williams then considers an objection to this view: “there is a powerful strain of thought that centres on a feeling of ultimate and outrageous absurdity in the idea that the achievement of the highest kind of moral worth should depend on natural capacities, unequally and fortuitously distributed as they are...” Williams focuses on Kant as providing the most important philosophical formulation of this way of thinking. Kant, on Williams’ reading, says that our moral capacity has nothing to do with capacities that vary between men.

## **Williams’ response:**

If whether a person is responsible for a particular act depends on certain non-moral capacities that they possess, capacities that vary between people, then it is false that moral capacity is independent from these non-moral capacities. Whether a person is responsible for a particular act depends on certain non-moral capacities that they possess, capacities that vary between people. Therefore: It is false that moral capacity is independent from certain non-moral capacities, capacities that vary between people.

## **Williams on each person should be treated as an end in themselves**

On the basis of a conception of moral capacity as independent of variable natural capacities, Kant argues that each person should be treated as an end in themselves. Williams poses the question of whether we can make sense of this claim without relying on Kant’s outlook on moral capacity. Williams focuses on the claim that each person should be treated with respect, as another way of putting the Kantian claim and as an interpretation of the normative claim that men should be treated as equal. He proposes an interpretation of what it is to treat each person with respect: Respecting another person, on Williams’ conception, involves:

- (i) Not letting our fundamental attitudes towards them be dictated by their technical success or social position;
- (ii) Trying to understand them from their human point of view;
- (iii) Not suppressing or distorting their consciousness of what they are doing.

## **Understanding them from their human point of view**

Williams introduces the notion of understanding a person from their human point of view through the example of a failed inventor. From the perspective of the history of inventions, he does not figure or he figures only as a failed inventor. But from the human point of view, he is someone who wanted to be a successful inventor, who believed he could be, who had certain feelings upon not succeeding, etc.

Williams develops an interpretation of what it is to respect each person, using concepts formed through reflecting on this example: “[Respect] enjoins us not to let our fundamental attitudes to men be dictated by the criteria of technical success or social position, and not to take them at the value carried by these titles and by the structures in which these titles place them. This does not mean, of course, that the fundamental view that should be taken of men is in the case of every man the same: on the contrary. But it does mean that each man is owed the effort of understanding...” The failed inventor example provides us with components (i) and (ii) of Williams’ notion of respect. Component (iii) comes from reflecting on a hierarchical society.

## **A hierarchical society**

Williams imagines a hierarchical society in which each man is content with their station within it. (He does not clarify a hierarchical society, but he seems to have in mind something like a caste system and not, say, a society with merit-based job hierarchies.) If respect consists in just (i) and (ii), then Williams thinks that a hierarchical society could potentially be a respectful one.

Williams, however, thinks that there is more to respect than considering each individual from their human point of view. “For it is precisely a mark of extreme exploitation or degradation that those who suffer it do not see themselves differently from the way they are seen by the exploiters; either they do not see themselves as anything at all, or they acquiesce passively in the role for which they have been cast. Here we evidently need something more than the precept that one should respect and try to understand another man’s consciousness of his own activities; it is also that one may not suppress or destroy that consciousness.”

Williams says that hierarchical societies depend for their stability on people having a mistaken conception of hierarchy as a necessity and a distorted conception of what they are doing within this society as a consequence. Owing to component (iii), an attitude of respect, or treating a person as an end in themselves, is against this kind of society in the long-term.

## **Liberalism**

Liberalism, political doctrine that takes protecting and enhancing the freedom of the individual to be the central problem of politics. Liberals typically believe that government is necessary to protect individuals from being harmed by others, but they also recognize that government itself can pose a threat to liberty. As the revolutionary American pamphleteer Thomas Paine expressed it in *Common Sense* (1776), government is at best “a necessary evil.” Laws, judges, and police are needed to secure the individual’s life and liberty, but their coercive power may also be turned against him. The problem, then, is to devise a system that gives government the power necessary to protect individual liberty but also prevents those who govern from abusing that power. The problem is compounded when one asks whether this is all that government can or should do on behalf of individual freedom. Some liberals—the so-called neoclassical liberals, or libertarians—answer that it is. Since the late 19th century, however, most liberals have insisted that the powers of government can promote as well as protect the freedom of the individual. According to modern liberalism, the chief task of government is to remove obstacles that prevent individuals from living freely or from fully realizing their potential. Such obstacles include poverty, disease, discrimination, and ignorance. The disagreement among liberals over whether government should promote individual freedom rather than merely protect it is reflected to some extent in the different prevailing conceptions of liberalism in the United States and Europe since the late 20th century. In the United States liberalism is associated with the welfare-state

policies of the New Deal program of the Democratic administration of Pres. Franklin D. Roosevelt, whereas in Europe it is more commonly associated with a commitment to limited government and laissez-faire economic policies.

## **General Characteristics**

Liberalism is derived from two related features of Western culture. The first is the West's preoccupation with individuality, as compared to the emphasis in other civilizations on status, caste, and tradition. Throughout much of history, the individual has been submerged in and subordinate to his clan, tribe, ethnic group, or kingdom. Liberalism is the culmination of developments in Western society that produced a sense of the importance of human individuality, a liberation of the individual from complete subservience to the group, and a relaxation of the tight hold of custom, law, and authority. In this respect, liberalism stands for the emancipation of the individual.

Liberalism also derives from the practice of adversariality in European political and economic life, a process in which institutionalized competition—such as the competition between different political parties in electoral contests, between prosecution and defense in adversary procedure, or between different producers in a market economy—generates a dynamic social order. Adversarial systems have always been precarious, however, and it took a long time for the belief in adversariality to emerge from the more traditional view, traceable at least to Plato, that the state should be an organic structure, like a beehive, in which the different social classes cooperate by performing distinct yet complementary roles. The belief that competition is an essential part of a political system and that good government requires a vigorous opposition was still considered strange in most European countries in the early 19th century.

Underlying the liberal belief in adversariality is the conviction that human beings are essentially rational creatures capable of settling their political disputes through dialogue and compromise. This aspect of liberalism became particularly prominent in 20th-century projects aimed at eliminating war and resolving disagreements between states through organizations such as the League of Nations, the United Nations, and the International Court of Justice (World Court). Liberalism has a close but sometimes uneasy relationship with democracy. At the centre of democratic doctrine is the belief that governments derive their authority from popular election; liberalism, on the other hand, is primarily concerned with the scope of governmental activity. Liberals often have been wary of democracy, then, because of fears that it might generate a tyranny by the majority. One might briskly say, therefore, that democracy looks after majorities and liberalism after unpopular minorities.

Like other political doctrines, liberalism is highly sensitive to time and circumstance. Each country's liberalism is different, and it changes in each generation. The historical development of liberalism over recent centuries has been a movement from mistrust of the state's power on the ground that it tends to be misused, to a willingness to use the power of government to correct perceived inequities in the distribution of wealth resulting from economic competition—inequities that purportedly deprive some people of an equal opportunity to live freely. The expansion of governmental power and responsibility sought by liberals in the 20th century was clearly opposed to the contraction of government advocated by liberals a century earlier. In the 19th century liberals generally formed the party of business and the entrepreneurial middle class; for much of the 20th century they were more likely to work to restrict and regulate business in order to provide greater opportunities for labourers and consumers. In each case, however, the liberals' inspiration was the same: a hostility to concentrations of power that threaten the freedom of the individual and pre-

vent him from realizing his full potential, along with a willingness to reexamine and reform social institutions in the light of new needs. This willingness is tempered by an aversion to sudden, cataclysmic change, which is what sets off the liberal from the radical. It is this very eagerness to welcome and encourage useful change, however, that distinguishes the liberal from the conservative, who believes that change is at least as likely to result in loss as in gain.

### **Rawls' Theory of Liberalism Rawls and Mill:**

Almost all the analysts of liberalism pay special attention to J.S. Mill's conception about liberty and liberalism. Because Mill was the first systematic philosopher who thought that if the role of the state is not reduced to the minimum level, the liberty of the individuals will never be properly realised and this he analysed from various angles and one such angle is utilitarianism. Before him others dealt with the subject but Mill's erudition surpassed their analysis. But in spite of these plus points Mill's approach to liberty and liberalism could not satisfy the scholars because of certain shortcomings which we have analysed. The passing away, of times, the advent of new age and ideas did not suppress people's interest about liberalism. In our earlier analysis we have noted the liberalism of Hayek and Robert Nozick. Now we shall turn our attention to John Rawls' analysis. We here quote a relevant passage from Gray.

He writes: The failings in the Millian project are in part a central motivation in the recent revival of contractarian approaches in the justification of liberal principles. In its most powerful and plausible form in the work of John Rawls... Rawls's contractarian approach is authentically individualist in a way. Mill's utilitarian ethics cannot be since it confers on individuals in the original position a veto against policies which would maximise general welfare while invading the liberty and damaging the interests of some".

### **Various Aspects of Rawls' Liberalism:**

#### **Concept of Liberty:**

Rawls' conception about liberalism is scattered throughout his book A Theory of Justice consisting of 514 pages (except index). It is very difficult to analyse all his views in precise form. Some are stated. One such concept is theory of liberty. Strictly speaking, it is connected with his views on liberalism. First we start how he defines liberty.

#### **He says that liberty can be explained by a reference to three items:**

- (1) The agents who are free.
- (2) The restrictions or limitations which they are free from.
- (3) Finally, what it is that they are free to do or not to do.

#### **In the light of these issues Rawls defines liberty in the following words:**

Liberty is a certain structure of institutions. A certain system of public rules defining rights and duties. In true liberty or a true liberal state it is very much essential to see that which agents are free. Here agent is used to denote various parts of society. For example, individuals, organisations, institutions. The term liberty relates not only to individuals because in today's society individuals are not alone, they form group and organisations which moved and removed the ideas and views of the individuals and in various other ways influence them. Naturally we can say that a society can be called free or liberal if its members and organisations are free.

A society or political system cannot function without law and restrictions. Naturally we can treat the restrictions are inexorable parts of the political system. The pertinent point is whether these re-

strictions are impeding the smooth functioning of individuals and numerous agents. If they considerably and unjustifiably impede the functions and freedom of all agents we can conclude that the political system is deprived of liberty and, hence, the political system cannot be called liberal. Rawls again raises the questions what functions the individuals and organisations are free to do. If they are prevented from performing very vital functions then the progress of the agents will receive great set back. It is also to be seen that whether the basic liberties are restricted or not. While considering liberty we must see that in its application if there is any type of discrimination. That is, if liberties are equally distributed or not. It is also found that in some political systems more important liberties are neglected or in one way or other limited. It is absolutely uncalled for. Rawls says that the aim of liberty shall always be the proper development of individual personality to achieve justice. Liberty will promote toleration and general interest in the people and at the same time reduce the scope or possibility of intolerance. When all these conditions are properly fulfilled the society will be assumed to have liberty and it is liberal.

### **Justice and Liberalism:**

John Rawls is remembered by students of political science for his thought-provoking analysis of the theory of justice. But his theory of justice is only a part of his philosophy and the philosophy is liberalism. We can say he has analysed justice, liberty etc. in the background of his liberalism and, as a result of it, it has always come to the limelight. A close analysis of his political ideas reveals that his liberalism comes very close to classical type. What he has said in his *A Theory of Justice* as Fairness constitutes the core of his liberalism. At least Gray thinks so. A well-ordered society must have a clear and comprehensive idea about justice. Not only this, justice must pervade to all spheres and institutions of society. When this comes to be true we shall call the society just and liberal. Rawls says that in a just society all the individuals shall have rights equal with others.

In other words, all the members of society shall have equal rights and this is the primary condition of justice. Rawls also says that inequalities in the allotment of rights is also to be granted provided that this system will benefit all and opportunities are opened to all.

### **Justice, Free Market and Liberalism:**

Rawls' theories of justice, liberty and liberalism harbour upon the free market concept. The chain of relationship among justice, liberty, liberalism and free market system may be stated briefly in the following way. The theory of private property is the most fundamental right and without it citizens cannot develop their qualities. In Locke's analysis its place is quite prominent.

Again, without free market economy right to property can never be attained. It is rather a corollary of free market system. All these combinedly build up the structure of liberal society or concept of liberalism.

### **Why Rawls and other liberal philosophers of the second half of the twentieth century focused their analysis on free market economy is based on the following arguments:**

- (1) Free market system is the most fundamental precondition of right to private property and liberty and liberalism cannot be imagined without them.
- (2) Right to property and free market are the basic constituents of justice. He (Rawls) argues that it is the natural liberty to have property and to deprive a man of this natural liberty is tantamount to violation of natural liberty and also the concept of justice.

(3) Along with the other votaries of free market system John Rawls believes that free market economy ensures the efficiency in production, distribution and pricing system. In state controlled economy or socialist systems, it is alleged, this is not possible to achieve. The decisions regarding production, pricing and distribution emanate from the top. So, for the sake of efficiency it is essential that private entrepreneurs are to be entrusted with the job of all the above-noted matters.

The attainment of efficiency, Rawls believes, is also an important aspect of liberalism. Both justice and liberalism want to see a society well-ordered. In the opinion of John Rawls only in a liberal state and liberal social system can there exist and flourish justice. It is also the view of other liberals.

(4) Rawls argues that the market economy is the best system and scheme. This conclusion is not based on the fantasy of some bourgeois economists, but on the experience gathered during the past several hundred years. Competitive economic arrangement and efficiency, Rawls says, cannot be separated from each other.

(5) Another important advantage of free market economy has been pointed out by him (Rawls): "A further and more significant advantage of a market system is that given the requisite background institution, it is consistent with equal liberties and fair equality of opportunity. Citizens have a free choice of carriers and occupations. There is no reason at all for the forced and central direction of labour".

(6) Establishment of market economy decentralises the economic power and it is a great and powerful step towards decentralisation. Liberalism believes that the citizens will participate in the economic activities and decision-making processes of the state.

### **First Principle of Justice and Liberalism:**

John Rawls has analysed two great principles of justice and here we shall discuss only one. Each person will have the most extensive scheme of equal basic liberties. When these basic liberties are guaranteed by the state and all measures are adopted for their realisation the state or political system will aptly be called liberal. As well as the realisation of basic liberties forms a part of justice. Justice and liberalism are inseparable concepts. Rawls has pointed out some basic liberties: right to vote, right to contest any office of the state (of course if qualification permits), freedom of speech and expression, freedom to move freely and peaceably, freedom to assemble together, freedom of thought and conscience, freedom of the person which includes freedom from psychological and physical oppression or assault, right to hold personal property and to dispose it, freedom from arbitrary arrest or freedom from seizure of personal property, equality before law and equal protection of law.

According to Rawls these are the basic liberties and for the attainment of justice these are to be distributed among all citizens. Rawls demands that no distinction shall be made arbitrarily while making arrangements for their allotment. This leads to both justice and liberalism. If we look at these rights and liberties we shall find that these are especially important for the proper development of individual's personality and according to philosophers of liberalism the concept of justice relates to the proper fulfilment of rights and liberties.

### **Liberalism and Autonomy:**

It has been observed that realisation of rights and liberties are a very important part of justice and to us of liberalism. Gray says, "A free man is one who possesses the rights and privileges needed for him to think and act autonomously—to rule himself and not to be ruled by another". One point is here quite clear. The realisation of liberties will never fall from heaven or they will not thrive in vac-

uum.

For their realisation a social structure is necessary and the structure must be, in all senses, autonomous. The core of the idea 'autonomy' is—one will be ruled by himself alone and not by anybody else. Rawls has discussed autonomy in his book. Defining autonomy, Rawls says that "it is the complete freedom to form our opinions and that the conscientious judgment of every moral agent ought absolutely be respected".

The activities of the individuals will not be unnecessarily restricted and everyone will have freedom to pursue his objectives. This is not only a fundamental freedom but also a constituent of liberalism. Without autonomy liberalism will not get any opportunity to flourish. Liberalism also does not overlook accountability. In all autonomous society the authority will have to give explanation for all its activities and decisions. Autonomy also implies that the society shall be administered in accordance with certain rules and regulations—that is, the state shall have limited powers.

### **Assessment:**

What Rawls says about liberalism in his A Theory of Justice is not final. He has updated his concepts and views in his Political Liberalism published in 1993. His theory of justice as well as concept of liberalism is based on justice as fairness. It is generally observed that the concept justice as fairness has been borrowed by him from the German philosopher Kant. Kant viewed the entire idea of justice in the background of philosophy.

But justice is not only a subject of philosophy; it also belongs to economics and politics. Particularly, the political scientists are generally interested in the subject. They are concerned with the realisation of justice and it is firmly believed that the realisation falls within the jurisdiction of government. Rawls does neglect this aspect but his analysis revolves around philosophy. Rawls has taken it for granted that only in a liberal state or in a democratic state people can have justice because these states have favourable atmosphere for the development of justice. But we are of opinion that non-liberal and particularly socialist states can have wide infrastructure which will favour justice and liberalism.

Socialists have reservations about the liberal theory of justice. So long the property and sources of production are controlled by few hands, economic and other inequalities will continue to exist and justice will not be within the reach of the people who constitute the majority part of the population. Marx, Engels and other socialists have emphasised it.

But in liberalism there is no scope of transferring the ownership of production and distribution from private hand to the authority of state and the liberals or supporters their of liberalism do not approve such a scheme because it is against their philosophy. Rawlsian theory of liberalism also deals with welfare of individuals. But the welfare functions, for their proper implementation, required the intervention of state and laws are to be enacted to that extent. There arises a confusion. Rawls, Nozick and many others have emphasised the limitations upon the activities of state. To what extent the functions of the state are to be restricted? We do not get any idea about it from Rawls.

John Gray (Liberalism) claims that Rawls does not conceal his allegiance to classical liberalism and he has made best efforts to revive it. It is believed by many the revival of classical liberalisation would be the best reply to the requirements of the present-day society. The collapse of Soviet so-

cialism, the acceptance of market economy by China and globalisation clearly demonstrate that the relevance of socialism to the needs of modern industrialised society is more or less exhausted. It has been asserted by some (including Rawls, Hayek and Nozick) that roll-back to classical liberalism can provide a suitable way. We do not know what shape this expectation will take in the coming years. People's ideas about society, role of the state and outlook of the individuals are undergoing rapid changes.

### **Recent Trends in Liberalism:**

From the eighties of the last century certain spectacular trends are perceptible in the domain of liberalism.

### **These may briefly be stated:**

- (1) After the fall of Soviet Union and the collapse of communism in that and other East European countries certain new ideological trends have emerged. One is, people's sympathy for socialism is downward-moving. Second is, number of Third World states are proceeding towards free market economy which is an indication of liberalism. Third, people's apathy to capitalism is gradually diminishing and they have taken the capitalist mode of production as granted. This is particularly evident in many states of Asia and Africa.
- (2) Simultaneously, there has emerged another trend. Some disquieting features have entered into the thought system of liberalism and this has forced many defenders of liberalism to give second thought to it. It has been well stated by Andrew Heywood in the following words: "Liberal triumphalism needs to be tempered by the recognition of new challenges that have forced liberals to rethink and same time, to revise their views. Indeed, in some respects, liberal ideology is suffering from a crisis of confidence evident in the growing reluctance of liberals to present their ideas as universal or fundamental principles".
- (3) The rise of feminism has posed a formidable challenge to liberalism. From seventies to eighties of the last century there had occurred a meteoric rise of feminist movement. The advocates of feminism have argued that women are deliberately neglected by various sections of the society and even liberal movement or liberalism has not paid any attention to the cause of feminism.  
This mentality has thrown a great assault to liberalism. Many feminists believe that liberalism is an unsuitable way or method of advancing the cause of feminism. This negative attitude of feminism about liberalism has inflicted "irreparable loss" for liberalism.
- (4) Liberalism is faced with another challenge. After the collapse of communism in Soviet Russia and East European states some people thought that liberalism would find fertile soil and congenial atmosphere for its growth and ramification but, ultimately, this did not happen. In Russia and Eastern European states two forces developed simultaneously. One is nationalism enveloped by ethnicity, and the other is liberalism. Russia is still in the grip of ethnic struggle although free market has been accepted as the basic form of social policy. In many Afro-Asian states people's sympathy to nationalism based on security, certainty and strength is prominent. Sympathy to liberalism is feeble. In many Afro-Asian states authoritarian rule has spread its roots to the depth of society which is a very intriguing development. Particularly in the West Asian states the authoritarianism has become a general feature.
- (5) We can still locate another trend. We know that liberalism gleefully embraces all opposite views and thoughts and strongly advocates for toleration. But the rise and rapid growth of fundamentalism and religious fanaticism have eclipsed the noble thoughts and outlook of liberal-

ism. Along with fundamentalism there has arisen terrorism. Both of them have put liberalism to litmus test.

On the one hand there is liberalism, strong urge for rapid development, free and peaceful cooperation among all the nations of the globe, and, on the other hand, fundamentalism and terrorism are creating chaos and unsurmountable problems. The adherents of religious fundamentalism and terrorism are arguing for right to self-determination and progress for particular social groups and communities.

### **Conclude with the following observation:**

“Far from moving towards a unified, liberal world, political development in the twenty-first century may be characterised by growing ideological diversity. Political Islam, Confucianism and even authoritarian nationalism may yet prove to be enduring rivals to Western liberalism”.

### **Nature of Neoliberalism:**

Recent developments have demonstrated beyond any shadow of doubt that people’s interest about liberalism has not ebbed at all, though it is faced with several challenges. Many thinkers in different parts of the globe take interest about the functioning of liberalism. This is mainly due to the fact that in the eighties and nineties of the last century in America, Europe, Asia and Africa many changes had occurred which cannot be delinked from liberalism.

Some such events may be noted to trace the changes in people’s attitude towards liberalism:

- (1) J. M. Keynes suggested some policies and schemes to combat the post-Second World War (1939-1945) economic crises and Keynesian policies bore fruits up to the sixties. Keynesian policies helped the resuscitation of economy by reducing unemployment and arresting the depression in economy.
- (2) In the seventies and eighties the situation dramatically changed. There was a downward trend in the productivity of labour, accumulation of capital or savings declined perceptively, the unemployment rate increased very rapidly and there was an upward trend of inflation. All these happened in those countries which adopted liberal economic policies and accepted liberalism as a political ideology.  
People’s faith on liberalism was faced with problems or challenges. Many of them began to doubt the potency of liberalism or the ability of liberalism to solve the basic problems of economics from which the liberal society suffered.
- (3) Not only crises engulfed liberalism but socialism was not free from crises. In no country socialism was successful. So both liberalism and socialism were in the grip of problems. The policy-makers, statesmen, and intellectuals began to think seriously about liberalism because socialism was foredoomed.
- (4) Many people in Britain and USA began to think the whole episode in new perspective. It was their conclusion that too much articulation on the increasing role of the state in welfare activities and encroachment on the freedom of individual entrepreneurs was the major cause of crisis in liberalism. Reagan administration in the USA and the elevation of Margaret Thatcher to the post of Prime Minister in the UK brought about rejuvenation in liberalism.

Both Reagan and Thatcher forcefully argued for the drastic cut of state’s expenditure on welfare activities and projects, revival of state initiative in deregulation and granting more freedom to individual entrepreneurs. Many people were also vocal about the rise in the rate of interest.

The overall political import of the new course became clear. Repression of workers' claims for better living standards and working conditions.

These changes in the matured capitalist countries were grouped under the head of neoliberalism. The term neoliberalism has been defined by many in different ways. For example, one writer says that "it is an updated version of classical political economy that was developed in writings of free market economists". It simply means that neoliberalism is nothing but the revival of classical liberalism. Market economy, allowance of more scope for the businessmen etc. are the chief characteristics.

But the authors of the article published in the Socialist Register (2002) have looked into the idea in a different way. They observed that the changes and policies that were adopted in the eighties and nineties encouraged many people to think about it.

### **The writers have made the following observation:**

"The new framework of rules to which the functioning of capitalism was subjected is now known as neoliberalism, a return to liberalism in a new configuration". The adoption of new policies produced results as desired.

There was a sharp decline in the unemployment rate, recession was no longer threatened, capital formation advanced forward. These were the overall achievements of capitalist economy under the banner of neoliberalism or 'old liberalism in new garb or bottle. But is it really liberalism? Let us observe.

### **Liberalism Liberalised:**

We have noted that one of the basic elements of liberalism is free market economy where there are large number of producers and investors and there is keen competition among them. This is called competitive economy and profits and prices are determined by the interplay between demand and supply.

But during the last two or three decades some new trends have developed and some of them are:

- (a) Ownership in the means of production and distribution is concentrated in the hands of few persons. It has led to the creation of large corporation. And thus the concept of free market has appeared to be a misnomer. In the earlier epochs there were large number of business organisations who competed among themselves and corporation has replaced it.
- (b) The supply of finance is also controlled by few financial institutions. Capital is no longer dependent on the personal savings. Numerous sources of capital formation are being devised or created by giant financial houses. In the field of capital formations banks are taking leadership.
- (c) "Capitalism gradually developed centralised institutions and mechanisms charged with the control of the macro-economy, with major consequences for the issuing of money, the level of activity and employment (Socialist Register 2002) Thus the concentration was not confined to any particular section of economy, it spreads its wings in all branches of economy and sectors of society thus nullifying the ideology of liberalism.
- (d) There was also the centralisation of management. The progress and better management of the economy necessitated the creation of good, expert and educated managers and the own-

ers of industry took care of it. Management was given high priority and different training schools or institutions were set up for better management. Ultimately, the management of the business or economy went out of the hands of individual industries. Like the supply of capital management was also controlled by few persons or institutions and in this way competition was buried.

- (e) "Neoliberalism strengthened the separation between the ownership and management. It accelerated the development of large non-financial corporations managed by business staffs; salaried management grew within financial institutions".

The above is the list of trends of capitalism in the era of neoliberalism. It is interesting to note that the defenders of these new trends did not abandon or criticise liberalism. They did not say that neoliberalism was unsuitable for the new era. We rather witness peaceful coexistence between liberalism or neoliberalism and the new ramifications of capitalist development.

Neoliberalism did not obstruct this. "Neoliberalism was possible because it did not interrupt the developments (of new capitalism) but strengthened them. Liberalism or neoliberalism proved its flexibility by welcoming the new systems of management and capital-formation.

## **Distributive Justice**

Theories of distributive justice seek to specify what is meant by a just distribution of goods among members of society. All liberal theories (in the sense specified below) may be seen as expressions of laissez-faire with compensations for factors that they consider to be morally arbitrary. More specifically, such theories may be interpreted as specifying that the outcome of individuals acting independently, without the intervention of any central authority, is just, provided that those who fare ill (for reasons that the theories deem to be arbitrary, for example, because they have fewer talents than others) receive compensation from those who fare well.

Liberal theories of justice consider the process, or outcome, of individuals' free actions to be just except insofar as this depends on factors, in the form of personal characteristics, which are considered to be morally arbitrary. In the present context these factors may be individuals' preferences, their abilities, and their holdings of land. Such theories may, then, be categorized according to which of these factors each theory deems to be morally arbitrary.

## **John Rawls on the Theory of Justice! Introductory:**

John Rawls is a top political scientist and academician of United States. He was born in 1921 and passed away in 2002. His most famous work is *A Theory of Justice* first published in 1970 and its revised edition was published in 1990. In the revised edition, Rawls claims, some important sections and views have been revised. Some political scientists claim that it is the most important work in the English speaking world after the Second World War. Rawls championed the cause of liberalism and challenged the conventional thought of equality and attainment of justice. In 1993 his another important work— *Political Liberalism* was published. Mainly these two works constituted his thought system which is modern liberalism. Even the social democrats and opponents of liberalism could not keep themselves away from the tremendous influence Rawls created in the academic circle. It is interesting to note that during the heyday of Soviet communism and Cold War Rawls offered an alternative scheme of political liberalism which was based on minimal state concept. He did not regard inequality as basis of society and enemy of social progress. Equality cannot be accepted as an important highway leading to the big capital of justice. Equality, inequali-

ty and other related ideas are to be judged in the background of social justice and social progress. He propounded his theory keeping the idea in mind that American capitalist system cannot be thoroughly revised or rejected. It has revised itself frequently.

### **Definition of Justice:**

Rawls says that the conception of justice is an inherent nature of our social as well as practical life. Barker has expressed a similar idea. However, in the opinion of Rawls "Justice in the first virtue of social institutions as truth is of system of thought". Justice is related to the social institutions which guide and mould the actions and ideas of social beings. We cannot imagine of a well ordered society whose core concept is not justice. Justice binds all men and institutions of society. The joining capacity and feature of justice has been forcefully advocated by Barker and Rawls shares the views of Barker. John Rawls has viewed justice in the background of society and for this reason he says that the main concern of the subject matter of justice is social structure which is the core of the society. That is justice deals with the basic social structure. The social institutions are very important in the sense that they take the responsibility of distributing the fundamental rights and duties efficiently.

It is also the important task of the social institutions to allocate judiciously the privileges and advantages for the people of society. Constitution, social, political and economic arrangements are included into these social institutions. Thus justice may conveniently be regarded as a social principle which determines the ways and procedure of distributing the rights and duties for the members of society. He further calls justice a social scheme on the basis of which rights, duties, opportunities and condition are allotted. Thus justice is both a principle and a scheme. In the opinion of Barker justice is a social reality and is originates from social thought. But social thought does not arise or develop in a single day or at a particular point of time. Different views and cross currents of opinion help the formation of social thought and it relates to the conception of justice.

So we can say after Rawls that "various conceptions of justice are the outgrowth of different notions of society against the background of opposing views of the natural necessities and opportunities of human life". In any liberal society opposing views must exist side by side and out of them a common opinion will one day emerge which will give rise to justice. So justice may duly be regarded as a "proper balance between competing claims (emphasis added)". This point of Rawls reminds us of Rousseau's general will which is the outcome of deliberations held at open general meeting and participated by all citizens.

Rawls' theory of justice consists of "certain distributive principles for the basic structure of society". In the light of this analysis John Rawls defines justice in the following words. "The concept of justice I take to be defined by the role of its principles in assuming rights and duties in defining the appropriate division of social advantages. A conception of justice is an interpretation of this role". Justice is, thus, an interpretation of principles that are suggested for the distribution of rights and duties and at the same time division of social advantages among all the members of body politic.

### **Justice as Fairness:**

The main theme of Rawls' theory of justice is it is interpreted as fairness. The dictionary meaning of fairness is appropriateness or just: In Rawls' conception that arrangement can be called just or appropriate which does not create any scope of partiality or inappropriate. The principles for the distribution of rights, duties and advantages will be applied in such manner as will give no contro-

versy.

### **Rawls explains the term fairness in the following way:**

"I shall try to use this principle to account for all requirements that are obligations as distinct from natural duties. This principle holds that a person is required to do his part as defined by the rules of an institution when two conditions are met, first the institution is just (or fair) that is it satisfies the two principles of justice and second, one has voluntarily accepted the benefits of the arrangement".

From the above definition of fairness we can form certain features some of which are the following:

- (1) According to John Rawls fairness denotes obligations. Obligation means an act which a person morally or legally is bound to do. Obligations are different from natural duties.
- (2) When a person is legally or morally bound to do an act or perform a duty his liberty will be restricted.
- (3) Fairness also implies that the members of the society are engaged in advantageous cooperative venture. Here two things are important. Individuals cooperate with each other. This co-operation places all the individuals participating in the act creates an atmosphere of mutual advantages for them all. This means that cooperation will create no disadvantage to anybody.
- (4) Rawls further says that the institutions must be fair or just. They must keep themselves above parochial interests. In many societies there are such institutions which have been created to serve group's interests and such institutions cannot serve the interests of justice.
- (5) General public will accept the arrangements of the institutions ungrudgingly. They will have no reservations or objections.
- (6) While discussing the nature of obligation one point is required to be mentioned here. Obligations give rise to the performance of duties which are not moral duties. The institutional or constitutional obligations impose duties upon individuals.

The constitutional or institutional obligations induce a man to perform some duties which ensure the realisation of justice. The performance of institutional duties enables an individual to manage a democratic society and furtherance of general welfare. We, therefore, conclude that the obligations with a strong emphasis on its nature, institutional arrangement and to actively cooperate with the duties made by the institution or any other official declaration are included into the fairness principle.

When the condition of fairness is fully satisfied the concept of justice will not remain far behind. We thus see that fairness, defined by Rawls, in his own way, practically constitutes the core of the theory of justice. But in close analysis it will be found that it is nearer to the traditional idea of justice which states that justice means to give everyone his due share.

### **Contract Theory and Justice:**

We have just now elaborated Rawls' view of justice as fairness. We now turn our attention to the origin of justice as fairness. After good deal of labour Rawls concludes that justice as fairness can aptly be traced to the social contract theory explained by Locke, Rousseau and Kant. He states that the contract theory has several facets such as formation of civil society set up a government. But Rawls is not concerned with all these facets. His chief aim is how the original agreement helped

the establishment of justice in society.

The rational and free individuals met together and settled among themselves the principles of original contract:

- (1) One such principle is they would cooperate among themselves to further their interests.
- (2) The society shall be established on the principle of equality.
- (3) Subsequently other terms of agreement may be finalised but these two terms—Cooperation and equality shall guide and control these terms.
- (4) On the basis of contract a society or government will be constituted but the purpose of this government (or society) shall be to ensure justice. John Rawls claims that the justice established in this way can be called justice as fairness.

The basic condition of the contract is that the persons who made the contract agreed to cooperate with each other and Rawls believes that this is a very important condition for furthering justice. Through the instrumentality of cooperation all the contracting individuals will fix up the principles that will determine the division of social benefits and allot fundamental rights and duties to which they are all entitled. Not only this the terms of the agreement will regulate the claims of persons.

This indicates that none will be allowed to claim anything which he cannot do. So far as this interpretation is concerned it is quite correct to say that contract theory builds up the foundation of justice as fairness.

### **Modus Operandi:**

Rawls has very briefly stated how contract established justice as fairness. In the state of nature all its inhabitants enjoyed equality and after forming a contract they finalised certain terms and conditions for the realisation of a number of purposes. This contract opened the way of attaining justice. They decided the principles for the allotment of rights, duties and all the social advantages. But the interesting fact is that all the members of the state of nature were absolutely ignorant of various aspects of society. For example, the relationship among the members of the state of nature, position of the individuals in the society, relationship between individual and the society etc. They did not know their fortune. Rawls calls this un-awareness as the veil of ignorance. (The veil of ignorance, we shall discuss later on.)

For the sake of clarification let us quote Rawls, “The principles of justice are chosen behind a veil of ignorance. This ensures that no one is advantaged or disadvantaged in the choice of principles by the outcome of natural chance or the contingency of social circumstances”. Justice originated from the fair agreement or bargain. The members of the state of nature entered into contract to make their lives easy, hurdle-free and more comfortable. This made way for arrival of justice.

### **Reason of Fairness:**

We have discussed how a contract initiated justice of fairness and at present we shall lay our hands on the analysis of reasons. According to Rawls the initial position (before the civil so-

ciety was set up) was appropriate because all the members of the state of nature were similarly advantaged and disadvantaged. None had the capacity to manipulate the situation in his favour. This appropriate position at the original stage that is at the state of nature was quite congenial for justice which would be fair. The people of the state of nature had very few choices and alternatives and they had to act and decide with those limited choices.

Another reason of why contract theory provided justice as fairness is the people of the state of nature voluntarily assembled together to set up a society and all of them were on equal footing. In the contract theory we find this interesting premise. Though the contention of the contract theoreticians is not founded on historical fact and data the premise they thought was to some extent real. Mention has been made that the parties to the contract were rational. The main argument behind this assumption is that they abandoned the state of nature and adopted a judicious decision. Rawls thinks that rationality also acts for achieving justice as fairness. Irrational or self interest seeking men cannot be regarded as builders of justice as fairness, because they will manipulate everything in their favour ignoring the general interests of the community.

### **Veil of Ignorance:**

One of the very strong pillars of Rawls' theory of justice is veil of ignorance which is an imaginary or hypothetical situation. When the members of the state of nature built up a civil society all of them were the prisoners of veil of ignorance. This veil of ignorance is a very important element of justice as fairness. Rawls has explained the concept elaborately in his book.

### **Different aspects of the concept are stated below:**

1. The parties to the contract were not well conversant with the particulars which are associated with society. For instance the nature, formation, function etc., of the society. The ignorance of these facts did not deter them from setting up civil society.
2. People were not well acquainted with their own position such as to what class they belonged? What was their exact status in society? What position people occupied in society.
3. They were also ignorant of the rights, duties, privileges, opportunities etc. Naturally they could not determine the principles and modus operandi of their distribution.
4. They had not formed any idea about good or bad, just and unjust; rationality and irrationality; abilities and inabilities; strength and weakness. Because of this ignorant people were not in a position to form an opinion in favour of any one. They had not the ability to disapprove anything. In fact, all of them started their life (which may be called civil life) with a clean slate. This was a very important factor for attaining justice. At least Rawls thinks so.
5. People at the initial situations did not develop any idea about economics, political condition or institution about civilisation or cultural condition.
6. Restricted knowledge or ignorance about the environment in which they lived stood on the way of acquiring adequate idea about certain basic facts. Some of the basic facts are: production of necessary goods, the employment of capital, protection of environment, proper and economic use of natural resources. All these elements of ignorance were the characteristic features of the people of the original position. According to Rawls the original position or situation is the state of nature.

Rawls in this way has analysed the different aspects of the veil of ignorance. We treat this concept as an important part of his theory of justice. But all these aspects of ignorance did not stand on the

way of achieving justice. Rawls says, "As far as possible the only particular facts which the parties know is that their society is subject to the circumstances of justice and whatever this implies." Rawls further says that the veil of ignorance was not a peculiar characteristic feature of the people of original position but was absolutely natural for them.

The great German philosopher Kant had an idea about this veil of ignorance and he referred it in his famous doctrine of categorical imperatives. Kant was not alone. Even in Rousseau's writing we get a reference to it. People of the state of nature were ignorant of civil society and because of that they enjoyed liberty. In the opinion of Rousseau civilisation threw a great assault upon the realisation of liberty and because of this they felt the necessity of a new form of society.

### **Reflective Equilibrium:**

Reflective equilibrium occupies an important place in Rawls' methodology. How Rawls explains it? "I assume that eventually we find a description of the initial situation that both expresses reasonable conditions and yields principles which match our considered judgments duly pruned and adjusted. This state of affairs I refer to as reflective equilibrium. It is an equilibrium because at last our principles and judgments coincide; and it is reflective, since we know to what principles our judgments conform and the premises of their derivation".

Put the idea of John Rawls in a comparatively simple language. "We must constantly check the conclusion of our moral reasoning against our initiative moral motions and possibly readjust the conditions of the original position so as to derive principles which are consistent with these fundamental moral beliefs". In order to arrive at certain conclusions in regard to justice individuals prepare judgments of the distribution of right, duties and privileges. We at the same time decide the principle. Rawls says that there shall be an equilibrium between principles on the one hand and judgments on the other. We check the conclusions in the background of morality or ethics. Until an equilibrium situation is reached adjustment and readjustment process continues.

Rawls further observes that this equilibrium position cannot be stable because when new situation emerges the old equilibrium position changes or is disturbed. Since society is in a fluctuating condition an equilibrium can never be stable. Individuals always check the condition in the light of new situation or circumstances. Naturally the old equilibrium cannot remain in its position. The old equilibrium disappears and makes way for a new one. In this way the whole process moves from one place or position to another.

Justice would be fair if there is a consistency between the principles decided in the light of the original position and our judgments. If there is inconsistency that would give birth to a faulty view about justice. In Rawls' analysis several factors have been found to interfere and the most important one is the individuals always analyse the entire phenomenon in the background of their moral reasoning. In other words, morality always guides them to take an action or to deceive about the attainment of justice.

In support of our contention we again quote a very lengthy passage from Rawls' book. "From the standpoint of moral theory the best account of a person's sense of justice is not the one which fits his judgments prior to his examining any conception of justice but rather the one which matches his judgments in reflective equilibrium? This state is one reached after a person has weighed various proposed conceptions and he has either revised his judgments to accord with one of them or held fast to his initial convictions".

## **Intuitionism:**

While explaining justice as fairness Rawls has briefly discussed intuitionism to support the theory. Dictionary defines intuitionism as the theory that primary truth and principles are known by intuition. The intuition means an ability to understand without the need for conscious reasoning. We want to see how Rawls has applied these ideas to his analysis of justice as fairness.

When the individuals are confronted with the task of taking a decision about justice they start to analyse various matters which they think relevant. First of all their duty is to weigh various principles which conform to the concept of justice.

This the individuals do by weighing different principles against one another and this they do by applying intuition and not conscious reasoning. Intuition and not reason is the technique they apply. The aim of the individuals is to arrive at what is just and what is unjust. If we scan Rawls' analysis in regard to the importance of intuitionism in the determination of justice we shall find it has a great role in finalising the concept of justice and its principles. Intuitionism or intuitionist theory is based on two ideas. One is there are number of first principles "which may conflict to give contrary directives". In the second place in intuitionism there is no specific method. Individuals try to reach a balance through the mechanism of intuitionism. Rawls' view point is for deciding what is justice as fairness men apply intuitionism and no empirical methods.

## **Two Principles of Justice:**

Two Principles Stated:

We have now reached the most crucial section of Rawls' theory of justice. The main structure of his theory is based on two principles and these he has stated in his book. The first principle is: "each person is to have an equal right to the most extensive scheme of equal basic liberties compatible with a similar scheme of liberties for others."

### **The second principles runs as follows:**

"Social and economic inequalities are to be arranged so that they are both

- (a) Reasonably expected to be to everyone's advantage and
- (b) Attached to positions and offices open to all."

These two principles are so much important that concept of justice cannot be analysed without them. Not only this the theory of justice revolves around these two basic principles. The principles relate to the fundamental structure of society. Again how the rights, duties and privileges are to be distributed among the individuals is decided by these principles.

## **Interpretation of the First Principle:**

Rawls admits that it is very difficult to make a list of all liberties which individuals can claim. Because in different socio-economic and political structures nature and number of liberties shall differ. In spite of this preliminary drawback we must try to show what the principle exactly means.

In a society there shall exist an extensive list of equal basic liberties. All the persons shall have equal right to all these liberties. No one can claim more than what others have got. Several things are very important here. (1) A society must publicly announce all the liberties to which its members shall be entitled. In other words, the members shall have equal right to all these liberties. These may alternatively be called social values. The social values include economic, cultural, political, religious freedom. In distributing these rights the authority of the state will not make any discrimina-

tion on the basis of race, sex, caste, language etc. Though Rawls does not categorically state, we surmise that the picture of a democratic state was very much active in his mind because only in a democracy an extensive list of liberties can be found. In fact, Rawls has prepared his theory of justice completely in the background of liberal state and politics. Such states have an elaborate scheme of liberties.

Rawls reminds us that mere announcement of liberties is not of prime importance. The authority must take care that none (because of manipulation or partiality adopted by authority) gets more than the other. The simple implication is that unequal distribution of liberties is not only intriguing but also the main cause of injustice. In the scheme of Rawls liberty has been prioritized. It means that justice is vital no doubt but if liberty is not given priority and a discrimination crops up in allotting rights and liberties injustice will be an inevitable consequence. For this reason in Rawls' scheme liberty has been given first preference. Hence we find that mere declaration of rights and liberties does not constitute justice, implementation is of vital importance.

### **Interpretation of the Second Principle:**

We believe that the second principle is more important than the first principle. The second principle has two parts. In these two parts there are two phrases:

- (1) Everyone's advantage and
- (2) Open to all. Rawls himself admits that both these phrases are ambiguous.

So it is not at all easy to arrive at any definite conclusion. But in spite of this ambiguity these two famous phrases cannot be abandoned. In the first place, government will make utmost efforts to decide the principles on the basis of which all the rights, liberties, duties and privileges will be equally distributed. This principle further asserts that the political system shall not make any discrimination. We have already mentioned this earlier. This principle has another aspect. Primarily the authority will not allow any type of inequality. Because strictly

viewed, inequality or unequal distribution of rights and privileges is an anathema of justice. But in the second principles Rawls makes heavy concessions for inequalities. He, here, imposes two powerful conditions. Inequalities or unequal distribution of rights, liberties duties and privileges will be allowed on the condition that it will be to everybody's advantage or in other words, one will not be in disadvantageous position and the other will be in advantageous position. This type of discrimination is harmful for the society.

Again Rawls observes that some may get greater privileges while others will get less. But the reason of this unequal distribution will be allowed on the condition that the privileges and opportunities shall be open to all. Its implication is every one shall have adequate freedom to reach the door of privileges. There shall be no restrictions. In any political system there are many agencies which allocate the rights, liberties and privileges on behalf of the state. Rawls is of opinion that the agencies must be efficient. If it is not so the advantages or privileges generated by society will not be able to reach every one. Moreover, the allocation of privileges will be so efficient that it cannot be altered further. Allocation of privileges will reach the maximum level. While distributing the privileges among the citizens the authority must take care of the fact that its doors shall be open to all. That is it must be accessible to all. This accessibility is part of the ambitious scheme—all rights, duties and privileges are open to all. The two things—accessibility to government and open to all—are inseparable. If any person feels that he is deterred from having opportunities which are allotted

to others and behind this deprivation there is no valid reason.

The rectification is possible only, if the citizen or the aggrieved person enjoys the accessibility to the authority, "Assigning rights and duties" writes John Rawls "is thought to give a scheme which allocates wealth and income," authority and responsibility, in a fair way (emphasis added) whatever this allocation turns out to be. It is clear from Rawls' view that allocation denotes not simply the income and wealth but also the opportunity to participate in the affairs of the government.

### **Other Aspects of Two Conditions:**

For the realisation of equal liberty it is essential that the economy will have a free market system. It is a very important precondition and if it is not satisfied there is no question of equal liberty. Free market means the market or the operation of the market shall be regulated by the basic principles of supply and demand and there shall be no interference of state or any other authority on behalf of the state. In such an economy individuals will have ample opportunity to enjoy equal liberty. Of course, the state will lay down the principles which will be carried out by all concerned. In this connection Norman Barry observes: The competitive market shall be regulated by the fair equality of opportunity principle. This principle then sanctions those social policies which are designed to mitigate the effects of social contingencies which give some groups and individuals, unfair advantages over others.

But there is one objection against this assumption or principle and this is it is egalitarian in nature. We believe that it is to some extent Utopian. It cannot be expected that everybody will have the opportunity to enjoy equal liberty in an economic structure which is regulated by this principle. Utopian because those who control and manage the economy will not allow others to reap full benefit of such an economy. Rawls has offered us a way out. While implementing the scheme of distributing opportunities, rights and duties the authority must give due consideration to natural talents. Rawls has argued that if the structure of society is modified that will provide ample scope for the distribution of wealth and income on the basis of natural abilities and talents.

The holder/owner of natural abilities and talents will get higher returns or remuneration. This will lead to inequality. But Rawls and many others apprehend that this type of distribution of income and wealth on the basis of natural talents is arbitrary and may encourage criticism. Rawls, therefore, suggests a midway by pointing out that prioritization of natural talents and abilities will give no problem if this goes to the benefit of the least advantaged. "Those with natural talents are entitled to high earnings only if such inequalities are to the benefit of the least advantaged."

The moot point here is that inequalities are not, Rawls assumes, harmful for society if they are capable for generating benefits for all including the least advantaged and by pronouncing this Rawls made a welcome for the inequalities directly and bestowing good wishes to capitalism. We now turn to the concept of efficiency which has a very important role in the field of the distribution of goods and privileges. The realisation of justice is closely connected with this distribution. Rawls has said that if the distribution of goods and privileges and the production of commodities are efficient then the realisation of justice will be possible.

If on the other hand there is inefficiency the victim will be justice. Instead of justice there will come injustice. From the analysis of Rawls it appears to us that the concept of justice is really a complex notion and its attainment largely depends upon the good deal of efficiency of production of goods and articles and their distribution. Now the question is what is efficiency and inefficiency? If the

distribution of goods, income, wealth and privileges is efficient there will be no further scope of distribution no scope for arrangement and rearrangement. That is the distribution system will be excellent.

On the other hand, if it is inefficient there will be scope for further arrangement and redistribution. Rawls says: "An arrangement of the basic structure is efficient when there is no way to change this distribution so as to raise the prospects of some without lowering the prospects of others". It is necessary to add few words to the idea of benefit. The aim of justice is to give maximum benefit to all including the least advantaged. Should benefit be interpreted in terms of utility? Do the two terms carry identical meaning? It can categorically be stated that Rawls does not use the term benefit in the sense of utility used by the utilitarians.

The utilitarian's thought of maximisation of utility irrespective of the distribution and remodelling of social structure. In the existing structure of society individuals will maximise their utility. But Rawls enters into the depth the matter He has also discussed justice in a greater perspective. "The striking feature of utilitarian view of justice is that it does not matter how the sum of satisfactions is distributed among individuals any more than it matters".

### **Pure Procedural Justice:**

According to Norman Barry Rawlsian theory of justice is blessed with certain advantages and this is chiefly due to the reason that his theory of justice is based on a system of pure procedural justice. We are to go through his ideas about procedural justice. Explaining procedural justice as pure form Rawls says that the activities of a person depend on what the rules empower him to do. Without the authority of rules/laws man cannot do anything. Of course, if he does anything without the authorisation of law that will be illegal. Simply stated, procedural justice envisages that individuals at first claim some rights and privileges, the principles determine the process/procedure by which these claims are to be satisfied and this in turn is legitimised by the basic structure.

What is pure procedural justice? The "pure procedural justice obtains when there is not independent criterion for the right result; instead there is a correct or fair procedure such that the outcome is likewise correct or fair provided that the procedure has been properly followed". This is, in brief, the pure procedural justice. Rawls claims that in order to understand the pure procedural justice it is necessary to compare it with perfect and imperfect procedural justice.

What do we mean by perfect procedural justice? The fairness of justice and other things such as division of wealth etc. is decided by an independent criterion. Again before the commencement of procedure the criterion must exist. The Persons concerned with the attainment of the procedural justice are sure that they would be able to reach the goal. If we look at the real situation we shall find that such type of perfect procedural justice is rare. In order to explain the imperfect procedural justice Rawls cites an example. He says that such form of justice is generally found in criminal trial cases. The lawyers adopt various procedures and arrangements to find out the culprit. The arrangements are selected to fit the situation and they are not previously selected. The important feature of imperfect procedural justice is there is no flexible procedure to arrive at conclusion.

In the light of the above analysis we can reasonably point out certain features of pure procedural justice.

These are briefly stated below:

- (1) In procedural justice no separate or independent criterion is used.
- (2) For pure procedural justice a fair or correct procedure is followed so that a fair justice can be built up.
- (3) Determination of the fair procedure is not enough. Such a procedure must be scrupulously observed.
- (4) There is another aspect of pure procedural justice and summarily stated it is— an impartial institution is to be set up or there shall be a number of impartial institutions.
- (5) Mere setting up of impartial institutions is not sufficient; they must have opportunity to function impartially and efficiently.
- (6) All the institutions or branches of the political system must cooperate with each other. This cooperation is indispensable and without it there shall arise chaos.

### **Basic Structure:**

Any analysis of justice is bound to remain incomplete without any reference to basic structure because basic structure according to John Rawls is basic or fundamental to the theory/concept of justice. "The basic structure" defines Rawls, "is a public system of rules defining a scheme of activities that leads men to act together so as to produce a greater sum of benefits and assigns to each certain recognised claims to a share of proceeds." It is of prime importance for a comprehensive analysis of justice. It can be explained in a slightly different way. It is a way in which the most important social institutions allocate rights, duties, privileges and responsibility among the members of the community. It further denotes the cooperation between the individuals and the various segments of the basic structure.

The important institutions include the constitution the major political, social and economic institutions which are involved in a number of activities connected with the administration of state. The effects of the basic structure on justice are profound. Its presence in the stages of justice is felt from the very beginning to the end. It is also an integral part of pure procedural justice.

### **Assessment:**

Rawlsian theory of justice is confronted with a number of criticisms and some of them are stated below:

1. Rawls' theory of justice has been framed in the background of liberal capitalist system. There is a general grievance against the capitalist system that the division of society into clear-cut classes, ownership of the means of production by very few persons, gross inequality of income between the classes etc. create injustice and the rectification of this situation was strongly felt. Rawls' theory of justice was a type of palliative to this condition. David Easton wanted to justify the capitalist system by his behaviouralism which indirectly stated that liberal political system possessed some self regulatory mechanisms which could withstand the onslaught on capitalism.

Rawls justified the inequalities in the distribution of income, wealth and privileges on the ground that it might be in the advantages to all. He does not utter a single word about the change of basic structure of society. He has introduced some concepts such as "veil of ignorance" "re-

flective equilibrium” etc. to elaborate his core ideas and support the existing liberal economy’s basic structure.

But we believe that all these are in vain and our stand will be strengthened if we seek the assistance of Ralph Miliband’s critical analysis of capitalist system which he has made in *The State in Capitalist Society* (1973). Our humble submission is so long as the capitalist system remains intact justice in real sense will remain a far cry.

2. Rawls has said that natural talents and abilities are to be properly rewarded. Our objection is to what extent these natural talents and abilities will come to the benefit of the society as a whole and the least advantaged in particular still is a matter of conjecture. Who are least advantaged? Who will decide it? There may be several categories of benefit and which category is most wanted who will settle it?  
All these are highly vexed issues and a balanced theory of justice requires an acceptable solution to all these issues and questions. But, the critics are of opinion that by rewarding the natural talents and abilities to their holders, an illuminating theory of justice cannot be constructed.
3. Rawls has said that economic inequalities are acceptable if they are everyone’s advantage and if offices are open to all. Rawls himself admits that “everyone’s advantages” and “open to all”—these two phrases are ambiguous and we also agree with him.  
How can an ordinary citizen deprived of all amenities and economic strength or opportunities compete with other persons for the post of American presidency. Cost of campaign requires millions of dollars and a poor or middle class man cannot imagine to contest for the post of presidency.
4. From his analysis we come to know that justice can be achieved through the implementation of efficiency. But who will implement it? Will the owners of capital and means of production invite the most efficient person to shoulder the responsibility of management in order to ensure efficiency? If anybody feels that the owners of production, in order to ensure an efficient system of production, will invite others to start an efficient system that will be a Utopian idea.
5. “A very difficult problem for Rawls is the identification of the least advantaged. This clearly cannot be literally the worst-of in any society and must refer to some class of persons. Rawls always refers to the representative man of the least advantaged group. He gives definitions of such a person but his whole approach has been vehemently criticised. This is because his methodology precludes him from considering the actual disadvantages of individuals”.  
It has further been observed that Rawls’ definition precludes many individuals from the scope of special need and care. Barry believes that Rawls’ analysis creates a big loophole in the body of his theory and this makes his theory, to a large extent, incomplete. He has however made a scope for necessary changes in his prescription when he says that various refinements can be made in practice.
6. Barry has drawn our attention to another limitation of Rawls’ theory of justice. “The nature and justification of the priority rule has been criticised. While in principle this provides a determinate solution to the possible conflicts between principles the priority of equal liberty over economic advantage has been challenged”.
7. The liberals also have strongly criticised his theory on the ground that it is very much egalitari-

an in nature and Rawls could not deny this charge. Rawls thought that the criteria suggested by him are difficult to apply and they are extremely egalitarian. Even Nozick could not fully support his theory.

## **Nozick's View on Theory of Justice**

### **Introductory:**

After throwing light on important aspects of Rawls' theory of justice we now embark on another theory of justice propounded by Robert Nozick in his *Anarchy, State and Utopia* (1974). Robert Nozick (1938-2002) was an American academic and a renowned political philosopher. His *Anarchy, State and Utopia* created a profound influence upon the contemporary academic world of political science and political philosophy. Rawls' theory of justice was based on liberty, equality and inequality.

The policy makers shall pursue a scheme for the furtherance of liberty, equality and inequalities where such inequalities will benefit the least advantaged. But Nozick developed his theory in response to Rawls' theory and he based his theory of justice on rights. Though both Rawls and Nozick have developed two theories of justice it cannot be said that Nozick was in any form critical of Rawls.

Rather he has showered huge accolade on the former. Rawls' theory of justice, Nozick cautiously maintains, "is a fountain of illuminating ideas, integrated together into a lovely whole. Political philosophers now must either work within his theory or explain why not". In his early years Nozick was a great supporter of extreme libertarianism and in the fag end of life he considerably modified his extreme libertarianism. Some are of opinion that ultimately Nozick appears to us as a strong supporter of a political doctrine which is known to us as neo-liberalism and in this respect he is to some extent at par with Hayek.

### **Concept of Distributive Justice:**

Before Starting analysis about distributive justice put forward by Robert Nozick, Analyse very briefly the concept of minimal state. In the classical political as well as liberal political theory the state was primarily known as night watchman state which implied that the state had to discharge minimum functions.

These were to maintain law and order, to take action against violence, to fight the foreign aggressors, to stop theft and fraud, to implement all sorts of contracts. In order to establish its existence and credibility the state had to do all these functions. But subsequently it was felt that the functions of the state could not be confined within the above noted categories and for this reason the state that did these functions came to be designated as minimal state.

Many liberal thinkers are of opinion that the greater the functions of the state the greater are the infringement of rights of the individuals. Though the minimal state performs minimum functions still it is held that such a state has enough power to enter into the domain the rights of the individuals. In spite of this situation the minimal state is known as the most extensive state and such a state is justified.

The reason of justifying it is such a state is the most powerful vehicle for arriving at distributive justice. It is the duty of a political system to see that none is deprived of justice and for that goal the state will have to take action.

## **Entitlement Theory:**

Mention has been made that Robert Nozick bases his theory of justice on rights. The rights come from the concept of entitlement. In other words rights mean entitlement. One has right or claim to anything means that one is entitled to it. If justice means the distribution of right, duties, privileges etc. then the idea of justice can appropriately be interpreted as entitlement theory of justice. Nozick is reluctant to give preference to distributive justice because this concept does not give proper idea about the theory. He observes: "it would be best to use a terminology that clearly is neutral". Implementation or realisation of the entitlement to holdings creates the foundation of the theory of justice. Thus Nozick's theory of distributive justice and entitlement theory are same and convey identical meaning.

## **There are three different principles or three major topics of holdings:**

1. When a man acquires a holding (we can interpret it as property though Nozick does not use this particular term) according to the principle of justice and law, then the person concerned is entitled to that holding. In other words, property acquired in a legal and justifiable way shall cause under the authority of the person who has acquired it and it is a type of justice.
2. If a person happens to acquire a holding by means of transfer and here in this case the basic principles of justice has been strictly adhered to, then this justice- based transfer can reasonably be called an entitlement. The transfer takes place from one person to another. There are different forms of transfer such as voluntary exchange, gifts or any other type.
3. In all societies not all transfers or acquisitions take place in proper or legal or justifiable ways. There may be illegal transfers or acquisitions and it has been found that such cases are not at all rare. Naturally the rectification of this injustice or wrong can lead to another type of holding. Nozick calls it the "rectification of injustice in holding".

When the three above noted holdings are conglomerated under one head that gives birth to a concrete shape of the theory of justice. It can be better put in the words of Nozick. He writes: "The general outlines of a theory of justice in holdings are that the holdings of a person are just if he is entitled to them by the principles of justice in acquisition and transfer, or, by the principle of rectification of injustice. If each person's holdings are just then the total set of holdings is just".

How do people come to know that injustice has been done to them in matter of holding? Nozick answers that from the fact/records of history or from various sources of information people gather the news that something wrong has been done to them and in that case they will move for the rectification of the wrong. If this does not happen, one cannot expect that justice will prevail.

## **Historical Principles and End-Result Principles:**

### **What is Historical Principle?**

For a better and illuminating formulation of a theory of justice Nozick has devised two principles- historical and end-result principles. Nozick has demonstrated that from distribution emanates entitlement and now the problem is how to decide that a distribution is just. If it is not just there cannot be justice.

In order to decide this problem Nozick has applied the criterion of historical principle. It says that the justness or unjustness of a distribution can be decided by the fact that whether it is historical

or not. Historical principle means how it come about? Past records will show to what extent a distribution is able to satisfy the requirements of justice. How he defines. "Historical principles of justice hold that past circumstances or actions of people can create differential entitlements or differential deserts to things".

If a scheme or distributive system is unjust or defective this can be rectified (of course if possible) or removed and in this way the distributive process moves from one stage to another or one scheme to another.

In the concept of historical principle there lies a clear hint of evolution of the theory of justice. There has occurred a gradual development of justice and this is chiefly due to the reason that the material circumstances of society change and this influences justice.

### **The End Result Principles:**

Nozick has awarded another name to end-result principles and it is current time- slice principles. This concept demonstrates that how things, rights, duties and privileges are distributed and as a result of distribution who has got what is to be decided. Here we find that the question is not about distribution per se, we are to look into the consequences of distribution.

If the end result is satisfactory then it can be held that justice will be the result of distribution. Let us put the matter in his own words. "According to current time- slice principles (also read end-result principles), all that needs to be looked at, in judging the justice of a distribution, is who ends up with what (ital added), in comparing any two distributions one need look only at the matrix presenting the distribution". Two important points to be noted here. Distribution must clearly state that who is getting what. The other point is this is possible only through comparison.

Nozick demands that only the end result principles can tell us what would be the exact nature of justice. If the procedure of distribution is incomplete or defective or cannot assure us of justice then the procedure can be changed. He also claims that this is the most reliable way of building up a theme of justice. We also partially agree with Robert Nozick. Partially because other factors are to be considered.

We thus come across the idea that the time-slice principles are also called unhistorical principles. Time-slice principles, end-result principles and unhistorical principles according to Nozick denote almost same thing. Norman Barry and many others say that utilitarianism and social justice theories are end-state doctrines. According to Nozick the socialist theory about workers' share in the profit of the company is based on historical principles. The workers claim that they also have a major share in the profit which the industry generates because this profit is the result of their labour. They have drawn this conclusion from the past history.

They have observed that the capitalists/owners of sources of production have gobbled the entire profit by nefarious means. "The socialist rightly holds onto the notions of earning producing, entitlement, desert and so forth and he rejects current time-slice principles that look only to the structure of the resulting set of holdings". From these two principles we form the idea that for a concrete theory of justice it is necessary to emphasise the entitlement concept. If there are any wrong doings in the acquisition of transfer of holding that must be rectified. Otherwise the justness of the distribution of entitlement will remain defective.

## **Patterned Principles:**

After analysing the historical and end-result principles, Nozick has introduced another principle which he has designated as patterned principle. In the opinion of Nozick : "Let us call a principle of distribution patterned if it specifies that a distribution is to vary along with some natural dimension (emphasis added), weighted sum of natural dimensions, or lexicographic ordering of natural dimensions". Distribution of things, rights etc. should be controlled by other criteria. It may be moral, merit, usefulness to society or weighted sum of merit etc. It implies that the distribution will depend on merit, deserve, usefulness to society or natural dimension. The entitlement theory we have just now sketched does not fall in the category of patterned principle. If a person possesses greater moral merit or if he has greater usefulness to society then he may naturally claim shares, greater reward or higher shares. And to deprive him of this rational claim will be tantamount to injustice. When the distribution is based on patterned principle it is also called patterned distribution. Hence the whole sequence of justice is not based on equal liberty or any other principle enunciated by John Rawls rather patterned principle and the pattern relates to various elements such as usefulness to society moral merit etc. By enunciating all these Nozick wants to establish a new doctrine.

## **Criticism of Patterned Principle:**

Nozick was quite conscious of the shortcomings of the patterned principle of justice and he has mentioned some of them.

### **We mention here few:**

- (1) Patterned principles only stress the patterned way of distribution of property and rights. But it is silent on the entitlement principles of holding and Nozick believes that only through the strengthening of this principle can justice be achieved. Hence its inability is not helpful for justice.
- (2) In the opinion of Nozick justice depends on both receiving and giving of holdings or property. These two combinedly form the fabric of justice. But patterned principle only emphasises the receiving aspect and ignores the giving of property. So the patterned principle of distributive justice is a theory of recipient justice.
- (3) Again there is a conflict between patterned principle and end-state principle. The patterned principle emphasises that men should be "rewarded according to the deserts is historical because it directs attention towards their past action".

What is the conclusion? "Nozick's own theory of justice is an historical un-patterned theory. It is an entitlement theory in which the distribution of individual property-holding is just if it is a consequence of fair acquisition. The only other aspect of justice is rectification, the principle which allows past injustices that is unfair acquisition to be corrected".

## **Locke's Theory of Acquisition:**

Nozick's theory of justice, sketched above, is a theory of entitlement and since it is a theory of entitlement it is also theory of acquisition or holding of property. Any theory of acquisition without any reference to Locke is bound to be unsatisfactory. Explaining the various aspects of social contract theory Locke has dealt with the concept of property. He maintains that in a society the person

who first lay his hand on a part of nature and made it usable with the help of labour that finally became his property. Here lies the idea of acquisition. Acquisition, thus, arises from man's intention to use something for his personal use which will satisfy his requirement. But there is a problem. Has every one opportunity to acquire holding/property through the utilisation of labour? This question originates from the concern that if everybody follows the same procedure ultimately there shall arise a shortage of property which means that everybody will not have any scope to acquire property. The labour is the main factor behind the acquisition and every one will have the opportunity to acquire property by dint of his labour. Locke arrived at this conclusion because he believed that there would be enough in the nature and none would be deprived of property. "Whatever then he removes out of the state that nature has provided and left it is he has mixed his labour with, and joined to it something that is his own and thereby makes his property. There is enough and as good left in common for others."

In this way acquisition was established in Lockean concepts of contract theory and property. This proves that even after the acquisition process continues enough portions of state of nature will remain for the acquisition of others. This process will not worsen the right and position of others in respect of the acquisition of property. But there is a complicated problem. If everybody goes on acquiring property freely or without any limitation, then time will come when nothing will be left or very little will be left for others which will not be enough for the sake of justice. A thorough study of Locke's The Second Treatise of Government assures us that he was quite aware of it. Nobody will be permitted to acquire more than what he needs. "A theory of appropriation incorporating the Lockean proviso will handle correctly the cases where someone appropriates the total supply of something necessary for life".

Whenever a person proceeds to appropriate holding/property he must not violate the Lockean proviso because any violation will go against justice. "Thus a person may not appropriate the only water hole in a desert and charge what he will. Nor may he charge what he will if he possesses one". "But this proviso would not, in Nozick's theory, prevent someone who discovered a cure for a fatal disease charging whatever price he liked".

### **Criticisms:**

Nozick's theory of justice is apparently attractive and convincing but in final analysis it is not so.

### **Critics have raised several objections against it:**

1. Nozick has given undue importance to distributive aspect of justice. Through the entitlement of holding he has built up the entitlement theory. Entitlement of holding may be in the form of acquisition or transfer or rectification of injustice. These are the cases of distribution but what about production? He has neglected it and we think that it is unjust. Both production and distribution are closely connected and to ignore one will lead to an incomplete theory.
2. Robert Nozick was in strong favour of minimal state which is equivalent to night watchman state. It means that in any society the state has a role to play, though the role may be minimum. Nozick's theory does not make it clear what role the state will exactly play in establishing justice. Moreover, since Nozick's theory falls into the category of distributive justice the state, through its elaborate machinery, must ensure proper distribution of holding, and at the same time entitlement to holding. If legal and other problems arise on the way of acquisition or trans-

fer or rectification of previous wrong who will take the responsibility of rectifying this or solving the problem? In Nozick's theory it remains unsolved.

3. Nozick has taken it for granted that people will strictly adhere to Locke's proviso that enough will be left for the use of others for their use and the situations of others will not worsen. This implies too much reliance on the rationality of holders or users of property. But we cannot say that all the property owners will resist them from acquiring property/holding beyond their necessity. If this happens in actual world, we are sure, there would not arise necessity of state or enforcing authority. Even the Utopian socialists and Rousseau could not imagine such a situation.
4. It is unfortunate that both Rawls and Nozick have offered us a theory of justice which they wanted to formulate in a society plagued by class divisions. If a society is divided into two opposing classes, and if one class is economically dominant the comparatively weak class would definitely be deprived of justice. For a real theory of justice, we firmly believe, there shall exist equality in its various manifestations.
5. Nozick, in his thorough analysis of distributive justice intends to highlight a greater philosophy and wants to draw the attention of his readers to politics which is popularly called liberalism. But though liberal philosophy has many good aspects, its black spots and irritating aspects are not to be ignored. The real picture of liberal political philosophy of USA, Britain, and other states is not unknown to us and in that perspective we can say that neither Rawls' nor Nozick's theory of justice attracts us. They are meant for capitalism.
6. Justice can be divided into social, economic and political and all are connected with each other. Rawls' and Nozick's theory speaks least about their connection. Their theory is based upon certain principles.

## Entitlements

Nozick's entitlements theory (as an extreme) treats no personal attributes as being arbitrary, and thus defines justice simply as laissez-faire, provided that no one's rights are infringed. In this view "the complete principle of distributive justice would say simply that a distribution is just if everyone is entitled to the holdings they possess under the distribution" (1974, 151).

## The Basic Schema

Nozick introduces his approach to "distributive justice" by noting that the term is not a neutral one, but presupposes some central authority that is effecting the distribution. But that is misleading, for there is no such body. Someone's property holdings are not allocated to her by some central planner: they arise from the sweat of her brow or through voluntary exchanges with, or gifts from, others. There is "no more a distributing or distribution of shares than there is a distributing of mates in a society in which persons choose whom they shall marry" (1974, 150). Accordingly, Nozick holds that the justice of a state of affairs is a matter of whether individuals are entitled to their holdings. In Nozick's schema, individuals' entitlements are determined by two principles, justice in acquisition and justice in transfer: If the world were wholly just, the following inductive definition would exhaustively cover the subject of justice in holdings.

1. A person who acquires a holding in accordance with the principle of justice in acquisition is

entitled to that holding.

2. A person who acquires a holding in accordance with the principle of justice intransfer, from someone else entitled to the holding, is entitled to the holding.
3. No one is entitled to a holding except by (repeated) applications of 1 and 2. (1974, 151)  
However, the world may not be wholly just: as Nozick observes, "not all actual situations are generated in accordance with the two principles of justice in holdings". The existence of past injustice "raises the third major topic under justice in holdings: the rectification of injustice in holdings" (1974, 152).

## Patterns

Nozick distinguishes entitlement principles of justice from patterned principles. A principle is patterned if "it specifies that a distribution is to vary along with some natural dimension, weighted sum of natural dimensions, or lexicographic ordering of natural dimensions". A distribution that is determined by peoples' ages or skin colours, or by their needs or merits, or by any combination of these, is patterned. Nozick claims that "almost every suggested principle of distributive justice is patterned" (1974, 156), where by "almost" he means "other than entitlement principles". The fundamental problem with patterned principles is that liberty upsets patterns. As Hume expresses it, "render possessions ever so equal, men's different degrees of art, care, and industry will immediately break that equality" (1751, 3.2). Nozick argues this using his famous Wilt Chamberlain example.

Suppose that a distribution that is (uniquely) specified as just by some patterned principle of distributive justice is realized: this may be one in which everyone has an equal share of wealth, or where shares vary in any other patterned way. Now there is a basketball player, one Wilt Chamberlain, who is of average wealth but of superior ability. He enters into a contract with his employers under which he will receive 25 cents for each admission ticket sold to see him play. As he is so able a player a million people come to watch him. Accordingly, Mr Chamberlain earns a further \$250,000. The question is, is this new distribution, in which Mr Chamberlain is much better off than in the original distribution, and also much better off than the average person, just? One answer must be that it is not, for the new distribution differs from the old, and by hypothesis the old distribution (and only that distribution) was just. On the other hand, the original distribution was just, and people moved from that to the new distribution entirely voluntarily. Mr Chamberlain and his employers voluntarily entered into the contract; all those who chose to buy a ticket to watch Mr Chamberlain play did so voluntarily; and no one else was affected. All holdings under the original distribution were, by hypothesis, just, and people have used them to their advantage: if people were not entitled to use their holdings to their advantage (subject to not harming others) it is not clear why the original distribution would have allocated them any holdings. If the original distribution was just and people voluntarily moved from it to the new distribution then the new distribution must be just.

## Justice in Acquisition

Acquisition of material is considered to be just if what is acquired is freely available and if acquiring it leaves sufficient material for others. Giving an operational meaning to this requires the specification of what acquisition means, what is freely available, and how leaving sufficient material for

others is to be interpreted. In these, Nozick, albeit with reservations, follows Locke. Locke interprets “acquiring” as “mixing one’s labour with” (1689, 2.5.27). I own my labour, and if I inextricably mix my labour with something that no one else owns then I make that thing my own. However, as Nozick points out (without proposing any resolution of these) there are a number of problems with this interpretation. It is not clear why mixing something that I own with something that I do not own implies that I gain the latter rather than lose the former. In Nozick’s example, “if I own a can of tomato juice and spill it in the sea ... do I thereby come to own the sea, or have I foolishly dissipated my tomato juice?” Further, it is not clear what determines how much of the unowned resource I come to own. If I build a fence around a previously unowned plot of land do I own all that I have enclosed, or simply the land under the fence? In Nozick’s example, “if a private astronaut clears a place on Mars, has he mixed his labor with (so that he comes to own) the whole planet, the whole uninhabited universe, or just a particular plot?” (1974, 174-175). Locke interprets “freely available” as being “in the state that nature hath provided”, and Nozick (without any argument) follows Locke in equating “freely available” with “unowned”. There are however, other possibilities. Virgin resources may be seen as being owned in common, or as being jointly owned in equal shares.

Locke interprets leaving sufficient for others as there being “enough, and as good, left in common for others” (1689, 2.5.27); this is the famous Lockean proviso. There are two possible interpretations of this: I may be made worse off by your appropriating a particular plot of land by no longer being able to appropriate it myself, or by no longer being able to use it. Nozick adopts the second, weaker, version.

### **Justice in Transfer**

The essence of Nozick’s principle of justice in transfer is that a transfer is just if it is voluntary, in that each party consents to it. Justice in transfer also involves the satisfaction of the Lockean proviso. This is both indirect and direct. It is indirect in that I cannot legitimately transfer to you something that has been acquired, by me or by anyone else, in violation of the proviso, for that thing is not rightfully mine to transfer. But the proviso is also direct, in that I may not by a series of transfers, each of which is legitimate on its own, acquire property that does not leave enough, and as good, for others.

### **Justice in Rectification**

Nozick’s basic schema applies to a world that is “wholly just”. However, the world may not be wholly just: people may have violated the principle of justice in acquisition, for example, by appropriating so much of a thing that an insufficient amount is left for others; or they may have violated the principle of justice in transfer, for example, by theft or fraud. Then, as Nozick observes, “the existence of past injustice (previous violations of the first two principles of justice in holdings) raises the third major topic under justice in holdings: the rectification of injustice in holdings”. Nozick identifies a number of questions that this raises: if past injustice has shaped present holdings in ways that are not identifiable, what should be done; how should violators compensate the victims; how does the position change if compensation is delayed; how, if at all, does the position change if the violators or the victims are no longer living; is an injustice done to someone whose holding which was itself based upon an injustice is appropriated; do acts of injustice lose their force over time; and what may the victims of injustice themselves do to rectify matters? However, these questions are not answered: as Nozick admits, “I do not know of a thorough or theoretically sophisticated treatment of such issues” (1974, 152).

## Summary

The strength of Nozick's entitlements theory of justice is that it uncompromisingly respects individual liberty, and thus avoids all the problems associated with patterned approaches to justice. However, by avoiding patterns it introduces its own problems, for in asking how distributions came about, rather than in simply assessing them as they are, Nozick necessarily delves into the mists of time. Here lie the two most significant, and related, problems with Nozick's theory: that of the relatively unsatisfactory nature of the principle of justice in initial acquisition, and that of the predominantly unexplained means of rectifying any injustice resulting from that.

## Dworkin; Justice as equality Equality of Resources

Equality of resources, as developed by Dworkin, treats individuals' abilities and external resources as arbitrary, but makes no adjustments for their preferences. The essence of this approach is the distinction between ambition-sensitivity, which recognizes differences which are due to differing ambitions, and endowment-sensitivity, which recognizes differences that are due to differing endowments.

## Initial Resources

Dworkin accepts that inequalities are acceptable if they result from voluntary choices, but not if they result from disadvantages that have not been chosen. However, initial equality of resources is not sufficient for justice. Even if everyone starts from the same position one person may fare better than another because of her good luck, or, alternatively, because of her lesser handicaps or greater talents. Dworkin motivates his theory of justice with the example of a number of survivors of a shipwreck who are washed up, with no belongings, on an uninhabited island with abundant natural resources. The survivors accept that these resources should be allocated among them in some equitable fashion, and agree that for a division to be equitable it must meet "the envy test", which requires that no one "would prefer someone else's bundle of resources to his own bundle" (1981, 285). The envy test, however, is too weak a test: Dworkin gives examples of allocations that meet this test but appear inequitable. Can you give an illustration here To deal with such cases Dworkin proposes that the survivors appoint an auctioneer who gives each of them an equal number of tokens. The auctioneer divides the resources into a number of lots and proposes a system of prices, one for each lot, denominated in tokens. The survivors bid for the lots, with the requirement that their total proposed expenditure in tokens not exceed their endowment of tokens. If all markets clear, that is, if there is precisely one would-be purchaser for each lot, then the process ends. If all markets do not clear then the auctioneer adjusts the prices, and continues to adjust them until they do.

## Fortune

Dworkin seeks to make people responsible for the effects of their choices, but not for matters beyond their control. To take account of the latter, he distinguishes between "option luck" and "brute luck". Option luck is "a matter of how deliberate and calculated gambles turn out". Brute luck is "a matter of how risks fall out that are not in that sense deliberate gambles" (1981, 293). People should be responsible for the outcomes of option luck, but not of brute luck. Dworkin's key argument concerning luck is that "insurance, so far as it is available, provides a link between brute and option luck, because the decision to buy or reject catastrophe insurance is a calculated gamble". Then because people should be responsible for the outcomes of option luck they should be responsible for the outcomes of all luck, at least if they could have bought insurance. Accordingly, Dworkin amends his envy test by requiring that "any resources gained through a successful gamble should be represented by the opportunity to take the gamble at the odds in force, and compa-

able adjustments made to the resources of those who have lost through gambles” (1981, 293-295).

## **Handicaps**

Insurance cannot remove all risks: if someone is born blind he cannot buy insurance against blindness. Dworkin seeks to take account of this through a hypothetical insurance scheme. He asks how much an average person would be prepared to pay for insurance against being handicapped if in the initial state everyone had the same, and known, chance of being handicapped. He then supposes that “the average person would have purchased insurance at that level” (1981, 298), and proposes to compensate those who do develop handicaps out of a fund that is collected by taxation but designed to match the fund that would have been provided through insurance premiums. The compensation that someone with a handicap is to receive is the contingent compensation that he would have purchased, knowing the risk of being handicapped, had actual insurance been available. Accordingly, the auction procedure is amended so that the survivors “now establish a hypothetical insurance market which they effectuate through compulsory insurance at a fixed premium for everyone based on speculations about what the average immigrant... would have purchased by way of insurance had the antecedent risk of various handicaps been equal” (1981, 301).

This process establishes equality of effective resources at the outset, but this equality will typically be disturbed by subsequent economic activity. If some survivors choose to work more than others they will produce, and thus have, more than their more leisurely compatriots. Thus at some stage the envy test will not be met. This, however, does not create a problem because the envy test is to be applied diachronically: “it requires that no one envy the bundle of occupation and resources at the disposal of anyone else over time, though someone may envy another’s bundle at any particular time” (1981, 306). Since everyone had the opportunity to work hard it would violate rather than endorse equality of resources if the wealth of the hardworking were from time to time to be distributed to the more leisurely.

## **Talents**

The essential reason why differential talents create a problem is that equality of resources at the outset will typically be disturbed, not because of morally acceptable differences in work habits, but because of morally arbitrary differences in talents. Requiring equality of resources only at the outset would be what Dworkin calls a starting-gate theory of fairness, which Dworkin sees as being “very far from equality of resources” and strongly rejects: “indeed it is hardly a coherent political theory at all”. Such a theory holds that justice requires equality of initial resources, but accepts laissez-faire thereafter. The fundamental problem with a starting-gate theory is that it relies on some purely arbitrary starting point. If the requirement of equality of resources is to apply at one arbitrary point, then presumably it is to apply at other points. If justice requires a Dworkinian auction when the survivors arrive, then it must require such an auction from time to time thereafter; and if justice accepts laissez-faire thereafter, it must accept it when they arrive. Dworkin requires neither that there be periodic auctions nor that there be laissez-faire at all times. His theory does not suppose that an equal division of resources is appropriate at one point in time but not at any other; it argues only that the resources available to someone at any moment be a function of the resources available to or consumed by him at others.

Dworkin’s aim is to specify a scheme that allows the distribution of resources at any point of time to be both ambition-sensitive, in that it reflects the cost or benefit to others of the choices people

make, but not be endowment-sensitive, in that it allows scope for differences in ability among people with the same ambitions. To achieve this, Dworkin proposes a hypothetical insurance scheme that is analogous to that for handicaps. In this scheme it is supposed that people know what talents they have, but not the income that these will produce, and choose a level of insurance accordingly. An imaginary agency knows each person's talents and preferences, and also knows what resources are available and the technology for transforming these into other resources. On the basis of this it computes the income structure, that is, the number of people earning each level of income that will emerge in a competitive market. Each person may buy insurance from the agency to cover the possibility of his income falling below whatever level he cares to name. Dworkin asks "how much of such insurance would the survivors, on average, buy, at what specified level of income coverage, and at what cost?" (1981, 317) and claims that the agency can answer this question.

This, however, is not clear. Consider four very weak requirements of such a scheme: it should distribute resources in such a way that not everyone could be better off under any alternative scheme; an increase in the resources available for allocation should not make anyone worse off; if two people have the same preferences and abilities then they should be allocated the same resources; and the scheme should not damage those whom it seeks to help. As is shown by Roemer, there is in Dworkin's framework no scheme that satisfies these requirements, so that "resource egalitarianism is an incoherent notion" (1985, 178).

## Summary

The strength of Dworkin's equality of resources theory of justice is that it seeks to introduce ambition-sensitivity without allowing endowment-sensitivity. To the extent to which it succeeds in this it thus, in Cohen's words, incorporates within egalitarianism "the most powerful idea in the arsenal of the anti-egalitarian right: the idea of choice and responsibility" (1989, 933). However, it is not entirely successful in this endeavour. There are a number of problems with Dworkin's auction scheme: for example, it is not clear that the auctioneer will ever discover prices at which there is precisely one would-be purchaser for each lot. However, these may be avoided by adopting the intended outcome of the auction, that is, as a free-market outcome in which everyone has the same wealth, as a specification of justice in its own right. But the problems with the insurance scheme are deeper, as Roemer's argument (presented above) demonstrates.

## Amartya Sen and the Idea of Justice

What is justice? What does a just society look like? And what principles should guide us there? These questions have occupied an entire tradition - the dominant tradition - of political philosophy, led above all by Thomas Hobbes, John Locke, Jean-Jacque Rousseau, Immanuel Kant, and among contemporary philosophers by John Rawls and Robert Nozick. But ask Amartya Sen and he will tell you they are precisely the wrong ones to ask. In his most recent book, *The Idea of Justice*, he argues that this traditional strain of political philosophy, which seeks to identify 'the just', or a single set of just principles that can then be used to design perfectly just institutions for governing society, reveals little about how we can identify and reduce injustices in the here and now.

According to Sen, the dominant approach, which he refers to as 'transcendental institutionalism', is beleaguered by two central problems: the problem of feasibility and the problem of redundancy. The first is a result of the practical difficulty, even impossibility, of arriving at a single set of principles that can help us to select just institutions through a process of impartial reasoning. In Rawls'

theory of justice, for instance, his two lexically ordered principles of justice are, it is argued, those that would be unanimously selected through an impartial decision procedure - through the hypothetical original position using the 'veil of ignorance' device. These principles then provide the basis for choosing actual institutions in the 'legislative stage'. Clearly, however, much depends on the assumption that Rawls' two principles of justice are those that would indeed emerge from the original position. And Sen is skeptical that this is so.

In fact, Sen maintains that there are many principles that can pass the test of impartiality. He illustrates this point, first, using an anecdote about the competing claims of three children over the distribution of a single flute. One child argues that they should receive the flute because they are the best flautist; the second, because they are the poorest of the lot; and the third, because they crafted the flute without help from the others. The three arguments are based, in turn, on principles of utility, economic equity, and the entitlement to the fruits of one's unaided efforts. Each can be defended with strong, impartial arguments. And, returning to Rawls, it is similarly possible, for example, to provide substantial reasons for selecting Harsanyi's utilitarian principle in the place of Rawls' maximin principle as the basis for resolving distributional questions within a situation similar to the original position.

But this indeterminacy has profound implications for Rawls' theory of justice, for 'if there is no unique emergence of a given set of principles of justice that together identify the institutions needed for the basic structure of society, then the entire procedure of justice as fairness, as developed in Rawls' classic theory, would be hard to use'. Sen even suggests that Rawls' basic claim about the emergence of a unique set of principles of justice from the original position (as defended in *A Theory of Justice*) was considerably qualified in his later writings, such as *The Law of Peoples*, and that accepting the full implications of these qualifications would mean abandoning the stage-by-stage theory of justice.

The second problem - the redundancy problem - is that the identification of fully just social arrangements is neither a necessary nor sufficient guide to reasoned choice of just policies, strategies or institutions. It is insufficient because, as Sen explains, 'the characterization of spotless justice, even if such a characterization were to emerge clearly, would not entail any delineation whatsoever of how diverse departures from spotlessness would be compared and ranked'. In other words, using an analogy with paintings, the fact that a person regards Da Vinci's *Mona Lisa* as the most perfect picture in the world does not reveal anything about how they would rank a Picasso against a Van Gogh. But it is also unnecessary because in adjudicating between the various merits of a Picasso and a Van Gogh there is no reason to identify the most perfect picture in the world, just as when determining the relative heights of Mount Kilimanjaro and Mount McKinley knowing that Mount Everest is taller than both is an entirely redundant fact.

In contrast to transcendental institutionalism, Sen advocates what he calls a 'realization-focused comparative approach'. In doing so, he sides with thinkers such as Adam Smith, Marquis de Condorcet, Jeremy Bentham, Mary Wollstonecraft, Karl Marx, and JS Mill, among others, who each attempted to evaluate the desirability of particular 'social realizations', rather than search for a set of perfectly just first principles. It may not be possible to agree on perfectly just institutions, but, Sen contends, using a comparative approach we can at least arrive at widespread consensus on the injustice of certain practices or outcomes relative to others.

Such a comparative approach to questions of justice, he believes, is closely aligned with social

choice theory, one of the many fields in which Sen made his mark as an economist, earning him a Nobel-prize in 1998. Social choice theory assumes that, like the plurality of impartial principles of justice that can plausibly sustain critical scrutiny, there can be a variety of competing principles that figure in our assessments of various social orderings. And while it may sometimes appear to be impossible to satisfy all or even most of these competing principles at once - as in Kenneth Arrow's impossibility theorem, for example - such impasses can often be resolved by incorporating more information about interpersonal comparisons of well-being and relative advantages. Similarly, Sen insists, 'for an adequate understanding of the demands of justice, the needs of social organizations and institutions, and the satisfactory making of public policies, we have to seek much more information and scrutinizing evidence'.

This, in particular, is something that Sen believes that Rawls' theory does not do well. Sen offers Rawls' use of the original position as an example of what he calls 'closed impartiality'. The 'veil of ignorance' device is, Sen admits, a useful, if hypothetical, way of reaching an impartial social choice, free of various vested interests. But it does not ensure the open scrutiny of the values of the people within the original position. The vast plurality of alternative views held by outsiders - their unique moral perspectives and rankings of social realizations that can reveal hidden biases in our choice of basic principles - are simply beyond the scope of Rawls' theory. Furthermore, by limiting moral claims of outsiders we may be doing an injustice to those that fall outside the artificially closed circle of the original position.

Sen contrasts this example of 'closed impartiality' with the 'open impartiality' of Adam Smith's 'impartial spectator'. Smith's reflective device, which asks us to observe our actions and institutions from the standpoint of an outsider, specifically refrains from limiting the extent to which the views of others can be considered, refusing to confine moral discussion within the boundaries of a nation-state or any other locality. And, as in social choice theory, such openness to, and critical reflection upon, alternative views and different ways of approaching social problems, Sen believes, can provide a more solid ground for ranking the 'just-ness' or, at least, manifest injustice of certain social realizations, even if they are merely partial and ordinal rather than comprehensive, cardinal rankings.

Of course, an engagement with contrary arguments does not imply that we will be able to arrive at agreed positions on every issue (and Sen does not see this as a drawback in his theory - not at all), nor does it oblige us to accept any of them. But there is a connection between what Sen calls the 'objectivity' of an ethical judgment and its ability to withstand open public scrutiny. Sen thus underscores the importance of public reasoning for justice throughout the book, and he regards democracy, especially when understood as 'government by discussion'

rather than the Schumpeterian 'government by elections', as a particularly appropriate form of public reasoning, which can serve to increase the 'objectivity' of political solutions.

Without doubt, the argument Sen presents in *The Idea of Justice* deserves to be seriously considered by contemporary political philosophers and lay-readers alike. It commands respect, for even if it fails to convince it will surely sharpen the arguments of others. Much of what passes for philosophy, including political philosophy, has been repeatedly accused of being irrelevant to the real choices and concerns of those outside of philosophy departments. And in *The Idea of Justice* Sen presents a serious challenge to those departments, forcing them to prove their relevance and demonstrate how they can actually inform tough decision-making.

However, if we are convinced by Sen's argument, this raises interesting questions about the role of the philosopher and their claim to any authority or special knowledge. According to Sen, 'philosophers' should not - and cannot - strive to become the architects of castles in the sky. Instead, he asks us all to start right at the foundations: to share, explore, and debate our perspectives on how to repair the edifices in which we currently live. Justice arises not from a blueprint, but from a process of open public reasoning in which as many potential policies, strategies or institutions are considered as possible. However, in this process it is not clear that the people who currently occupy philosophy departments have any special standing. They become, according to Sen, purveyors rather than adjudicators of wisdom, on an even standing with economists, doctors, scientists and lawyers, with whom they should collaborate intensely. Sen's Philosopherturns out to be anyone willing to cross boundaries, willing to explore alternative ways of thinking and living across disciplines, communities and time. What matters is that people know more about what's out there and make more informed choices - that they are smarter - because, for Sen, smarter is better.

### **Amartya Sen's Development as Freedom**

Amartya Sen's *Development as Freedom* has been widely praised as a way forward for a more humane society since it was published a decade ago in 1999, the year after its author won the Bank of Sweden prize in economics (otherwise known as the Nobel Prize for economics). To many, it is the standard for ethical economics, so much so that one critic laments 'until now the issue of ethics and economics, especially in the context of development, has been dominated by Amartya Sen, almost to the extent of being a one-man show with supporting acts' (Fine, 2004). Kofi Annan says of Amartya Sen that 'the world's poor and dispossessed could have no more articulate or insightful a champion'. It has almost reached the point where criticizing Amartya Sen, like Mother Theresa, is out of bounds. In this critical assessment of Sen's much lauded book, **Denis O'Hearn** considers its central thesis and impact on development.

### **The argument**

Sen's thesis is simple. Freedom is both the primary end and the principal means of development. Insofar as many of us have been critical of approaches to development that emphasize growth in Gross Domestic Product (GDP), rising personal incomes, industrialization, technological advance, or social modernization, we should be glad that such a distinguished economist is apparently tooting our horn. Yet there are deeply troubling elements in Sen's basic assumptions about the nature of people and his lack of a feasible prescription for reaching his stated goals that make *Development as Freedom* not just misguided but even rather dangerous.

Sen gives two reasons why freedom should be the primary element of development: first, the only acceptable evaluation of human progress is primarily and ultimately enhancement of freedom; second, the achievement of development is dependent on the free agency of people. Many people will agree with the first assertion, as long as the definition of freedom is wide enough to include freedom from material or spiritual want, which it does for Sen. The second assertion is more controversial within mainstream economics and popular discourse: the reason usually given by economists to cut back on public expenditures, including education, housing, healthcare and social welfare, is that poor economies cannot afford such expenditures and that development (in terms of economic growth) must happen first and only then can societies afford to look after the social welfare of their people (for a classic version of this 'stage' thesis, see Rostow, 1960). Sen breaks with this orthodoxy, providing evidence that high incomes do not necessarily lead to wellbeing (for instance, in terms of life expectancy), and arguing that welfare expenditures can be a spur to rather

than a drain on economic growth, especially since they are labor-intensive and since labor is so cheap in poor countries. Thus, he argues against the 'Lee Thesis', named for President Lee Kuan Yew of Singapore, which states that denying political and civil rights is acceptable if it promotes economic development and the general wealth of the population (Sen, 1999:15). He rightly insists that we should approach political freedoms and civil rights not through the means of eventually achieving them (GDP growth) but as a direct good in their own right. Freedom is also good because it creates growth.

Sen mentions five distinct freedoms: political freedoms, economic facilities, social opportunities, transparency guarantees, and protective security. Freedom, he says, is a principle determinant of individual initiative and social effectiveness; it is good primarily because it enhances the ability of individuals to help themselves, a property that Sen describes as the 'agency aspect' of the individual (Sen, 1999:19). Thus, his definition of poverty is individual: it is the deprivation of basic capabilities, always defined as individual capabilities. Having stated the prerequisites of freedom and capability in individual terms, Sen never attempts to derive the social origins of ethics, or their historical or cultural specificity, or the ways in which some kinds of capability may be socially organized rather than just a sum of individual capacities. Social capabilities are derived from individual ones and, although Sen recognizes a need for social institutions, it is only to buttress individual freedoms that may be suppressed by imperfections of capitalism that arise from wrong-headed approaches to development. In echoing the political economist Adam Smith, Sen sees social institutions as having a limited role as you cannot replace individual responsibility by social regulation: 'there is no substitute for individual responsibility' (Sen, 1999:283). Unemployment is bad because of its 'far-reaching debilitating effects on individual freedom, initiative, and skills'. Sen thus asserts the positive role of the market and opposes regulations that impede the freedom of people to decide where to work, what to produce, and what to consume. In his argument for economic freedom, he oddly cites Marx, saying that his support for the end of bondage and use of terms such as 'free labor' meant that Marx was an advocate of capitalist freedoms. His conception of democracy is limited to pluralist or electoral democracy, without knowledge of critiques of the exercise of power within pluralism (Lukes, 1974) or conception of alternative models of democracy such as confederalism (see Bookchin, 1989).

The center of Sen's vision is what he calls a 'capability approach', where the basic concern of human development is 'our capability to lead the kind of lives we have reason to value', rather than the usual concentration on rising GDP, technical progress, or industrialization (Sen, 1999:285). His approach 'inescapably focuses on the agency and judgment of individuals' (ibid.:288) including their capability, responsibility, and opportunity. Raising human capability is good because it improves: the choices, wellbeing, and freedom of people; their role in influencing social change; and their role in influencing economic production.

He painstakingly distinguishes human capability from human capital. Human capital is important, as it refers to the agency of people in augmenting production possibilities. Yet human capability is more important because it refers to the substantive freedom of people to lead the lives they have reason to value and to enhance the real choices they have. Education, for example, is crucial beyond its role in production; its most important role being that of increasing human capability and therefore choice. Again, Sen cites Adam Smith who links productive abilities to lifestyles to education and training, and presumes the improvability of each. While the popularity of the concept of human capital is for Sen 'certainly an enriching move', it needs supplementation by an approach that takes human capability as its central concern.

## Another side to Sen?

The apparently progressive and humane aspects of Sen's thesis are outweighed, fatally I believe, by several problems: individualism, microeconomic foundations to the exclusion of macroeconomics, localism, and lack of historical understanding. For a supposedly progressive analysis, Sen's sources of inspiration are rather strange. Most frequently quoted is Adam Smith, particularly on the subject of freedom to engage in exchange and transaction as a basic liberty but also in his defenses of the state's limited role in certain aspects of general social welfare and his concern with 'necessities' and 'conditions of living'. Also quoted as champions of freedom are: Aristotle, for his focus on 'flourishing' and 'capacity'; Montesquieu and James Stuart, for their invocation of interest as a bulwark against despotism; and Friedrich Hayek, for championing liberties and freedoms as a foundation of economic progress. In the end, Sen is ultimately revealed as a champion of capitalism with good values such as transparency, where people can be trusted to do what they say they will do, and good behavioral ethics.

It is unsurprising that Sen should invoke Hayek in such a positive light, for his economics while humane are almost entirely centred on the individual, and he usually cites freedom in the context of 'individual freedom', saying that the most important aspect of freedom is its 'opportunity aspect...the extent to which people have the opportunity to achieve outcomes that they value and have reason to value' (Sen, 1999:291). Essentially, then, Sen proposes that development is driven by capitalism laced with good values: transparency, where folks can be trusted to do what they say they will do, decent behavioral ethics, etc.. Yet he provides no theory of where such ethics originate, apart from the apparent righteousness of arguments like his own about the superiority of being good and trustworthy. In capitalism, as we have been shown time and again, reasoned argument is simply not enough.

His 'entitlement' and 'capability' approaches are individualistic in methodology, derived from microeconomics and generalized by adding problems of access to non-market-related entitlements. As Ben Fine (2004) says, Sen's conception of development boils down to 'what can I get from what I have, given the conditions for transforming one to the other?' It is 'profoundly neutral' with respect both to underlying social relations and the historical specificity of unequal entitlements. His is a quite Eurocentric understanding of equity that goes back to Hobbes' seventeenth century definition of equal insecurity and equal subordination to the market. Although Sen explains that his conception of ethics sprang from a racist murder of a Muslim that he witnessed in Bangladesh during his youth, it is surprising that his understanding of ethics and economic man is so resolutely Western. However, Fine suggests that this may be explained by his Cambridge economics training and by the degree to which economics as a discipline and way of thinking has colonized the other social sciences.

What is most surprising about Sen's analysis, given his subject is development among the less wealthy regions of the world, is the absence of a theory of global capitalism. Indeed, he ignores problems of unequal trade, including disadvantageous international divisions of labor, the exercise of global power and the behavior of International Financial Institutions. Sen's lack of historical or global consideration is most apparent in his analysis of famine, which he provides as the major reason why freedom must accompany development. Economic security, he insists, derives from freedom. 'It is not surprising', he says, 'that no famine has ever taken place in the history of the world in a functioning democracy'. Rather, famines tend to occur in one-party governments and military dictatorships and colonies ruled from elsewhere. Economic security is one of the 'advantages of democratic pluralism'. Or, again, 'a society that allows famines to occur when pre-

vention is possible is unjust in a clearly significant way'. Societies need to identify 'patent injustices'. This begs the question, what is a 'society'? For Sen society simply appears to be the nation state, or state governments within a federal system, with no conception of how 'patent injustices' may arise because of and be reproduced by world-systemic processes and interrelations.

Obviously Sen has either not read or simply decided to ignore the role of the West and global processes in causing famine. In his book, *Victorian Holocausts*, Mike Davis makes a compelling case that the third world was created by famine, which was a tool both invented and used by Western colonial powers to move people off of the land and enable the institution of private property and excessive rents. Thus, in his consistent effort to place all economic consequences in the hands of individuals (who have more or less capability), and their governments (which enable or not), Sen fails to consider that the best of pluralist parliaments face world economic processes and powers over which they have little or no control. The West has enjoyed pluralist democracy (which, by the way, is no utopia) in many cases because the rest of the world starved.

### **Conclusion: Sen today?**

It is not surprising that Amartya Sen's work has received such universal acclaim, even by mainstream economists. Clearly his vision is a humane one. Yet because he remains on the safe ground of Western individualism and avoids critical analysis of major western states and institutions, his work is hardly threatening. It provides plenty of wiggle room for states and institutions that want to show 'improvement' in freedom, equality, life expectancy, education and capacity, and so on, without really questioning or much less changing their status quo. There is a whole other part of the world that is not touched by Sen's analysis of development and it is now going through one of its deepest crises. The basic developmental focus that has been with us since at least Aristotle, the development of possessive individualism where freedom is defined by security of property and the ability to trade it on markets, is extended into Sen's conceptions of development. This individualistic world predominates today in the Washington Consensus, trade liberalization, and in agreements such as the General Agreement on Trade in Services (GATS) and Trade in Intellectual Property Rights (TRIPS). These policies aim to reinforce the impact of possessive individualism by extending the freedom of transnational corporations (TNCs) and rich investors to 'engage in exchange and transaction' throughout the world.

In the name of liberalization, communities are broken down and they lose capacity and capability. Even those few of their members who manage to gain more education and skills or accumulate some capital through micro-financing find themselves constrained by the way that the market limits where they can sell their labor, to whom, for what price, and in how it is used. Meanwhile, speculators on the futures market use their greatly expanded rights of the past two decades to 'engage in exchange and transaction' in a way that has caused sharp increases in the price of food staples like lentils, wheat and rice, and severe housing instability. Countries such as India that try to regulate such speculation are subject to sanctions as the International Financial Institutions liberalize financial services under GATS (see for example Vander Stichele, 2008). Privatization of water, gas, and other basic resources under the guise of freedom to 'engage in exchange and transaction' mean that more people than ever are vulnerable to ill-health or death through the lack of these basic necessities.

Increasingly, observers of global capitalism and privatisation conclude that we now require concepts of development that recognize and emphasize the collective rights of communities, women, and the poor to find alternative routes to 'development as freedom'. In many places today, particu-

larly in Latin America, there is a struggle not so much between Washington and the global South, but between emerging movements and progressive governments of different shades about whether and to what degree a livable world is really possible under the old rules of global liberalization.

## **Sen's Capability Approach**

The Capability Approach is defined by its choice of focus upon the moral significance of individuals' capability of achieving the kind of lives they have reason to value. This distinguishes it from more established approaches to ethical evaluation, such as utilitarianism or resourcism, which focus exclusively on subjective well-being or the availability of means to the good life, respectively. A person's capability to live a good life is defined in terms of the set of valuable 'beings and doings' like being in good health or having loving relationships with others to which they have real access.

The Capability Approach was first articulated by the Indian economist and philosopher Amartya Sen in the 1980s, and remains most closely associated with him. It has been employed extensively in the context of human development, for example, by the United Nations Development Programme, as a broader, deeper alternative to narrowly economic metrics such as growth in GDP per capita. Here 'poverty' is understood as deprivation in the capability to live a good life, and 'development' is understood as capability expansion.

Within academic philosophy the novel focus of Capability Approach has attracted a number of scholars. It is seen to be relevant for the moral evaluation of social arrangements beyond the development context, for example, for considering gender justice. It is also seen as providing foundations for normative theorising, such as a capability theory of justice that would include an explicit 'metric' (that specifies which capabilities are valuable) and 'rule' (that specifies how the capabilities are to be distributed). The philosopher Martha Nussbaum has provided the most influential version of such a capability theory of justice, deriving from the requirements of human dignity a list of central capabilities to be incorporated into national constitutions and guaranteed to all up to a certain threshold.

This article focuses on the philosophical aspects of the Capability Approach and its foundations in the work of Amartya Sen. It discusses the development and structure of Sen's account, how it relates to other ethical approaches, and its main contributions and criticisms. It also outlines various capability theories developed within the Capability Approach, with particular attention to that of Martha Nussbaum.

## **The Development of Sen's Capability Approach**

### **a. Sen's Background**

Amartya Sen had an extensive background in development economics, social choice theory (for which he received the 1998 Nobel Prize in Economics), and philosophy before developing the Capability Approach during the 1980s. This background can be pertinent to understanding and assessing Sen's Capability Approach because of the complementarity between Sen's contributions to these different fields. Sen's most influential and comprehensive account of his Capability Approach, *Development as Freedom* (Sen 1999), helpfully synthesizes in an accessible way many of these particular, and often quite technical, contributions.

Sen first introduced the concept of capability in his Tanner Lectures on Equality of What? (Sen 1979) and went on to elaborate it in subsequent publications during the 1980s and 1990s. Sen

notes that his approach has strong conceptual connections with **Aristotle's** understanding of human flourishing (this was the initial foundation for Nussbaum's alternative Capability Theory); with **Adam Smith**, and with Karl Marx. Marx discussed the importance of functionings and capability for human well-being. For example, Sen often cites Smith's analysis of relative poverty in *The Wealth of Nations* in terms of how a country's wealth and different cultural norms affected which material goods were understood to be a 'necessity'. Sen also cites Marx's foundational concern with "replacing the domination of circumstances and chance over individuals by the domination of individuals over chance and circumstances".

## **b. Sen's Concerns**

The Capability Approach attempts to address various concerns that Sen had about contemporary approaches to the evaluation of well-being, namely:

- (1) Individuals can differ greatly in their abilities to convert the same resources into valuable functionings ('beings' and 'doings'). For example, those with physical disabilities may need specific goods to achieve mobility, and pregnant women have specific nutritional requirements to achieve good health. Therefore, evaluation that focuses only on means, without considering what particular people can do with them, is insufficient.
- (2) People can internalize the harshness of their circumstances so that they do not desire what they can never expect to achieve. This is the phenomenon of 'adaptive preferences' in which people who are objectively very sick may, for example, still declare, and believe, that their health is fine. Therefore, evaluation that focuses only on subjective mental metrics is insufficient without considering whether that matches with what a neutral observer would perceive as their objective circumstances.
- (3) Whether or not people take up the options they have, the fact that they do have valuable options is significant. For example, even if the nutritional state of people who are fasting and starving is the same, the fact that fasting is a choice not to eat should be recognized. Therefore evaluation must be sensitive to both actual achievements ('functionings') and effective freedom ('capability').
- (4) Reality is complicated and evaluation should reflect that complexity rather than take a shortcut by excluding all sorts of information from consideration in advance. For example, although it may seem obvious that happiness matters for the evaluation of how well people are doing, it is not all obvious that it should be the only aspect that ever matters and so nothing else should be considered. Therefore, evaluation of how well people are doing must seek to be as open-minded as possible. (Note: This leads to the deliberate 'under-theorization' of the Capability Approach that has been the source of some criticism, and it motivated the development of Nussbaum's alternative Capability Theory.)

## **2. Sen's Critiques of Utilitarianism and Resourcism**

An important part of Sen's argument for the Capability Approach relates to his critique of alternative philosophical and economics accounts. In particular, he argues that, whatever their particular strengths, none of them provide an analysis of well-being that is suitable as a general concept; they are all focused on the wrong particular things (whether utility, liberty, commodities, or primary goods), and they are too narrowly focused (they exclude too many important aspects from evalua-

tion). Sen's criticisms of economic utilitarianism and John Rawls' primary goods are particularly important in the evolution of his account and its reception.

## **a. Utilitarianism**

Economics has a branch explicitly concerned with ethical analysis ('Welfare Economics'). Sen's systematic criticism of the form of utilitarianism behind welfare economics identifies and rejects each of its three pillars: act consequentialism, welfarism, and sum-ranking.

### **i. Act-Consequentialism**

According to act consequentialism, actions should be assessed only in terms of the goodness or badness of their consequences. This excludes any consideration of the morality of the process by which consequences are brought about, for example, whether it respects principles of fairness or individual agency. Sen argues instead for a 'comprehensive consequentialism' which integrates the moral significance of both consequences and principles. For example, it matters not only whether people have an equal capability to live a long life, but how that equality is achieved. Under the same circumstances women generally live longer than men, for largely biological reasons. If the only thing that mattered was achieving equality in the capability to live a long life this fact suggests that health care provision should be biased in favor of men. However, as Sen argues, trying to achieve equality in this way would override important moral claims of fairness which should be included in a comprehensive evaluation.

### **ii. Welfarism**

Welfarism is the view that goodness should be assessed only in terms of subjective utility. Sen argues that welfarism exhibits both 'valuational neglect' and 'physical condition neglect'. First, although welfarism is centrally concerned with how people feel about their lives, it is only concerned with psychological states, not with people's reflective valuations. Second, because it is concerned only with feelings it neglects information about physical health, though this would seem obviously relevant to assessing well-being. Not only does subjective welfare not reliably track people's actual interests or even their urgent needs, it is also vulnerable to what Sen calls 'adaptive preferences'. People can become so normalized to their conditions of material deprivation and social injustice that they may claim to be entirely satisfied. As Sen puts it, Our mental reactions to what we actually get and what we can sensibly expect to get may frequently involve compromises with a harsh reality. The destitute thrown into beggary, the vulnerable landless labourer precariously surviving at the edge of subsistence, the overworked domestic servant working round the clock, the subdued and subjugated housewife reconciled to her role and her fate, all tend to come to terms with their respective predicaments. The deprivations are suppressed and muffled in the scale of utilities (reflected by desire-fulfilment and happiness) by the necessity of endurance in uneventful survival. (Sen 1985, 21-22).

### **iii. Sum Ranking**

Sum-ranking focuses on maximizing the total amount of welfare in a society without regard for how it is distributed, although this is generally felt to be important by the individuals concerned. Sen argues, together with liberal philosophers such as Bernard Williams and John Rawls, that sum-ranking does not take seriously the distinction between persons. Sen also points out that individuals differ in their ability to convert resources such as income into welfare. For example, a disabled person may need expensive medical and transport equipment to achieve the same level of welfare. A society that tried to maximize the total amount of welfare would distribute resources so that the marginal increase in welfare from giving an extra dollar to any person would be the same. Resources would therefore be distributed away from the sick and disabled to people who are more

efficient convertors of resources into utility.

## **b. Resourcism**

Resourcism is defined by its neutrality about what constitutes the good life. It therefore assesses how well people are doing in terms of their possession of the general purpose resources necessary for the construction of any particular good life. Sen's criticism of **John Rawls'** influential account of the fair distribution of primary goods stands in for a criticism of resourcist approaches in general. Sen's central argument is that resources should not be the exclusive focus of concern for a fairness-based theory of justice, even if, like Rawls's primary goods, they are deliberately chosen for their general usefulness to a good life. The reason is that this focus excludes consideration of the variability in individuals' actual abilities to convert resources into valuable outcomes. In other words, two people with the same vision of the good life and the same bundle of resources may not be equally able to achieve that life, and so resourcists' neutrality about the use of resources is not as fair as they believe it is. More specifically, Sen disputes Rawls' argument that the principles of justice should be worked out first for the 'normal' case, in terms of a social contract conceived as a rational scheme for mutually advantageous cooperation between people equally able to contribute to society, and only later extended to 'hard' cases, such as of disability. Sen believes such cases are far from abnormal and excluding them at the beginning risks building a structure that excludes them permanently. The general problem is that such accounts 'fetishize' resources as the embodiment of advantage, rather than focusing on the relationship between resources and people. Nevertheless Sen acknowledges that although the distribution of resources should not be the direct concern in evaluating how well people are doing, it is very relevant to considerations of procedural fairness.

## **3. Core Concepts and Structure of Sen's Capability Approach**

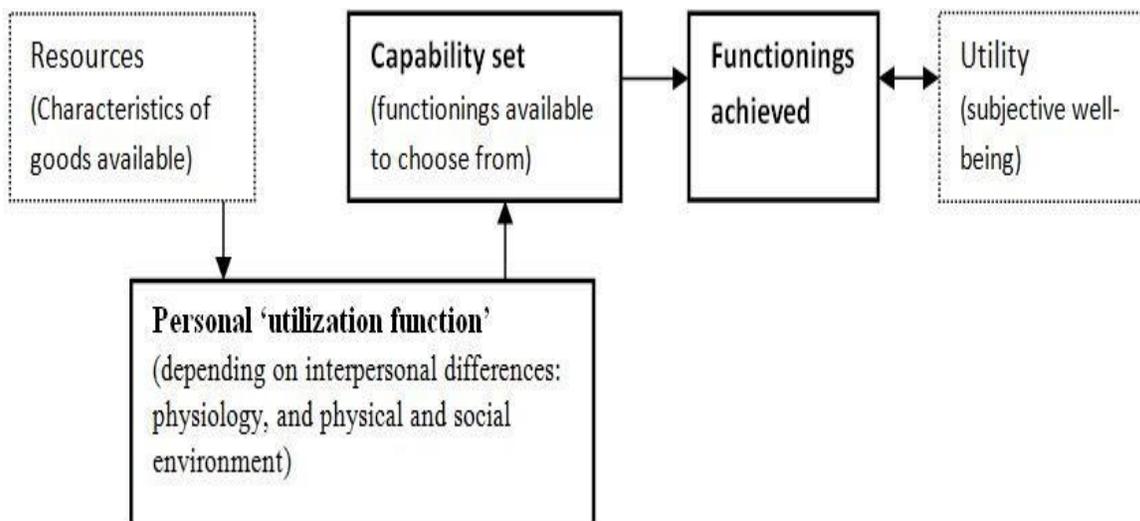

This section provides a technical overview of Sen's account.

### **a. Functionings and Capability**

When evaluating well-being, Sen argues, the most important thing is to consider what people are actually able to be and do. The commodities or wealth people have or their mental reactions (utility) are an inappropriate focus because they provide only limited or indirect information about how well a life is going. Sen illustrates his point with the example of a standard bicycle. This has the characteristics of 'transportation' but whether it will actually provide transportation will depend on the characteristics of those who try to use it. It might be considered a generally useful tool for most people to extend their mobility, but it obviously will not do that for a person without legs. Even if that person, by some quirk, finds the bicycle delightful, we should nevertheless be able to note within our evaluative system that she still lacks transportation. Nor does this mental reaction show that the same person would not appreciate transportation if it were really available to her. The Capability Approach focuses directly on the quality of life that individuals are actually able to achieve. This quality of life is analyzed in terms of the core concepts of 'functionings' and 'capability'.

- Functionings are states of 'being and doing' such as being well-nourished, having shelter. They should be distinguished from the commodities employed to achieve them (as 'bicycling' is distinguishable from 'possessing a bike').
- Capability refers to the set of valuable functionings that a person has effective access to. Thus, a person's capability represents the effective freedom of an individual to choose between different functioning combinations – between different kinds of life – that she has reason to value. (In later work, Sen refers to 'capabilities' in the plural (or even 'freedoms') instead of a single ca-

pability set, and this is also common in the wider capability literature. This allows analysis to focus on sets of functionings related to particular aspects of life, for example, the capabilities of literacy, health, or political freedom.)

**Figure 1. Outline of the core relationships in the Capability Approach**

Figure 1 outlines the core relationships of the Capability Approach and how they relate to the main alternative approaches focused on resources and utility. Resources (such as a bicycle) are considered as an input, but their value depends upon individuals’ ability to convert them into valuable functionings (such as bicycling), which depends, for example, on their personal physiology (such as health), social norms, and physical environment (such as road quality). An individual’s capability set is the set of valuable functionings that an individual has real access to. Achieved functionings are those they actually select. For example, an individual’s capability set may include access to different functionings relating to mobility, such as walking, bicycling, taking a public bus, and so on. The functioning they actually select to get to work may be the public bus. Utility is considered both an output and a functioning. Utility is an output because what people choose to do and to be naturally has an effect on their sense of subjective well-being (for example, the pleasure of bicycling to work on a sunny day). However the Capability Approach also considers subjective well-being – feeling happy – as a valuable functioning in its own right and incorporates it into the capability framework.

**b. Valuation: Which Functionings Matter for the Good Life?**

Sen argues that the correct focus for evaluating how well off people are is their capability to live a life we have reason to value, not their resource wealth or subjective well-being. But in order to begin to evaluate how people are performing in terms of capability, we first need to determine which functionings matter for the good life and how much, or at least we need to specify a valuation procedure for determining this.

One way of addressing the problem is to specify a list of the constituents of the flourishing life, and do this on philosophical grounds (Martha Nussbaum does this for her Capability Theory of Justice). Sen rejects this approach because he argues that it denies the relevance of the values

people may come to have and the role of democracy (Sen 2004b). Philosophers and social scientists may provide helpful ideas and arguments, but the legitimate source of decisions about the nature of the life we have reason to value must be the people concerned. Sen therefore proposes a social choice exercise requiring both public reasoning and democratic procedures of decision-making.

One reason that social scientists and philosophers are so keen to specify a list is that it can be used as an index: by ranking all the different constituents of the flourishing life with respect to each other it would allow easier evaluation of how well people are doing. Sen's social choice exercise is unlikely to produce collective agreement on a complete ranking of different functionings, if only because of what Rawls called the 'fact of reasonable disagreement'. But Sen argues that substantial action-guiding agreement is possible. First, different valuational perspectives may 'intersect' to reach similar judgments about some issues, though by way of different arguments. Second, such agreements may be extended by introducing 'ranges' of weights rather than cardinal numbers. For example, if there are four conflicting views about the relative weight to be attached to literacy vis-à-vis health, of  $\frac{1}{2}$ ,  $\frac{1}{3}$ ,  $\frac{1}{4}$  and  $\frac{1}{5}$ , that contains an implicit agreement that the relative weight on education should not exceed  $\frac{1}{2}$ , nor fall below  $\frac{1}{5}$ , so having one unit of literacy and two of health would be better than having two units of literacy and one of health.

Sen does suggest that in many cases a sub-set of crucially important capabilities associated with basic needs may be relatively easily identified and agreed upon as urgent moral and political priorities. These 'basic capabilities', such as education, health, nutrition, and shelter up to minimally adequate levels, do not exhaust the resources of the capability approach, only the easy agreement on what counts as being scandalously deprived. They may be particularly helpful in assessing the extent and nature of poverty in developing countries. However, taking a basic capability route has implications for how the exercise of evaluating individuals' capability can proceed, since it can only evaluate how well people's lives are going in terms of the basics.

### **c. Evaluation: What Capability do People Have to Live a Good Life?**

Evaluating capability is a second order exercise concerned with mapping the set of valuable functionings people have real access to. Since it takes the value of functionings as given, its conclusions will reflect any ambiguity in the valuation stage. Assessing capability is more informationally demanding than other accounts of advantage since it not only takes a much broader view of what well-being achievement consists in but also tries to assess the freedom people actually have to choose high quality options. This is not a purely procedural matter of adding up the number of options available, since the option to purchase a tenth brand of washing powder has a rather different significance than the option to vote in democratic elections. For example, Sen argues that the eradication of malaria from an area enhances the capability of individuals living there even though it doesn't increase the number of options those individuals have (since they don't have the 'option' to live in a malarial area anymore). Because the value of a capability set represents a person's effective freedom to live a valuable life in terms of the value of the functionings available to that individual, when the available functionings are improved, so is the person's effective freedom. The capability approach in principle allows a very wide range of dimensions of advantage to be positively evaluated ('what capabilities does this person have?').

This allows an open diagnostic approach to what is going well or badly in people's lives that can be used to reveal unexpected shortfalls or successes in different dimensions, without aggregating them all together into one number. The informational focus can be tightened depending on the

purpose of the evaluation exercise and relevant valuational and informational constraints. For example, if the approach is limited to considering 'basic capabilities' then the assessment is limited to a narrower range of dimensions and attempts to assess deprivation – the shortfall from the minimal thresholds of those capabilities – which will exclude evaluation of how well the lives of those above the threshold are going.

As well as being concerned with how well people's lives are going, the Capability Approach can be used to examine the underlying determinants of the relationship between people and commodities, including the following (Sen 1999, 70-71):

- (1) Individual physiology, such as the variations associated with illnesses, disability, age, and gender. In order to achieve the same functionings, people may have particular needs for non-standard commodities – such as prosthetics for a disability – or they may need more of the standard commodities – such as additional food in the case of intestinal parasites. Note that some of these disadvantages, such as blindness, may not be fully 'correctable' even with tailored assistance.
- (2) Local environment diversities, such as climate, epidemiology, and pollution. These can impose particular costs such as more or less expensive heating or clothing requirements.
- (3) Variations in social conditions, such as the provision of public services such as education and security, and the nature of community relationships, such as across class or ethnic divisions.
- (4) Differences in relational perspectives. Conventions and customs determine the commodity requirements of expected standards of behaviour and consumption, so that relative income poverty in a rich community may translate into absolute poverty in the space of capability. For example, local requirements of 'the ability to appear in public without shame' in terms of acceptable clothing may vary widely.
- (5) Distribution within the family – distributional rules within a family determining, for example, the allocation of food and health-care between children and adults, males and females. The diagnosis of capability failures, or significant interpersonal variations in capability, directs attention to the relevant causal pathways responsible. Note that many of these interpersonal variations will also influence individuals' abilities to access resources to begin with. For example, the physically handicapped often have more expensive requirements to achieve the same capabilities, such as mobility, while at the same time they also have greater difficulty earning income in the first place.

#### **4. Applying Sen's Capability Approach**

The concept of a capability has a global-local character in that its definition abstracts from particular circumstances, but its realization depends on specific local requirements. For example, the same capability to be well-nourished can be compared for different people although it may require different amounts and kinds of food depending on one's age, state of health, and so on. This makes the Capability Approach applicable across political, economic, and cultural borders. For example, Sen points out that being relatively income poor in a wealthy society can entail absolute poverty in some important capabilities, because they may require more resources to achieve. For example, the capability for employment may require more years of education in a richer society

Many capabilities will have underlying requirements that vary strongly with social circumstances (although others, such as adequate nourishment, may vary less). For example, the ‘ability to appear in public without shame’ seems a capability that people might generally be said to have reason to value, but its requirements vary significantly according to cultural norms from society to society and for different groups within each society (such as by gender, class, and ethnicity). Presently in Saudi Arabia, for example, women must have the company of a close male relative to appear in public, and require a chauffeur and private car to move between private spaces (since they are not permitted to use public transport or drive a car themselves). Strictly speaking the Capability Approach leaves open whether such ‘expensive’ capabilities, if considered important enough to be guaranteed by society as a matter of justice, should be met by making more resources available to those who need them (subsidized cars and chauffeurs), or by revising the relevant social norms. The Capability Approach only identifies such capability failures and diagnoses their causes. However, if there is general agreement in the first place that such capabilities should be equally guaranteed for all, there is a clear basis for criticizing clearly unjust social norms as the source of relative deprivation and thus as inconsistent with the spirit of such a guarantee.

The capability approach takes a multi-dimensional approach to evaluation. Often it may seem that people are generally well-off, yet a closer analysis reveals that this ‘all-things-considered’ judgement conceals surprising shortfalls in particular capabilities, for example, the sporting icon who can’t read. Capability analysis rejects the presumption that unusual achievement in some dimensions compensates for shortfalls in others. From a justice perspective, the capability approach’s relevance here is to argue that if people are falling short on a particular capability that has been collectively agreed to be a significant one, then justice would require addressing the shortfall itself if at all possible, rather than offering compensation in some other form, such as increased income. Capability evaluation is informationally demanding and its precision is limited by the level of agreement about which functionings are valuable. However, Sen has shown that even where only elementary evaluation of quite basic capabilities is possible (for example, life-expectancy or literacy outcomes), this can still provide much more, and more relevant, action-guiding information than the standard alternatives. In particular, by making perspicuous contrasts between successes and failures the capability approach can direct political and public attention to neglected dimensions of human well-being. For example, countries with similar levels of wealth can have dramatically different levels of aggregate achievement – and inequality – on such non-controversially important dimensions as longevity and literacy. And, vice versa, countries with very small economies can sometimes score as highly on these dimensions as the richest. This demonstrates both the limitations of relying exclusively on economic metrics for evaluating development, and the fact that national wealth does not pose a rigid constraint on such achievements (that GNP is not destiny). Such analyses are easily politicized in the form of the pointed question, Why can’t we do as well as them?

	<b>Philippines</b>	<b>South Africa</b>
Gross National Income per capita (ppp)	\$ 4,002	\$9,812
Life expectancy (years)	72.3	52
Mean years of schooling	8.7	8.2

## Criticisms of Sen's Capability Approach

This section outlines important criticisms of Sen's approach, together with his responses.

### a. Illiberalism

Liberal critics of Sen often identify the focus of the Capability Approach – 'the ability to achieve the kind of lives we have reason to value' – as problematic because it appears to impose an external valuation of the good life, whatever people may actually value. Rawls, for example, notes that the reason for liberals to focus on the fair allocation of general purpose resources rather than achievement is that this best respects each individual's fundamental right to pursue their own conception of the good life. This relates to Rawls' conception of justice as political rather than meta-physical: it is not the task of justice to assess people's achievements, but rather to ensure the fairness of the conditions of participation in a society. Justice should be neutral with regard to judging different people's conceptions of the good. But this neutrality seems incompatible with the Capability Approach's concern with assessing people's achievements, which would seem to require a much more substantive view of what counts as a good life than one needs for assessing general purpose resources. Rawls suggests that this constitutes the privileging of a particular (non-political) comprehensive conception of rational advantage or the good.

In replying to this criticism, Sen particularly points to the heterogeneity (variability) in people's abilities to convert the same bundle of resources into valuable functionings. Theories of justice that focus on the distribution of means implicitly assume that they will provide the same effective freedom to live the life one has reason to value to all, but this excludes relevant information about the relationship between particular people and resources. Even if one abstracts from existing social inequalities or the results of personal choices ('option luck'), as many liberal theories of justice do, one will still find a substantial and pervasive variation in the abilities of different members of a society to utilize the same resources – whether of specific goods like education or general purpose goods like income. That means that even if it happened that everyone had the same conception of the good, and the same bundle of resources, the fact of heterogeneity would mean that people would have differential real capability to pursue the life they had reason to value. Therefore, Sen argues, a theory of justice based on fairness should be directly and deeply concerned with the effective freedom – capability – of actual people to achieve the lives they have reason to value.

### b. Under-Theorisation

Both capability theorists and external critics express concern that the content and structure of Sen's Capability Approach is under-theorised and this makes it unsuitable as a theory of justice. Sen does not say which capabilities are important or how they are to be distributed: he argues that those are political decisions for the society itself to decide. Many philosophers have argued that without an objectively justified list of valuable capabilities the nature of the life 'we have reason to want' is unclear and so it is hard to identify the goal that a just society should be aiming towards, to assess how well a society is doing, or to criticize particular shortfalls. Different capability theorists have taken different approaches to the valuation of capabilities, from procedural accounts to ones based on substantive understandings of human nature. There are related concerns about the institutional structure of the Capability Approach, for example, brought by the Rawlsian social justice theorist, Thomas Pogge (Pogge 2002). How should capabilities be weighted against each other and non-capability concerns? For example, should some basic capabilities be prioritized as more urgent? What does the Capability Approach imply for interpersonal equality? How should capability enhancement be paid for? How much responsibility should individuals take for the results of their own choices? What should be done about non-remediable deprivations, such as

blindness? Sen's main response to such criticisms has been to admit that the Capability Approach is not a theory of justice but rather an approach to the evaluation of effective freedom.

### **c. Individualism**

Sen's emphasis on individual effective freedom as the focal concern of the Capability Approach has been criticized as excessively individualistic. There are several components to this family of criticisms. Some communitarians see Sen's account as lacking interest in, and even sometimes overtly hostile to, communal values and ways of life because of an excessive focus on individuals. Charles Gore, for example, has argued that Sen's approach only considers states of affairs and social arrangements in terms of how good or bad they are for an individual's well-being and freedom (Gore 1997). But this excludes consideration of certain other goods which individuals may have reason to value which are 'irreducibly social' because they cannot be reduced to properties of individuals, such as a shared language, set of moral norms, or political structure. A related criticism argues that Sen's emphasis on individual freedom is vague and fails to consider how one individual's freedom may affect others. Martha Nussbaum, for example, points out that a just society requires balancing and even limiting certain freedoms, such as regarding the expression of racist views, and in order to do so must make commitments about which freedoms are good or bad, important or trivial (Nussbaum 2003). Others have noted that 'freedom' though broad, is a poor way of conceptualizing certain inter-personal goods such as friendship, respect, and care. A third line of critique takes issue with Sen's 'thin' agency based picture of persons as too abstract and rationalistic. It is said to be founded too closely in Sen's personal dialectical relationship between economics and philosophy, and not enough in the perspectives and methods of anthropology, sociology, or psychology (see, for example, Giri 2000; Gasper 2002). As a result Sen's account is said to have a poor grasp, for example, of the centrality and complexity of personal growth and development.

With regard to 'irreducibly social goods' like culture, Sen argues that they not only enter into the analysis instrumentally (such as in the requirements for appearing in public without shame) but also as part of the lives people have reason to value. Nevertheless Sen is clear in his view that the value of social goods is only derivative upon the reflective choices of those concerned (see, for example, Sen 2004a). So if people on reflection don't value such social goods as the traditional religious institutions of their society or continuing to speak a minority language then that should trump the 'right' of those institutions to continue. With regard to freedom, Sen distinguishes the ability to choose between different options from the value of those options. These two together make up effective freedom or capability. Simple freedom to choose may be vulnerable to the objection that it is compatible with invidious freedoms, but the Capability Approach is concerned with people's ability to live a life they have reason to value, which incorporates an ethical evaluation of the content of their options. It is not concerned only with increasing people's freedom-as-power. Finally, Sen's Capability Approach is particularly concerned with grasping the dimensions of human well-being and advantage missing from standard approaches. This relates to its concern with tracing the causal pathways of specific deprivations, with how exactly different people are able or unable to convert resources into valuable functionings.

Although this remains somewhat abstractly presented in the formal structure of the Capability Approach, Sen's analysis of, for example, adaptive preferences and intra-household distribution do go at least some way to a situated and sociological analysis.

#### **d. Information Gaps**

Sen's Capability Approach is founded on the idea that much more information about the quality of human lives can and should be taken into account in evaluating them. The Human Development Index developed by Amartya Sen and the economist Mahbub ul Haq in 1990 for the United Nations Development Programme's Human Development Reports is the most influential capability metric currently used. However it has been criticized for its crudeness. It contains only three dimensions – longevity, literacy (mean years of schooling), and Gross National Income per capita – which are weighted equally. The Capability Approach is supposed to be interested in assessing how people fare on many dimensions of life including some which seem very difficult to obtain information about, such as people's real choice sets or such complicated capabilities as the ability to appear in public without shame or to form relationships with others. It also requires detailed information on the real inter-personal variations in translating commodities into functionings. It is not clear however that such informational ambitions could ever be realized. Furthermore even the effort of trying to collect such detailed information about people's lives and their 'real' disabilities can be seen as invasive.

Sen was concerned about the crudeness of the Human Development Index (HDI) from the start, but was won over by Mahbub ul Haq's argument for the rhetorical significance of a composite index of human well-being that could compete directly with the crude GDP per capita numbers that have been so influential in development thinking. Thus the HDI does not fully reflect the scope or methodology of the Capability Approach. Nevertheless it has succeeded in demonstrating that capability related information can be used systematically as a credible supplement to economic metrics. Sen accepts that some information about capabilities is easier to obtain than others. Firstly, he argues that we already have quite extensive information about some basic capabilities even for many quite poor countries, such as about health, that can and should be systematically assessed. There is therefore no need to limit our assessment to economic metrics which firstly count the wrong things (means) and secondly also come with significant measurement error despite their apparent numerical precision. Secondly, he argues that if researchers accept the capability space as the new priority for evaluation that will motivate the development of new data collection priorities and methods. As a result more information will become available about how people are faring on the currently 'missing dimensions' of the lives we have reason to value, for example, relating to employment or gender equality in domestic arrangements. Nevertheless, the Capability Approach is not concerned with information collection for its own sake, but rather with the appropriate use of information for assessment. It is therefore not committed to, nor does its effective use require, building a perfect information collection and assessment bureaucracy.

#### **6. Theorising the Capability Approach**

A number of philosophers sympathetic to Sen's foundational concerns have nevertheless been dissatisfied with the vagueness and under-elaboration of the theoretical structure of his Capability Approach (although these features seem to be quite deliberate on Sen's part). A number of theoretical accounts have been developed that seek to elaborate the Capability Approach more systematically and to address these philosophers' particular concerns. Some theoretical accounts are primarily concerned with operationalising the evaluative dimension of the Capability Approach: the assessment of quality of life, well-being and human development. Others focus on developing a capability based 'Theory of Justice' in the spirit of its concerns. This section provides a brief outline of some of these.

#### **a. Generating Lists for Empirical Research in the Social Sciences (Ingrid Robeyns)**

Ingrid Robeyns argues that attempting to develop a single all-purpose list of capabilities would be incompatible with Sen's concern with a general framework of evaluation. Instead she proposes a procedural approach to the selection of capabilities for particular purposes, such as the evaluation of gender inequality in terms of capabilities (Robeyns 2003). She claims that valuational procedures that meet her criteria provide epistemic, academic, and political legitimacy for empirically evaluating capability. Her five criteria are:

- (1) Explicit formulation. All proposed list elements should be explicit, so they can be discussed and debated.
- (2) Methodological justification. The method of generating the list should be made explicit so it can be scrutinized.
- (3) Sensitivity to context. The level of abstraction of the list should be appropriate to its purposes, whether for philosophical, legal, political, or social discussion.
- (4) Different levels of generality. If the list is intended for empirical application or public policy then it should be drawn up in two distinct stages, first an ideal stage and then a pragmatic one that reflects perhaps temporary feasibility constraints on information and resources.
- (5) Exhaustion and non-reduction. The list should include all important elements and those elements should not be reducible to others (though they may overlap).

### **b. A Participatory Approach to Evaluating Capability Expansion (Sabina Alkire)**

Sabina Alkire has developed a philosophically grounded framework for the participatory valuation and evaluation of development projects in terms of capability enhancement (Alkire 2005). This allows her to go beyond standard cost-benefit analyses of development projects in financial terms to investigate which capabilities that the people concerned have reason to value are enhanced and by how much.

Alkire's approach has 2 stages of evaluation: i) a theoretical one-off stage in which 'philosophers' employ practical reason to reflexively identify the basic spheres or categories of value, and ii) a local participatory phase in which members of a social group deliberate, with the aid of a facilitator, about what their needs are and what, and how, they would like to do about them (with the basic categories employed as prompts to ensure that all main dimensions of value are discussed). For the first, philosophical, stage Alkire proposes an adaptation of the practical reasoning approach of John Finnis to identify the basic dimensions of human well-being by asking iteratively, 'why do I/others do what we do?' until one comes to recognize the basic reasons for which no further reasoned justification can be given. This method is intended to yield substantive and objective descriptions of the fundamental, non-hierarchically ordered, dimensions of human flourishing, while allowing the content and relative importance of these dimensions to be specified in a participatory process according to a particular group's historical, cultural, and personal values. The intrinsically important dimensions identified by this method are: Life; Knowledge; Play; Aesthetic experience; Sociability; Practical reasonableness; Religion.

One of the advantages Alkire claims for her approach is its ability to elicit what the people whose lives are the subject of development projects really consider valuable, which may some-

times surprise external planners and observers. Her use of the participatory approach for assessing NGO fieldwork in Pakistan showed, for example, that even the very poor can and do reasonably value other things than material well-being, such as religion and social participation.

### **c. Justice as Equal Capability of Democratic Citizenship (Elizabeth Anderson)**

Elizabeth Anderson has proposed a partial theory of justice based on equal capability of democratic citizenship (Anderson 1999). Anderson takes equality in social relationships as the focus for her egalitarian theory of justice and argues that one should analyze the requirements of such equality in terms of the social conditions supporting it as a capability. Although Anderson's primary concern is for equality in the particular dimension of democratic citizenship, she suggests that this has extensive egalitarian implications for the nature of the society as a whole, because other capabilities – such as relating to health, education, personal autonomy and self-respect, and economic fairness – are required as supporting conditions to realize truly equal citizenship. She argues that, "Negatively, people are entitled to whatever capabilities are necessary to enable them to avoid or escape entanglement in oppressive social relationships. Positively, they are entitled to whatever capabilities are necessary for functioning as an equal citizen in a democratic state (Anderson 1999, 317)."

### **d. Capability as Freedom from Domination (John Alexander)**

John Alexander has proposed a capability theory based on a Republican understanding of the importance of freedom as non-domination (Alexander 2008). He argues that the Capability Approach's concern with people's 'real freedom' sets it outside and against the standard liberal egalitarian theory of justice framework which understands freedom as the absence of constraints. But he argues that the Capability Approach should go further to elaborate this commitment to real freedom in Republican terms. In this perspective it is not only important that one be able to achieve certain functionings, such as mobility, but whether one's achievement of these are conditional on the favor or goodwill of other people or are independently guaranteed by one's own rights and powers. Capability is standardly understood as mapping one's range of choices over valuable functionings regardless of their content. For example, the ability of a physically disabled but socially well-connected person to travel outside whenever she wants by arranging the help of friends, family and voluntary organizations. In addition the Republican perspective requires that her capability for mobility should be independent of context. For example, in the form of a guaranteed legal right to government assistance on demand, or by the provision of her own specially adapted self-drive vehicle. Otherwise she may be said to be still deprived since her capability is not completely free.

Domination should also be integrated into capability evaluation because it will often be a cause of capability deprivation. It is no coincidence that the people who are most capability deprived are often the poorest and weakest in society, and as a result also vulnerable to yet further exploitation. This emphasis on freedom from domination also gives a strong normative orientation to the Capability Approach's evaluation of the causes of capability failure: some causes are simply unacceptable, such as social norms restricting women's freedom of movement and employment, and should be removed rather than mitigated.

## **7. Martha Nussbaum's Capability Theory of Justice**

This section outlines Martha Nussbaum's work on the Capability Approach: its structure, criticisms, and relationship to Amartya Sen's work.

## **a. Structure and Development of Nussbaum's Capability Theory**

Martha Nussbaum has developed the most systematic, extensive, and influential capability theory of justice to date. Nussbaum aims to provide a partial theory of justice (one that doesn't exhaust the requirements of justice) based on dignity, a list of fundamental capabilities, and a threshold. Nussbaum's list of The Central Human Capabilities (Reproduced from *Creating Capabilities* 2011, 33-4)

1. **Life.** Being able to live to the end of a human life of normal length; not dying prematurely, or before one's life is so reduced as to be not worth living.
2. **Bodily Health.** Being able to have good health, including reproductive health; to be adequately nourished; to have adequate shelter.
3. **Bodily Integrity.** Being able to move freely from place to place; to be secure against violent assault, including sexual assault and domestic violence; having opportunities for sexual satisfaction and for choice in matters of reproduction.
4. **Senses, Imagination, and Thought.** Being able to use the senses, to imagine, think, and reason – and to do these things in a “truly human” way, a way informed and cultivated by an adequate education, including, but by no means limited to, literacy and basic mathematical and scientific training. Being able to use imagination and thought in connection with experiencing and producing works and events of one's own choice, religious, literary, musical, and so forth. Being able to use one's mind in ways protected by guarantees of freedom of expression with respect to both political and artistic speech, and freedom of religious exercise. Being able to have pleasurable experiences and to avoid non-beneficial pain.
5. **Emotions.** Being able to have attachments to things and people outside ourselves; to love those who love and care for us, to grieve at their absence; in general, to love, to grieve, to experience longing, gratitude, and justified anger. Not having one's emotional development blighted by fear and anxiety. (Supporting this capability means supporting forms of human association that can be shown to be crucial in their development.)
6. **Practical Reason.** Being able to form a conception of the good and to engage in critical reflection about the planning of one's life. (This entails protection for the liberty of conscience and religious observance.)
7. **Affiliation.**
  - A. Being able to live with and toward others, to recognize and show concern for other human beings, to engage in various forms of social interaction; to be able to imagine the situation of another. (Protecting this capability means protecting institutions that constitute and nourish such forms of affiliation, and also protecting the freedom of assembly and political speech.)
  - B. Having the social bases of self-respect and nonhumiliation; being able to be treated as a dignified being whose worth is equal to that of others. This entails provisions of nondiscrimination on the basis of race, sex, sexual orientation, ethnicity, caste, religion, national origin.
8. **Other Species.** Being able to live with concern for and in relation to animals, plants, and the world of nature.

9. Play. Being able to laugh, to play, to enjoy recreational activities.
10. Control Over One's Environment.
  - A. Political. Being able to participate effectively in political choices that govern one's life; having the right of political participation, protections of free speech and association.
  - B. Material. Being able to hold property (both land and movable goods), and having property rights on an equal basis with others; having the right to seek employment on an equal basis with others; having the freedom from unwarranted search and seizure. In work, being able to work as a human being, exercising practical reason, and entering into meaningful relationships of mutual recognition with other workers.

In her early contributions to the capability approach, Nussbaum justified the composition of her list by explicitly Aristotelian argument about the perfectionist requirements of the truly human life (Nussbaum 1988). In the mid-1990s however she converted the structure of her account to a Rawlsian style 'politically liberal' account. This means that she now presents her list as a proposal that is neutral with respect to particular conceptions of the good, but can be endorsed by many different groups in a society through an overlapping consensus. However the list components themselves remain almost identical and retain a distinctively Aristotelian cast.

Nussbaum's account is motivated by a concept of human dignity (in contrast to Sen's emphasis on freedom), which she links to flourishing in the Aristotelian sense. She argues that her list of 10 fundamental capabilities follow from the requirements of dignity and have been tested and adapted over the course of an extensive cross-cultural dialogue she has carried out, particularly in India (as related in her book, *Women and Human Development*, 2001). The threshold is a 'sufficiency' principle that specifies the minimum requirements of justice: everyone must be entitled to each capability at least to this degree by their governments and relevant international institutions. Access to these capabilities is required by human dignity, Nussbaum argues, but this does not mean that a life lacking in any of these, whether from external deprivation or individual choice, is a less than human life. Choice and deprivation are different however. If someone lacks access to these capabilities, for example, to be well-nourished (bodily health), that reflects a failure by society to respect her human dignity. If someone chooses not to take up her opportunities to certain capabilities, for example, to adopt an ascetic life-style and fast for religious reasons at the expense of her bodily health, respecting that choice is also an aspect of respecting her dignity.

Nussbaum suggests that her list, together with the precise location of the threshold, should be democratically debated and incorporated into national constitutional guarantees, international human rights legislation and international development policy. In keeping with its commitment to political liberalism, the components of Nussbaum's list have a 'thick-vague' character in that while they have a universal claim to be of central importance to any human life, their definition is vague enough to allow their specification in multiple ways that reflect the values, histories, and special circumstances of particular political societies. For example, freedom of speech may be defined differently in law in the USA and Germany, because of their different histories, without endangering the fundamental capability. Nevertheless, because each capability is equally centrally important and a shortfall in any area is significant in itself, the scope for governments to make trade-offs between them, for example, on the basis of quantitative cost-benefit analysis, is limited.

## **b. Criticisms of Nussbaum's Theory**

Nussbaum's capability theory of justice received quite intense criticism. Some have questioned the epistemological basis of her approach, finding it rather suspicious that after all her years of cross-cultural discussion her list remains basically the same rather 'intellectualized' Aristotelian one she had suggested in the first place (Okin 2003), and suggest that it rather reflects the values of a typical 21<sup>st</sup> century American liberal than a set of timeless universal values or a contemporary global overlapping consensus (Stewart 2001). Others have argued that her legal-moral-philosophical orientation is elitist and over-optimistic about what constitutions and governments are like and are capable of (Menon 2002); is over-specified and paternalistic yet still misses out important capabilities and is inappropriate for many uses, such as quality of life measurement or development field-work (Alkire 2005, 35-45).

In response to such criticisms, Nussbaum has defended the contents of her list as having cross-cultural credibility, but also emphasised that she is not trying to impose a definitive capability theory on everyone. She makes a clear and explicit distinction between the dimensions of justification (why her theory is best) and implementation (its more humble meta-status as an object for democratic deliberation and decision by those concerned) (Nussbaum 2004).

### **c. Sen and Nussbaum**

Nussbaum and Sen collaborated in the late 1980s and early 1990s and since they are the most high-profile writers in the Capability Approach their accounts are often elided, despite significant differences. When they are distinguished, Nussbaum's account is often seen as the more 'philosophical' because she has developed the Capability Approach in a more orthodox philosophical way, for example, by focusing on theoretical rigor, coherence and completeness. As a result, Sen's approach is sometimes perceived merely as a predecessor to Nussbaum's more developed second generation account, and therefore of primarily historical interest to understanding the Capability Approach rather than a parallel account in its own right.

The accounts of Sen and Nussbaum differ significantly in ways that relate to their different concerns and backgrounds. In particular:

- Nussbaum is concerned to produce a philosophically coherent normative (partial) theory of justice; Sen is concerned with producing a general framework for evaluating the quality of lives people can lead that can incorporate the very diverse concerns and dimensions that may be applicable.
- While Sen's approach is founded on enhancing individual freedom, Nussbaum's theory is founded on respecting human dignity.
- Sen's comprehensive consequentialism makes room for incorporating empirical information about feasibility and instrumental relationships between capabilities when considering policies; Nussbaum largely rejects such instrumental analysis because she is wary of its 'Utilitarian associations'.
- Sen's Capability Approach in its normative 'developmental' aspect, is mainly concerned with practical incremental improvements; Nussbaum's approach is rather more utopian in that it demands the full implementation of minimal justice (achievement of the minimum thresholds of all fundamental capabilities) for all, and this is specified so demandingly that no country yet meets it (though she has suggested that Finland may be close).

### **Introduction**

Marxism, or Scientific Socialism, is the name given to the body of ideas first worked out by Karl Marx (1818-1883) and Friedrich Engels (1820-1895). In their totality, these ideas provide a fully

worked-out theoretical basis for the struggle of the working class to attain a higher form of human society - socialism. The study of Marxism falls under three main headings, corresponding broadly to philosophy, social history and economics - Dialectical Materialism, Historical Materialism and Marxist Economics. These are the famous "Three component parts of Marxism" of which Lenin wrote. The Education for Socialists series was launched to promote the study of Marxism. They are intended to assist the student of Marxism by providing an introduction to the subject matter, with suitable Marxist texts that we hope will whet their appetite for further reading and study. In the first of these Education for Socialists study guides, we provide a selection of material on Dialectical Materialism. The other "component parts", as well as other fundamental questions, will be dealt with in future issues. The guides are suitable for individual study or as the basis of a Marxist discussion group. In beginning this study of Dialectical Materialism the editors are publishing an introductory article by Rob Sewell. While this is a good start to the subject, there is no substitute for proceeding from there to tackle the philosophical works of Marx, Engels, Lenin, Trotsky, Plekhanov and others. Unfortunately Marx and Engels never wrote a comprehensive work on dialectical materialism, although they intended to do so. On his death, Engels left a pile of manuscripts, which he intended to work up into an account of dialectics, or the laws of motion of nature, human society and human thought. These were later published as the Dialectics of Nature. Even in their rough, unfinished form these notes give a brilliant insight into the method of Marxism and its relation to the sciences.

The newer reader should not be put off by the sometimes difficult and abstract ideas expressed in these writings. Whatever the initial difficulty, a certain perseverance will pay just rewards. Marxism is a science with its own terminology, and therefore makes heavy demands upon the beginner. However, every serious worker and student knows that nothing is worthwhile if attained without a degree of struggle and sacrifice.

The theories of Marxism provide the thinking worker with a comprehensive understanding. It is the duty of every worker and student to conquer for himself or herself the theories of Marx and Engels, as an essential prerequisite for the conquest of society by working people. We recognise that there are real obstacles in the path of the worker's struggle for theory. A man or woman who is obliged to toil long hours in work, who has not had the benefit of a decent education and consequently lacks the habit of reading, finds great difficulty in absorbing some of the more complex ideas, especially at the outset. Yet it was for workers that Marx and Engels wrote, and not for "clever" academics. "Every beginning is difficult" no matter what science we are talking about. To the class conscious worker who is prepared to persevere, one promise can be made: once the initial effort is made to come to grips with unfamiliar and new ideas, the theories of Marxism will be found to be basically straight-forward and simple.

Once the basic concepts of Marxism are conquered, they open up a whole new outlook on politics, the class struggle, and every aspect of life. As a further introduction to dialectics, we are also re-publishing in this issue Trotsky's *ABC of Materialist Dialectics*, also by Trotsky *A Triumph of Dialectical Materialism*, an extract from Lenin's *The Three Sources and Three Components parts of Marxism*, Lenin's *Elements of Dialectics*, and an extract from Engels' *Ludwig Feuerbach and the End of Classical German Philosophy*.

For further study, we recommend the following works by Engels, especially chapters 12 and 13 in *Anti-Duhring*, the introduction to the *Dialectics of Nature*, and *Ludwig Feuerbach and the end of classical German Philosophy*. Those who wish to go into greater depth should try reading Plekhanov's *The Monist View of History*, Lenin's *Materialism and Empirio-Criticism*, as well as his *Philo-*

sophical Notebooks (Collected Works, Vol. 38). Although these books are not an easy read, they are nonetheless very rewarding if studied thoroughly.

## **What is Dialectical Materialism? Do we need a philosophy?**

Scientific socialism or Marxism is composed of three component parts: Dialectical Materialism, Historical Materialism and Marxist Economics. This pamphlet, the first in this series, is an introduction to the concepts of Dialectical Materialism - the method of Marxism. For those unacquainted with Marxist philosophy, dialectical materialism may seem an obscure and difficult concept. However, for those prepared to take the time to study this new way of looking at things, they will discover a revolutionary outlook that will allow them an insight into and understanding of the mysteries of the world in which we live. A grasp of dialectical materialism is an essential prerequisite in understanding the doctrine of Marxism. Dialectical materialism is the philosophy of Marxism, which provides us with a scientific and comprehensive world outlook. It is the philosophical bedrock - the method - on which the whole of Marxist doctrine is founded. According to Engels, dialectics was "our best working tool and our sharpest weapon." And for us also, it is a guide to action and our activities within the working class movement. It is similar to a compass or map, which allows us to get our bearings in the turmoil of events, and permits us to understand the underlying processes that shape our world.

Whether we like it or not, consciously or unconsciously, everyone has a philosophy. A philosophy is simply a way of looking at the world. Under capitalism, without our own scientific philosophy, we will inevitably adopt the dominant philosophy of the ruling class and the prejudices of the society in which we live. "Things will never change" is a common refrain, reflecting the futility of changing things and of the need to accept our lot in life. There are other such proverbs as "There is nothing new under the sun", and "History always repeats itself", which reflect the same conservative outlook. Such ideas, explained Marx, form a crushing weight on the consciousness of men and women.

Just as the emerging bourgeoisie in its revolution against feudal society challenged the conservative ideas of the old feudal aristocracy, so the working class, in its fight for a new society, needs to challenge the dominant outlook of its own oppressor, the capitalist class. Of course, the ruling class, through its monopoly control of the mass media, the press, school, university and pulpit, consciously justifies its system of exploitation as the most "natural form of society". The repressive state machine, with its "armed bodies of men", is not sufficient to maintain the capitalist system. The dominant ideas and morality of bourgeois society serve as a vital defence of the material interests of the ruling class. Without this powerful ideology, the capitalist system could not last for any length of time.

"In one way or another," states Lenin, "all official and liberal science defends wage-slavery... To expect science to be impartial in a wage-slave society is as foolishly naïve as to expect impartiality from manufacturers on the question of whether workers' wages ought not to be increased by decreasing the profits of capital."

Official bourgeois ideology conducts a relentless war against Marxism, which it correctly sees as a mortal danger to capitalism. The bourgeois scribes and professors pour out a continual stream of propaganda in an attempt to discredit Marxism - particularly the dialectic. This has especially been the case since the collapse of the Berlin Wall, and the ferocious ideological offensive against Marxism, communism, revolution, and such like. "Marxism is dead", they repeatedly proclaim like

some religious incantation. But Marxism refuses to lie down in front of these witch doctors! Marxism reflects the unconscious will of the working class to change society. Its fate is linked to that of the proletariat.

The apologists of capitalism, together with their shadows in the labour movement, constantly assert that their system is a natural and permanent form of society. On the other hand, the dialectic asserts that nothing is permanent and all things perish in time. Such a revolutionary philosophy constitutes a profound threat to the capitalist system and therefore must be discredited at all cost. This explains the daily churning out of anti-Marxist propaganda. But each real step forward in science and knowledge serves to confirm the correctness of the dialectic. For millions of people the growing crisis of capitalism increasingly demonstrates the validity of Marxism. The objective situation is forcing working people to seek a way out of the impasse. "Life teaches", remarked Lenin. Today, to use the famous words of the Communist Manifesto, "A spectre is haunting Europe, the spectre of communism."

In the fight for the emancipation of the working class, Marxism also wages a relentless war against capitalism and its ideology, which defends and justifies its system of exploitation, the "market economy". But Marxism does more than this. Marxism provides the working class with "an integral world outlook irreconcilable with any form of superstition, reaction, or defence of bourgeois oppression." (Lenin) It seeks to reveal the real relationships that exist under capitalism and arms the working class with an understanding of how it can achieve its own emancipation. Dialectical materialism, to use the words of the Russian Marxist Plekhanov, is more than an outlook, it is a "philosophy of action."

## **The Limits of Formal logic**

Men and women attempt to think in a rational manner. Logic (from the Greek logos, meaning word or reason) is the science of the laws of thinking. Whatever thoughts we think, and whatever language they are expressed in, they must satisfy the requirements of reasoning. These requirements give rise to laws of thought, to the principles of logic. It was the Greek philosopher Aristotle (384 - 322BC) more than 2,000 years ago who formulated the present system of formal logic - a system that is the basis of our educational establishments to this very day. He categorised the method of how we should reason correctly and how statements are combined to arrive at judgements, and from them, how conclusions are drawn. He laid down three basic laws of logic: the principle of Identity ( $A = A$ ), of contradiction ( $A$  cannot be  $A$  and not- $A$ ), and the excluded middle ( $A$  is either  $A$  or not- $A$ ; there is no middle alternative).

Formal logic has held sway for more than two millennia and was the basis of experiment and the great advances of modern science. The development of mathematics was based on this logic. You cannot teach a child to add up without it. One plus one equals two, not three. Formal logic may seem like common sense and is responsible for the execution of a million and one everyday things, but - and this is the big but - it has its limits. When dealing with drawn out processes or complicated events, formal logic becomes a totally inadequate way of thinking. This is particularly the case in dealing with movement, change and contradiction. Formal logic regards things as fixed and motionless. Of course, this is not to deny the everyday usefulness of formal logic, on the contrary, but we need to recognise its limits.

"The dialectic is neither fiction or mysticism," wrote Leon Trotsky, "but a science of the forms of our thinking insofar as it is not limited to the daily problems of life but attempts to arrive at an un-

derstanding of more complicated and drawn-out processes. The dialectic and formal logic bear a relationship similar to that between higher and lower mathematics." (The ABC of Materialist Dialectics) With the development of modern science, the system of classification (of Linnaeus) was based on formal logic, where all living things were divided into species and orders. This constituted a great leap forward for biology compared to the past. However, it was a fixed and rigid system, with its rigid categories, which over time revealed its limits. Darwin in particular showed that through evolution it was possible for one species to be transformed into another species. Consequently, the rigid system of classification had to be changed to allow for this new understanding of reality.

In effect, the system of formal logic broke down. It could not cope with these contradictions. On the other hand, dialectics - the logic of change - explains that there are no absolute or fixed categories in nature or society. Engels had great fun in pointing to the duck-billed platypus, this transitional form, and asking where it fitted into the rigid scheme of things! Only dialectical materialism can explain the laws of evolution and change, which sees the world not as a complex of ready-made things, but as a complex of processes, which go through an uninterrupted transformation of coming into being and passing away. For Hegel, the old logic was exactly like a child's game, which sought to make pictures out of jigsaw pieces. "The fundamental flaw in vulgar thought", wrote Trotsky, "lies in the fact that it wishes to content itself with motionless imprints of reality which consists of eternal motion." Before we look at the main laws of dialectical materialism, let us take a look at the origins of the materialist outlook.

## **Materialism versus idealism**

"The philosophy of Marxism is materialism", wrote Lenin. Philosophy itself fits into two great ideological camps: materialism and idealism. Before we proceed, even these terms need an explanation. To begin with, materialism and idealism have nothing whatsoever in common with their everyday usage, where materialism is associated with material greed and swindling (in short, the morality of present-day capitalism) and idealism with high ideals and virtue. Far from it!

Philosophical materialism is the outlook which explains that there is only one material world. There is no Heaven or Hell. The universe, which has always existed and is not the creation of any supernatural being, is in the process of constant flux. Human beings are a part of nature, and evolved from lower forms of life, whose origins sprung from a lifeless planet some 3.6 billion or so years ago. With the evolution of life, at a certain stage, came the development of animals with a nervous system, and eventually human beings with a large brain. With humans emerged human thought and consciousness. The human brain alone is capable of producing general ideas, i.e., thinking. Therefore matter, which existed eternally, existed and still exists independently of the mind and human beings. Things existed long before any awareness of them arose or could have arisen on the part of living organisms.

For materialists there is no consciousness apart from the living brain, which is part of a material body. A mind without a body is an absurdity. Matter is not a product of mind, but mind itself is the highest product of matter. Ideas are simply a reflection of the independent material world that surrounds us. Things reflected in a mirror do not depend on this reflection for their existence. "All ideas are taken from experience, are reflections - true or distorted - of reality," states Engels. Or to use the words of Marx, "Life is not determined by consciousness, but consciousness by life." Marxists do not deny that mind, consciousness, thought, will, feeling or sensation are real. What materialists deny is that the thing called "the mind" exists separately from the body. Mind is not distinct from the body. Thinking is the product of the brain, which is the organ of thought.

Yet this does not mean that our consciousness is a lifeless mirror of nature. Human beings relate to their surroundings; they are aware of their surroundings and react accordingly; in turn, the environment reacts back upon them. While rooted in material conditions, human beings generalise and think creatively. They in turn change their material surroundings. On the other hand, philosophical idealism states that the material world is not real but is simply the reflection of the world of ideas. There are different forms of idealism, but all essentially explain that ideas are primary and matter, if it exists at all, secondary. For the idealists, ideas are dis severed from matter, from nature. This is Hegel's conception of the Absolute Idea or what amounts to God. Philosophical idealism opens the road, in one way or another, to the defence of or support for religion and superstition. Not only is this outlook false, it is also profoundly conservative, leading us to the pessimistic conclusion that we can never understand the "mysterious ways" of the world. Whereas materialism understands that human beings not only observe the real world, but can change it, and in doing so, change themselves. The idealist view of the world grew out of the division of labour between physical and mental labour. This division constituted an enormous advance as it freed a section of society from physical work and allowed them the time to develop science and technology. However, the further removed from physical labour, the more abstract became their ideas. And when thinkers separate their ideas from the real world, they become increasingly consumed by abstract "pure thought" and end up with all types of fantasies. Today, cosmology is dominated by complex abstract mathematical conceptions, which have led to all sorts of weird and wonderful erroneous theories: the Big Bang, beginning of time, parallel universes, etc. Every break with practice leads to a one-sided idealism.

The materialist outlook has a long history stretching back to the ancient Greeks of Anaxagoras (c.500 - 428 BC) and Democritus (c.460 - c.370 BC). With the collapse of Ancient Greece, this rational outlook was cut across for a whole historical epoch, and only after the reawakening of thought following the demise of the Christian Middle Ages was there a revival of philosophy and natural science. From the seventeenth century, the home of modern materialism was England. "The real progenitor of English materialism is Bacon," wrote Marx. The materialism of Francis Bacon (1561 - 1626) was then systemised and developed by Thomas Hobbes (1588 - 1679), whose ideas were in turn developed by John Locke (1632 - 1704). The latter already thought it possible that matter could possess the faculty of thinking. It is no accident that these advances in human thought coincided with the rise of the bourgeoisie and great advances in science, particularly mechanics, astronomy and medicine. These great thinkers in turn provided the breakthrough for the brilliant school of French materialists of the eighteenth century, most notably René Descartes (1596 - 1650).

It was their materialism and rationalism that became the creed of the Great French Revolution of 1789. These revolutionary thinkers recognised no external authority. Everything from religion to natural science, from society to political institutions, was subjected to the most searching criticism. Reason became the measure of everything. This materialist philosophy, consistently championed by Holbach (1723 - 1789) and Helvetius, was a revolutionary philosophy. "The universe is the vast unity of everything that is, everywhere it shows us only matter in movement," states Holbach. "This is all that there is and it displays only an infinite and continuous chain of causes and actions; some of these causes we know, since they immediately strike our senses; others we do not know since they act on us only by means of consequences, quite remote from first causes." This rational philosophy was an ideological reflection of the revolutionary bourgeoisie's struggle against the church, the aristocracy and the absolute monarchy. It represented a fierce attack on

the ideology of the Old Order. In the end, the kingdom of Reason became nothing more than the idealised kingdom of the bourgeoisie. Bourgeois property became one of the essential rights of man. The revolutionary materialists paved the way for the new bourgeois society and the domination of new private property forms. "Different times, different circumstances, a different philosophy," stated Denis Diderot (1713 - 1784).

The new materialism, although a revolutionary advance, tended to be very rigid and mechanical. These new philosophers attacked the church and denied the self-sufficiency of the soul and held that man was simply a material body as all other animals and inorganic bodies. Man was regarded as a more complex and more delicate mechanism than other bodies. According to La Mettrie (1709 - 1751) in his principal work *Man the Machine*, "We are instruments endowed with feeling and memory."

For the French materialists the origin of knowledge - the discovery of objective truth - lay through the action of nature on our senses. The planets and man's place within the solar system and nature itself was fixed. For them, it was a clockwork world, where everything had its logical static place, and where the impulse for movement came from outside. The whole approach, while materialist, was mechanical, and failed to grasp the living reality of the world. It could not grasp the universe as a process, as matter undergoing continuous change. This weakness led to the false dichotomy between the material world and the world of ideas. And this dualism opened the door to idealism.

Others held to a monist view that the universe was one system which was not pure spirit or pure matter. Spinoza was the first to work out such a system. While he saw the need for a God, the universe was one system, which was wholly material from end to end.

## **Dialectics and Metaphysics**

The Marxist view of the world is not only materialist, but also dialectical. For its critics, the dialectic is portrayed as something totally mystical, and therefore irrelevant. But this is certainly not the case. The dialectical method is simply an attempt to understand more clearly our real interdependent world. Dialectics, states Engels in *Anti-Duhring*, "is nothing more than the science of the general laws of motion and development of nature, human society and thought." Put simply, it is the logic of motion.

It is obvious to most people that we do not live in a static world. In fact, everything in nature is in a state of constant change. "Motion is the mode of existence of matter," states Engels. "Never anywhere has there been matter without motion, nor can there be." The earth revolves continually around its axis, and in turn itself revolves around the sun. This results in day and night, and the different seasons that we experience throughout the year. We are born, grow up, grow old and eventually die. Everything is moving, changing, either rising and developing or declining and dying away. Any equilibrium is only relative, and only has meaning in relation to other forms of motion.

"When we consider and reflect upon nature at large or the history of mankind or our own intellectual activity, at first we see the picture of an endless entanglement of relations and reactions, permutations and combinations, in which nothing remains what, where, and as it was, but everything moves, changes, comes into being, and passes away," remarks Engels. "We see, therefore, at first the picture as a whole, with its individual parts still more or less kept in the background; we observe the movements, transitions, connections rather than the things that move, combine, and

are connected. This primitive, naïve but intrinsically correct conception of the world is that of ancient Greek philosophy, and was first clearly formulated by Heraclitus: everything is and is not, for everything is fluid, is constantly changing, constantly coming into being and passing away."

The Greeks made a whole series of revolutionary discoveries and advances in natural science. Anaximander made a map of the world, and wrote a book on cosmology, from which only a few fragments survive. The Antikythera mechanism, as it is called, appears to be the remains of a clockwork planetarium dating back to the first century BC. Given the limited knowledge of the time, many were anticipations and inspired guesses. Under slave society, these brilliant inventions could not be put to productive use and were simply regarded as playthings for amusement. The real advances in natural science took place in the mid-fifteenth century. The new methods of investigation meant the division of nature into its individual parts, allowing objects and processes to be classified. While this provided massive amount of data, objects were analysed in isolation and not in their living environment. This produced a narrow, rigid, metaphysical mode of thought that has become the hallmark of empiricism. "The Facts" became the all important feature. "Now, what I want is, Facts. Teach these boys and girls nothing but Facts. Facts alone are wanted in life," states the Dickensian character Thomas Gradgrind in *Hard Times*.

"To the metaphysician things and their mental reflexes, ideas, are isolated, are to be considered one after the other and apart from each other, are objects of investigation fixed, rigid, given once and for all", states Engels. "He thinks in absolutely irreconcilable antitheses. 'His communication is "yea, yea; nay, nay"; for whatsoever is more than these cometh of evil.' For him a thing either exists or does not exist; a thing cannot at the same time be itself and something else. Positive and negative absolutely exclude one another; cause and effect stand in rigid antithesis one to another.

"At first sight this mode of thinking seems to us very luminous, because it is that of so-called sound common sense. Only sound common sense, respectable fellow that he is, in the homely realm of his own four walls, has very wonderful adventures directly he ventures out into the wide world of research. And the metaphysical mode of thought, justifiable and necessary as it is in a number of domains whose extent varies according to the nature of the particular object of investigation, sooner or later reaches a limit beyond which it becomes one-sided, restricted, abstract, lost in insoluble contradictions. In the contemplation of individual things it forgets the connection between them; in the contemplation of their existence it forgets the beginning and the end of that existence; of their repose, it forgets their motion. It cannot see the wood for the trees."

Engels goes on to explain that for everyday purposes we know whether an animal is alive or not. But upon closer examination, we are forced to recognise that is not a simple straightforward question. On the contrary, it is a complex question. There are raging debates even today as to when life begins in the mothers' womb. Likewise, it is just as difficult to say when the exact moment of death occurs, as physiology proves that death is not a single instantaneous act, but a protracted process. In the brilliant words of the Greek philosopher Heraclitus, "It is the same thing in us that is living and dead, asleep and awake, young and old; each changes place and becomes the other. We step and we do not step into the same stream; we are and we are not."

Not everything is as appears on the surface of things. Every species, every aspect of organic life, is every moment the same and not the same. It develops by assimilating matter from without and simultaneously discards other unwanted matter; continually some cells die, while others are renewed. Over time, the body is completely transformed, renewed from top to bottom. Therefore,

every organicity is both itself and yet something other than itself.

This phenomenon cannot be explained by metaphysical thought or formal logic. This approach is incapable of explaining contradiction. This contradictory reality does not enter the realm of common sense reasoning. Dialectics, on the other hand, comprehends things in their connection, development, and motion. As far as Engels was concerned, "Nature is the proof of dialectics." Here is how Engels described the rich processes of change in his book the *Dialectics of Nature*:

"Matter moves in an eternal cycle, completing its trajectory in a period so vast that in comparison with it our earthly year is as nothing; in a cycle in which the period of highest development, namely the period of organic life with its crowning achievement - self-consciousness, is a space just as comparatively minute in the history of life and self-consciousness; in a cycle in which every particular form of the existence of matter - be it the sun or a nebula, a particular animal or animal-species, a chemical combination or decomposition - is equally in transition; in a cycle in which nothing is eternal, except eternally changing, eternally moving matter and the laws of its movement and change. But however often and pitilessly this cycle may be accomplished in time and space, however many countless suns and earths may arise and fall, however long it may be necessary to wait until in some solar system, on some planet appear conditions suitable for organic life, however many countless beings may fall and rise before, out of their midst, develop animals with a thinking brain that find an environment that permits them to live, be it even only for a short period, we are, nevertheless, assured that matter in all its changes remains eternally one and the same, that not one of its attributes may perish, and that that same iron necessity which compels the destruction of the highest early bloom of matter - the thinking spirit - also necessitates its rebirth at some other place, at some other time."

Along with, and following the French philosophy of the eighteenth century, arose a new radical German philosophy. Through Emmanuel Kant, the culmination of this philosophy was epitomised by the system of George F. Hegel, who had greatly admired the French Revolution. Hegel, although an idealist, was the most encyclopaedic mind of his age. The great contribution of this genius was the rescuing of the dialectical mode of thought originally developed by the ancient Greek philosophers some 2,000 years before.

"Changes in being consist not only in the fact that one quantity passes into another quantity, but also that quality passes into quantity, and vice versa," wrote Hegel. "Each transition of the latter kind represents an interruption, and gives the phenomenon a new aspect, qualitatively distinct from the previous one. Thus water when cooled grows hard, not gradually... but all at once; having already cooled to freezing-point, it can still remain a liquid only if preserves a tranquil condition, and then the slightest shock is sufficient for it suddenly to become hard... In the world of moral phenomena... there take place the same changes of quantitative into qualitative, and differences in qualities there also are founded upon quantitative differences. Thus, a little less, a little more constitutes that limit beyond which frivolity ceases and there appears something quite different, crime..." (*Science of Logic*).

Hegel's works are full of references and examples of dialectics. Unfortunately, Hegel was not only an idealist, but wrote in the most obscure and abstruse fashion imaginable, making his works very difficult to read. Lenin, while re-reading Hegel in exile during the First World War, wrote: "I am in general trying to read Hegel materialistically: Hegel is materialism which has been stood on its head (according to Engels) - that is to say, I cast aside for the most part God, the Absolute, the Pure Idea, etc." Lenin was greatly impressed by Hegel, and, despite his idealism, later recommend-

ed that young communists study his writings for themselves.

The young Marx and Engels were followers of the great Hegel. They learned a colossal amount from this teacher. He opened their eyes to a new outlook on the world epitomised by the dialectic. By embracing the dialectic, Hegel freed history from metaphysics. For the dialectic, there is nothing final, absolute, or sacred. It reveals the transitory character of everything. However, Hegel was limited by his knowledge, the knowledge of his age, and the fact he was an idealist. He regarded thoughts within the brain not as more or less abstract pictures of real things and processes, but as realisations of the "Absolute Idea", existing from eternity. Hegel's idealism turned reality on its head.

Nevertheless, Hegel systematically outlined the important laws of change, touched upon earlier.

### **The law of quantity into quality (and vice versa)**

"It has been said that there are no sudden leaps in nature, and it is a common notion that things have their origin through gradual increase or decrease," states Hegel. "But there is also such a thing as sudden transformation from quantity to quality. For example, water does not become gradually hard on cooling, becoming first pulpy and ultimately attaining a rigidity of ice, but turns hard at once. If temperature be lowered to a certain degree, the water is suddenly changed into ice, i.e., the quantity - the number of degrees of temperature - is transformed into quality - a change in the nature of the thing." (Logic).

This is the cornerstone of understanding change. Change or evolution does not take place gradually in a straight smooth line. Marx compared the social revolution to an old mole burrowing busily beneath the ground, invisible for long periods, but steadily undermining the old order and later emerging into the light in a sudden overturn. Even Charles Darwin believed that his theory of evolution was essentially gradual and that the gaps in the fossil record did not represent any breaks or leaps in evolution, and would be "filled in" by further discoveries. In this Darwin was wrong. Today, new theories, essentially dialectical, have been put forward to explain the leaps in evolution. Stephen J. Gould and Niles Eldredge termed their dialectical theory of evolution "punctuated equilibria". They explained that there were long periods of evolution where there were no apparent changes taking place, then suddenly, a new life form or forms emerged. In other words, quantitative differences gave rise to a qualitative change, leading to new species. The whole of development is characterised by breaks in continuity, leaps, catastrophes and revolutions.

The emergence of single-cellular life in the earth's oceans some 3.6 billion years ago was a qualitative leap in the evolution of matter. The "Cambrian explosion", some 600 million years ago, where complex multicellular life with hard parts exploded onto the scene was a further qualitative leap forward in evolution. In the lower Palaeozoic, some 400 to 500 million years ago, the first vertebrate fish emerged. This revolutionary design became dominant and advanced through the amphibians (which lived both in water and on land), through reptiles, and finally branched off into warm-blooded creatures: birds and mammals. Such revolutionary leaps culminated in human beings that have the capacity to think. Evolution is a long process whereby an accumulation of changes inside and outside the organism leads to a leap, a qualitatively higher state of development.

Just as colossal subterranean pressures that accumulate and periodically break through the earth's crust in the form of earthquakes, so gradual changes in the consciousness of workers lead to an explosion in the class struggle. A strike in a factory is not caused by outside "agitators", but

is produced by an accumulation of changes within the factory that finally pushes the workforce to strike. The "cause" of the strike maybe something quite small and incidental, a tea-break for instance, but it has become "the last straw that breaks the camel's back", to use a popular (dialectical) expression. It has become the catalyst whereby quantity changes into quality.

Today, a whole series of left wing electoral victories within the British trade unions are a product of a long accumulation of discontent within the union rank and file. Twenty years of bitter attacks on the working class has resulted in these changes at the top of the trade unions. Only those armed with a Marxist philosophy could foresee this development, which is rooted in the changing objective situation. These changes of mood, which are already taking place in the trade unions, will inevitably be reflected within the Labour Party at a certain stage that will result in the demise of the right wing under Blair. The ultra-lefts on the fringes of the Labour movement have continually written off the Labour Party as something that could never be changed. They are incapable of thinking dialectically, and have an empirical and formalistic outlook that only sees the surface of reality. They fail to draw a distinction between appearance and reality - between the immediate appearance evident to observation and the hidden processes, interconnections and laws that underlie the observed facts. In other words, they are blind to the subterranean processes taking place before their very eyes. "Blairism dominates the Labour Party!" they exclaim and throw up their hands in despair. They are under the spell of formal logic, and do not understand the process at work that will inevitably undermine Blairism, and lead to its collapse, as night follows day. As they wrote off the right wing unions in the past, they write off the Labour Party today. On the basis of events and the pressures of the leftward moving trade union movement, the Labour Party, given its roots in the trade unions, will inevitably move in a similar direction.

Marx stressed that the task of science is always to proceed from the immediate knowledge of appearances to the discovery of reality, of the essence, of the laws underlying the appearances. Marx's Capital is a fine example of this method. "The way of thinking of the vulgar economists", wrote Marx to Engels, "derives from the fact that it is always only the immediate form in which relationships appear which is reflected in the brain, and not their inner connections." (June 27, 1867) The same could be said of those who in the past wrote off the Soviet Union as "state capitalist". Stalinism had nothing in common with socialism; it was a repressive regime, where workers had less rights than in the west. However, instead of a scientific analysis of the Soviet Union, they simply pronounced it state capitalist. As Trotsky explained the theorists of state capitalism looked at the USSR through the eyes of formal logic. It was either-or, black or white. The USSR was either a wonderful socialist state, as the Stalinists said, or it must be a (state) capitalist state. Such thinking is pure formalism. They never understood the possibility of a degeneration of the workers' state into a chronically deformed variant of proletarian rule, as explained by Trotsky. It is clear that the revolution, due to its isolation in a backward country, went through a process of degeneration. However, while the nationalised planned economy remained, not everything was lost. The bureaucracy was not a new ruling class, but a parasitic growth on the state, which usurped political power. Only a new political revolution could eliminate the bureaucracy and reintroduce soviets and workers' democracy.

The supporters of state capitalism tied themselves in knots, confusing counterrevolution with revolution and vice versa. In Afghanistan, they supported the reactionary fundamentalist mujahideen as "freedom fighters" against Russian "imperialism". With the collapse of the USSR and the move to restore capitalism from 1991 onwards, they remained neutral in face of real capitalist counterrevolution.

## The unity of Opposites

"The contradiction, however, is the source of all movement and life; only in so far as it contains a contradiction can anything have movement, power, and effect." (Hegel). "In brief", states Lenin, "dialectics can be defined as the doctrine of the unity of opposites. This embodies the essence of dialectics..." The world in which we live is a unity of contradictions or a unity of opposites: cold-heat, light-darkness, Capital-Labour, birth-death, riches-poverty, positive-negative, boom-slump, thinking-being, finite-infinite, repulsion-attraction, left-right, above-below, evolution-revolution, chance-necessity, sale-purchase, and so on. The fact that two poles of a contradictory antithesis can manage to coexist as a whole is regarded in popular wisdom as a paradox. The paradox is a recognition that two contradictory, or opposite, considerations may both be true. This is a reflection in thought of a unity of opposites in the material world. Motion, space and time are nothing else but the mode of existence of matter. Motion, as we have explained is a contradiction, - being in one place and another at the same time. It is a unity of opposites. "Movement means to be in this place and not to be in it; this is the continuity of space and time - and it is this which first makes motion possible." (Hegel) To understand something, its essence, it is necessary to seek out these internal contradictions. Under certain circumstances, the universal is the individual, and the individual is the universal. That things turn into their opposites, - cause can become effect and effect can become cause - is because they are merely links in the never-ending chain in the development of matter.

"The negative is to an equal extent positive," states Hegel. Dialectical thought is "comprehending the antithesis in its unity." In fact Hegel goes further: "Contradiction is the root of all movement and vitality, and it is only insofar as it contains a Contradiction that anything moves and has impulse and activity...Something moves, not because it is here at one point of time and there at another, but because at one and the same point of time it is here and not here, and in this here both is and is not. We must grant the old dialecticians the contradictions which they prove in motion; but what follows is not that there is no motion, but rather that motion is existent Contradiction itself." Therefore for Hegel, something is living insofar as it contains contradiction, which provides it with self-movement.

The Greek atomists first advanced the revolutionary theory that the material world was made up of atoms, considered the smallest unit of matter. The Greek word atomos means indivisible. This was a brilliant intuitive guess. Twentieth century science proved that everything was composed of atoms, although it was subsequently discovered that even smaller particles existed. Every atom contains a nucleus at its centre, composed of sub-atomic particles called protons and neutrons. Orbiting around the nucleus are particles known as electrons. All protons carry a positive electrical charge, and would therefore repel each other, but they are bound together by a type of energy known as the strong nuclear force. This shows that everything that exists is based on a unity of opposites and has self-movement of "impulse and activity", to use Hegel's words.

In humans, the level of blood sugar is essential for life. Too high a level is likely to result in diabetic coma, too little and the person is incapable of eating. This safe level is regulated by the rate at which sugar is released into the bloodstream by the digestion of carbohydrates, the rate at which stored glycogen, fat or protein is converted into sugar, and the rate at which sugar is removed and utilised. If the blood sugar level rises, then the rate of utilisation is increased by the release of more insulin from the pancreas. If it falls, more sugar is released into the blood, or the person gets hungry and consumes a source of sugar. In this self-regulation of opposing forces, of positive and

negative feedbacks, the blood level is kept within tolerable limits.

Lenin explains this self-movement in a note when he says, "Dialectics is the teaching which shows how opposites can be and how they become identical - under what conditions they are identical, becoming transformed into one another - why the human mind should grasp these opposites not as dead, rigid, but living, conditional, mobile, becoming transformed into one another." Lenin also laid great stress on the importance of contradiction as the motive force of development. "It is common knowledge that, in any given society, the strivings of some of its members conflict with the strivings of others, that social life is full of contradictions, and that history reveals a struggle between nations and societies, as well as within nations and societies, and, besides, an alternation of periods of revolution and reaction, peace and war, stagnation and rapid progress or decline." (Lenin, Three Sources and Component Parts of Marxism). This is best illustrated by the class struggle. Capitalism requires a capitalist class and a working class. The struggle over the surplus value created by the workers and expropriated by the capitalists leads to an irreconcilable struggle that will provide the basis for the eventual overthrow of capitalism, and the resolution of the contradiction through the abolition of classes.

### **The Negation of the Negation**

The general pattern of historical development is not one of a straight line upward, but of a complex interaction in which each step forward is only achieved at the cost of a partial step backwards. These regressions, in turn, are remedied at the next stage of development.

The law of the negation of the negation explains the repetition at a higher level of certain features and properties of the lower level and the apparent return of past features. There is a constant struggle between form and content and between content and form, resulting in the eventual shattering of the old form and the transformation of the content.

This whole process can be best pictured as a spiral, where the movement comes back to the position it started, but at a higher level. In other words, historical progress is achieved through a series of contradictions. Where the previous stage is negated, this does not represent its total elimination. It does not wipe out completely the stage that it supplants.

"The capitalist method of appropriation, which springs from the capitalist method of production, and therefore capitalist private property, is the first negation of individual private property based on one's own labour. But capitalist production begets with the inevitableness of a natural process its own negation. It is the negation of the negation," remarked Marx in volume one of Capital.

Engels explains a whole series of examples to illustrate the negation of the negation in his book Anti-Duhring. "Let us take a grain of barley. Millions of such grains of barley are milled, boiled and brewed and then consumed. But if such a grain of barley meets with conditions which for it are normal, if it falls on suitable soil, then under the influence of heat and moisture a specific change takes place, it germinates; the grain as such ceases to exist, it is negated, and in its place appears the plant which has arisen from it, the negation of the grain. But what is the normal life-process of this plant? It grows, flowers, is fertilised and finally once more produces grains of barley, and, as soon as these have ripened, the stalk dies, is in its turn negated. As a result of this negation of the negation we have once again the original grain of barley, but not as a single unit, but ten, twenty or thirty fold."

The barley lives and evolves by means of returning to its starting point - but at a higher level. One

seed has produced many. Also over time, plants have evolved qualitatively as well as quantitatively. Successive generations have shown variations, and become more adapted to their environment. Engels gives a further example from the insect world. "Butterflies, for example, spring from the egg through a negation of the egg, they pass through certain transformations until they reach sexual maturity, they pair and are in turn negated, dying as soon as the pairing process has been completed and the female has laid its numerous eggs."

## **Hegel and Marx**

Hegel, who had a giant intellect, illuminated a great many things. It was a debt that Marx repeatedly recognised. "The mystification which dialectic suffers in Hegel's hands, by no means prevents him from being the first to present its general form of working in a comprehensive and conscious manner," states Marx. Nevertheless, Hegel's philosophical system was a huge miscarriage. It suffered from an incurable internal contradiction. Hegel's conception of history is an evolutionary one, where there is nothing final or eternal. However, his system laid claim to being the absolute truth, in complete contradiction to the laws of dialectical thought. While Hegel defended the status quo in Germany, the dialectic embraced a revolutionary view of constant change. For Hegel, all that was real was rational. But using the Hegelian dialectic, all that is real will become irrational. All that exists deserves to perish. In this lay the revolutionary significance of the Hegelian philosophy. The solution of this contradiction led back to materialism, but not the old mechanical materialism, but one based upon the new sciences and advances. "Materialism rose again enriched by all the acquisitions of idealism. The most important of these acquisitions was the dialectical method, the examination of phenomena in their development, in their origin and destruction. The genius who represented this new direction of thought was Karl Marx," writes Plekhanov. Spurred on by revolutionary developments in Europe in 1830-31, the Hegelian School split into left, right and centre. The most prominent representative of the Hegelian Left was Ludwig Feuerbach who challenged the old orthodoxy, especially religion, and placed materialism at the centre of things again. "Nature has no beginning and no end. Everything in it is in mutual interaction, everything at once effect and cause, everything in it is all-sided and reciprocal..." writes Feuerbach, adding that there is no place there for God. "Christians tear out the spirit, the soul, of man out of his body and make this torn-out, disembodied spirit into their God." Despite Feuerbach's limitations, Marx and Engels welcomed the new breakthrough with enthusiasm.

"But in the meantime", noted Engels, "the Revolution of 1848 thrust the whole of philosophy aside as unceremoniously as Feuerbach himself was also pushed into the background." It was left to Marx and Engels to consistently apply the dialectic to the new materialism, producing dialectical materialism. For them, the new philosophy was not an abstract philosophy, but directly linked to practice. "Dialectics reduces itself to the science of the general laws of motion, both of the external world and of human thought - two sets of laws which are identical in substance, but differ in their expression in so far as the human mind can apply them consciously, while in nature and also up to now for the most part in human history, these laws assert themselves unconsciously, in the form of external necessity, in the midst of an endless series of seeming accidents." (Engels) Neither Marx nor Engels left behind them a comprehensive book on dialectics as such. Marx was pre-occupied with Capital. Engels intended to write such a book, but was overtaken by the need to complete Capital after Marx's death. He nevertheless wrote quite extensively on the subject, especially in *Anti-Dühring* and *the Dialectics of Nature*. Lenin commented, "If Marx did not leave behind him a 'Logic' (with a capital letter), he did leave the logic of Capital, and this ought to be utilised to the full. In Capital, Marx applied to a single science logic, dialectics and the theory of knowledge of materialism (three words are not needed: it is one and the same thing) which has

taken everything valuable in Hegel and developed it further."

Today, a small number of scientists, mainly from the natural sciences, have become conscious of the dialectic, which has opened their eyes to problems in their specialised fields. This relationship between science and dialectical materialism has been fully discussed in the book by Alan Woods and Ted Grant *Reason in Revolt*. They showed, along with Engels, that nature is completely dialectical. Apart from Stephen J. Gould and Niles Eldredge, Richard Levins and Richard Lewontin, who regard themselves as dialectical materialists, have also

written about the application of the dialectic to the field of biology in their book *The Dialectical Biologist*: "What characterises the dialectical world, in all its aspects, as we have described it is that it is constantly in motion. Constants become variables, causes become effects, and systems develop, destroying the conditions that gave rise to them. Even elements that appear to be stable are in a dynamic equilibrium of forces that can suddenly become unbalanced, as when a dull grey lump of metal of a critical size becomes a fireball brighter than a thousand suns. Yet the motion is not unconstrained and uniform. Organisms develop and differentiate, then die and disintegrate. Species arise but inevitably become extinct. Even in the simple physical world we know of no uniform motion. Even the earth rotating on its axis has slowed down in geological time. The development of systems through time, then, seems to be the consequence of opposing forces and opposing motions.

"This appearance of opposing forces has given rise to the most debated and difficult, yet the most central, concept in dialectical thought, the principle of contradiction. For some, contradiction is an epistemic principle only. It describes how we come to understand the world by a history of antithetical theories that, in contradiction to each other and in contradiction to observed phenomena, lead to a new view of nature. Kuhn's (1962) theory of scientific revolution has some of this flavour of continual contradiction and resolution, giving way to new contradiction. For others, contradiction becomes an ontological property at least of human social existence. For us, contradiction is not only epistemic and political, but also ontological in the broadest sense. Contradictions between forces are everywhere in nature, not only in human social institutions. This tradition of dialectics goes back to Engels (1880) who wrote, in *Dialectics of Nature*, that 'to me there could be no question of building the laws of dialectics of nature, but of discovering them in it and evolving them from it.'" (*The Dialectical Biologist*, p.279) Marxists have always stressed the unity of theory and practice. "Philosophers have only interpreted the world, in various ways; the point, however, is to change it", as Marx pointed to in his thesis on Feuerbach. "If the truth is abstract it must be untrue," states Hegel. All truth is concrete. We have to look at things as they exist, with a view to understanding their underlying contradictory development. This has very important conclusions, especially for those fighting to change society. Unlike the Utopian socialists who viewed socialism as a wonderful idea, Marxists see the development of socialism as arising out of the contradictions of capitalism. Capitalist society has prepared the material basis for a classless society with its highly developed productive forces and its world division of labour. It has brought into being the working class, whose very life existence brings it into conflict with capitalism. On the basis of experience, it will become fully conscious of its position in society and it will be transformed, in the words of Marx, from a "class in-itself" to a "class for-itself".

Dialectics bases itself on determinism, but this has nothing in common with fatalism which denies the existence of accident in nature, society and thought. Dialectical determinism asserts the unity

of necessity and accident, and explains that necessity expresses itself through accident. All events have causes, necessary events and accidental ones alike. If there were no causal laws in nature everything would be in a state of utter chaos. It would be an impossible position where nothing could exist. So everything is dependent upon everything else, as in a continuous chain of cause and effect. Particular events always have a chance or accidental character, but these arise only as the result of a deeper necessity. In fact, necessity manifests itself through a series of accidents. Without doubt, accidents have their place, but the essential thing is to discover what laws determine this deeper necessity.

From the point of view of superficial observation, everything may appear to be accidental or open to chance. This can appear especially so when we have no knowledge of the laws that govern change and their interconnections. "Where on the surface accident holds sway, there actually it is always governed by inner, hidden laws and it is only a matter of discovering these laws," remarked Engels in Ludwig Feuerbach. In nature, the evolution of matter follows a certain path, although how, when, and in what form this is realised, depends upon accidental circumstances. For example, whether life was created or not on earth depended on a whole series of accidental factors, such as the presence of water, different chemical elements, the earth's distance from the sun, an atmosphere, etc. "It is the nature of matter to advance to the evolution of thinking beings", states Engels, "hence, too, this always necessarily occurs whenever the conditions for it (not necessarily identical at all places and times) are present...what is maintained to be necessary is composed of sheer accidents, and the so-called accidental is the form behind which necessity hides itself."

Superficial historians have written that the First World War was "caused" by the assassination of a Crown Prince at Sarajevo. To a Marxist this event was an historical accident, in the sense that this chance event served as the pretext, or catalyst, for the world conflict which had already been made inevitable by the economic, political and military contradictions of imperialism. If the assassin had missed, or if the Crown Prince had never been born, the war would still have taken place, on some other diplomatic pretext or other. Necessity would have expressed itself through a different "accident".

In the words of Hegel, everything which exists, exists of necessity. But, equally, everything which exists is doomed to perish, to be transformed into something else. Thus what is "necessary" in one time and place becomes "unnecessary" in another. Everything begets its opposite, which is destined to overcome and negate it. This is true of individual living things as much as societies and nature generally.

Every type of human society exists because it is necessary at the given time when it arises: "No social order ever disappears before all the productive forces for which there is room in it, have been developed: and new higher relations of production never appear before the material conditions of their existence have matured in the womb of the old society. Therefore mankind always takes up only such problems as it can solve, since, looking at the matter more closely, we will always find that the problem itself arises only when the material conditions necessary for its solution already exist or at least are in the process of formation." (Marx, Critique of Political Economy.)

Slavery, in its day, represented an enormous leap forward over barbarism. It was a necessary stage in the development of productive forces, culture and human society. As Hegel brilliantly explained it: "It is not so much from slavery as through slavery that man becomes free." Similarly capi-

talism was originally a necessary and progressive stage in human society. However, like primitive communism, slavery, and feudalism, capitalism has long since ceased to represent a necessary and progressive social system. It has foundered upon the deep contradictions inherent in it, and is doomed to be overcome by the rising forces of the new society within the old, represented by the modern proletariat. Private ownership of the means of production and the nation state, the basic features of capitalist society, which originally marked a great step forward, now serve only to fetter and undermine the productive forces and threaten all the gains made in centuries of human development.

Capitalism is now a thoroughly degenerate social system, which must be overthrown and replaced by its opposite, socialism, if human culture is to survive. Marxism is determinist, but not fatalist. Men and women make history. The transformation of society can only be achieved by men and women consciously striving for their own emancipation. This struggle of the classes is not predetermined. Who succeeds depends on many factors, and a rising, progressive class has many advantages over the old, decrepit force of reaction. But ultimately, the result must depend upon which side has the stronger will, the greater organisation and the most skilful and resolute leadership. The victory of socialism will mark a new and qualitatively different stage of human history. To be more accurate it will mark the end of the prehistory of the human race, and start a real history. However on the other hand, socialism marks a return to the earliest form of human society - tribal communism - but on a much higher level, which stands upon all the enormous gains of thousands of years of class society. The negation of primitive communism by class society is in turn negated by socialism. The economy of superabundance will be made possible by the application of conscious planning to the industry, science and technique established by capitalism, on a world scale. This in turn will once and for all make redundant the division of labour, the difference between mental and manual labour, between town and countryside, and the wasteful and barbaric class struggle and enable the human race at last to set its resources to the conquest of nature: to use Engels' famous phrase, "the leap of man from the realm of necessity to the realm of freedom".

### **The ABC of Materialist Dialectics**

The dialectic is neither fiction nor mysticism, but a science of the forms of our thinking insofar as it is not limited to the daily problems of life but attempts to arrive at an understanding of more complicated and drawn-out processes. The dialectic and formal logic bear a relationship similar to that between higher and lower mathematics. I will here attempt to sketch the substance of the problem in a very concise form. The Aristotelian logic of the simple syllogism starts from the proposition that A is equal to A. This postulate is accepted as an axiom for a multitude of practical human actions and elementary generalisations. But in reality A is not equal to A. This is easy to prove if we observe these two letters under a lens - they are quite different from each other.

But, one can object, the question is not of the size or the form of the letters, since they are only symbols for equal quantities: for instance, a pound of sugar. The objection is beside the point; in reality a pound of sugar is never equal to a pound of sugar - a more delicate scale always discloses a difference. Again one can object: but a pound of sugar is equal to itself. Neither is this true - all bodies change uninterruptedly in size, weight, colour, etc. They are never equal to themselves. A sophist will respond that a pound of sugar is equal to itself "at a given moment." Aside from the extremely dubious practical value of this 'axiom,' it does not withstand theoretical criticism either. How should we conceive the word 'moment'? If it is an infinitesimal interval of time, then a pound of sugar is subjected during the course of that 'moment' to inevitable changes.

Or is the 'moment' a purely mathematical abstraction, that is, a zero of time? But everything exists in time; and existence itself is an uninterrupted process of transformation; time is consequently a fundamental element of existence. Thus the axiom  $A$  is equal to  $A$  signifies that a thing is equal to itself if it does not change, that is, if it does not exist. At first glance it could seem that these "subtleties" are useless. In reality they are of decisive significance. The axiom  $A$  is equal to  $A$  appears on one hand to be the point of departure for all our knowledge, on the other hand the point of departure for all the errors in our knowledge.

To make use of the axiom  $A$  is equal to  $A$  with impunity is possible only within certain limits. When quantitative changes in  $A$  are negligible for the task at hand, then we can presume  $A$  is equal to  $A$ . This is, for example, the manner in which a buyer and a seller consider a pound of sugar. We consider the temperature of the sun likewise. Until recently we considered the buying power of the dollar in the same way. But quantitative changes beyond certain limits become converted into qualitative. A pound of sugar subjected to the action of water or kerosene ceases to be a pound of sugar. A dollar in the embrace of a president ceases to be a dollar. To determine at the right moment the critical point where quantity changes into quality is one of the most important and difficult tasks in all the spheres of knowledge, including sociology.

Every worker knows that it is impossible to make two completely equal objects. In the elaboration of bearing-brass into cone bearings, a certain deviation is allowed for the cones which should not, however, go beyond certain limits (this is called tolerance). By observing the norms of tolerance, the cones are considered as being equal ( $A$  is equal to  $A$ ). When the tolerance is exceeded, the quantity goes over into quality; in other words, the cone bearings become inferior or completely worthless.

Our scientific thinking is only a part of our general practice, including techniques. For concepts there also exists "tolerance" which is established not by formal logic issuing from the axiom  $A$  is equal to  $A$  but by dialectical logic issuing from the axiom that everything is always changing. "Common sense" is characterized by the fact that it systematically exceeds dialectical "tolerance." Vulgar thought operates with such concepts as capitalism, morals, freedom, workers' state, etc., as fixed abstractions, presuming that capitalism is equal to capitalism, morals are equal to morals, etc. Dialectical thinking analyses all things and phenomena in their continuous change, while determining in the material conditions of those changes that critical limit beyond which  $A$  ceases to be  $A$ , a workers' state ceases to be a workers' state.

The fundamental flaw of vulgar thought lies in the fact that it wishes to content itself with motionless imprints of reality, which consists of eternal motion. Dialectical thinking gives to concepts, by means of closer approximations, corrections, concretisations, a richness of content and flexibility, I would even say a succulence, which to a certain extent brings them close to living phenomena. Not capitalism in general but a given capitalism at a given stage of development. Not a workers' state in general, but a given workers' state in a backward country in an Imperialist encirclement etc. Dialectical thinking is related to vulgar thinking in the same way that a motion picture is related to a still photograph. The motion picture does not outlaw the still photograph but combines a series of them according to the laws of motion. Dialectics does not deny the syllogism, but teaches us to combine syllogisms in such a way as to bring our understanding closer to the eternally changing reality.

Hegel in his Logic established a series of laws: change of quantity into quality, development

through contradictions, conflict of content and form, interruption of continuity, change of possibility into inevitability, etc., which are just as important for theoretical thought as is the simple syllogism for more elementary tasks. Hegel wrote before Darwin and before Marx. Thanks to the powerful impulse given to thought by the French Revolution, Hegel anticipated the general movement of science. But because it was only an anticipation, although by a genius, it received from Hegel an idealistic character. Hegel operated with ideological shadows as the ultimate reality. Marx demonstrated that the movement of these ideological shadows reflected nothing but the movement of material bodies.

We call our dialectic materialist since its roots are neither in heaven nor in the depths of our "free will" but in objective reality, in nature. Consciousness grew out of the unconscious, psychology out of physiology, the organic world out of the inorganic, the solar system out of nebula. On all the rungs of this ladder of development the quantitative changes were transformed into qualitative. Our thought including dialectical thought is only one of the forms of the expression of changing matter. There is place within this system for neither God, nor Devil, nor immortal soul nor eternal norms of laws and morals. The dialectic of thinking, having grown out of the dialectic of nature, possesses consequently a thoroughly materialist character.

Darwinism, which explained the evolution of species through quantitative transformations passing into qualitative, was the highest triumph of the dialectic in the whole field of organic matter. Another great triumph was the discovery of the table of atomic weights of chemical elements and further the transformation of one element into another. With these transformations (species, elements, etc.) is closely linked the question of classifications, just as important in the natural as in the social sciences. Linnaeus's system (eighteenth century), utilizing as its starting point the immutability of species, was limited to the description and classification of plants according to their external characteristics.

The infantile period of botany is analogous to the infantile period of logic, since the forms of our thought develop like everything that lives. Only decisive repudiation of the idea of fixed species, only the study of the history of the evolution of plants and their anatomy prepared the basis for a really scientific classification. Marx, who in distinction from Darwin was a conscious dialectician, discovered a basis for the scientific classification of human societies in the development of their productive forces and the structure of the relations of ownership, which constitute the anatomy of society. Marxism substituted for the vulgar descriptive classification of societies and states, which even up to now still flourishes in the universities, a materialistic dialectical classification. Only through using the method of Marx is it possible correctly to determine both the concept of a workers' state and the moment of its downfall.

All this, as we see, contains nothing "metaphysical" or "scholastic," as conceited ignorance affirms. Dialectical logic expresses the laws of motion in contemporary scientific thought. The struggle against materialist dialectics on the contrary expresses a distant past conservatism of the petty bourgeoisie, the self-conceit of university routinists and . . . a spark of hope for an afterlife.

### **From 'Ludwig Feuerbach and the End of Classical German Philosophy'**

Out of the dissolution of the Hegelian school, however, there developed still another tendency, the only one which has borne real fruit. And this tendency is essentially connected with the name of Marx.

The separation from Hegelian philosophy was here also the result of a return to the materialist standpoint. That means it was resolved to comprehend the real world - nature and history - just as it presents itself to everyone who approaches it free from preconceived idealist crotchets. It was decided mercilessly to sacrifice every idealist which could not be brought into harmony with the facts conceived in their own and not in a fantastic interconnection. And materialism means nothing more than this. But here the materialistic world outlook was taken really seriously for the first time and was carried through consistently - at least in its basic features - in all domains of knowledge concerned.

Hegel was not simply put aside. On the contrary, a start was made from his revolutionary side, described above, from the dialectical method. But in its Hegelian form, this method was unusable. According to Hegel, dialectics is the self-development of the concept. The absolute concept does not only exist - unknown where - from eternity, it is also the actual living soul of the whole existing world. It develops into itself through all the preliminary stages which are treated at length in the Logic and which are all included in it. Then it "alienates" itself by changing into nature, where, unconscious of itself, disguised as a natural necessity, it goes through a new development and finally returns as man's consciousness of himself. This self-consciousness then elaborates itself again in history in the crude form until finally the absolute concept again comes to itself completely in the Hegelian philosophy. According to Hegel, therefore, the dialectical development apparent in nature and history - that is, the causal interconnection of the progressive movement from the lower to the higher, which asserts itself through all zigzag movements and temporary retrogression - is only a copy [Abklatsch] of the self-movement of the concept going on from eternity, no one knows where, but at all events independently of any thinking human brain. This ideological perversion had to be done away with. We again took a materialistic view of the thoughts in our heads, regarding them as images [Abbilder] of real things instead of regarding real things as images of this or that stage of the absolute concept. Thus dialectics reduced itself to the science of the general laws of motion, both of the external world and of human thought - two sets of laws which are identical in substance, but differ in their expression in so far as the human mind can apply them consciously, while in nature and also up to now for the most part in human history, these laws assert themselves unconsciously, in the form of external necessity, in the midst of an endless series of seeming accidents. Thereby the dialectic of concepts itself became merely the conscious reflex of the dialectical motion of the real world and thus the dialectic of Hegel was turned over; or rather, turned off its head, on which it was standing, and placed upon its feet. And this materialist dialectic, which for years has been our best working tool and our sharpest weapon, was, remarkably enough, discovered not only by us but also, independently of us and even of Hegel, by a German worker, Joseph Dietzgen. (2)

In this way, however, the revolutionary side of Hegelian philosophy was again taken up and at the same time freed from the idealist trimmings which with Hegel had prevented its consistent execution. The great basic thought that the world is not to be comprehended as a complex of readymade things, but as a complex of processes, in which the things apparently stable no less than their mind images in our heads, the concepts, go through an uninterrupted change of coming into being and passing away, in which, in spite of all seeming accidentally and of all temporary retrogression, a progressive development asserts itself in the end - this great fundamental thought has, especially since the time of Hegel, so thoroughly permeated ordinary consciousness that in this generality it is now scarcely ever contradicted. But to acknowledge this fundamental thought in words and to apply it in reality in detail to each domain of investigation are two different things. If, however, in-

investigation always proceeds from this standpoint, the demand for final solutions and eternal truths ceases once for all; one is always conscious of the necessary limitation of all acquired knowledge, of the fact that it is conditioned by the circumstances in which it was acquired. On the other hand, one no longer permits oneself to be imposed upon by the antithesis, insuperable for the still common old metaphysics, between true and false, good and bad, identical and different, necessary and accidental. One knows that these antitheses have only a relative validity; that that which is recognized now as true has also its latent false side which will later manifest itself, just as that which is now regarded as false has also its true side by virtue of which it could previously be regarded as true. One knows that what is maintained to be necessary is composed of sheer accidents and that the so-called accidental is the form behind which necessity hides itself - and so on. The old method of investigation and thought which Hegel calls "metaphysical", which preferred to investigate things as given, as fixed and stable, a method the relics of which still strongly haunt people's minds, had a great deal of historical justification in its day. It was necessary first to examine things before it was possible to examine processes. One had first to know what a particular thing was before one could observe the changes it was undergoing. And such was the case with natural science. The old metaphysics, which accepted things as finished objects, arose from a natural science which investigated dead and living things as finished objects. But when this investigation had progressed so far that it became possible to take the decisive step forward, that is, to pass on the systematic investigation of the changes which these things undergo in nature itself, then the last hour of the old metaphysic struck in the realm of philosophy also. And in fact, while natural science up to the end of the last century was predominantly a collecting science, a science of finished things, in our century it is essentially a systematizing science, a science of the processes, of the origin and development of these things and of the interconnection which binds all these natural processes into one great whole. Physiology, which investigates the processes occurring in plant and animal organisms; embryology, which deals with the development of individual organisms from germs to maturity; geology, which investigates the gradual formation of the Earth's surface - all these are the offspring of our century.

### **The Three Sources and Component Parts of Marxism (extract)**

The philosophy of Marxism is materialism. Throughout the recent history of Europe, and particularly at the end of the eighteenth century in France, which was the scene of the decisive battle against every kind of medieval rubbish, against serfdom in institutions and ideas, materialism proved to be the only consistent philosophy, true to all the teachings of natural science, hostile to superstitions, cant, etc. The enemies of democracy tried, therefore, with all their energy, to "overthrow," undermine and defame materialism, and defended various forms of philosophic idealism, which always leads, in one way or another, to the defence and support of religion. Marx and Engels always defended philosophic materialism in the most determined manner, and repeatedly explained the profound error of every deviation from this basis. Their views are more dearly and fully expounded in the works of Engels, Ludwig Feuerbach and Anti-Duhring, which, like the Communist Manifesto, are household books for every conscious worker.

However, Marx did not stop at the materialism of the eighteenth century but moved philosophy forward. He enriched it by the achievements of German classical philosophy especially by Hegel's system, which in its turn had led to the materialism of Feuerbach. Of these the main achievement is dialectics, i.e., the doctrine of development in its fuller, deeper form, free from one-sidedness-the doctrine, also, of the relativity of human knowledge that provides us with a reflection of eternally developing matter. The latest discoveries of natural science-radium, electrons, the transmutation of elements-are a remarkable confirmation of the dialectical materialism of Marx, despite the doc-

trines of bourgeois philosophers with their "new" returns to old and rotten idealism.

While deepening and developing philosophic materialism, Marx carried it to its conclusion; he extended its perception of nature to the perception of human society. The historical materialism of Marx represented the greatest conquest of scientific thought. Chaos and arbitrariness, which reigned until then in the views on history and politics, were replaced by a strikingly consistent and harmonious scientific theory, which shows how out of one order of social life another and higher order develops, in consequence of the growth of the productive forces - how capitalism, for instance, grows out of serfdom. Just as the cognition of man reflects nature (i.e., developing matter) which exists independently of him, so also the social cognition of man (i.e., the various views and doctrines-philosophic, religious, political, etc.) reflects the economic order of society. Political institutions are a superstructure on the economic foundation. We see, for example, that the various political forms of modern European states serve the purpose of strengthening the domination of the bourgeoisie over the proletariat. The philosophy of Marx completes in itself philosophic materialism which has provided humanity, and especially the working class, with a powerful instrument of knowledge.

### **Lenin's Collected Works**

The splitting of a single whole and the cognition of its contradictory parts is the essence (one of the "essentials", one of the principal, if not the principal, characteristics or features) of dialectics. That is precisely how Hegel, too, puts the matter. The correctness of this aspect of the content of dialectics must be tested by the history of science. This aspect of dialectics (e.g. in Plekhanov) usually receives inadequate attention: the identity of opposites is taken as the sum-total of examples ("for example, a seed", "for example, primitive communism". The same is true of Engels. But it is "in the interests of popularisation ...") and not as a law of cognition (and as a law of the objective world.)

In mathematics: + and -, differential and integral, In mechanics: action and reaction, In physics: positive and negative electricity, In chemistry: the combination and dissociation of atoms, In social science: the class struggle. The identity of opposites (it would be more correct, perhaps, to say their "unity", -although the difference between the terms identity and unity is not particularly important here. In a certain sense both are correct) is the recognition (discovery) of the contradictory, mutually exclusive, opposite tendencies in all phenomena and processes of nature (including mind and society). The condition for the knowledge of all processes of the world in their "self-movement", in their spontaneous development, in their real life, is the knowledge of them as a unity of opposites. Development is the "struggle" of opposites. The two basic (or two possible? Or two historically observable?) conceptions of development (evolution) are: development as decrease and increase, as repetition, and development as a unity of opposites (the division of a unity into mutually exclusive opposites and their reciprocal relation)!

In the first conception of motion, self-movement, its driving force, its source, its motive, remains in the shade (or this source is made external - God, subject, etc.). In the second conception the chief attention is directed precisely to knowledge of the source of "self"-movement. The first conception is lifeless, pale and dry. The second is living. The second alone furnishes the key to the "self-movement" of everything existing; it alone furnishes the key to "leaps", to the "break in continuity," to the transformation into the opposite", to the destruction of the old and the emergence of the new.

The unity (coincidence, identity, equal action) of opposites is conditional, temporary, transitory, relative. The struggle of mutually exclusive opposites is absolute, just as development and motion are absolute. NB: The distinction between subjectivism (scepticism, sophistry, etc.) and dialectics, incidentally, is that in (objective) dialectics the difference between the relative and the absolute is itself relative. For objective dialectics there is an absolute within the relative. For subjectivism and sophistry the relative is only relative and excludes the absolute.

In his Capital, Marx first analyses the simplest, most ordinary and fundamental, most common and everyday relation of bourgeois (commodity) society, a relation encountered billions of times, viz., the exchange of commodities. In this very simple phenomenon (in this "cell" of bourgeois society) analysis reveals all the contradictions (or the germs of all contradictions) of modern society. The subsequent exposition shows us the development (both growth and movement) of these contradictions and of this society in the Sum of its individual parts. From its beginning to its end. Such must also be the method of exposition (or study) of dialectics in general (for with Marx the dialectics of bourgeois society is only a particular case of dialectics). To begin with what is the simplest, most ordinary, common, etc., with any proposition: the leaves of a tree are green; John is a man; Fido is a dog, etc. Here already we have dialectics (as Hegel's genius recognised); the individual is the universal.

Consequently, the opposites (the individual is opposed to the universal) are identical: the individual exists only in the connection that leads to the universal. The universal exists only in the individual and through the individual. Every individual is (in one way or another) a universal. Every universal is (a fragment, or an aspect, or the essence of) an individual. Every universal only approximately embraces all the individual objects. Every individual enters incompletely into the universal, etc., etc. Every individual is connected by thousands of transitions with other kinds of individuals (things, phenomena, processes) etc. Here already we have the elements, the germs, the concepts of necessity, of objective connection in nature, etc. Here already we have the contingent and the necessary, the phenomenon and the essence; for when we say: John is a man, Fido is a dog, this is a leaf of a tree, etc., we disregard a number of attributes as contingent; we separate the essence from the appearance, and counterpose the one to the other.

Thus in any proposition we can (and must) disclose as in a "nucleus" (:cell") the germs of all the elements of dialectics, and thereby show that dialectics is a property of all human knowledge in general. And natural science shows us (and here again it must be demonstrated in any simple instance) objective nature with the same qualities, the transformation of the individual into the universal, of the contingent into the necessary, transitions, modulations, and the reciprocal connection of opposites. Dialectics is the theory of knowledge of (Hegel and) Marxism. This is the "aspect" of the matter (it is not "an aspect" but the essence of the matter) to which Plekhanov, not to speak of other Marxists, paid no attention.

Knowledge is represented in the form of a series of circles both by Hegel (see Logic) and by the modern epistemologists" of natural science, the eclectic and foe of Hegelianism (which he did not understand!!), Paul Volkman. "Circles" in philosophy: [is a chronology of persons - essential? No! Ancient: from Democritus to Plato and the dialectics of Heraclitus. Renaissance: Descartes versus Gassendi (Spinoza?)

Modern: Holbach-Hegel (via Berkeley, Hume, Kant). Hegel - Feuerbach – Marx Dialectics as living, many-sided knowledge (with the number of sides eternally increasing), with an infinite number of

shades of every approach and approximation to reality (with a philosophical system growing into a whole out of each shade) - here we have an immeasurably rich content as compared with metaphysical materialism, the fundamental misfortune of which is its inability to apply dialectics to the theory of reflection, to the process and development of knowledge.

Philosophical idealism is only nonsense from the standpoint of crude, simple, metaphysical materialism. From the standpoint of dialectical materialism, on the other hand, philosophical idealism is a one-sided, exaggerated, development (inflation, distension) of one of the features, aspects, facets of knowledge, into an absolute, divorced from matter, from nature, apotheosised. Idealism is clerical obscurantism. True. But philosophical idealism is ("more correctly" and "in addition") a road to clerical obscurantism through one of the shades of the infinitely complex knowledge (dialectical) of man. Human knowledge is not (or does not follow) a straight line, but a curve, which endlessly approximates a series of circles, a spiral. Any fragment, segment, section of this curve can be transformed (transformed one-sidedly) into an independent, complete, straight line, which then (if one does not see the wood for the trees) leads into the quagmire, into clerical obscurantism (where it is anchored by the class interests of the ruling classes). Rectilinearity and one-sidedness, woodenness and petrification, subjectivism and subjective blindness - voila the epistemological roots of idealism. And clerical obscurantism (= philosophical idealism), of course, has epistemological roots, it is not groundless; it is a sterile flower undoubtedly, but a sterile flower that grows on the living tree of living, fertile, genuine, powerful, omnipotent, objective, absolute human knowledge.

### **Marx's Theory of Alienation**

The alienation of labour that takes place specifically in capitalist society is sometimes mistakenly described as four distinct types or forms of alienation. It is, on the contrary, a single total reality that can be analyzed from a number of different points of view. In the Economic and Philosophic Manuscripts, Marx discusses four aspects of the alienation of labour, as it takes place in capitalist society: one is alienation from the product of labour; another is alienation from the activity of labour; a third is alienation from one's own specific humanity; and a fourth is alienation from others, from society. There is nothing mysterious about this fourfold breakdown of alienation. It follows from the idea that all acts of labour involve an activity of some sort that produces an object of some sort, performed by a human being (not a work animal or a machine) in some sort of social context.

Alienation in general, at the most abstract level, can be thought of as a surrender of control through separation from an essential attribute of the self, and, more specifically, separation of an actor or agent from the conditions of meaningful agency. In capitalist society the most important such separation, the one that ultimately underlies many, if not most other forms, is the separation of most of the producers from the means of production. Most people do not themselves own the means necessary to produce things. That is, they do not own the means that are necessary to produce and reproduce their lives. The means of production are, instead owned by a relatively few. Most people only have access to the means of production when they are employed by the owners of the means of production to produce under conditions that the producers themselves do not determine.

So alienation is not meant by Marx to indicate merely an attitude, a subjective feeling of being without control. Although alienation may be felt and even understood, fled from and even resisted, it is not simply as a subjective condition that Marx is interested in it. Alienation is the objective

structure of experience and activity in capitalist society. Capitalist society cannot exist without it. Capitalist society, in its very essence, requires that people be placed into such a structure and, even better, that they come to believe and accept that it is natural and just. The only way to get rid of alienation would be to get rid of the basic structure of separation of the producers from the means of production. So alienation has both its objective and subjective sides. One can undergo it without being aware of it, just as one can undergo alcoholism or schizophrenia without being aware of it. But no one in capitalist society can escape this condition (without escaping capitalist society). Even the capitalist, according to Marx, experiences alienation, but as a "state", differently from the worker, who experiences it as an "activity". Marx, however, pays little attention to the capitalist's experience of alienation, since his experience is not of the sort which is likely to bring into question the institutions that underpin that experience. The first aspect of alienation is alienation from the product of labour. In capitalist society, that which is produced, the objectification of labour, is lost to the producer. In Marx's words, "objectification becomes the loss of the object". The object is a loss, in the very mundane and human sense, that the act of producing it is the same act in which it becomes the property of another. Alienation here, takes on the very specific historical form of the separation of worker and owner. That which I produced, or we produced, immediately becomes the possession of another and is therefore out of our control. Since it is out of my control, it can and does become an external and autonomous power on its own.

In making a commodity as a commodity (for the owner of the means of production) I not only lose control over the product I make, I produce something which is hostile to me. We produce it; he possesses it. His possession of what we produce gives him power over us. Not only are we talking here about the things that are produced for direct consumption. More basically, we are talking about the production of the means of production themselves. The means of production are produced by workers, but completely controlled by owners. The more we, the workers, produce, the more productive power there is for someone else to own and control. We produce someone else's power over us. He uses what we have produced in order to wield his power over us. The more we produce, the more they have and the less we have. If I make a wage, I can work for forty or fifty years, and at the end of my life have not much more than I had at the beginning, and none of my fellow workers do either. Where has all this work gone? Some has gone into sustaining us so that we can go on working, but a great deal has gone into the expanded reproduction of the means of production, on behalf of the owners and their power. "Society" gets wealthier, but the individuals themselves do not. They do not own or control a greater proportion of the wealth.

The hostility of the product over which I relinquish my control in selling my labour – this also refers to the inhuman power of the impersonal laws of production. The laws of capitalist production have power over me. The boss, the capitalist owner himself, may simply be regarded as merely the representative of more remote, hidden, and inscrutable forces. His excuse, when he informs me that I am no longer needed, that he would have to close up the place or go broke if he didn't do this, is no mere excuse. The capitalist himself is merely a priest who lives well off the service of capital, and not a god. When the god speaks, he too must jump, or he will find himself in my place, where god knows, no one wants to be. So, between him and me, it's "nothing personal". But this is exactly the problem, not an excuse.

The second aspect of alienation, alienation from the activity of labour, means that in labouring I lose control over my life-activity. Not only do I lose control over the thing I produce, I lose control over the activity of producing it. My activity is not self-expression. My activity has no relation to my desires about what I want to do, no relation with the ways I might choose to express myself, no re-

lation with the person I am or might try to become. The only relation that the activity has with me is that it is a way of filling my belly and keeping a roof over my head. My life activity is not life-activity. It is merely the means of self-preservation and survival. In alienated labour, Marx claims, humans are reduced to the level of an animal, working only for the purpose of filling a physical gap, producing under the compulsion of direct physical need.

Alienation from my life-activity also means that my life-activity is directed by another. Somebody else, the foreman, the engineer, the head office, the board of directors, foreign competition, the world-market, the very machinery I am operating, it/they decide what and how and how long and with whom I am going

to act. Somebody else also decides what will be done with my product. And I must do this for the vast majority of my waking hours on earth. What could and should be free conscious activity, and what they tell me I have contracted to do as a free worker, becomes forced labour. It is imposed by my need and by the other's possession of the means of satisfying all needs. As a result I relate to my own activity as though it were something alien to me, as though it were not really mine, which it isn't. I do not truly belong in this place, doing this thing over and over and over again, until I cannot even think or feel anything but the minutes ticking over until quitting time. The real me wants to be doing something.

My activity becomes the activity of another. Life comes to be split between alien work and escape from working, which for us is "leisure". Because our own life activity becomes an alien power over our lives, activity itself gets a bad name. and we tend to avoid it when we are on our own, in our "free time". Free time itself tends to become equated with freedom from activity, because activity is compulsion. Freedom is equated with the opposite of action and production; freedom is consumption, or just passive, mindless "fun", or just blowing off steam. Only in class society is there such an equation of activity with pain and of leisure with inactivity or sloth, for activity under alienated labour is not self-expression but self-denial. All our capacities are parceled out into marketable skills. We talk about "human resources" or youth as "our most precious resource", all of which pseudo-humanist jargon expresses the same reality, that human labour is turned into a commodity to be bought and sold like any other.

As this civilization moves on we get, of course, an ever finer and more detailed separation of hand and brain, of sense and intelligence, manifested in the truncated capacities of both masters and wage-slaves. Some people are likely to spend their entire lives developing the capacity to locate defects in the ends of cans. This becomes their forced contribution to the human species. And it is in this sense that we are not without cause, in the latest stages of capitalism, of thinking of ourselves as appendages of a machine. In a sense, capitalism involves a devolution even behind the work-animal. At least the work-animal is an enslaved total organism. Even a tool or a slave can be used to carry out many different things. But by the time you get to the highest stage of capitalism, human functions can be more dehumanized than that of a tool: you become the appendage of a machine, just part of a tool, a cog in the vast machine of production.

By many routes, then, alienation from the product and from the activity of labour lead up to and involve alienation in its third aspect, alienation from the self or from the human essence. It is not only the product that becomes an alien power. It is not only that self-development becomes self-denial. Internally related to these others is a loss of self. To alienate my labour-power, to be forced to sell it as a commodity on the market, is to lose my life-activity, which is my very self. It is to become other than myself. Sometimes we speak innocently enough of being beside ourselves or

feeling remote from ourselves; or sometimes we use the language of the search for identity and authenticity, of not knowing who we are or not recognizing who we've become. From a Marxian point of view, we are talking about something social and historical rather than something metaphysical or existential. At a deeper level still, the sense of loss of identity or loss of meaning is an expression, but one still alienated itself, of our real loss of humanity, alienation from the human "species-being", as Marx sometimes calls it. This is one thing Marxists mean when they talk about de-humanization.

There is a further aspect of alienation from self which Marx pays little attention to in his later work, but which receives some mention in the Manuscripts and remains important at an implicit level. And it is perhaps most appropriate to discuss it in relation to alienation from self. This further aspect is alienation from sensuousness. Marx conceives of the history of human labour as, among other things, a formation of the human senses themselves. The human senses are not passive mechanisms, a blank slate on which the world leaves its mark more or less clearly and strongly. Marx understands sense perception itself to be the outcome of a process of the labour of a historical subject. The sensuous forms in which we perceive things and their relations is therefore the product of the history of an active subject. The sense themselves are not given, once and for all, but open to education, broadening, refining, formation and re-formation.

If the senses themselves are a product of the process of human collective self-constitution, it is meaningful to speak of an alienation of sensuousness. In capitalist society, our life activity is alienated. As a result we engage in inherently sensuous activities, but in an alienated fashion, almost exclusively, that is, for non-sensuous, extrinsic, extraneous purposes. In order to satisfy virtually any need, we must in capitalist society, work through the medium of money. Most of the things we do, we do in order to make money or to put ourselves in the position to make money, or improve our capacities to make money. There is very little, if anything that a human being could imagine wanting, that is not offered to us as a possible object of a cash transaction. Thus the things with which we are engaged are never approached with an eye to either their own intrinsic value or to their human value in a broader sense. We do not relate most of the time to most things in terms of their intrinsically sensuous and aesthetic reality. The imperatives of capitalist society thus enter into our conscious and semi-conscious experience even at the level of sense and perception itself. We are taught to literally see and feel things as utilities, as abstract counters in the process of making still more money. We become alienated from what Marx calls our subjective human sensibilities. Our senses are not so much animalized or brutalized as they are mechanized. If our life-activity were our own, this would necessarily involve the intensive cultivation of our capacity for aesthetic appreciation of sensuous reality. Humans are, after all, according to Marx, the only species that can produce in conscious appreciation of the laws of beauty. Under alienated labour, sense experience becomes a modifiable sign for things and relations that can be turned into money, the sign of all things. Because our activity is degraded to the level of mechanical subservience to crude needs, or, in reaction to that we perhaps become aesthetes, we regard everything only from the standpoint of the use it can be put. Or we come to attach a perception of beauty or aesthetic value to that which commands a high price. We can be impressed with the supposed aesthetic value of something because it is expensive.

This relation to everything, even the objects of sense and beauty, in terms of its usefulness to the expanded reproduction of capital means we no longer have an eye for the thing itself. Oriented mainly to pieces of the world whose monetary value means that they are essentially interchangeable, we are brought that much more easily to relate to ourselves and each other in this way. We

begin to evaluate ourselves and each other in terms of the amount of money we can make. Or parts of ourselves can be ranked in such terms. We are less able, if still able, to perceive and appreciate the intrinsic qualities of anything, even including ourselves. This dehumanization of the senses, and of perception and of judgement, is not something accidental to the dehumanization of humans.

We are thus led to the fourth aspect, alienation from other people, or from society. Once the traditional community (which understood itself as natural) is broken down, human beings become essentially potentially useful or threatening objects. One can now have enemies in a new sense. Only with the breakdown of primitive communism does man become a wolf to man. "Man is a wolf to man" (*homo homini lupus*) was one of Hobbes's favourite sayings. "Wolflike" behaviour can and does occur in "primitive" societies and between such societies, but it is not the principle of those societies. It does become the central and organizing principle of class societies. In the market it is hard to say that the antagonism of classes becomes more severe, but the antagonism among individuals certainly increases. Now, according to Marx, "human nature" must be grasped as "the ensemble of social relations". It is not simply our neuro-physiological constitution or our DNA that makes us behave or act selfishly. We live, according to Marx, in a society in which each individual must see in every other, not the possibility of his liberty, but its limitation. Every other becomes an obstacle to me, but – and this is important too – a needed obstacle, a customer, a client, a creditor, a debtor, an employer or employee. (We haven't even come up with a better replacement for patriarchal terms such as husband and wife than "partner" – which suggests nothing so much as a boardroom full of lawyers). The other is a rival. It is not that cooperation here is impossible. In fact we learn to coordinate our activities on an ever more grand scale and complex level. It is that this cooperation can only take place as the coincidence of separate and competing "enlightened" self-interests.

In feudal society, or in Aristotle's polis, one's life-activity was directly determined by one's pre-ordained social status. Along with this, however, came a solidary bond integrating the occupants of the various strata. The lord-peasant relationship was a direct, personal bond of two-way loyalty and duty (and even affection). The exploitation of the peasant was an integral part of a patriarchal relation. Even though the solidarity of such societies was a pseudo-solidarity, a solidarity based upon exploitation, it was still a solidarity. What the market society does is to relentlessly smash the patriarchal links between lord and peasant. Each individual is to be thrown upon his own resources in order to make his fortune or not, as the case may be. The market society severs the patriarchal link between lord and peasant, lord and lord, peasant and peasant, and substitutes for it the cash nexus. For the personal relationship is substituted one of personal indifference. The bottom line of the contractual relationship is cash. Previously the worker worked for the community either directly or in personal subservience to his superior, and the subservience of labour was an essential feature of a community felt to have the unity of an organism. Previously it was assumed that community was only possible as the subordination of one social organ to another.

Now, however, my work is not service. Now I work for money, which I will spend any damn way I feel like. As a result, for Marx, although this is in one way a less illusory of living, since it doesn't need to depend on religious or mythical foundations to justify an explicit and clear hierarchy, in another way it is more illusory. My freedom is largely only in appearance. In reality my life-activity is still given up to a superior who is a superior, even though he is formally and by law my equal. In his later work, Marx will especially concentrate on the fact that everything is translated into money terms, and that all relations are mediated by money. In capitalist society, he says, "everyone carries

the social bond in his pocket.”

Although Marx does not in the 1844 Manuscripts make the point directly and explicitly, there is a direct connection between Marx's thoughts on alienation from society and his critique of the state. Those who wish to follow this theme further should read *On the Jewish Question*. For Marx, the existence of the state implies what we could call a political alienation. Often the Marxian notion of the abolition or the withering away of the state is met by the sort of puzzled reaction one might reserve for the abolition of the sun, moon and stars. But Marx would not call the operation of something like Rousseau's general will a state. The form of direct self-government comprised in the idea of the sovereignty of the general will would not be considered a state form. The state, according to Marx, is the set of institutions that arises in order to hold together a society that is continually falling apart. The state is a function of other, deeper social antagonisms that are in principle corrigible. It is a function of the universal individual antagonisms of class societies, but especially a function of class division itself, and of the possibility of open class antagonism. The state is a necessary means of coercion and coordination once society can no longer hold itself together by other means, or before it has learned how to do so once again.

The state is an integral part of class society, not something apart from or beyond it; not something neutral and capable of standing disinterestedly above all particular interests. Whereas theorists like Hegel would argue that in the modern state individuals were in actual reality reconciled and unified, Marx maintains that the state is necessary only because of the real antagonisms class societies generate and sustain among individuals. Nor do individuals in the modern, liberal or even democratic-capitalist state really find a community of equals. Instead, in the state, they come together to deny the inequality and separateness that is their real existence in social and economic life. Their coming together in the political community of the state is thus an illusion, because they are separated in fact. The solidarity of earlier, more organic forms of society is supposedly recovered, in bourgeois society, in the political relationship of free and equal citizens. But this is a pseudo-solidarity, given the lie by the many substantial inequalities outside the formal equality established by constitutional law, and by the fact that the powerful within the private sphere have the power to reach out and have the state work primarily in their fundamental interests. As the French writer, Anatole France once said, “the law, in its majestic equality, forbids rich and poor alike from begging alms, stealing bread and sleeping under bridges.” It is only because in real life people are alienated from one another through the cash nexus that is increasingly the only thing that connects them, that they must solidarize in an ideal and false unity a formally equal citizens.

Here the notion of an “inverted” or “double” world appears that will become important later on in Marx's notion of “commodity fetishism”. As a corrective to, and also as a mystification of, a contradictory reality, a supplementary but illusory reality is invented and, as it were, laid on top of the first. What is illusory is not the actual power of the state, but the notions that the state is the only thing that can hold a society of human beings together, and that it can do this while sustaining and expressing the freedom and equality of all its citizens. The state is just such an illusory reality, existing by virtue of the misperception that the antagonisms of bourgeois society are the natural and inevitable, eternal and essential antagonisms of human beings as such. And, in truth, it is a necessary and real illusion – to bourgeois society. Thus, the state cannot be abolished, as some anarchists would have it, by the fiat of individuals. The abolition of the state depends on the prior transformation and abolition of class society. The state functions essentially to maintain society in its present form, as a society based upon class divisions rooted in the way material life is produced and reproduced. But the abolition of class society and its state would not mean the disappearance

of differences or of the need for politics. If anything politics would be more prevalent than ever (as opposed to the administration of a subject population) – if what we mean by politics is something like individuals communicating and acting together to resolve conflicts between human needs and social conditions. The existence of processes through which individuals decide upon common policies and common action is not what Marx would call the state.

## The Marxist Critique of Capitalism

Karl Marx saw capitalism as a progressive historical stage that would eventually be followed by socialism.

### Key Points

- Karl Marx saw capitalism as a progressive historical stage that would eventually stagnate due to internal contradictions and be followed by socialism.
- Marxists define capital as “a social, economic relation” between people (rather than between people and things). In this sense they seek to abolish capital.
- Revolutionary socialists believe that capitalism can only be overcome through revolution.
- Social democrats believe that structural change can come slowly through political reforms to capitalism.
- Marxists define capital as “a social, economic relation” between people (rather than between people and things).
- Normative Marxism advocates a revolutionary overthrow of capitalism that would lead to socialism, before eventually transforming into communism after class antagonisms and the state ceased to exist.

### Key Terms

- **revolution:** A political upheaval in a government or nation-state characterized by great change.
- **socialism:** Any of various economic and political philosophies that support social equality, collective decision-making, distribution of income based on contribution and public ownership of productive capital and natural resources, as advocated by socialists.
- **progressive:** Favoring or promoting progress; advanced.

Capitalism has been the subject of criticism from many perspectives during its history. Criticisms range from people who disagree with the principles of capitalism in its entirety, to those who disagree with particular outcomes of capitalism. Among those wishing to replace capitalism with a different method of production and social organization, a distinction can be made between those believing that capitalism can only be overcome with revolution (e.g., revolutionary socialism) and those believing that structural change can come slowly through political reforms to capitalism (e.g., classic social democracy).

Karl Marx saw capitalism as a progressive historical stage that would eventually stagnate due to internal contradictions and be followed by socialism. Marxists define capital as “a social, economic relation” between people (rather than between people and things). In this sense they seek to abolish capital. They believe that private ownership of the means of production enriches capitalists (owners of capital) at the expense of workers. In brief, they argue that the owners of the means of production exploit the workforce.

In Karl Marx's view, the dynamic of capital would eventually impoverish the working class and thereby create the social conditions for a revolution. Private ownership over the means of production and distribution is seen as creating a dependence of non-owning classes on the ruling class, and ultimately as a source of restriction of human freedom.

Marxists have offered various related lines of argument claiming that capitalism is a contradiction-laden system characterized by recurring crises that have a tendency towards increasing severity. They have argued that this tendency of the system to unravel, combined with a socialization process that links workers in a worldwide market, create the objective conditions for revolutionary change. Capitalism is seen as just one stage in the evolution of the economic system.

Normative Marxism advocates for a revolutionary overthrow of capitalism that would lead to socialism, before eventually transforming into communism after class antagonisms and the state cease to exist. Marxism influenced social democratic and labor parties as well as some moderate democratic socialists, who seek change through existing democratic channels instead of revolution, and believe that capitalism should be regulated rather than abolished.

### **Marx's Theory of Class Struggle**

Marx's sociology is in fact, sociology of class struggle. According to Bendix and Lipset, "A social class in Marx's terms is any aggregate of persons who perform the same function in the organization of production." According to Marx, "Class is the manifestation of economic differentiation."

The concept of class struggle, though not originally propounded by Karl Marx, is yet one of his great contributions to Sociology. To Marx, "the history of all hitherto existing society is the history of class struggle." (The first line of communist manifesto (1848) reads.) According to Raymond Aron, "the classes are the principal actors in the historical drama of capitalism in particular and of history in general."

Classes refer to the groups of people having their own role to play in the relations of production. Relations of production refer to the fact that in the process of industrial production the labour and capital stands in specific relation to each other. Labour is the capacity which the working class possesses.

Capital is the instrument invested out of which profit is derived. Those who possess capital they are the owners of capital. Those who are labourers—they are the owners of labour power. Capital gets profit, labour gets wage. Labour and capital are interrelated, they are inseparable. One cannot be thought of without the other.

### **Marx says:**

Classes are hence the groups of people identified and distinguished from each other on the basis of their relations to the economic means of production. Economic means of production refers to the economic infrastructure that few people own as against many. Few people are capitalists and many are labourers. Economic infrastructure refers to all those land, machinery, tools, technology and the skills that assist the process of production.

### **The Class Structure:**

The word "class" originated from the Latin term "Classis" a group called to arms, a division of the people. In the rule of legendary Roman king, Servius Tullius (678- 534 B.C), the Roman society was divided into five classes or orders according to their wealth. Subsequently the word 'class' was ap-

plied to large groups of people into which human society came to be divided. Marx recognized class as a unique feature of capitalist societies. Marx has used the term Social class throughout his works but explained it only in a fragmented form. The clearest passages on the concept of class structure can be found in the third volume of his famous work Capital (1894). Under the title of "Social classes", Marx distinguished three classes related to the three sources of income.

- (i) Owners of simple labour power or labourers whose main source of income is labour.
- (ii) Owners of capital or capitalists whose main source of income is profit or surplus value.
- (iii) Landowners whose main source of income is ground rent.

In this way the class structure of modern capitalist society is composed of three major classes' i.e. salaried labourers of workers, capitalists and landowners. At a broader level, society could be divided into two major classes—Haves and Have-not's. Haves are the owners of land/or capital often called as Bourgeoisie and the Have-not's are those who own nothing but their own labour power, often called as Proletariates. According to Marx, "a social class occupies a fixed place in the process of production."

### **Bendix and Lipset have identified five variables that determine a class in the Marxian sense:**

1. Conflicts over the distribution of economic rewards between the classes.
2. Easy communication between the individuals in the same class position so that ideas and action programs are readily disseminated.
3. Growth of class consciousness in the sense that the members of the class have a feeling of solidarity and understanding of their historical role.
4. Profound dissatisfaction in the lower class over its inability to control the economic structure of which it feels itself to be the exploited victim.
5. Establishment of a political organization resulting from the economic structure, the historical situation and maturation of class-consciousness.

### **Criteria for Determination of Class: A social class has two major criteria:**

- (a) Objective Criteria
- (b) Subjective Criteria.

#### **(a) Objective Criteria:**

People sharing the same relationship to the means of production comprise a class. For example, all labourers have a similar relationship with the land owners. On the other hand all the landowners as a class have a similar relationship with the land and labourers. In this way, labourers on one hand and land owners on the other hand could be seen as classes. However, for Marx, this relationship is not sufficient to determine the class. Because according to him it is not sufficient for class to be "Class in itself" but it should also be "Class for itself". Marx means by "Class in itself" the objective criteria of any social class. He is not satisfied with the objective criteria. Hence, he equal-

ly emphasizes upon the other major criteria i.e. "class for itself" or the subjective criteria.

### **(b) Subjective Criteria:**

Any collectivity of human grouping with a similar relationship would make a category not a class, if subjective criteria are not included. The members of any one class not only have similar consciousness but they also share a similar consciousness of the fact that they belong to the same class. This similar consciousness of a class serves as the basis for uniting its members for organising social action. Here this similar consciousness towards acting together for their common interest is what Marx class-"Class for itself." In this way these two criteria together determine a class and class structure in any given society.

### **Classification of Societies in History and Emergence of Classes:**

Marx differentiated stages of human history on the basis of their economic regime or modes of production.

### **He distinguished four major modes of production:**

6. The Asiatic
7. The Ancient
8. The Feudal
9. The Capitalistic

He predicted that all social development will culminate into a stage called Communism.

### **He simplified this classification of societies or various stages of human history into:**

10. Primitive-Communal
11. Slave-owning
12. Feudal
13. Capitalist
14. Communist stage.

### **1. The Primitive:**

Communal system was the first and the lowest form of organization of people. It existed for thousands of years. Man started using primitive tools like sticks and stones for hunting and food gathering. Gradually man improved these tools. He learned to make fire, cultivation and animal husbandry.

In this system of very low level of forces of production, the relations of production were based on common ownership of the means of production. Therefore, these relations were based on mutual assistance and co-operation. These relations were conditioned by the fact that people with their primitive implements could only withstand the mighty forces of nature together, collectively.

In such a situation, exploitation of man by man did not exist because of two reasons. Firstly, the tools used (means of production) were so simple that they could be reproduced by any one. These were implements like spear, stick, bow and arrow etc. Hence no person or group of people had the monopoly of ownership over the tools.

Secondly, production was at a low scale. The people existed more or less on a subsistence level.

Their production was just sufficient to meet the needs of the people provided everybody worked. Therefore it was a situation of no master and no servant. All were equal. Gradually, with time man started perfecting his tools, his craft of producing and surplus production started taking place. This led to private property and primitive equality gave way to social inequality. Thus, the first antagonistic classes, slaves and slave owners appeared. This is how the development of the forces of production led to the replacement of primitive communal system by slavery.

## **2. Slave-owning:**

In the slave-owning society, primitive tools were perfected and bronze and iron tools replaced the stone and wooden implements. Large scale agriculture, live stock raising, mining and handicrafts developed. The development of this type of forces of production also changed the relations of production.

These relations were based on the slave owners absolute ownership of both the means of production and the slave himself and everything he produced. The owner left the slave only with the bare minimum necessities to keep him from dying of starvation. In this system, the history of exploitation of man by man and the history of class struggle began.

The development of productive forces went on and slavery became an impediment to the expansion of social production. Production demanded the constant improvement of implements, higher labour productivity but the slave had no interest in this as it would not improve his position.

With the passage of time the class conflict between the classes of slave owners and the slaves became acute and it was manifested in slave revolts. These revolts together with the raids from neighbouring tribes undermined the foundations of slavery leading to a new stage, i.e. Feudal system.

## **3. Feudal:**

The Progressive development of the productive forces continued under feudalism. Man started using inanimate sources of energy, i.e. water and wind, besides human labour. The crafts advanced further, new implements and machines were invented and old ones are improved.

The labour of craftsmen was specialized raising productivity considerably. The development of forces of production led to emergence of feudal relations of production. These relations were based on the feudal lord's ownership of the serfs or landless peasants. The production relations were relations of domination and subjection, exploitation of the serfs by the feudal lords.

Nevertheless, these relations were more progressive than in slavery system, because they made the labourers interested to some extent, in their labour. The peasants and the artisans could own the implements or small parts of land. These forces of production underwent changes due to new discoveries, increasing demands for consumption caused by population increase and discovery of new markets through colonialism.

All this led to the need and growth of mass scale manufacture. This became possible due to advances in technology. This brought the unorganized labourers at one place, i.e. the factory. This sparked off already sharpened class conflict leading to peasant revolution against landowners.

The new system of production demanded free labourer whereas the serf was tied to the land; therefore the new forces of production also changed the relations of production culminating into a change in the mode of production from feudalism to capitalism.

## **Intensification of Class Conflict under Capitalism:**

Large-scale machine production is the specific feature of the productive forces of capitalism. Huge factories, plants and mines took place of artisan workshops and manufactures. In a century or two, capitalism accomplished much more in developing the productive forces than had been done in all the proceeding eras of human history. The vigorous growth of the forces of production was helped by the capitalist relations of production based on private capitalist ownership.

Under capitalism, the producer, the proletariat, is legally free, being attached neither to the land nor to any particular factory. They are free in the sense that they can go to work for any capitalist, but they are not free from the bourgeois class as a whole. Possessing no means of production, they are compelled to sell their labour power and thereby came under the yoke of exploitation.
