Due to this exploitation the relatively free labourers became conscious of their class interest and organize themselves into a working class movement. This working class movement intensified its struggle against the bourgeois class. It begins with bargaining for better wages and working conditions and cultivates into an intensified class conflict which is aimed at over throwing the capitalist system. Marx said that the capitalist system symbolises the most acute form of inequality, exploitation and class antagonism. This paves the way for a socialist revolution which would lead to a new stage of society i.e. Communism.

## **Class Struggle:**

The theory of class struggle is central to Marxian thought. The first line of Communist Manifesto (1848) reads: "The history of all hitherto existing society is the history of class struggle." "Free-man and, slave, patricians and plebian, lord and serf, guild master and journey man, in a word, oppressor and the oppressed stood in constant opposition to one another, carried on uninterrupted now hidden and now open fight, a fight that each time ended in a revolutionary reconstitution of society at large, or in common ruin of the contending classes."

The perpetual tension, conflict or the antagonism between the owning and the non-owning class is called Class struggle. Not only the classes but also the class struggle is economically conditioned. Therefore Marx says that economic relationship is the very basis of all other types of relationships. i.e., social, political and legal and these are called the super structures. Economic relationship decides, defines and determines all other forms of relationships; i.e. social, political and legal. This is what is called the concept of economic determinism by Marx.

## **Criticisms:**

Marxian theory of class struggle has been put to various criticisms. This theory is having propaganda value. The theory of revolution that Marx presents on the basis of the conflict of interest between the social classes is not convincing. There may be revolution due to causes other than these; and the same may not involve force or violence. The technological revolution of 18th and 19th century, the constitutional changes in the 19th century England, Arya Samaj movement of Dayanand Saraswati are illustrations of the revolutionary changes brought about in the respective areas, without the use of force. The abolition of caste system by the legislative measures is no less revolutionary.

Marx has made many predictions in regard to the development of the future capitalistic society especially in regard to its relations with the proletariat and about the inevitable struggle between the capitalist and the proletariat has not come off. Marx has ignored social conditions. He has failed to distinguish between the social and economic classes. It has been said that it is not correct to believe that all struggle is always a class struggle. He has not followed the nature of struggle.

The concept of alienation of individual from his social system is a complete ambiguity. Marx sociology reduces him to mere zero. There is however, no change in his position. Karl Marx leaves him as much hand and foot bound in his system, as he found him under the established one. The hope of achieving the total man is thus completely lost.

Max Weber considered the philosophy of Marx as "false"; "because it is incompatible with both the nature of science and nature of human existence." Max Weber does not support that only economic factor can influence the course of history. Marxian concept of classless society remains only as a political instrument in the hands of the communists. This concept is being misused for gaining political benefits. It is thus reduced to the level of a tool of political propaganda. Marxian theory of classless society is a kind of Utopian dream. Bogardus says, "Marxian communism is the result of the Plato's communism and Moore's Utopianism." In spite of the above criticisms, shortcomings, the theory of the classless society, class & class struggle has, had a tremendous appeal to the people with a sense of social justice.

### **Classless society**

**Classless society** is a term used by political and social theorists in a variety of contexts. It is used to describe societies in which classes have never developed, such as tribal and nomadic communities in which all the members have similar economic roles. It is also used to describe an ideal state in which every member of society has an equal status. "Classless society" can refer to a hierarchical society in which social classes have been deliberately abolished, such as a commune or an Israeli kibbutz. "Classless society" is an important term in Marxist theory, where it refers to the ultimate ideal condition of social organization, expected to occur when true communism is achieved. According to Marxist theory, social classes emerged with the development of agriculture and the production of surplus food, a circumstance which allowed one group to become dominant over the rest of society. In a society where every worker owns the means of production, Marx theorized that the state would no longer be necessary and would gradually disappear.

Some social theorists argue that modern democratic society is a "classless society" because social and economic mobility have obliterated the dominance of a single group of people.

### **Social Class**

A social class is, basically, a group of people that have similar social status. The relative importance and definition of membership in a particular class differs greatly over time and between societies, particularly in societies having a legal differentiation of groups of people by birth or occupation. Many scholars view societies as stratifying into a hierarchical system of "socioeconomic classes" based on economic status, wealth, or income. From ancient history until the development of trade and industry, many historians and economists used a bi-partite model to view societies as consisting of an upper class of the immensely wealthy and powerful, and a lower class of the poor and weak. The development of urbanization and trade, and later of industrialization, resulted in the emergence of an increasingly powerful economic middle class of artisans, merchants, manufacturers, and highly paid professionals.

### **Marxist Theory of Classless Society Marx and Engels**

Karl Marx and his collaborator Friedrich Engels adopted Hegel's explanation of history as a dialectical process of thesis, antithesis, and synthesis. Instead of Hegel's theory that historical conflict occurred among nation-states constantly jockeying for power, Marx and Engels proposed that the conflict was between socio-economic classes. Their theories appeared to explain the social and

political disorders arising from the Industrial Revolution, and to offer a satisfactory solution in which the establishment of a truly communist society would give everyone equal status. The state would then wither away and man at last become "fully human" in a classless society. The theory of Marx and Engels was developed in response to the unbridled capitalism of laissez-faire, but failed to address the problem of the control of political power. Marx's fellow revolutionary the Russian anarchist M.A. Bakunin observed, "[The revolutionaries would vivisect society in the name of dogmas]and destroy the present order, only to erect their own rigid dictatorship among its ruins."

### **Marx's Classless Society**

According to Marxist theory, tribal society, primitive communism, was classless, because everyone was equally poor and carried out the same work. The transition to agriculture created the possibility of producing a surplus product, more than was necessary to satisfy an individual's immediate needs. The development of productive forces made possible the development of a class society, because the surplus product could be used to nourish a ruling class which did not participate in production. Surplus product was stored until a time of need in special repositories, which then had to be guarded. During times of need, the consumption of the stored products had to be regulated so that they were not all immediately consumed. Those in control of distributing the stored food had the power to deny food to certain individuals, and therefore had to be more powerful than the masses of the population. Thus the ruling class was born. Marx termed this "the first negation," the negation of the classless society. Three societies followed the classless tribal society: ancient society, in which the major class distinction was between master and slave; feudal society, in which lord and serf were opponents in a class war; and bourgeois society, or capitalism, in which the class division existed between factory owner and worker. According to Marx, there would be a classless society once again at the end of development, which would negate class society.

This ideal classless society would be a co-operative union of free producers, who would be both owners of the means of production and workers. There would be no private ownership of the means of production, which would be the property of the whole society. All decisions would be made in a grassroots democratic system, and the state as an instrument of class rule become superfluous and die off. Following the proletarian revolution the economic system would no longer be plagued by rivalry and economic crises, and production would greatly increase. Agriculture would be organized and practiced on larger farms. It would be possible to eliminate all shortages, so that the reasonable needs of all people could be satisfied. The worker would no longer be alienated from the products of his labor; work would become an expression of an individual's personality.

### **Class Theory of Max Weber**

When sociologists speak of "class" they usually mean economically based classes in modern or near pre-modern society. Modern usage of the word "class" outside of Marxism generally considers only the relative wealth of individuals or social groups, and not the ownership of the means of production.

The sociologist Max Weber formulated a three-component theory of stratification, with social, status and party classes (or politics) as conceptually distinct elements. Social class is based on an individual's economic relationship to the market, including those of owner, renter, employee, or financier. A status class or group is differentiated by non-economic qualities such as prestige,

honor, religion, and intelligence. Party classes are determined by affiliations in the political domain. All three of these dimensions have consequences for what Weber called "life chances," or possibilities for success as defined by the individual or by society.

## **Classlessness**

The term classlessness has been used to describe several different social phenomena.

- Societies in which classes have never developed. These are usually societies in which all people naturally play similar economic roles and have never created a division of labor; they include most early human groups, as well as many modern tribal and nomadic societies. Some of these are forms of primitive communism.
- Societies where classes have been deliberately abolished. Such a situation is usually the result of a voluntary decision by the members of a certain society, to abolish that society's class structure. This includes many modern communes and social experiments, such as the Paris Commune, and the Israeli kibbutzes. The abolition of social classes and the establishment of a classless society is the ultimate ideological goal of communism, libertarian socialism and anarchism.
- The term 'classless society' is sometimes also used to describe a hierarchical society in which a person's status is not determined by their birth. For example, the British Prime Minister John Major said in 1990, "I want changes to produce across the whole of this country a genuinely classless society so people can rise to whatever level from whatever level they started."
- The term "classlessness" has also been used to describe the intelligentsia in a society by some political writers, who argue that the intelligentsia do not feel allegiance to any particular class and are best placed to articulate the needs of society without bias. Critics argue that the intelligentsia are, more often than not, associated with the middle or upper class.
- Classlessness also refers to the state of mind required in order to operate effectively as a social anthropologist. Anthropological training includes making assessments of, and therefore becoming aware of, one's own class assumptions, so that these can be set aside from conclusions reached about other societies. Classlessness requires the recognition and avoidance of ethnocentric biases, and the achievement of a "neutral axiology" as described by Max Weber, in order to avoid reaching conclusions about the societies being studied which are colored by the anthropologist's own class values.

## **Modern Democracy and Classless Society**

Some modern scholars argue that traditional social classes do not exist in modern democratic society. Their argument is based on a definition of "class" which includes specific measures of class identity. Some of these are the demographic and ethnic similarity among members of a class; the extent to which the members of a class share a common cultural orientation; whether the members of a class share distinct, life-defining experiences and a common sentiment about their class status; and whether the members of a class have a common political affiliation. In a modern democratic society in which education is universally available and social mobility is tied to economic success, these criteria could be used to conclude that it is a classless society.

Critics argue that because economic status determines access to education and opportunity, a self-perpetuating upper class does exist even in a democratically mobile society. Perceptions of a dominant social class are strong in democratic nations, such as the United Kingdom, which have a historical aristocracy.

## COMMUNITARIANISM

Communitarianism is a social philosophy that core assumption is the required shared ("social") formulations of the good. The assumption is both empirical (social life exhibits shared values) and normative (shared values ought to be formulated). While many sociologists may consider such an assumption as subject to little controversy, communitarianism is in effect a highly contested social philosophy. It is often contrasted with liberalism (based on the works of John Locke, Adam Smith, and John Stuart Mill, not to be confused with liberalism as the term is used in contemporary American politics). Liberalism's core assumption is that what people consider right or wrong, their values, should strictly be a matter for each individual to determine. To the extent that social arrangements and public policies are needed, these should not be driven by shared values but by voluntary arrangements and contracts among the individuals involved, thus reflecting their values and interests. Communitarians, in contrast, see social institutions and policies as affected by tradition and hence by values passed from generation to generation. These become part of the self through nonrational processes, especially internalization, and are changed by other processes such as persuasion, religious or political indoctrination, leadership, and moral dialogues.

In addition, communitarianism emphasizes particularism, the special moral obligations people have to their families, kin, communities, and societies. In contrast, liberalism stresses the universal rights of all individuals, regardless of their particular membership. Indeed, liberal philosopher Jeremy Bentham declared that the very notion of a society is a fiction.

Until 1990, sociological and social psychological researchers and theorists and communitarian philosophers often ignored one another's works, despite the fact that they dealt with closely related issues. It should be noted, though, that communitarians were much more inclined to be openly and systematically normative than many social scientists.

## HISTORY

Like many other schools of thought, communitarianism has changed considerably throughout its history, and has various existing camps that differentiate significantly. As far as can be determined, the term "communitarian" was not used until 1841, when Goodwyn Barmby, an official of the Communist Church, founded the Universal Communitarian Association. Communitarian issues were addressed long before that date, however, for instance in Aristotle's comparison of the isolated lives of people in the big metropolis to close relationships in the smaller city. Both the Old and the New Testament deal with various issues one would consider communitarian today, for instance the obligations to one's community. The social teaching of the Catholic Church (for instance, concerning subsidiarity) and of early utopian socialism (for example, regarding communal life and solidarity), all contain strong communitarian elements, although these works are not comprehensive communitarian statements and are not usually considered as communitarian works per se.

Among early sociologists whose work is strongly communitarian, although this fact is as a rule overlooked by social philosophers, are Ferdinand Tönnies, especially his comparison of the *Gemeinschaft* and *Gesellschaft*, (or community and society); Emile Durkheim, especially his concerns about the integrating role of social values and the relations between the individual and society; and George Herbert Mead. These works are extensively examined elsewhere in this encyclopedia and hence are not discussed here. A communitarian who combined social philosophy and sociology Martin Buber. Especially relevant are Buber's contrast between I-It and I-Thou relations, his interest in dialogue, and his distinction between genuine communal relationships and objectified ones.

Other sociologists whose work contains communitarian elements are Robert E. Park, William Kornhauser, and Robert Nisbet. Philip Selznick, Robert Bellah and his associates, and Amitai Etzioni wrote books that laid the foundations for new (or responsive) communitarianism, which Etzioni launched as a "school" and somewhat of a social movement in 1990. Selznick's *The Moral Commonwealth* is especially key in forming a strong intellectual grounding for new communitarian thinking, and presents an integration of moral and social theory in a synthesis of "communitarian liberalism." According to Selznick, communitarianism does not reject basic liberal ideals and achievements; it seeks reconstruction of liberal perspectives to mitigate the excesses of individualism and rationalism, and to encourage an ethic of responsibility (in contrast to liberalism, where the concept of responsibility has no major role). In a community there is an irrepressible tension between exclusion and inclusion, and between civility and piety. Thus community is not a restful idea, a realm of peace and harmony. On the contrary, competing principles must be recognized and dealt with.

## **AUTHORITARIAN, POLITICAL THEORETICAL, AND RESPONSIVE COMMUNITARIANISM**

Different communitarian camps are no closer to one another than National Socialists (Nazis) are to Scandinavian Social Democrats (also considered socialists). It is hence important to keep in mind which camp one is considering. The differences concern the normative relations between social order and liberty, and the relations between the community and the individual.

**Authoritarian Communitarians.** Authoritarian communitarians (some of whom are often referred to as "Asian" or "East Asian" communitarians) are those who argue that to maintain social order and harmony, individual rights and political liberties must be curtailed. Some believe in the strong arm of the state (such as former Singapore Prime Minister Lee Kuan Yew and Malaysian head of state Mahathir Bin Mohamad), and some in strong social bonds and the voice of the family and community (especially the kind of society Japan had, at least until 1990). Among the arguments made by authoritarian communitarians is that social order is important to people, while what the West calls "liberty" actually amounts to social, political, and moral anarchy; that curbing legal and political rights is essential for rapid economic development; and that legal and political rights are a Western idea, which the West uses to harshly judge other cultures that have their own inherent values. The extent to which early sociological works, for instance, by Tönnies and *Community and Power* by Robert Nisbet, include authoritarian elements, is open to question.

**Political Theoreticians** . In the 1980s communitarian thinking became largely associated with three scholars: Charles Taylor, Michael Sandel, and Michael Walzer. They criticized liberalism for its failure to realize that people are socially "situated" or contextualized, and its negligence of the greater common good in favor of individualistic self-interests. In addition, as Chandran Kukathas relates in *The Communitarian Challenge to Liberalism* (Paul, Miller, Paul, eds. 1990, p.90), communitarians argue that political community is an important value which is neglected by liberal political theory. Liberalism, they contend, views political society as a supposedly neutral framework of rules within which a diversity of moral traditions coexist. . [Such a view] neglects the fact that people have, or can have, a strong and 'deep' attachment to their societies—to their nations. While for many outside sociology, especially until 1990, these three scholars were considered the founding fathers of communitarian thinking, none of them uses the term in their work, possibly to avoid being confused with authoritarian communitarians. These scholars almost completely ignored sociological work that preceded them, and were largely ignored by sociologists.

## **New or Responsive Communitarians**

Early in 1990, a school of communitarianism was founded in which sociologists played a key role, although it included scholars from other disciplines such as William A. Galston (political theory), Mary Ann Glendon (law), Thomas Spragens, Jr. (political science), and Alan Ehrenhalt (writer) to mention but a few. The group, founded by Amitai Etzioni, took communitarianism from a small and somewhat esoteric academic discipline and introduced it into public life, and recast its academic content. Its tools were The Responsive Communitarian Platform: Rights and Responsibilities, a joint manifesto summarizing the guiding principles of the group; an intellectual quarterly, The Responsive Community, whose editors include several sociologists; several books; position papers on issues ranging from a communitarian view of the family to organ donation and to bicultural education; and numerous public conferences, op-eds.

## **Key Assumptions and Concepts**

Responsive communitarianism methodologically is based on the macro- sociological assumption that societies have multiple and not wholly compatible needs and values, in contrast to philosophies that derive their core assumptions from one overarching principle, for instance liberty for libertarianism. Responsive communitarianism assumes that a "good society" is based on a carefully crafted balance between liberty and social order, between individual rights and social responsibilities, between particularistic (ethnic, racial, communal) and society- wide values and bonds. In that sense, far from representing a Western model, the communitarian good society combines 'Asian' values (also reflecting tenets of Islam and Judaism that stress social responsibilities) with a Western concern with political liberty and individual rights.

While the model of the good society is applicable to all societies, communitarianism stresses that different societies, during various historical periods, may be off balance in rather contrasting ways and hence may need to move in different directions in order to approximate the same balance. Thus, contemporary East Asian societies require much greater tolerance for individual and communal differences, while in the American society—especially at the end of the 1980s—excessive individualism needs to be reigned in. To put it differently, communitarianism suggests that the specific normative directives that flow from the good society model are historically and culturally contingent.

Responsive communitarians stress that the relationship between liberty and social order is not a zero-sum situation; up to a point they are mutually supportive. Thus, in situations such as those prevailing in late-1990s Moscow, where liberty and social order are neglected, increasing order might well also enhance people's autonomy and life choices. The same might be said about reducing crime in American cities when it reached the point where people did not venture into parks, and were reluctant to ride the subway or walk the streets after dark. Moreover, totalitarian regimes, the ultimate loss of freedom, are said to arise when order is minimized.

While up to a point social order and liberty enhance one another, if the level of social order is increased further and further, responsive communitarians expect it to reach a level where it will erode people's liberty. And, if the scope of liberty is extended ever more, it will reach a point where it will undermine the social order. This idea is expressed in the term inverting symbiosis, which indicates that up to a point liberty and order nourish one another, and beyond it they turn antagonistic.

The same point applies to the relationship between the self and the community. Political theorists have tended to depict the self as "encumbered," "situated," or "contextualized," all of which imply that it is constrained by social order. Responsive communitarians stress that individuals within communities are able to be more reasonable and productive than isolated individuals, but if social pressure to conform reaches a high level, such pressures undermine the development and expression of the self.

The next question is: Under what conditions can the zone of symbiosis be expanded, and that of antagonism between liberty and order be minimized? To answer that question the communitarian view of human nature must be introduced. While sociologists tend to avoid this term, on the grounds that it is not testable and can lead to racism (as evident in the notion that some groups of people are more intelligent by nature), communitarians use the term with less reluctance.

The view of human nature most compatible with responsive communitarian thinking is a dynamic (developmental) view, which holds that people at birth are akin to animals. But unlike social conservatives, who tend to embrace a dour view of human nature, and tend to view even adults after socialization as impulsive, irrational, dangerous, or sinful—communitarians maintain that people can become increasingly virtuous if the proper processes of value-internalization and reinforcement of undergirding social institutions, the "moral infrastructure," are in place. At the same time, communitarians do not presume that people can be made as virtuous as liberals assume them to be from the onset. (Liberals tend to assume that crime and forms of deviant behavior reflect social conditions, especially government interventions that pervert good people, rather than criminals' innate nature.)

The moral infrastructure, an essential foundation of a good society, draws on four social formations: families, schools, communities, and the community of communities. The four core elements of the moral infrastructure are arranged like Chinese nesting boxes, one within the other, and in a sociological progression. Infants are born into families, which communitarians stress have been entrusted throughout human history with beginning the process of instilling values and launching the moral self. Schools join the process as children grow older, further developing the moral self ("character"), or trying to remedy character neglect suffered under family care. Schools are hence viewed not merely or even primarily as places of teaching, where the passing of knowledge and skills occur, but as educational institutions in the broadest sense of the term.

Human nature, communitarians note, is such that even if children are reared in families dedicated to child raising and moral education, and children graduate from strong and dedicated schools, these youngsters are still not sufficiently equipped for a good, communitarian society. This is a point ignored by social philosophers who often assume that once people have acquired virtue and are habituated, they will be guided by their inner moral compass. The very concept of "conscience" assumes the formation of a perpetual inner gyroscope.

In contrast, communitarians—following standard sociological positions—assume that the good character of those who have acquired it tends to degrade. If left to their own devices, individuals gradually lose much of their commitments to their values, unless these are continuously reinforced. A major function of the community, as a building block of the moral infrastructure, is to reinforce the character of its members. This is achieved by the community's "moral voice," the informal sanction of others, built into a web of informal affect-laden relationships, which communities provide. In general, the weaker the community—because of high population turnover, few

shared core values, high heterogeneity, etc.—the thinner the social web and the slacker the moral voice. The strength of the moral voice and the values it speaks for have been studied using a series of questions such as, Should one speak up if child abuse is witnessed? Or if children are seen painting swastikas? What about less dire situations, such as insisting that friends wear their seatbelts, or admonishing a nondisabled person one witnesses parking in a handicap space?

Informal surveys show that Americans in the 1980s were very reluctant to raise their moral voice; many accepted the liberal ideology that what is morally sound is to be determined by each individual, and one should not pass judgments over others. Alan Wolfe's study, *One Nation After All*, found that Americans, even in conservative parts of the country, have grown very tolerant of a great variety of social behavior. Increase in tolerance is of course by itself virtuous; communitarians, though, raise the question: At which point does such increased tolerance engendering an amoral culture where spousal abuse, discrimination, child neglect, drunk drivers, obsessive materialism, and other forms of antisocial behavior become matters the community should ignore, leaving them to individual discretion or the law.

More specifically, communitarians inquire various elements of the moral infrastructure whether they reinforce, neglect, or undermine it. In this context, the special communitarian perspective of voluntary associations is especially important. Previously, the significance of these associations has been highlighted as protecting individuals from the state (a protection they would not have if they faced the state as isolated or "atomized" individuals), and as intermediating bodies that aggregate, transmit, and underwrite individual signals to the state.

Communitarians argue that, in addition, the very same voluntary associations often fulfill a rather different role: They serve as social spaces in which members of communities reinforce their social webs and articulate their moral voice. That is, voluntary associations often constitute a basis of communal relationships. Thus, the members of a local chapter of the Masons, Elks, or Lions care about one another and reinforce each other's particular brand of conservative views. Similarly, the members of the New York City Reform Clubs, Americans for Democratic Action, and local chapters of the ACLU reinforce one another's particular brand of liberal views.

Communitarians pay special attention to the condition of public spaces as places communities happen (as distinct from private places like homes and cars). Even though one may carpool with friends or have them over for a visit, these are mainly activities of small friendship groups (what Robert Putnam calls "bowling alone"). Communities need more encompassing webs, and those are formed and reinforced in public gathering places—from school assembly halls to parks, from plazas to promenades. To the extent that these spaces become unsafe, communities lose one of their major sources of reinforcement; recapturing them for community use is hence a major element of community regeneration.

Most important, drawing again on sociology, and particularly on what has been called the "consensus" rather than the "conflict" model, communitarians tend to maintain that if in addition to strong families and schools that build character, a society has communities, where social webs are intact and that moral voice is clearly articulate, that society will be able to base its social order largely on moral commitments rather than the forces of the state. This is the case, communitarians argue, drawing on sociological assumptions and studies, because once moral commitments are internalized and reinforced they help shape people's preferences in favor of prosocial behavior—thus reducing the need for coercion by the state and diminishing the tension between liberty and social

order.

Many discussions of community and of the moral infrastructure stop at this point, having explored the moral agency of family, school, and community. However, social and moral communities are not freestanding; they are often parts of more encompassing social entities. Moreover, communitarians note that unless communities are bound socially and morally into more encompassing entities, they may war with one another. Hence, the importance of communities of communities, the society.

Communitarians argue that one should not view society as composed of millions of individuals, but as pluralism within unity. They further maintain that subcultures and loyalties are not a threat to the integrity of society as long as a core of shared values and institutions (such as the Constitution and its Bill of Rights, the democratic way of life, and mutual tolerance) are respected. Communitarians draw on the four elements of the moral infrastructure—families, schools, communities, and communities of communities—as a sort of a checklist to help determine the state of the moral infrastructure in a given society. They argue that the decline of the two-parent family (due to high divorce rates, growing legitimization of single-parent families, and psychological disinvestment of parents in children), the deterioration of schools (due to automatic promotions and deterioration of social order in schools), the decline of communities (due to modernization), and the decline of the community of communities (as a result of excessive emphasis on diversity without parallel concern over shared bonds) resulted in the decline of moral and social order in the American society during the 1970s and 1980s. This was evidenced by the sharp rise in violent crime, drug abuse, teen pregnancy, and in the decline of voluntarism, among other factors. The fact that some of these trends slowed down and reversed in the 1990s is viewed in part by communitarians as a reflection of changes in social thinking and practices they helped champion.

Here lies a great difference between the communitarian position and that of various religious social conservatives. Both groups recognize the need to regenerate the moral infrastructure, but conservatives favor returning to traditional social formations while communitarians point to new ways of shoring up society's ethical framework. For instance, many social conservatives favor women "graciously submitting to their husbands" and returning to homemaking, while communitarians argue for peer marriage, a concept introduced by Pepper Schwartz. Peer marriage suggests equal rights and responsibilities for mothers and fathers, but favors marriages that last, as compared to the liberal argument that single-parent families or child care centers can socialize children as well if not better than two-parent families. (Among the sociologists who have struck a communitarian position in this matter are Linda Waite, Glen Elder, Alice Rossi, and David Popenoe).

The communitarian argument over the role of communities in maintaining social order is strongly supported by sociological research of the kind conducted by Robert Sampson on the role of communities in fighting crime and drug abuse. David Karp and Todd Clear have also studied community involvement in criminal justice, focusing on ideas of restorative justice and policies that are concerned more with reintegrating offenders into their communities than merely punishing them. Other communitarian themes examined by sociologists include topics explored by Edward W. Lehman, especially his writing on macro-sociology; Martin Whyte's work on the family; and Richard Coughlin's comparison of communitarian thinking to socioeconomics.

## **CIVIL SOCIETY, THE THIRD WAY, AND THE GOOD SOCIETY**

Much of the normative debate in the West, at least since the middle of the nineteenth century, has

focused on the merit of the free market (or capitalism) versus the role of the state in securing the citizens' well-being. Communitarians have basically leapfrogged this debate, focusing instead on the importance of the third element of social life, that of the civic society, which is neither state nor market. Communitarians have played a key role in the debate over the condition of civic society in the West, such as examining whether participation in voluntary associations, voting, and trust in institutions have declined, and to what effect. The work of Robert Bellah and his associates has been particularly influential here, demonstrating the rise of first expressive and then instrumental individualism, and their ill effects.

Communitarians have argued that rather than dumping people (often the most vulnerable members of society) into the marketplace as the welfare state is curtailed, civic society's various institutions can empower these individuals to help one another in attending to some of their social needs. Communal institutions (including places of worship) can shoulder important parts of care previously provided by state agencies, although the state will have to continue to shoulder an important part of the burden. Communitarians stress that mutuality, rather than charity, is the basis for community-wide action that is not solely limited to helping one particular vulnerable group or another. The CPR training of some 400,000 Seattle citizens, who are thus able to help one another without public costs or private charges, is held up as a key case in point. Other examples include voluntary recycling programs, crime watch patrols, and above all the massive assistance given to immigrants by members of their own ethnic group. Communitarians have also pointed to the importance of a culture of civility in maintaining a society's ability to work out differences without excessive conflict.

Communitarians have argued that a civic society is good, but not good enough. Civic society tends to be morally neutral on many matters other than values concerning its own inherent virtue and the attributes citizens need to make them into effective members of a civic society, for instance, to be able to think critically. Thus, all voluntary associations, from the KKK to the Urban League, from militias to Hadassah, are considered to have the same basic standing. In contrast, a good society seeks to promote a core of substantive values, and thus views some social associations and activities as more virtuous than others. In the same vein, communitarians have stressed that while everyone's legal right to free speech should be respected, there is no denying that some speech—seen from the community's viewpoint—is morally sound while other speech is abhorrent. For instance, the (legal) right to speak does not make hate speech (morally) right. Communitarians would not seek to suppress hate speech by legal means, however, but they urge communities to draw on their moral voice to chastise those who speak in ways that are offensive.

## **CRITICS AND RESPONSES**

Critics of responsive communitarianism argue that the concept of community is vague; indeed that the term "community" itself cannot be well defined. In response, community has been defined as a combination of two elements: a) A web of affect-laden relationships among a group of individuals, relationships that often crisscross and reinforce one another (rather than merely one-on-one or chainlike individual relationships) and b) A measure of commitment to a set of shared values, norms, and meanings, and a shared history and identity to a particular culture.

Some critics also contend that the quest for community is anachronistic, that contemporary societies are urban and populations geographically highly mobile, and thus bereft of community. Communitarians respond that communities exist in contemporary societies in small towns, suburbs, campuses and within city neighborhoods, often based on ethnic ties in places such as Korea

Town in Los Angeles, Little Italy in New York City, the Irish section of South Boston, and so on. Moreover, communitarians point out that communities need not be geographic, members can be spread among nonmembers. For instance, homosexual groups often constitute communities even if they are not all neighbors.

Critics maintain that communities are authoritarian and oppressive, and have charged communitarians with seeking "Salem without witches." Communitarians respond that communities vary regarding this assessment. Contemporary communities tend to be relatively freer, given the relative ease of intercommunity mobility as well as shifting loyalties and psychic investments among various groups of which the same person is a member. Critics also maintain that communities are exclusionary, and hence bigoted. Communitarians respond that communities must respect the laws of the society in which they are situated, but do tend to thrive on a measure of homogeneity and on people's desire to be with others of their own kind. Moreover, given the human benefit of community membership, a measure of self-segregation should be tolerated. Critics of responsive communitarianism claim that communitarians ignore matters of power and injustice as well as economic considerations, and are generally inclined to adopt a consensus rather than a conflict model. Communitarians agree that they ought to pay more attention to the effects of these factors on communities. However, they do envision the possibilities of conflict within communities, and responsive communitarians do propose that one should not treat conflict and community as mutually exclusive. Extending this idea to the treatment of diversity and multiculturalism, communitarians argue in favor of a society in which many differences can be celebrated as long as a set of commitments to the overarching society is upheld.

## **VALUES AND VIRTUES**

While sociologists greatly altered and enriched communitarian thinking, communitarian thinking's main contribution to sociology is the challenge of facing issues raised by the moral standing of various values, and the related question of cross-cultural moral judgments. Sociologists tend to treat all values as conceptually equal; a sociologist may refer to racist Afrikaners' beliefs and to humanitarian beliefs using the same "neutral" term, calling both "values." Communitarians use the term virtue to denote that some values (or belief systems) have a higher standing than others because they are compatible with the good society, while other values are not (and hence aberrant).

In the same vein, communitarians do not shy away from passing cross-cultural moral judgments, rejecting cultural relativism's claim that all cultures have basically equal moral standing. Thus, they view female circumcision, sex slaves, and hudud (chopping off the right hand of thieves) as violations of liberty and individual rights, and abandoning children, violating implicit contracts built into communal mutuality, or neglecting the environment, as evidence of a lack of commitment to social order and neglect of social responsibilities.

## **IMPACT**

So far this examination has focused on the place of communitarian thinking in academic, conceptual, theoretical, and imperial works. Responsive communitarians have also been playing a considerable public role, presenting themselves as the founders of a new kind of environmental movement, one dedicated to shoring up society (not the state) rather than nature. Like environmentalism, communitarianism appeals to audiences across the political spectrum, although it has found greater acceptance with some groups rather than others. British Prime Minister Tony Blair is reported to have adopted the communitarian platform, and German Social Democrat Rudolf Scharping has suggested that his party should meet the communitarians "half way." President Bill

Clinton and his wife Hillary Rodham Clinton (author of *It Takes a Village*) have combined communitarian with welfare-liberal themes. Among conservatives, Jack Kemp, a group of Tory members of the British parliament (especially David Willet), and German governor Kurt Biedenkopf are often listed as influenced by communitarianism. While this is only a partial list, it serves to illustrate the scope of communitarianism's influence and its cross over traditional ideological lines.

Communitarian terms have become part of the public vocabulary in the 1990s, especially references to "assuming responsibilities to match rights," while "communitarianism" itself is used much less often. The number of articles about communitarian thinking in the popular press increased twelvefold during the last decade of the twentieth century. The increase in the number of books, articles, and Ph.D. dissertations in academia for the same period, has been about eightfold. Interestingly, taking communitarianism from academia to the "streets" in the early 1990s resulted in the middle and late 1990s into a significant increase in academic interest. In the process, bridges have been built between social philosophers, sociologists, and community members and leaders, although they still sometimes travel on parallel rather than convergent pathways.

## **Communitarianism**

Communitarianism is the idea that human identities are largely shaped by different kinds of constitutive communities (or social relations) and that this conception of human nature should inform our moral and political judgments as well as policies and institutions. We live most of our lives in communities, similar to lions who live in social groups rather than individualistic tigers who live alone most of the time. Those communities shape, and ought to shape, our moral and political judgments and we have a strong obligation to support and nourish the particular communities that provide meaning for our lives, without which we'd be disoriented, deeply lonely, and incapable of informed moral and political judgment.

Communitarian ideas have a long history, in the West, China, and elsewhere, but modern-day communitarianism began in the upper reaches of Anglo-American academia in the form of a critical reaction to John Rawls' landmark 1971 book *A Theory of Justice* (Rawls 1971). Drawing primarily upon the insights of Aristotle and Hegel, political philosophers such as Alasdair MacIntyre, Michael Sandel, Charles Taylor and Michael Walzer disputed Rawls' assumption that the principal task of government is to secure and distribute fairly the liberties and economic resources individuals need to lead freely chosen lives. These critics of liberal theory never did identify themselves with the communitarian movement (the communitarian label was pinned on them by others, usually critics), much less offer a grand communitarian theory as a systematic alternative to liberalism. Nonetheless, certain core arguments meant to contrast with liberalism's devaluation of community recur in the works of the four theorists named above (Avineri & de-Shalit 1992, Bell 1993, Berten et al. 1997, Mulhall & Swift 1996, and Rasmussen 1990), and for purposes of clarity one can distinguish between claims of three sorts: methodological claims about the importance of tradition and social context for moral and political reasoning, ontological or metaphysical claims about the social nature of the self, and normative claims about the value of community.

This essay is therefore divided in three parts, and for each part I present the main communitarian claims, followed by an argument (in each part) that philosophical concerns in the 1980s have largely given way to the political concerns that motivated much of the communitarian critique in the first place.

## **Universalism Versus Particularism**

Communitarians have sought to deflate the universal pretensions of liberal theory. The main target has been Rawls' description of the original position as an "Archimedean point" from which the structure of a social system can be appraised, a position whose special virtue is that it allows us to regard the human condition "from the perspective of eternity", from all social and temporal points of view. Whereas Rawls seemed to present his theory of justice as universally true, communitarians argued that the standards of justice must be found in forms of life and traditions of particular societies and hence can vary from context to context. Alasdair MacIntyre and Charles Taylor argued that moral and political judgment will depend on the language of reasons and the interpretive framework within which agents view their world, hence that it makes no sense to begin the political enterprise by abstracting from the interpretive dimensions of human beliefs, practices, and institutions (Taylor 1985, ch. 1; MacIntyre 1978, chs. 18–22 and 1988, ch. 1; Benhabib 1992, pp. 23–38, 89n4). Michael Walzer developed the additional argument that effective social criticism must derive from and resonate with the habits and traditions of actual people living in specific times and places. Even if there is nothing problematic about a formal procedure of universalizability meant to yield a determinate set of human goods and values, "any such set would have to be considered in terms so abstract that they would be of little use in thinking about particular distributions" (Walzer 1983, 8; Young 1990, 4). In short, liberals who ask what is just by abstracting from particular social contexts are doomed to philosophical incoherence and liberal theorists who adopt this method to persuade people to do the just thing are doomed to political irrelevance.

Rawls has since tried to eliminate the universalist presuppositions from his theory. In *Political Liberalism*, (Rawls 1993) he argues in a communitarian vein that his conception of the person as impartial citizen provides the best account of liberal-democratic political culture and that his political aim is only to work out the rules for consensus in political communities where people are willing to try for consensus. In *The Law of Peoples*, (Rawls 1999) he explicitly allows for the possibility that liberalism may not be exportable at all times and places, sketching a vision of a "decent, well-ordered society" that liberal societies must tolerate in the international realm. Such a society, he argues, need not be democratic, but it must be non-aggressive towards other communities, and internally it must have a "common good conception of justice", a "reasonable consultation hierarchy", and it must secure basic human rights. Having said that, one still gets the sense that the liberal vision laid out in *A Theory of Justice* is the best possible political ideal, one that all rational individuals would want if they were able to choose between the available political alternatives. There may be justifiable non-liberal regimes, but these should be regarded as second best to be tolerated and perhaps respected, not idealized or emulated.

Other liberal theorists have taken a harder line against communitarian concessions, arguing that liberal theory can and should present itself as a universally valid ideal. Brian Barry, for one, opens his widely cited book *Justice as Impartiality* by boldly affirming the universality of his theory: "I continue to believe in the possibility of putting forward a universally valid case in favor of liberal egalitarian principles" (Barry 1995, 3). Barry does recognize that a theory of justice must be anchored in substantive moral considerations, but his normative vision appears to be limited to the values and practices of liberal Western societies. He seems distinctly uninterested in learning anything worthwhile from non-Western political traditions: for example, his discussion of things Chinese is confined to brief criticisms of the Cultural Revolution and the traditional practice of foot-binding. One might consider the reaction to a Chinese intellectual who puts forward a universal theory of justice that draws on the Chinese political tradition for inspiration and completely ignores the history and moral argumentation in Western societies, except for brief criticisms of slavery and imperialism.

Still, it must be conceded that 1980s communitarian theorists were less-than- successful at putting forward attractive visions of non-liberal societies. The communitarian case for pluralism for the need to respect and perhaps learn from non-liberal societies that may be as good as, if not better than, the liberal societies of the West may have been unintentionally undermined by their own use of (counter) examples. In *After Virtue*, Alasdair MacIntyre defended the Aristotelian ideal of the intimate, reciprocating local community bound by shared ends, where people simply assume and fulfill socially given roles (MacIntyre 1984). But this pre-modern *Gemeinschaft* conception of an all-encompassing community that members unreflectively endorse seemed distinctly ill-suited for complex and conflict-ridden large-scale industrialized societies. In *Spheres of Justice*, Michael Walzer pointed to the Indian caste system, “where the social meanings are integrated and hierarchical” (Walzer 1983, 313) as an example of a non-liberal society that may be just according to its own standards. Not surprisingly, few readers were inspired by this example of non-liberal justice (not to mention the fact that many contemporary Indian thinkers view the caste system as an unfortunate legacy of the past that Indians should strive hard to overcome). In short, this use of ill-informed examples may have unintentionally reinforced the view that there are few if any justifiable alternatives to liberalism in modern societies. Communitarians could score some theoretical points by urging liberal thinkers to be cautious about developing universal arguments founded exclusively on the moral argumentation and political experience of Western liberal societies, but few thinkers would really contemplate the possibility of non-liberal practices appropriate for the modern world so long as the alternatives to liberalism consisted of Golden Ages, caste societies, fascism, or actually-existing communism. For the communitarian critique of liberal universalism to have any lasting credibility, thinkers need to provide compelling counter-examples to modern-day liberal-democratic regimes and 1980s communitarians came up short.

By the 1990s, fairly abstract methodological disputes over universalism versus particularism faded from academic prominence, and the debate now centers on the theory and practice of universal human rights. This is largely due to the increased political salience of human rights since the collapse of communism in the former Soviet bloc. On the liberal side, the new, more political voices for liberal universalism have been represented by the likes of Francis Fukuyama, who famously argued that liberal democracy’s triumph over its rivals signifies the end of history (Fukuyama 1992). This view also revived (and provoked) the second wave communitarian critique of liberal universalism and the debate became much more concrete and political in orientation.

Needless to say, the brief moment of liberal euphoria that followed the collapse of the communism in the Soviet bloc has given way to a sober assessment of the difficulties of implementing liberal practices outside the Western world. It is now widely recognized that brutal ethnic warfare, crippling poverty, environmental degradation, and pervasive corruption, to name some of the more obvious troubles afflicting the developing world, pose serious obstacles to the successful establishment and consolidation of liberal democratic political arrangements. But these were seen as unfortunate (hopefully temporary) afflictions that may delay the end of history when liberal democracy has finally triumphed over its rivals. They were not meant to pose a challenge to the ideal of liberal democracy. It was widely assumed that liberal democracy is something that all rational individuals would want if they could get it.

The deeper challenge to Western liberal democracy has emerged from the East Asian region. In the 1990s, the debate revolved around the notion of “Asian values”, a term devised by several Asian officials and their supporters for the purpose of challenging Western-style civil and political

freedoms. Asians, they claim, place special emphasis upon family and social harmony, with the implication that those in the chaotic and crumbling societies of the West should think twice about intervening in Asia for the sake of promoting human rights and democracy. As Singapore's Lee Kuan Yew put it, Asians have "little doubt that a society with communitarian values where the interests of society take precedence over that of the individual suits them better than the individualism of America". Such claims attracted international attention primarily because East Asian leaders seemed to be presiding over what a U.N. human development report called 'the most sustained and widespread development miracle of the twentieth century, perhaps all history'. In 1997–98, however, the East Asian miracle seemed to have collapsed. And it looks like Asian values was one casualty of the crisis.

The political factors that focused attention on the East Asian challenge remain in place, however. East Asian economies did eventually recover. China in particular looks set to become an economic and political heavyweight with the power to seriously challenge the hegemony of Western liberal democratic values in international fora (see Bell 2015). Thus, one hears frequent calls for cross-cultural dialogue between the West and the East designed to understand and perhaps learn from the other side. Failing to take seriously East Asian political perspectives risks widening misunderstandings and setting the stage for hostilities that could have been avoided.

From a theoretical point of view, however, it must be conceded that the official debate on Asian values has not provided much of a challenge to dominant Western political outlooks. The main problem is that the debate has been led by Asian leaders who seem to be motivated primarily by political considerations, rather than by a sincere desire to make a constructive contribution to the debate on universalism versus particularism. Thus, it was easy to dismiss—rightly so, in most cases—the Asian challenge as nothing but a self-serving ploy by government leaders to justify their authoritarian rule in the face of increasing demands for democracy at home and abroad.

Still, it would be a mistake to assume that nothing of theoretical significance has emerged from East Asia. The debate on Asian values has also prompted critical intellectuals in the region to reflect on how they can locate themselves in a debate on human rights and democracy in which they had not previously played a substantial part. Neither wholly rejecting nor wholly endorsing the values and practices ordinarily realized through a liberal democratic political regime, these intellectuals are drawing on their own cultural traditions and exploring areas of commonality and difference with the West. Though often less provocative than the views of their governments in the sense that few argue for the wholesale rejection of Western-style liberal democracy with an East Asian alternative these unofficial East Asian viewpoints may offer more lasting contributions to the debate. Let me (briefly) note three relatively persuasive East Asian arguments for cultural particularism that contrast with traditional Western arguments for liberal universalism:

1. Cultural factors can affect the prioritizing of rights, and this matters when rights conflict and it must be decided which one to sacrifice. In other words, different societies may rank rights differently, and even if they face a similar set of disagreeable circumstances they may come to different conclusions about the right that needs to be curtailed. For example, U.S. citizens may be more willing to sacrifice a social or economic right in cases of conflict with a civil or political right: if neither the constitution nor a majority of democratically elected representatives support universal access to health care, then the right to health care regardless of income can be curtailed. In contrast, the Chinese may be more willing to sacrifice a civil or political liberty in cas-

es of conflict with a social or economic right: there may be wide support for restrictions on the right to form independent labor associations if they are necessary to provide the conditions for economic development. Different priorities assigned to rights can also matter when it must be decided how to spend scarce resources. For example, East Asian societies with a Confucian heritage will place great emphasis upon the value of education, and they may help to explain the large amount of spending on education compared to other societies with similar levels of economic development.

2. Cultural factors can affect the justification of rights. In line with the arguments of “1980s communitarians” such as Michael Walzer, it is argued that justifications for particular practices valued by Western-style liberal democrats should not be made by relying on the abstract and unhistorical universalism that often disables Western liberal democrats. Rather, they should be made from the inside, from specific examples and argumentative strategies that East Asians themselves use in everyday moral and political debate. For example, the moral language (shared even by some local critics of authoritarianism) tends to appeal to the value of community in East Asia, and this is relevant for social critics concerned with practical effect. One such communitarian argument is that democratic rights in Singapore can be justified on the grounds that they contribute to strengthening ties to such communities as the family and the nation.
3. Cultural factors can provide moral foundations for distinctive political practices and institutions (or at least different from those found in Western-style liberal democracies). In East Asian societies influenced by Confucianism, for example, it is widely held that children have a profound duty to care for elderly parents, a duty to be forsaken only in the most exceptional circumstances.<sup>[7]</sup> In political practice, it means that East Asian governments have an obligation to provide the social and economic conditions that facilitate the realization of this duty. Political debate tends to center on the question of whether the right to filial piety is best realized by means of a law that makes it mandatory for children to provide financial support for elderly parents as in mainland China, Japan, and Singapore or whether the state should rely more on indirect methods such as tax breaks and housing benefits that simply make at-home care for the elderly easier, as in Korea and Hong Kong. But the argument that there is a pressing need to secure this duty in East Asia is not a matter of political controversy.

Thinkers influenced by East Asian cultural traditions such as Confucianism have also argued for distinctive as-yet-unrealized political practices and institutions that draw on widely-held cultural values for inspiration. For example, the Chinese thinker Jiang Qing has argued for a tricameral legislature appropriate for the Chinese context, with a meritocratic “House of Exemplary Persons” and a “House of Cultural Continuity” that would complement and balance a democratic legislature (Jiang 2012). Korean scholars Hahm Chaihark and Jongryn Mo argue for the need to revive and adapt for the contemporary era such Choson dynasty institutions as policy lectures and the Confucian censorate, traditional institutions that played the role of monitoring the dealings of the Emperor (Hahm (Chaihark) 2003, Mo 2003, Bell 2000, ch. 5).

In contrast to 1980s communitarian thinkers, East Asian critics of liberal universalism have succeeded in pointing to particular non-liberal practices and institutions that may be appropriate for the contemporary world. Some of these may be appropriate only for societies with a Confucian heritage, others may also offer insights for mitigating the excesses of liberal modernity in the West. What cannot be denied is that they have carried forward the debate beyond the implausible

alternatives to liberalism offered by 1980s communitarian thinkers.

It is worth emphasizing, however, that contemporary communitarians have not been merely defending parochial attachments to particular non-liberal moralities. Far from arguing that the universalist discourse on human rights should be entirely displaced with particular, tradition-sensitive political language, they have criticized liberals for not taking universality seriously enough, for failing to do what must be done to make human rights a truly universal ideal. These communitarians—let us label them the “cosmopolitan critics of liberal universalism”—have suggested various means of improving the philosophical coherence and political appeal of human rights.

In fact, there is little debate over the desirability of a core set of human rights, such as prohibitions against slavery, genocide, murder, torture, prolonged arbitrary detention, and systematic racial discrimination. These rights have become part of international customary law, and they are not contested in the public rhetoric of the international arena. Of course many gross violations occur off the record, and human rights groups such as Amnesty International have the task of exposing the gap between public allegiance to rights and the sad reality of ongoing abuse. This is largely practical work, however. There is not much point writing about or deliberating about the desirability of practices that everyone condemns at the level of principle.

But political thinkers and activists around the world can and do take different sides on many pressing human rights concerns that fall outside what Walzer terms the “minimal and universal moral code” (Walzer 1987, 24; Walzer 1994). This gray area of debate includes criminal law, family law, women’s rights, social and economic rights, the rights of indigenous peoples, and the attempt to universalize Western-style democratic practices. The question is: how can the current thin list of universal human rights be expanded to include some of these contested rights?

Charles Taylor has put forward the following proposal (Taylor 1999). He imagines a cross-cultural dialogue between representatives of different traditions. Rather than argue for the universal validity of their views, however, he suggests that participants should allow for the possibility that their own beliefs may be mistaken. This way, participants can learn from each others’ “moral universe”. There will come a point, however, when differences cannot be reconciled. Taylor explicitly recognizes that different groups, countries, religious communities, and civilizations hold incompatible fundamental views on theology, metaphysics, and human nature. In response, Taylor argues that a “genuine, unforced consensus” on human rights norms is possible only if we allow for disagreement on the ultimate justifications of those norms. Instead of defending contested foundational values when we encounter points of resistance (and thus condemning the values we do not like in other societies), we should try to abstract from those beliefs for the purpose of working out an “overlapping consensus” (to borrow from Rawls’s 1993 terminology) of human rights norms. As Taylor puts it, “we would agree on the norms while disagreeing on why they were the right norms, and we would be content to live in this consensus, undisturbed by the differences of profound underlying belief” (Taylor 1999, 124).

While Taylor’s proposal moves the debate on universal human rights forward, it still faces certain difficulties. For one thing, it may not be realistic to expect that people will be willing to abstract from the values they care deeply about during the course of a global dialogue on human rights. Even if people agree to abstract from culturally specific ways of justifying and implementing norms, the likely outcome is a withdrawal to a highly general, abstract realm of agreement that fails to resolve actual disputes over contested rights. For example, participants in a cross-cultural

dialogue can agree on the right not to be subject to cruel and unusual punishment while radically disagreeing upon what this means in practice—a committed Muslim can argue that theft can justifiably be punished by amputation of the right hand, whereas a Western liberal will want to label this an example of cruel and unusual punishment.

As we have seen, the debate on universalism versus particularism has moved from fairly abstract methodological disputes between Anglo-American philosophers to relatively concrete international political disputes between philosophers, social scientists, government officials, and NGO activists. The distinctive communitarian contribution has been to cast doubt on universal theories grounded exclusively in the liberal moralities of the Western world, on the grounds that cultural particularity should both make one sensitive to the possibility of justifiable areas of difference between the West and the rest and to the need for more cross-cultural dialogue for the purpose of improving the current thin human rights regime. Various contributions from East Asia and elsewhere have given some meat to these challenges to liberal universalism. In any case, let us now turn to the second main area of controversy between liberals and communitarians—the debate over the self that has similarly moved from philosophy to politics.

## THE COMMUNITARIAN CRITIQUE OF LIBERALISM

- I. Intellectual fashions are notoriously short-lived, very much like fashions in popular music, art, or dress. But there are certain fashions that seem regularly to reappear. Like pleated trousers or short skirts, they are inconstant features of a larger and more steadily prevailing phenomenon - in this case, a certain way of dressing. They have brief but recurrent lives; we know their transience and expect their return. Needless to say, there is no afterlife in which trousers will be permanently pleated or skirts forever short. Recurrence is all. Although it operates at a much higher level (an infinitely higher level?) of cultural significance, the communitarian critique of liberalism is like the pleating of trousers: transient but certain to return. It is a consistently intermittent feature of liberal politics and social organization. No liberal success will make it permanently unattractive. At the same time, no communitarian critique, however penetrating, will ever be anything more than an inconstant feature of liberalism. Someday, perhaps, there will be a larger transformation, like the shift from aristocratic knee-breeches to plebian pants, rendering liberalism and its critics alike irrelevant. But I see no present signs of anything like that, nor am I sure that we should look forward to it. For now, there is much to be said for a recurrent critique, whose protagonists hope only for small victories, partial incorporations, and when they are rebuffed or dismissed or coopted, fade away for a time only to return. Communitarianism is usefully contrasted with social democracy, which has succeeded in establishing a permanent presence alongside of and some times conjoined with liberal politics. Social democracy has its own intermittently fashionable critics, largely anarchist and libertarian in character. Since it sponsors certain sorts of communal identification, it is less subject to communitarian criticism than liberalism is. But it can never escape such criticism entirely, for liberals and social democrats alike share a commitment to economic growth and cope (although in different ways) with the deracinated social forms that growth produces. Community itself is largely an ideological presence in modern society; it has no recurrent critics of its own. It is intermittently fashionable only because it no longer exists in anything like full strength, and it is criticized only when it is fashionable. The communitarian critique is nonetheless a powerful one; it would not recur if it were not capable of engaging our minds and feelings. In this essay, I want to investigate the power of its current American versions and then offer a version of my own -less power-

ful, perhaps, than the ones with which I shall begin, but more available for incorporation within liberal (or social democratic) politics. I do not mean (I hardly have the capacity) to lay communitarianism to rest, although I would willingly wait for its reappearance in a form more coherent and incisive than that in which it currently appears. The problem with communitarian criticism today - I am not the first to notice this - is that it suggests two different, and deeply contradictory, arguments against liberalism. One of these arguments aimed primarily at liberal practice, the other primarily at liberal theory, but they cannot both be right. It is possible that each one is partly right - indeed, I shall insist on just this partial validity - but each of the arguments is right in a way that undercuts the value of the other.

- II. The first argument holds that liberal political theory accurately represents liberal social practice. As if the Marxist account of ideological reflection were literally true, and exemplified here, contemporary Western societies (American society especially) are taken to be the home of radically isolated individuals, rational egotists, and existential agents, men and women protected and divided by their inalienable rights. Liberalism tells the truth about the asocial society that liberals create - not, in fact, *ex nihilo* as their theory suggests, but in a struggle against traditions and communities and authorities that are forgotten as soon as they are escaped, so that liberal practices seem to have no history. The struggle itself is ritually celebrated but rarely reflected on. The members of liberal society share no political or religious traditions they can tell only one story about themselves and that is the story of *ex nihilo* creation, which begins in the state of nature or the original position. Each individual imagines himself absolutely free, unencumbered, and on his own - and enters society, accepting its obligations, only in order to minimize his risks. His goal is security, and security is, as Marx wrote, "the assurance of his egoism." And as he imagines himself, so he really is, that is, an individual separated from the community, withdrawn into himself, wholly preoccupied with his private interest and acting in accordance with his private caprice.... The only bond between men is natural necessity, need, and private interest. (I have used masculine pronouns in order to fit my sentences to Marx's. But it is an interesting question, not addressed here, whether this first communitarian critique speaks to the experience of women: Are necessity and private interest their only bonds with one another?) The writings of the young Marx represent one of the early appearances of communitarian criticism, and his argument, first made in the 1840s, is powerfully present today. Alastair MacIntyre's description of the incoherence of modern intellectual and cultural life and the loss of narrative capacity makes a similar point in updated, state-of-the-art, theoretical language.<sup>2</sup> But the only theory that is necessary to the communitarian critique of liberalism is liberalism itself. All that the critics have to do, so they say, is to take liberal theory seriously. The self-portrait of the individual constituted only by his willfulness, liberated from all connection, without common values, binding ties, customs, or traditions - sans eyes, sans teeth, sans taste, sans everything - need only be evoked in order to be devalued: It is already the concrete absence of value. What can the real life of such a person be like? Imagine him maximizing his utilities, and society is turned into a war of all against all, the familiar rat race, in which, as Hobbes wrote, there is "no other goal, nor other garland, but being foremost."<sup>3</sup> Imagine him enjoying his rights, and society is reduced to the coexistence of isolated selves, for liberal rights, according to this first critique, have more to do with "exit" than with "voice."<sup>4</sup> They are concretely expressed in separation, divorce, withdrawal, solitude, privacy, and political apathy. And finally, the very fact that individual life can be described in these two philosophical languages, the language of utilities and the language of rights, is a further mark, says MacIntyre, of its

incoherence: Men and women in liberal society no longer have access to a single moral culture within which they can learn how they ought to live.' There is no consensus, no public meeting-of-minds, on the nature of the good life, hence the triumph of private caprice, revealed, for example, in Sartrean existentialism, the ideological reflection of everyday capriciousness. We liberals are free to choose, and we have a right to choose, but we have no criteria to govern our choices except our own wayward understanding of our wayward interests and desires. And so our choices lack the qualities of cohesion and consecutiveness. We can hardly remember what we did yesterday; we cannot with any assurance predict what we will do tomorrow. We cannot give a proper account of ourselves. We cannot sit together and tell comprehensible stories, and we recognize ourselves in the stories we read only when these are fragmented narratives, without plots, the literary equivalent of atonal music and nonrepresentational art. Liberal society, seen in the light of this first communitarian critique, is fragmentation in practice; and community is the exact opposite, the home of coherence, connection, and narrative capacity. But I am less concerned here with the different accounts that might be provided of this lost Eden than I am with the repeated insistence on the reality of fragmentation after the loss. This is the common theme of all contemporary communitarianisms: neoconservative lamentation, neo-Marxist indictment, and neoclassical or republican hand-wringing. (The need for the prefix "neo" suggests again the intermittent or recurrent character of communitarian criticism.) I should think it would be an awkward theme, for if the sociological argument of liberal theory is right, if society is actually decomposed, without residue, into the problematic coexistence of individuals, then we might well assume that liberal politics is the best way to deal with the problems of decomposition. If we have to create an artificial and ahistorical union out of a multitude of isolated selves, why not take the state of nature or the original position as our conceptual starting point? Why not accept, in standard liberal fashion, the priority of procedural justice over substantive conceptions of the good, since we can hardly expect, given our fragmentation, to agree about the good? Michael Sandel asks whether a community of those who put justice first can ever be more than a community of strangers.<sup>6</sup> The question is a good one, but its reverse form is more immediately relevant: If we really are a community of strangers, how can we do anything else but put justice first?

- III. We are saved from this entirely plausible line of argument by the second communitarian critique of liberalism. The second critique holds that liberal theory radically misrepresents real life. The world is not like that nor could it be. Men and women cut loose from all social ties, literally unencumbered, each one the one and only inventor of his or her own life, with no criteria, common standards, to guide the invention - these are mythical figures. How can any group of people be strangers to one another when each member of the group is born with parents, and when these parents have friends, relatives, neighbors, comrades at work, coreligionists, and fellow citizens - connections, in fact, which are not so much chosen as passed on and inherited? Liberalism may well enhance the significance of purely contractual ties, but it is obviously false to suggest, as Hobbes sometimes seemed to do, that all our connections are mere "market friendships," voluntarist and self-interested in character, which cannot outlast the advantages they bring. It is in the very nature of a human society that individuals bred within it will find themselves caught up in patterns of relationship, networks of power, and communities of meaning. That quality of being caught up is what makes them persons of a certain sort. And only then can they make themselves persons of a (marginally) different sort by reflecting on what they are and by acting in more or less distinctive ways within the patterns, networks, and communities that are willy-nilly theirs. The

burden of the second critique is that the deep structure even of liberal society is in fact communitarian. Liberal theory distorts this reality and, insofar as we adopt the theory, deprives us of any ready access to our own experience of communal embeddedness. The rhetoric of liberalism -this is the argument of the authors of *Habits of the Heart* - limits our understanding of our own heart's habits, and gives us no way to formulate the convictions that hold us together as persons and that bind persons together into a community. The assumption here is that we are in fact persons and that we are in fact bound together. The liberal ideology of separatism cannot take personhood and bondedness away from us. What it does take away is the sense of our personhood and bondedness, and this deprivation is then reflected in liberal politics. It explains our inability to form cohesive solidarities, stable movements and parties, that might make our deep convictions visible and effective in the world. It also explains our radical dependence (brilliantly foreshadowed in Hobbes's *Leviathan*) on the central state. But how are we to understand this extraordinary disjunction between communal experience and liberal ideology, between personal conviction and public rhetoric, and between social bondedness and political isolation? That question is not addressed by communitarian critics of the second sort. If the first critique depends on a vulgar Marxist theory of reflection, the second critique requires an equally vulgar idealism. Liberal theory now seems to have a power over and against real life that has been granted to few theories in human history. Plainly, it has not been granted to communitarian theory, which cannot, on the first argument, overcome the reality of liberal separatism and cannot, on the second argument, evoke the already existing structures of social connection. In any case, the two critical arguments are mutually inconsistent; they cannot both be true. Liberal separatism either represents or misrepresents the conditions of everyday life. It might, of course, do a little of each - the usual muddle - but that is not a satisfactory conclusion from a communitarian standpoint. For if the account of dissociation and separatism is even partly right, then we have to raise questions about the depth, so to speak, of the deep structure. And if we are all to some degree communitarians under the skin, then the portrait of social incoherence loses its critical force.

**IV.** But each of the two critical arguments is partly right. I will try to say what is right about each, and then ask if something plausible can be made of the parts. First, then, there cannot be much doubt that we (in the United States) live in a society where individuals are relatively dissociated and separated from one another, or better, where they are continually separating from one another-continually in motion, often in solitary and apparently random motion, as if in imitation of what physicists call Brownian movement. Hence we live in a profoundly unsettled society. We can best see the forms of unsettlement if we track the most important moves. So, consider (imitating the Chinese style) the Four Mobilities:

1. Geographic mobility. Americans apparently change their residence more often than any people in history, at least since the barbarian migrations, excluding only nomadic tribes and families caught up in civil or foreign wars. Moving people and their possessions from one city or town to another is a major industry in the United States, even though many people manage to move themselves. In another sense, of course, we are all self-moved, not refugees but voluntary migrants. The sense of place must be greatly weakened by this extensive geographic mobility, although I find it hard to say whether it is superseded by mere insensitivity or by a new sense of many places. Either way, communitarian feeling seems likely to decline in importance. Communities are more than just locations, but they are most often successful when they are permanently located.

2. Social mobility. This article will not address the arguments about how best to describe social standing or how to measure changes, whether by income, education, class membership, or rank in the status hierarchy. It is enough to say that fewer Americans stand exactly where their parents stood or do what they did than in any society for which we have comparable knowledge. Americans may inherit many things from their parents, but the extent to which they make a different life, if only by making a different living, means that the inheritance of community, that is, the passing on of beliefs and customs, is uncertain at best. Whether or not children are thereby robbed of narrative capacity, they seem likely to tell different stories than their parents told.
  
3. Marital mobility. Rates of separation, divorce, and remarriage are higher today than they have ever been in our own society and probably higher than they have ever been in any other (except perhaps among Roman aristocrats, although I know of no statistics from that time, only anecdotes). The first two mobilities, geographic and social, also disrupt family life, so that siblings, for example, often live at great distances from one another, and later as uncles and aunts, they are far removed from nephews and nieces. But what we call "broken homes" are the product of marital breaks, of husbands or wives moving out - and then, commonly, moving on to new partners. Insofar as home is the first community and the first school of ethnic identity and religious conviction, this kind of breakage must have countercommunitarian consequences. It means that children often do not hear continuous or identical stories from the adults with whom they live. (Did the greater number of children ever hear such stories? The death of one spouse and the remarriage of the other may once have been as common as divorce and remarriage are today. But, then, other sorts of mobility have to be considered: Both men and women are more likely today to marry across class, ethnic, and religious lines; remarriage will therefore often produce extraordinarily complex and socially diverse families - which probably are without historical precedent.)
  
4. Political mobility. Loyalty to leaders, movements, parties, clubs, and urban machines seems to decline rapidly as place and social standing and family membership become less central in the shaping of personal identity. Liberal citizens stand outside all political organizations and then choose the one that best serves their ideals or interests. They are, ideally, independent voters, that is, people who move around; they choose for themselves rather than voting as their parents did, and they choose freshly each time rather than repeating themselves. As their numbers increase, they make for a volatile electorate and hence for institutional instability, particularly at the local level where political organization once served to reinforce communal ties.

The effects of the Four Mobilities are intensified in a variety of ways by other social developments which we are likely to talk about in the common metaphor of movement: the advance of knowledge, technological progress, and so on. But I am concerned here only with the actual movement of individuals. Liberalism is, most simply, the theoretical endorsement and justification of this movement.<sup>9</sup> In the liberal view, then, the Four Mobilities represent the enactment of liberty, and the pursuit of (private or personal) happiness. And it has to be said that, conceived in this way, liberalism is a genuinely popular creed. Any effort to curtail mobility in the four areas described here would require a massive and harsh application of state power. Nevertheless, this popularity has an underside of sadness and discontent that are intermittently articulated, and communitarianism is, most simply, the intermittent articulation of these feelings. It reflects a sense of loss, and the loss is real. People do not always leave their old neighborhoods or hometowns willingly or happily.

Moving may be a personal adventure in our standard cultural mythologies, but it is as often a family trauma in real life.

The same thing is true of social mobility, which carries people down as well as up and requires adjustments that are never easy to manage. Marital breaks may sometimes give rise to new and stronger unions, but they also pile up what we might think of as family fragments: single-parent households, separated and lonely men and women, and abandoned children. And independence in politics is often a not-so-splendid isolation: Individuals with opinions are cut loose from groups with programs. The result is a decline in "the sense of efficacy," with accompanying effects on commitment and morale. All in all, we liberals probably

know one another less well, and with less assurance, than people once did, although we may see more aspects of the other than they saw, and recognize in him or her a wider range of possibilities (including the possibility of moving on). We are more often alone than people once were, being without neighbors we can count on, relatives who live nearby or with whom we are close, or comrades at work or in the movement.

This is the truth of the first communitarian argument. We must now fix the limits of this truth by seeking what is true in the second argument. In its easiest version, the second argument - that we are really, at bottom, creatures of community - is certainly true but of uncertain significance. The ties of place, class or status, family, and even politics survive the Four Mobilities to a remarkable extent. To take just one example, from the last of the Four: It remains true, even today in this most liberal and mobile of societies, that the best predictor of how people will vote is our knowledge of how their parents voted.<sup>10</sup> All those dutifully imitative young Republicans and Democrats testify to the failure of liberalism to make independence or waywardness of mind the distinctive mark of its adherents.

The predictive value of parental behavior holds even for independent voters: They are simply the heirs of independence. But we do not know to what extent inheritances of this sort are a dwindling communal resource; it may be that each generation passes on less than it received. The full liberalization of the social order, the production and reproduction of self-inventing individuals, may take a long time, much longer, indeed, than liberals themselves expected. There is not much comfort here for communitarian critics, however; while they can recognize and value the survival of older ways of life, they cannot count on, and they must have anxieties about, the vitality of those ways. But there is another approach to the truth of the second critical argument. Whatever the extent of the Four Mobilities, they do not seem to move us so far apart that we can no longer talk with one another. We often disagree, of course, but we disagree in mutually comprehensible ways. I should think it fairly obvious that the philosophical controversies that MacIntyre laments community. For there is no imaginable community that would not be alien to the eternally transgressive self. If the ties that bind us together do not bind us, there can be no such thing as a community. If it is anything at all, communitarianism is antithetical to transgression. And the transgressive self is antithetical even to the liberal community which is its creator and sponsor.<sup>1</sup>

Liberalism is a self-subverting doctrine; for that reason, it really does require periodic communitarian correction. But it is not a particularly helpful form of correction to suggest that liberalism is literally incoherent or that it can be replaced by some preliberal or antiliberal community waiting somehow just beneath the surface or just beyond the horizon. Nothing is waiting; American communitarians

have to recognize that there is no one out there but separated, rights-bearing, voluntarily associating, freely speaking, liberal selves. It would be a good thing, though, if we could teach those selves to know themselves as social beings, the historical products of, and in part the embodiments of, liberal values. For the communitarian correction of liberalism cannot be anything other than a selective reinforcement of those same values or, to appropriate the well-known phrase of Michael Oakeshott, a pursuit of the intimations of community within them.

V. The place to begin the pursuit is with the liberal idea of voluntary association, which is not well-understood, it seems to me, either among liberals or among their communitarian critics. In both its theory and its practice, liberalism expresses strong associative tendencies alongside its dissociative tendencies: Its protagonists form groups as well as split off from the groups they form; they join up and resign, marry and divorce. Nevertheless, it is a mistake, and a characteristically liberal mistake, to think that the existing patterns of association are entirely or even largely voluntary and contractual, that is, the product of will alone. In a liberal society, as in every other society, people are born into very important sorts of groups, born with identities, male or female, for example, working class, Catholic or Jewish, black, democrat, and so on. Many of their subsequent associations (like their subsequent careers) merely express these

underlying identities, which, again, are not so much chosen as enacted."4 Liberalism is distinguished less by the freedom to form groups on the basis of these identities than the freedom to leave the groups and sometimes even the identities behind. Association is always at risk in a liberal society. The boundaries of the group are not policed; people come and go, or they just fade into the distance without ever quite acknowledging that they have left. That is why liberalism is plagued by free-rider problems - by people who continue to enjoy the benefits of membership and identity while no longer participating in the activities that produce those benefits." Communitarianism, by contrast, is the dream of a perfect free-riderlessness.

At its best, the liberal society is the social union of social unions that John Rawls described: a pluralism of groups bonded by shared ideas of toleration and democracy.<sup>6</sup> But if all the groups are precarious, continually on the brink of dissolution or abandonment, then the larger union must also be weak and vulnerable. Or, alternatively, its leaders and officials will be driven to compensate for the failures of association elsewhere by strengthening their own union, that is, the central state, beyond the limits that liberalism has established. These limits are best expressed in terms of individual rights and civil liberties, but they also include a prescription for state neutrality. The good life is pursued by individuals, sponsored by groups; the state presides over the pursuit and the sponsorship but does not participate in either. Presiding is singular in character; pursuing and sponsoring are plural. Hence it is a critical question for liberal theory and practice whether the associative passions and energies of ordinary people are likely over the long haul to survive the Four Mobilities and prove themselves sufficient to the requirements of pluralism. There is at least some evidence that they will not prove sufficient without a little help. But, to repeat an old question, whence cometh our help? A few of the existing social unions live in the expectation of divine assistance. For the rest, we can only help one another, and the agency through which help of that sort comes most expeditiously is the state.

But what kind of a state is it that fosters associative activities? What kind of a social union is it that includes without incorporating a great and discordant variety of social unions? Obviously, it is a liberal state and social union; any other kind is too dangerous for communities and individuals alike. It would be an odd enterprise to argue in the name of communitarianism for an alternative

state, for that would be to argue against our own political traditions and to repudiate whatever community we already have. But the communitarian correction does require a liberal state of a certain sort, conceptually though not historically unusual: a state that is, at least over some part of the terrain of sovereignty, deliberately nonneutral. The standard liberal argument for neutrality is an induction from social fragmentation. Since dissociated individuals will never agree on the good life, the state must allow them to live as they think best, subject only to John Stuart Mill's harm principle, without endorsing or sponsoring any particular understanding of what "best" means.

But there is a problem here: The more dissociated individuals are, the stronger the state is likely to be, since it will be the only or the most important social union. And then membership in the state, the only good that is shared by all individuals, may well come to seem the good that is "best." This is only to repeat the first communitarian critique, and it invites a response like the second critique: that the state is not in fact the only or even, for ordinary people in their everyday lives, the most important social union. All sorts of other groups continue to exist and to give shape and purpose to the lives of their members, despite the triumph of individual rights, the Four Mobilities in which that triumph is manifest, and the free-riding that it makes possible. But these groups are continually at risk. And so the state, if it is to remain a liberal state, must endorse and sponsor some of them, namely, those that seem most likely to provide shapes and purposes congenial to the shared values of a liberal society.'

No doubt, there are problems here too, and I do not mean to deny their difficulty. But I see no way to avoid some such formulation - and not only for theoretical reasons. The actual history of the best liberal states, as of the best social democratic states (and these tend increasingly to be the same states), suggest that they behave in exactly this way, although often very inadequately.

Three relatively familiar examples of state behavior of this kind. First, the Wagner Act of the 1930s: This was not a standard liberal law, hindering the hindrances to union organization, for it actively fostered union organization, and it did so precisely by solving the free-rider problem. By requiring collective bargaining whenever there was majority support (but not necessarily unanimous support) for the union, and then by allowing union shops, the Wagner Act sponsored the creation of strong unions capable, at least to some degree, of determining the shape of industrial relations."

Of course, there could not be strong unions without working class solidarity; unionization is parasitic on underlying communities of feeling and belief. But those underlying communities were already being eroded by the Four Mobilities when the Wagner Act was passed, and so the Act served to counter the dissociative tendencies of liberal society. It was nevertheless a liberal law, for the unions that it helped create enhanced the lives of individual workers and were subject to dissolution and abandonment in accordance with liberal principles should they ever cease to do that. The second example is the use of tax exemptions and matching grants of tax money to enable different religious groups to run extensive systems of day-care centers, nursing homes, hospitals, and so on - welfare societies inside the welfare state. I do not pretend that these private and pluralist societies compensate for the shoddiness of the American welfare state. But they do improve the delivery of services by making it a more immediate function of communal solidarity.

The state's role here, beside establishing minimal standards, is to abate, since in this case it cannot entirely solve the free-rider problem. If some number of men and women end up in a Catholic nursing home, even though they never contributed to a Catholic charity, they will at least have paid their taxes. But why not nationalize the entire welfare system and end free-ridership? The liberal response is that the social union of social unions must always operate at two levels: A welfare system run entirely by private, nonprofit associations would be dangerously inadequate and inequitable.

ble in its coverage; and a totally nationalized system would deny expression to local and particularist solidarities.<sup>9</sup> The third example is the passage of plant-closing laws designed to afford some protection to local communities of work and residence. Inhabitants are insulated, although only for a time, against market pressure to move out of their old neighborhoods and search for work elsewhere. Although the market "needs" a highly mobile work force, the state takes other needs into account, not only in a welfarist way (through unemployment insurance and job retraining programs) but also in a communitarian way.

But the state is not similarly committed to the preservation of every neighborhood community. It is entirely neutral toward communities of ethnicity and residence, offering no protection against strangers who want to move in. Here, geographic mobility remains a positive value, one of the rights of citizens. Unions, religious organizations, and neighborhoods each draw on feelings and beliefs that, in principle if not always in history, predate the emergence of the liberal state. How strong these feelings and beliefs are, and what their survival value is, I cannot say. Have the unions established such a grip on the imaginations of their members as to make for good stories? There are some good stories, first told, then retold, and sometimes even re-enacted. But the narrative line does not seem sufficiently compelling to younger workers to sustain anything like the old working class solidarity. Nor is it sufficient for a religious organization to provide life cycle services for its members if they are no longer interested in its religious services. Nor are neighborhoods proof for long against market pressure. Still, communal feeling and belief seem considerably more stable than we once thought they would be, and the proliferation of secondary associations in liberal society is remarkable - even if many of them have short lives and transient memberships. One has a sense of people working together and trying to cope, and not, as the first communitarian critique suggests, just getting by on their own, by themselves, one by one.

**VI.** A good liberal (or social democratic) state enhances the possibilities for cooperative coping. John Dewey provided a useful account of such a state in *The Public and Its Problems*. Published in 1927, the book is a commentary on and a partial endorsement of an earlier round of communitarian criticism. Dewey shared with the critics of his time, who called themselves "pluralists," an uneasiness with the sovereign state, but he was not quite as uneasy as most of them were. He also shared an admiration for what he called "primary groupings" within the state, but he was more inclined than the pluralists were to qualify his admiration. Primary groupings, he wrote, are "good, bad, and indifferent," and they cannot by their mere existence fix the limits of state activity. The state is not "only an umpire to avert and remedy trespasses of one group upon another." It has a larger function: "It renders the desirable association solid and more coherent. It places a discount upon injurious groupings and renders their tenure of life precarious . . . [and] it gives the individual members of valued associations greater liberty and security; it relieves them of hampering conditions. It enables individual members to count with reasonable certainty upon what others will do."

These may seem like tasks too extensive for a liberal state, but they are constrained by the constitutional establishment of individual rights - which are themselves (on the pragmatic understanding) not so much recognitions of what individuals by nature are or have as expressions of hope about what they will be and do. Unless individuals act together in certain ways, state action of the sort that Dewey recommended cannot get started. When we recognize the "right of the citizens peacefully to assemble," for example, we are hoping for assemblies of citizens. If we then discriminate among such assemblies, we do so on limited grounds, fostering only those that really do express communities of feeling and belief and do not violate liberal principles of association. It is often ar-

gued these days that the non neutral state, whose activities I have made some attempt to justify, is best understood in republican terms. A revival of neoclassical republicanism provides much of the substance of contemporary communitarian politics. The revival, I have to say, is largely academic; unlike other versions of communitarianism in Dewey's time and ours, it has no external reference. There really are unions, churches, and neighborhoods in American society, but there are virtually no examples of republican association and no movement or party aimed at promoting such association. Dewey would

probably not recognize his "public," nor Rawls his "social union," as versions of republicanism, if only because in both these cases, energy and commitment have been drained from the singular and narrowly political association to the more various associations of civil society. Republicanism by contrast is an integrated and unitary doctrine in which energy and commitment are focused primarily on the political realm. It is a doctrine adapted (in both its classical and neoclassical forms) to the needs of small, homogeneous communities, where civil society is radically undifferentiated. Perhaps the doctrine can be extended to account for a "republic of republics," a decentralized and participatory revision of liberal democracy. A considerable strengthening of local governments would then be required in the hope of encouraging the development and display of civic virtue in a pluralist variety of social settings. This indeed is a pursuit of the intimations of community within liberalism, for it has more to do with John Stuart Mill than with Rousseau. Now we are to imagine the nonneutral state empowering cities, towns, and boroughs; fostering neighborhood committees and review boards; and always on the look-out for bands of citizens ready to take responsibility for local affairs.<sup>2</sup> None of this is any guarantee against the erosion of the underlying communities or the death of local loyalties. It is a matter of principle that communities must always be at risk. And the great paradox of a liberal society is that one cannot set oneself against this principle without also setting oneself against the traditional practices and shared understandings of the society. Here, respect for tradition requires the precariousness of traditionalism. If the first communitarian critique were true in its entirety, if there were no communities and no traditions, then we could just proceed to invent new ones. Insofar as the second critique is even partly true, and the work of communal invention is well begun and continually in progress, we must rest content with the kinds of corrections and enhancements - they would be, in fact, more radical than these terms suggest - that Dewey described.

**VII.** I have avoided until now what is often taken to be the central issue between liberals and their communitarian critics - the constitution of the self. Liberalism, it is commonly said, is founded on the idea of a presocial self, a solitary and sometimes heroic individual confronting society, who is fully formed before the confrontation begins. Communitarian critics then argue, first, that instability and dissociation are the actual and disheartening achievement of individuals of this sort and, second, that there really cannot be individuals of this sort. The critics are commonly said in turn to believe in a radically socialized self that can never "confront" society because it is, from the beginning, entangled in society, itself the embodiment of social values. The disagreement seems sharp enough, but in fact, in practice, it is not sharp at all - for neither of these views can be sustained for long by anyone who goes beyond staking out a position and tries to elaborate an argument.

Nor does liberal or communitarian theory require views of this sort. Contemporary liberals are not committed to a presocial self, but only to a self capable of reflecting critically on the values that have governed its socialization; and communitarian critics, who are doing exactly that, can hardly go on to claim that socialization is everything. The philosophical and psychological issues here go

very deep, but so far as politics is concerned, there is little to be won on this battlefield; concessions from the other side come too easily to count as victories. The central issue for political theory is not the constitution of the self but the connection of constituted selves, the pattern of social relations. Liberalism is best understood as a theory of relationship, which has voluntary association at its center and which understands voluntariness as the right of rupture or withdrawal. What makes a marriage voluntary is the permanent possibility of divorce. What makes any identity or affiliation voluntary is the easy availability of alternative identities and affiliations. But the easier this easiness is, the less stable all our relationships are likely to become.

The Four Mobilities take hold and society seems to be in perpetual motion, so that the actual subject of liberal practice, it might be said, is not a presocial but a postsocial self, free at last from all but the most temporary and limited alliances. Now, the liberal self reflects the fragmentation of liberal society: It is radically underdetermined and divided, forced to invent itself anew for every public occasion. Some liberals celebrate this freedom and self-invention; all communitarians lament its arrival, even while insisting that it is not a possible human condition. I have argued that insofar as liberalism tends toward instability and dissociation, it requires periodic communitarian correction. Rawls's "social union of social unions" reflects and builds on an earlier correction of this kind, the work of American writers like Dewey, Randolph Bourne, and Horace Kallen. Rawls has given us a generalized version of Kallen's argument that America, after the great immigration, was and should remain a "nation of nationalities."

In fact, however, the erosion of nationality seems to be a feature of liberal social life, despite intermittent ethnic revivals like that of the late 1960s and 1970s. We can generalize from this to the more or less steady attenuation of all the underlying bonds that make social unions possible. There is no strong or permanent remedy for communal attenuation short of an antiliberal curtailment of the Four Mobilities and the rights of rupture and divorce on which they rest. Communitarians sometimes dream of such a curtailment, but they rarely advocate it. The only community that most of them actually know, after all, is just this liberal union of unions, always precarious and always at risk. They cannot triumph over this liberalism; they can only, sometimes, reinforce its internal associative capacities. The reinforcement is only temporary, because the capacity for dissociation is also strongly internalized and highly valued. That is why communitarianism criticism is doomed - it probably is not a terrible fate - to eternal recurrence.

## **The Debate Over the Self**

Communitarian thinkers in the 1980s such as Michael Sandel and Charles Taylor argued that Rawlsian liberalism rests on an overly individualistic conception of the self. Whereas Rawls argues that we have a supreme interest in shaping, pursuing, and revising our own life-plans, he neglects the fact that our selves tend to be defined or constituted by various communal attachments (e.g., ties to the family or to a religious tradition) so close to us that they can only be set aside at great cost, if at all. This insight led to the view that politics should not be concerned solely with securing the conditions for individuals to exercise their powers of autonomous choice, as we also need to sustain and promote the social attachments crucial to our sense of well-being and respect, many of which have been involuntarily picked up during the course of our upbringing. First, however, let us review the ontological or metaphysical debate over the self that led to this political conclusion.

In an influential essay titled "Atomism", Charles Taylor objected to the liberal view that "men are self-sufficient outside of society". (Taylor 1985, 2000) Instead, Taylor defends the Aristotelian view

that “Man is a social animal, indeed a political animal, because he is not self-sufficient alone, and in an important sense is not self-sufficient outside a polis” (Taylor 1985, 190). Moreover, this atomistic view of the self can undermine liberal society, because it fails to grasp the extent to which liberalism presumes a context where individuals are members of, and committed to, a society that promotes particular values such as freedom and individual diversity. Fortunately, most people in liberal societies do not really view themselves as atomistic selves.

But do liberal thinkers actually defend the idea that the self is created ex-nihilo, outside of any social context and that humans can exist (and flourish) independently of all social contexts? In fact, Taylor’s essay was directed at the libertarian thinker Robert Nozick. As it turns out, the communitarian critique of the atomistic self does not apply to Rawlsian liberalism: in Part III of *Theory of Justice*, Rawls pays close attention to the psychological and social conditions that facilitate the formation of liberal selves committed to justice. But few readers ever got to Part III of Rawls’ massive tome, so communitarians got quite a bit of mileage from their critique of liberal atomism. This charge didn’t stick, however.

While liberals may not have been arguing that individuals can completely extricate themselves from their social context, the liberal valuation of choice still seemed to suggest an image of a subject who impinges his will on the world.<sup>[9]</sup> Drawing on the insights of Heidegger and Wittgenstein, communitarians argued that this view neglects the extent to which individuals are embodied agents in the world. Far from acting in ways designed to realize an autonomously arrived-at life-plan, vast areas of our lives are in fact governed by unchosen routines and habits that lie in the background. More often than not we act in ways specified by our social background when we walk, dress, play games, speak, and so on without having formulated any goals or made any choices. It is only when things break down from the normal, everyday, unchosen mode of existence that we think of ourselves as subjects dealing with an external world, having the experience of formulating various ways of executing our goals, choosing from among those ways, and accepting responsibility for the outcomes of our actions. In other words, traditional intentionality is introduced at the point that our ordinary way of coping with things is insufficient. Yet this breakdown mode is what we tend to notice, and philosophers have therefore argued that most of our actions are occasioned by processes of reflection. Liberals have picked up this mistaken assumption, positing the idea of a subject who seeks to realize an autonomously arrived-at life-plan, losing sight of the fact that critical reflection upon one’s ends is nothing more than one possibility that arises when our ordinary ways of coping with things is insufficient to get things done.

Some liberals have replied by recognizing the point that vast areas of our lives are governed by unchosen habits and routines, that the deliberate, effortful, choosing subject mode may be the exception rather than the rule. They emphasize, however, that the main justification for a liberal politics concerned primarily with securing the conditions for individuals to lead autonomous lives rests on the possibility and desirability of normative self-determination, that is, on the importance of making choices with respect to things that we value (Doppelt 1989). While it may be true that certain communal practices often, or even mostly, guide our behavior behind our backs, it doesn’t follow that those practices ought to be valued, or reflectively endorsed in non-ordinary moments of existence, much less that the government ought somehow to promote these practices. And what liberals care about ultimately is the provision of the rights, powers, and opportunities that individuals need to develop and implement their own conceptions of the good life.

This qualified version of the liberal self, however, still seems to imply that moral outlooks are, or

should be, the product of individual choice. One's social world, communitarians can reply, provides more than non-moral social practices like table manners and pronunciation norms—it also provides some sort of orientation in moral space. We cannot make sense of our moral experience unless we situate ourselves within this given moral space, within the authoritative moral horizons. What Charles Taylor calls “higher, strongly evaluated goods” (Taylor 1989)—the goods we should feel committed to, those that generate moral obligations on us regardless of our actual preferences are not somehow invented by individuals, but rather they are located within the social world which provides one's framework of the lower and the higher. Thus, the liberal ideal of a self who freely invents her own moral outlook, or private conception of the good, cannot do justice to our actual moral experience.

But once again, liberals need not deny the assumption that our social world provides a framework of the higher and the lower nor need it be presumed that we must regard our own moral outlook as freely invented. Will Kymlicka, for example, explicitly recognizes that things have worth for us in so far as they are granted significance by our culture, in so far as they fit into a pattern of activities which is recognized by those sharing a certain form of life as a way of leading a good life (Kymlicka 1989, 166). That one's social world provides the range of things worth doing, achieving, or being does not, however, undermine the liberal emphasis on autonomy, for there is still substantial room for individual choice to be made within this set. The best life is still the one where the individual chooses what is worth doing, achieving, or being, though it may be that this choice has to be made within a certain framework which is itself unchosen.

Communitarians can reply by casting doubt on the view that choice is intrinsically valuable, that a certain moral principle or communal attachment is more valuable simply because it has been chosen following deliberation among alternatives by an individual subject. If we have a highest-order interest in choosing our central projects and life-plans, regardless of what is chosen, it ought to follow that there is something fundamentally wrong with unchosen attachments and projects. But this view violates our actual self-understandings. We ordinarily think of ourselves, Michael Sandel says, “as members of this family or community or nation or people, as bearers of this history, as sons or daughters of that revolution, as citizens of this republic”, (Sandel 1981, 179) social attachments that more often than not are involuntarily picked up during the course of our upbringing, rational choice having played no role whatsoever. I didn't choose to love my mother and father, to care about the neighborhood in which I grew up, to have special feelings for the people of my country, and it is difficult to understand why anyone would think I have chosen these attachments, or that I ought to have done so. In fact, there may even be something distasteful about someone who questions the things he or she deeply cares about—certainly no marriage could survive too long if fundamental understandings regarding love and trust were constantly thrown open for discussion! Nor is it obvious that, say, someone who performs a good deed following prolonged calculation of pros and cons is morally superior than a Mother-Teresa type who unreflectively, spontaneously acts on behalf of other people's interests.

Liberals can reply that the real issue is not the desirability of choice, but rather the possibility of choice. There may well be some unchosen attachments that need not be critically reflected upon and endorsed, and it may even be the case that excessive deliberation about the things we care about can occasionally be counter-productive. But some of our ends may be problematic and that is why we have a fundamental interest in being able to question and revise them. Most important is not choosing our own life-plans; rather, liberalism founded on the value of self-determination requires only that we be able to critically evaluate our ends if need be, hence that “no end or goal is

exempt from possible re-examination” (Kymlicka 1989, 52; Dworkin 1989, 489; Macedo 1990, 247). For example, an oppressed woman has a fundamental interest in being able to critically reflect upon traditional understandings of what it means to be a good wife and mother, and it would be unjust to foreclose her freedom to radically revise her plans.

This response, however, still leaves open the possibility of a deep challenge to liberal foundations. Perhaps we are able to reexamine some attachments, but the problem for liberalism arises if there are others so fundamental to our identity that they cannot be set aside, and that any attempt to do so will result in serious and perhaps irreparable psychological damage. In fact, this challenge to liberalism would only require that communitarians be able to identify one end or communal attachment so constitutive of one’s identity that it cannot be revised and rejected. A psychoanalyst, for example, may want to argue that (at least in some cases) it is impossible to choose to shed the attachment one feels for one’s mother, and that an attempt may lead to perverse and unintended consequences. A feminist theorist may point to the mother-child relationship as an example of a constitutive feature of one’s identity and argue that any attempt to deny this fails to be sensitive to women’s special needs and experiences (Frazer & Lacey 1993, 53–60). An anthropologist may argue on the basis of field observations that it is impossible for an Inuit person from Canada’s far north to suddenly decide to stop being an Inuit and that the only sensible response is to recognize and accept this constitutive feature of his identity. Or a gay liberation activist may claim that it is both impossible and undesirable for gays to repress their biologically-given sexual identity. These arguments are not implausible, and they seem to challenge the liberal view that no particular end or commitment should be beyond critical reflection and open to revision.

Assume, for the sake of argument, that we can identify one particular attachment so deeply embedded that it is impossible to really bring to conscious awareness and so significant for one’s well-being that an individual can only forsake commitment to its good at the cost of being seriously psychologically disturbed. This end is beyond willed change and one loses a commitment to it at the price of being thrown into a state of disorientation where one is unable to take a stand on many things of significance (Taylor 1989, 26–7). Does this really threaten liberal politics? It may, if liberal politics really rests on the liberal self. Fortunately, that is not the case. Rereading some of the communitarian texts from the 1980s, there seems to have been an assumption that once you expose faulty foundations regarding the liberal self, the whole liberal edifice will come tumbling down. The task is to criticize the underlying philosophy of the self, win people on your side, and then we can move on to a brand new communitarian society that owes nothing to the liberal tradition. This must have been an exhilarating time for would-be revolutionaries, but more level-headed communitarians soon realized that overthrowing liberal rights was never part of the agenda. Even if liberals are wrong to deny the existence of constitutive ends—even if the philosophical justifications for a liberal form of social organization founded on the value of reflective choice are rotten to the core—there are still many, relatively pragmatic reasons for caring about rights in the modern world. To name some of the more obvious benefits, liberal rights often contribute to security, political stability and economic modernization.

In short, the whole debate about the self appears to have been somewhat misconceived. Liberals were wrong to think they needed to provide iron-clad philosophies of the self to justify liberal politics, and communitarians were wrong to think that challenging those foundations was sufficient to undermine liberal politics. Not surprisingly, both sides soon got tired of debating the pros and cons of the liberal self. By the early 1990s, this liberal-communitarian debate over the self had effectively faded from view in Anglo-American philosophy.

So what remains of the communitarian conception of the self? What may be distinctive about communitarians is that they are more inclined to argue that individuals have a vital interest in leading decent communal lives, with the political implication that there may be a need to sustain and promote the communal attachments crucial to our sense of well-being. This is not necessarily meant to challenge the liberal view that some of our communal attachments can be problematic and may need to be changed, thus that the state needs to protect our powers to shape, pursue, and revise our own life-plans. But our interest in community may occasionally conflict with our other vital interest in leading freely chosen lives, and the communitarian view is that the latter does not automatically trump the former in cases of conflict. On the continuum between freedom and community, communitarians are more inclined to draw the line towards the latter.

But these conflicts cannot be resolved in the abstract. Much turns on empirical analyses of actual politics—to what extent our interest in community is indeed threatened by excess liberal politics, to what extent the state can play a role in remedying the situation, to what extent the nourishment of communal ties should be left to civil society, and so on. This is where the political communitarians of the last decade have shed some light. Now turn to the politics of community, the third major strand of the communitarian thought.

### **The Politics of Community**

In retrospect, it seems obvious that communitarian critics of liberalism may have been motivated not so much by philosophical concerns as by certain pressing political concerns, namely, the negative social and psychological effects related to the atomistic tendencies of modern liberal societies. Whatever the soundness of liberal principles, in other words, the fact remains that many communitarians seem worried by a perception that traditional liberal institutions and practices have contributed to, or at least do not seem up to the task of dealing with, such modern phenomena as alienation from the political process, unbridled greed, loneliness, urban crime, and high divorce rates. And given the seriousness of these problems in the United States, it was perhaps inevitable that a second wave of 1990s communitarians such as Amitai Etzioni and William Galston would turn to the more practical political terrain of emphasizing social responsibility and promoting policies meant to stem the erosion of communal life in an increasingly fragmented society. Much of this thinking has been carried out in the flagship communitarian periodical, *The Responsive Community*, which is edited by Amitai Etzioni and includes contributions by an eclectic group of philosophers, social scientists, and public policy makers [this periodical, regrettably, folded in 2004 due to financial constraints]. Etzioni is also the director of a think-tank, Institute for Communitarian Policy Studies, that produces working papers and advises government officials in Washington.

Such political communitarians blame both the left and the right for our current malaise. The political left is chastised not just for supporting welfare rights economically unsustainable in an era of slow growth and aging populations, but also for shifting power away from local communities and democratic institutions and towards centralized bureaucratic structures better equipped to administer the fair and equal distribution of benefits, thus leading to a growing sense of powerlessness and alienation from the political process. Moreover, the modern welfare state with its universalizing logic of rights and entitlements has undermined family and social ties in civil society by rendering superfluous obligations to communities, by actively discouraging private efforts to help others (e.g., union rules and strict regulations in Sweden prevent parents from participating voluntarily in the governance of some day care centers to which they send their children), and even by providing incentives that discourage the formation of families (e.g., welfare payments are cut

off in many American states if a recipient marries a working person) and encourage the break-up of families (e.g., no-fault divorce in the US is often financially rewarding for the non custodial parent, usually the father).

Libertarian solutions favored by the political right have contributed even more directly to the erosion of social responsibilities and valued forms of communal life, particularly in the UK and the US. Far from producing beneficial communal consequences, the invisible hand of unregulated free-market capitalism undermines the family (e.g., few corporations provide enough leave to parents of newborn children), disrupts local communities (e.g., following plant closings or the shifting of corporate headquarters), and corrupts the political process (e.g., US politicians are often dependent on economic interest groups for their political survival, with the consequence that they no longer represent the community at large). Moreover, the valorization of greed in the Thatcher/Reagan era justified the extension of instrumental considerations governing relationships in the marketplace into spheres previously informed by a sense of uncalculated reciprocity and civil obligation. This trend has been reinforced by increasing globalization, which pressures states into conforming to the dictates of the international marketplace. More specifically in the American context, communitarian thinkers such as Mary Ann Glendon indict a new version of rights discourse that has achieved dominance of late (Glendon 1991). Whereas the assertion of rights was once confined to matters of essential human interest, a strident rights rhetoric has colonized contemporary political discourse, thus leaving little room for reasoned discussion and compromise, justifying the neglect of social responsibilities without which a society could not function, and ultimately weakening all appeals to rights by devaluing the really important ones.

To remedy this imbalance between rights and responsibilities in the US, political communitarians proposed a moratorium on the manufacture of new rights and changes to our "habits of the heart" away from exclusive focus on personal fulfillment and towards concern with bolstering families, schools, neighborhoods, and national political life, changes to be supported by certain public policies. Notice that this proposal takes for granted basic civil and political liberties already in place, thus alleviating the concern that communitarians are embarking on a slippery slope to authoritarianism. Still, communitarian thinkers quietly lifted the call for a moratorium on the minting of new rights, presumably because of growing consensus that marginalized groups, such as same-sex couples seeking the right to legally sanctioned marriage, have a legitimate claim to new rights (Macedo, 2015) and would be paying the price for the excesses of others if the moratorium is put into effect.

More serious from the standpoint of those generally sympathetic to communitarian aspirations, however, is the question of what exactly this has to do with community. For one thing, Etzioni himself seeks to justify his policies with reference to need to maintain a balance between social order and freedom, (Etzioni 1996) as opposed to appealing to the importance of community. But there is nothing distinctively communitarian about the preoccupation with social order; both liberals such as John Stuart Mill and Burkean conservatives affirm the need for order. And when the term community is employed by political communitarians, it seems to mean anything they want it to mean. Worse, as Elizabeth Frazer has argued, it has often been used to justify hierarchical arrangements and delegitimize areas of conflict and contestation in modern societies (Frazer 1999).

Still, it is possible to make sense of the term community as a normative ideal. Communitarians begin by positing a need to experience our lives as bound up with the good of the communi-

ties out of which our identity has been constituted. This excludes contingent attachments such as golf-club memberships, that do not usually bear on one's sense of identity and well-being (the co-authors of *Habits of the Heart* (Bellah et al. 1985) employ the term "lifestyle enclaves" to describe these attachments). Unlike pre-modern defenders of *Gemeinschaft*, however, it is assumed that there are many valued forms of communal life in the modern world. So the distinctive communitarian political project is to identify valued forms of community and to devise policies designed to protect and promote them, without sacrificing too much freedom. Typically, communitarians would invoke the following types of communities:

1. Communities of place, or communities based on geographical location. This is perhaps the most common meaning associated with the word community. In this sense, community is linked to locality, in the physical, geographical sense of a community that is located somewhere. It can refer to a small village or a big city. A community of place also has an affective component—it refers to the place one calls "home", often the place where one is born and bred and the place where one would like to end one's days even if home is left as an adult. At the very least, communitarians posit an interest in identifying with familiar surroundings. In terms of political implications, it means that, for example, political authorities ought to consider the existent character of the local community when considering plans for development (Jane Jacobs famously documented the negative effects of razing, instead of renovating, run-down tenements that are replaced by functionally adequate but characterless low-income housing blocs (Jacobs 1965). Even big cities can and should strive to protect and promote a distinctive ethos (Bell and de-Shalit 2011). Other suggestions to protect communities of place include: granting community councils veto power over building projects that fail to respect existent architectural styles; implementing laws regulating plant closures so as to protect local communities from the effects of rapid capital mobility and sudden industrial change; promoting local-ownership of corporations; (Shuman 1999) and imposing restrictions on large-scale discount outlets such as Wal-Mart that threaten to displace small, fragmented, and diverse family and locally owned stores (Ehrenhalt 1999).
2. Communities of memory, or groups of strangers who share a morally- significant history. This term—first employed by the co-authors of *Habits of the Heart*—refers to imagined communities that have a shared history going back several generations. Besides tying us to the past, such communities turn us towards the future—members strive to realize the ideals and aspirations embedded in past experiences of those communities, seeing their efforts as being, in part, contributions to a common good. They provide a source of meaning and hope in people's lives. Typical examples include the nation and language-based ethnocultural groups. In Western liberal democracies, this typically translates into various nation- building exercises meant to nourish the bonds of commonality that tie people to their nations, such as national service and national history lessons in school textbooks. Self-described republicans such as Michael Sandel place special emphasis upon the national political community and argue for measures that increase civic engagement and public-spiritedness (Sandel 1996). However, there is increased recognition of the multi-national nature of contemporary states, and modern Western states must also try to make room for the political rights of minority groups. These political measures have been widely discussed in the recent literature on nationalism, citizenship, and multiculturalism.
3. Psychological communities, or communities of face-to-face personal interaction governed by sentiments of trust, co-operation, and altruism. This refers to a group of persons who partici-

pate in common activity and experience a psychological sense of togetherness as shared ends are sought. Such communities, based on face-to-face interaction, are governed by sentiments of trust, cooperation, and altruism in the sense that constituent members have the good of the community in mind and act on behalf of the community's interest. They differ from communities of place by not being necessarily defined by locality and proximity. They differ from communities of memory in the sense that they are more "real", they are typically based on face to face social interaction at one point in time and consequently tend to be restricted in size. The family is the prototypical example. Other examples include small-scale work or school settings founded on trust and social cooperation.

Communitarians tend to favor policies designed to protect and promote ties to the family and family-like groups. This would include such measures as encouraging marriage and increasing the difficulty of legal marriage dissolution. These policies are supported by empirical evidence that points to the psychological and social benefits of marriage (Waite 1996). Communitarians also favor political legislation that can help to restructure education in such a way that peoples deepest needs in membership and participation in psychological communities are tapped at a young age. The primary school system in Japan, where students learn about group cooperation and benefits and rewards are assigned to the classroom as a whole rather than to individual students, could be a useful model (Reid 1999).

What makes the political project of communitarianism distinctive is that it involves the promotion of all three forms of valued communal life. This leads, however, to the worry that seeking the goods of various communities may conflict in practice. Etzioni, for example, argues for a whole host of pro-family measures: mothers and fathers should devote more time and energy to parenting (in view of the fact that most childcare centers do a poor job of caring for children), labor unions and employers ought to make it easier for parents to work at home, and the government should force corporations to provide six months of paid leave and another year of unpaid leave. The combined effect of these changes of the heart and public policies in all likelihood would be to make citizens into largely private, family-centered persons.

Yet Etzioni also argues that the American political system is corrupt to the core, concluding that only extensive involvement in public affairs by virtuous citizens can remedy the situation: "once citizens are informed, they must make it their civic duty to organize others locally, regionally, and nationally to act on their understanding of what it takes to clean up public life in America" (Etzioni 1993, 244) But few can afford sufficient time and energy to devote themselves fully to both family life and public affairs, and favoring one ideal is most likely to erode the other. Surely it is no coincidence that republican America in Jefferson's day relied on active, public-spirited male citizens largely freed from family responsibilities. Conversely, societies composed of persons leading rich and fulfilling family lives (such as contemporary Singapore) tend to be ruled by paternalistic despots who can rely on a compliant, politically apathetic populace.

Communitarians who advocate both increased commitment to public affairs and strengthened ties to the workplace (to the point that it becomes a psychological community) also face the problem of conflicting commitments. Michael Sandel, for example, speaks favorably of "proud craftsmen" in the Jacksonian era and of Louis Brandeis's idea of "industrial democracy, in which workers participated in management and shared responsibilities for running the business" (Sandel 1996, 170, 213) Identification with the workplace and industrial democracy are said to improve workers civic

capacities, but that may not be the case. In the same way that extensive involvement in family life can conflict with commitments to public life, few persons will have sufficient time and energy for extensive participation in both workplace and public affairs. Recall that the republican society of ancient Athens relied on active, public-spirited males freed from the need to work (slaves did most of the drudge labor).

It is also worth noting that devotion to the workplace can undermine family life. As Tatsuo Inoue of Tokyo University argues, Japanese-style communitarianism—strong communal identity based on the workplace—sometimes leads to *karoshi* (death from overwork) and frequently deprives workers of “the right to sit down at the dinner table with their families” (Inoue 1993). Just as liberals (pace Ronald Dworkin) sometimes have to choose between ideals (e.g., freedom and equality) that come into conflict with one another if a serious effort is made to realize any one of them fully, so communitarians may have to make some hard choices between valued forms of communal life. Still, there may be some actual or potential win-win scenarios cases where promoting a particular form of communal life can promote, rather than undermine, other forms—and political communitarians will of course favor change of this sort. For example, critics have objected to residential community associations, or “walled communities”, on the grounds that they undermine attachment to the polity at large and erode the social cohesion and trust needed to promote social justice and sustain the democratic process (McKenzie 1994). Might it then be possible to reform urban planning so that people can nurture strong local communities without undermining attachment to the national community, perhaps even strengthening broader forms of public-spiritedness? Many practical suggestions along these lines have been raised. Architects and urban planners in the US known as the New Urbanists, for example, have proposed various measures to strengthen community building—affordable housing, public transport, pedestrian focused environments, and public space as an integral part of neighborhoods—that would not have the “privatizing” consequences of gated communities. The problem, as Gerald Frug points out, is that “virtually everything they want to do is now illegal. To promote the new urbanist version of urban design, cities would have to revise municipal zoning laws and development policy from top to bottom.” This points to the need for public policy recommendations explicitly designed to favor complementing forms of communal attachments.

Just as it would be wrong to assume that communitarian goals always conflict, so one should allow for the possibility that individual rights and communitarian goals can co-exist and complement each other. In Singapore, for example, it can be argued that more secure democratic rights would have the effect of strengthening commitment to the common national good. The Singapore government does not hide the fact that it makes life difficult for many who aim to enter the political arena on the side of opposition parties: Between 1971 and 1993, according to Attorney General Chan Sek Keong, eleven opposition politicians were made bankrupt (and hence ineligible to run in elections). Whether intended or not, such actions send an unpatriotic message to the community at large: Politics is a dangerous game for those who haven't been specially anointed by the top leadership of the ruling party, so you should stick to your own private affairs. As Singaporean journalist Cherian George puts it, one can hardly blame people for ignoring their social and political obligations “when they hear so many cautionary tales: Of Singaporeans whose careers came to a premature end after they voiced dissent; of critics who found themselves under investigation; of individuals who were detained without trial even though they seemed not to pose any real threat; of tapped phones and opened letters”. The moral of these stories: In Singapore, better to mind your own business, make money, and leave politics to the politicians.’ Put positively, if the aim is to secure attachment to the community at large, then implementing genuinely competitive elections,

including the freedom to run for the opposition without fear of retaliation, is an important first step (see also Chan 2014). The communitarian case for democratic elections is particularly powerful in small communities where it is easier to establish a sense of communal solidarity.

The Singapore case, however, points to another dimension of the politics of community that brings us back to the communitarian defense of cultural particularism. Democratic reformers in Singapore typically think of democracy in terms of free and fair competitive elections what Western analysts often label “minimal democracy”. In Hong Kong, the situation is similar—the aspiration to “full” democracy put forward by social critics turns out to mean (nothing more than) an elected legislature and Chief Executive. Put differently, it is quite striking that the republican tradition in communitarian thought with its vision of strong democracy supported by active, public-spirited citizens who participate in political decision-making and help shape the future direction of their society through political debate seems largely absent from political discourse in Singapore and Hong Kong, and perhaps East Asia more generally. Many East Asians are clamoring for secure democratic rights, but this rarely translates into the demand that all citizens should be committed to politics on an ongoing basis or the view that, as David Miller puts it, “politics is indeed a necessary part of the good life” (Miller 2000). At one level, the relative absence of republican ideals can be explained by the fact that there are no equivalents of Aristotle and Jean-Jacques Rousseau in East Asian philosophy. It can also be argued that republicanism fails to resonate because East Asians typically place more emphasis on other forms of communal life—the family in particular has been an important theme in Confucian ethical theory and practice (relative to Western philosophy). To the extent that different forms of communal life do conflict in practice, in short, it may be the case that different cultures will draw the line in different places.

But this is not to suggest that each community draws the line in its own way, and there is no more room for moral debate or social critique. While there may be a strong case for endorsing “the way things are done” if shared understandings conform to the views shared by both defenders and critics of the political status quo, more often than not social critics will find fault with the communitarian excesses in particular societies. For example, Chang Kyung-Sup argues that Korean “familism” harms individuals and poses a serious stumbling block to the establishment of a democratic polity in Korea (see Chang 2004). In this context, it may well be counter-productive to place too much emphasis on the moral qualities of family life. But other societies—relatively individualistic societies suffering from the undesirable social consequences of divorce and single-parent families or communitarian societies that justify sacrificing families in the interests of the workplace—may need to rejuvenate family life and they may well look to Korean “familism” for ideas. In other words, what seems like a communitarian excess in one society can be a source of inspiration for another. So, the conclusion is, yes, community is valuable—at least as valuable as the need for freedom, if not more so. Communitarians have usefully distinguished between forms of valuable communities and Anglo-American political communitarians have designed menus of policy options to promote those forms of communities. The varieties of communitarian politics in East Asia offers further possibilities. However, which form of community to emphasize and which form to deemphasize depends upon the needs and problems of particular societies. The political implications of communitarianism, in short, depend upon the cultural outlooks and social priorities of particular contexts.

Let me end with the question of why East Asians should look to communitarianism when the rich and diverse Confucian tradition can be drawn upon to express communitarian values. After all, there is substantial overlap between the two philosophies—both emphasize the value of relation-

ships for the good life as well as stress the importance of education and non-coercive modes of moral education with legal rights as last resort fall-back mechanisms (see Bell 2008, ch. 9)—so why not stick to the “local” philosophy of Confucianism? In an East Asian context, it seems strange to promote a communitarian philosophy that was shaped by concerns about individualistic excesses in Western countries when the communitarian Confucian tradition continues to shape values and inform “habits of the heart” (see Sun 2013; Hammond and Richey 2015; Billioud and Thorel 2015). And it’s still a matter of argument whether communitarianism really constitutes a philosophy or tradition, as opposed to a critical extension of the liberal tradition. But nobody doubts that Confucianism constitutes its own tradition. So what good reason can there be for East Asians to identify with communitarianism rather than Confucianism?

One response is that Confucianism has been tainted by its apparent endorsement of immoral practices, such as patriarchal values that have contributed to the subordination and suffering of women. But contemporary feminist theorists have reinterpreted Confucianism to make it more compatible with modern-day values while maintaining commitment to central Confucian values (see, e.g., Chan 2007). And those central Confucian values—commitment to the family, to the material well-being of the people, to meritocracy in education and politics, to ritual (*li*), humaneness (*ren*), diversity in harmony (*he*), and this-worldly outlooks—may in fact be more appropriate for modern-day societies than many other philosophies (consider the fact that most Western philosophers prior to the twentieth century devalued the family). Bai Tongdong, for example, argues that a modernized form of central Confucian values can inspire humane governance both at home and abroad (Bai 2019).

In an East Asian context, what communitarianism can do is help to remedy the drawbacks of Confucianism. For example, there is a tension between the universalizing impulses of early Confucianism—Confucius and Mencius did not consider the possibility of morally legitimate alternatives to their values—and the moral pluralism that tends to characterize the modern world. Communitarians can remind Confucians that their philosophy may be more appropriate in certain settings than others, and that they should allow for the possibility of morally legitimate alternatives in different contexts. It seems strange, for example, for Confucians to think that Christian believers should change their primary religious allegiance from God to family ancestors (just as it seems strange for Christians to ask Confucians to do the opposite).

Communitarian insights about civil society as the sites for moral education can help to remedy the Confucian focus on the family as the only (or main) springboard for moral learning. Confucians have long argued that it is possible and desirable to extend family values outside the family, but the family-centered reality in most East Asian societies with a Confucian heritage suggests that Confucianism may not be sufficient. There has been some work exploring the ‘intermediary associations’ in Confucianism (see, e.g., de Bary 1998), but the communitarians debates in the West may offer more insights in this respect. Also, the Confucian emphasis on meritocratic rule by the most talented and virtuous members of the community may encourage excessive political passivity on the part of ordinary citizens. Again, Confucians can look to communitarianism (as well as contemporary debates about deliberative democracy) for insights about values and practices that allow ordinary citizens to make meaningful contributions to the political process, even in political contexts (such as China) without democratic elections to choose top leaders. Democratic education is not, to say the least, a Confucian imperative. In short, communitarian insights can usefully supplement Confucian values in an East Asian context, just as they can supplement liberal values in Western societies.

Overall, though, it must be conceded that communitarianism has lost salience as a motivating political ideal in both East Asia and the West. Do we have any reason to think it might be revived? In East Asia, we can expect that communitarian themes will continue to take the form of Confucian values. In the West, however, the excesses of populism may present an opportunity for communitarian-inspired political activists. Populism, arguably, is a response to the decline of valued forms of community. Strongmen such as Donald Trump rail against elites and promise to restore traditional sources of meaning to disempowered and atomized individuals. But the problem is not elitism or hierarchy per se. Any modern society needs hierarchies and the task is to distinguish between bad forms of hierarchy that benefit the powerful and oppress the weak, and good forms of hierarchy that express morally defensible values (Bell and Wang 2020). Hierarchical forms of communal life can be reinterpreted and modernized so they are compatible with progressive values. What's missing is a social and political movement that can restore and reinterpret forms of communal life appropriate for the modern world.

## **Multiculturalism**

The idea of multiculturalism in contemporary political discourse and in political philosophy reflects a debate about how to understand and respond to the challenges associated with cultural diversity based on ethnic, national, and religious differences. The term "multicultural" is often used as a descriptive term to characterize the fact of diversity in a society, but in what follows, the focus is on multiculturalism as a normative ideal in the context of Western liberal democratic societies. While the term has come to encompass a variety of normative claims and goals, it is fair to say that proponents of multiculturalism find common ground in rejecting the ideal of the "melting pot" in which members of minority groups are expected to assimilate into the dominant culture. Instead, proponents of multiculturalism endorse an ideal in which members of minority groups can maintain their distinctive collective identities and practices. In the case of immigrants, proponents emphasize that multiculturalism is compatible with, not opposed to, the integration of immigrants into society; multiculturalism policies provide fairer terms of integration for immigrants.

Modern states are organized around the language and culture of the dominant groups that have historically constituted them. As a result, members of minority cultural groups face barriers in pursuing their social practices in ways that members of dominant groups do not. Some theorists argue for tolerating minority groups by leaving them free of state interference (Kukathas 1995, 2003). Others argue that mere toleration of group differences falls short of treating members of minority groups as equals; what is required is recognition and positive accommodation of minority group practices through what the leading theorist of multiculturalism Will Kymlicka has called "group-differentiated rights" (1995). Some group-differentiated rights are held by individual members of minority groups, as in the case of individuals who are granted exemptions from generally applicable laws in virtue of their religious beliefs or individuals who seek language accommodations in education and in voting. Other group-differentiated rights are held by the group qua group rather than by its members severally; such rights are properly called "group rights," as in the case of indigenous groups and minority nations, who claim the right of self-determination. In the latter respect, multiculturalism is closely allied with nationalism.

Multiculturalism is part of a broader political movement for greater inclusion of marginalized groups, including African Americans, women, LGBTQ people, and people with disabilities (Glazer 1997, Hollinger 1995, Taylor 1992). This broader political movement is reflected in the "multiculturalism" debates in the 1980s over whether and how to diversify school curricula to recognize the

achievements of historically marginalized groups. But the more specific focus of contemporary theories of multiculturalism is the recognition and inclusion of minority groups defined primarily in terms of ethnicity, nationality, and religion. The main concern of contemporary multiculturalism are immigrants who are ethnic and religious minorities (e.g. Latinx people in the U.S., Muslims in Western Europe), minority nations (e.g. the Basque, Catalans, Québécois, Welsh) and indigenous peoples (e.g. Native peoples and indigenous groups in Canada, the U.S., Australia, and New Zealand).

### **The claims of multiculturalism**

Multiculturalism is closely associated with “identity politics,” “the politics of difference,” and “the politics of recognition,” all of which share a commitment to revaluing disrespected identities and changing dominant patterns of representation and communication that marginalize certain groups (Gutmann 2003, Taylor 1992, Young 1990). Multiculturalism involves not only claims of identity and culture as some critics of multiculturalism suggest. It is also a matter of economic interests and political power: it includes demands for remedying economic and political disadvantages that people suffer as a result of their marginalized group identities.

Multiculturalists take for granted that it is “culture” and “cultural groups” that are to be recognized and accommodated. Yet multicultural claims include a wide range of claims involving religion, language, ethnicity, nationality, and race. Culture is a contested, open-ended concept, and all of these categories have been subsumed by or equated with the concept of culture. Disaggregating and distinguishing among different types of claims can clarify what is at stake (Song 2008). Language and religion are at the heart of many claims for cultural accommodation by immigrants. The key claim made by minority nations is for self-government rights. Race has a more limited role in multicultural discourse. Antiracism and multiculturalism are distinct but related ideas: the former highlights “victimization and resistance” whereas the latter highlights “cultural life, cultural expression, achievements, and the like” (Blum 1992, 14). Claims for recognition in the context of multicultural education are demands not just for recognition of aspects of a group’s actual culture (e.g. African American art and literature) but also for acknowledgment of the history of group subordination and its concomitant experience (Gooding-Williams 1998).

Examples of cultural accommodations or “group-differentiated rights” include exemptions from generally applicable law (e.g. religious exemptions), assistance to do things that members of the majority culture are already enabled to do (e.g. multilingual ballots, funding for minority language schools and ethnic associations, affirmative action), representation of minorities in government bodies (e.g. ethnic quotas for party lists or legislative seats, minority-majority Congressional districts), recognition of traditional legal codes by the dominant legal system (e.g. granting jurisdiction over family law to religious courts), or limited self-government rights (e.g. qualified recognition of tribal sovereignty, federal arrangements recognizing the political autonomy of Québec) (for a helpful classification of cultural rights, see Levy 1997).

Typically, a group-differentiated right is a right of a minority group (or a member of such a group) to act or not act in a certain way in accordance with their religious obligations and/or cultural commitments. In some cases, it is a right that directly restricts the freedom of non-members in order to protect the minority group’s culture, as in the case of restrictions on the use of the English language in Québec. When the right-holder is the group, the right may protect group rules that restrict the freedom of individual members, as in the case of the Pueblo membership rule that excludes the children of women who marry outside the group. Now that you have a sense of the

kinds of claims that have been made in the name of multiculturalism, we can now turn to consider different normative justifications for these claims.

### **Justifications for multiculturalism Recognition**

One justification for multiculturalism arises out of the communitarian critique of liberalism. Liberals tend to be ethical individualists; they insist that individuals should be free to choose and pursue their own conceptions of the good life. They give primacy to individual rights and liberties over community life and collective goods. Some liberals are also individualists when it comes to social ontology (what some call methodological individualism or atomism). Methodological individualists believe that you can and should account for social actions and social goods in terms of the properties of the constituent individuals and individual goods. The target of the communitarian critique of liberalism is not so much liberal ethics as liberal social ontology. Communitarians reject the idea that the individual is prior to the community and that the value of social goods can be reduced to their contribution to individual well-being. They instead embrace ontological holism, which acknowledges collective goods as, in Charles Taylor's words, "irreducibly social" and intrinsically valuable (Taylor 1995).

An ontologically holist view of collective identities and cultures underlies Taylor's argument for a "politics of recognition." Drawing on Rousseau, Herder, and Hegel, among others, Taylor argues that we do not become full human agents and define our identity in isolation from others; rather, "we define our identity always in dialogue with, sometimes in struggle against, the things our significant others want to see in us" (1994, 33). Because our identities are formed dialogically, we are dependent on the recognition of others. The absence of recognition or mis-recognition can cause serious injury: "A person or a group of people can suffer real damage, real distortion, if the people or society around them mirror back to them a confining or demeaning or contemptible picture of themselves". The struggle for recognition can only be satisfactorily resolved through "a regime of reciprocal recognition among equals". Taylor distinguishes the politics of recognition from the traditional liberal "politics of equal respect" that is "inhospitable to difference, because (a) it insists on uniform application of the rules defining these rights, without exception, and (b) it is suspicious of collective goals". By contrast, the politics of recognition is grounded on "judgments about what makes a good life—judgments in which the integrity of cultures has an important place". He discusses the example of the survival of French culture in Quebec. The French language is not merely a collective resource that individuals might want to make use of and thereby seek to preserve, as suggested by a politics of equal respect. Instead, the French language is an irreducibly collective good that itself deserves to be preserved: language policies aimed at preserving the French language in Québec "actively seek to create members of the community" by assuring that future generations continue to identify as French-speakers. Because of the indispensable role of cultures in the development human agency and identity, Taylor argues, we should adopt the presumption of the equal worth of all cultures.

### **Equality**

A second justification for multiculturalism comes from within liberalism but a liberalism that has been revised through critical engagement with the communitarian critique of liberalism. Will Kymlicka has developed the most influential liberal theory of multiculturalism by marrying the liberal values of autonomy and equality with an argument about the value of cultural membership (1989, 1995, 2001). Rather than beginning with intrinsically valuable collective goals and goods as Taylor does, Kymlicka views cultures as instrumentally valuable to individuals, for two main reasons. First, cultural membership is an important condition of personal autonomy. In his first

book, *Liberalism, Community, and Culture* (1989), Kymlicka develops his case for multiculturalism within a Rawlsian framework of justice, viewing cultural membership as a “primary good,” things that every rational person is presumed to want and which are necessary for the pursuit of one’s goals (Rawls 1971, 62). In his later book, *Multicultural Citizenship* (1995), Kymlicka drops the Rawlsian scaffolding, relying instead on the work of Avishai Margalit and Joseph Raz on national self-determination (1990). One important condition of autonomy is having an adequate range of options from which to choose (Raz 1986). Cultures serve as “contexts of choice,” which provide meaningful options and scripts with which people can frame, revise, and pursue their goals (Kymlicka 1995, 89). Second, cultural membership plays an important role in people’s self-identity. Citing Margalit and Raz as well as Taylor, Kymlicka views cultural identity as providing people with an “anchor for their self-identification and the safety of effortless secure belonging”. This means there is a deep and general connection between a person’s self-respect and the respect accorded to the cultural group of which she is a part. It is not simply membership in any culture but one’s own culture that must be secured in order for cultural membership to serve as a meaningful context of choice and a basis of self-respect.

Kymlicka moves from these premises about the instrumental value of cultural membership to the egalitarian claim that because members of minority groups are disadvantaged in terms of access to their own cultures (in contrast to members of the majority culture), they are entitled to special protections. It is important to note that Kymlicka’s egalitarian argument for multiculturalism rests on a theory of equality that critics have dubbed “luck egalitarianism” (Anderson 1999, Scheffler 2003). According to luck egalitarians, individuals should be held responsible for inequalities resulting from their own choices, but not for inequalities deriving from unchosen circumstances (Dworkin 1981; Rakowski 1993). The latter inequalities are the collective responsibility of citizens to address. For example, inequalities stemming from one’s social starting position in life are unchosen yet so strongly determine our prospects in life. Luck egalitarians argue that those born into poor families are entitled to collective support and assistance via a redistributive tax scheme. Kymlicka adds cultural membership to this list of unchosen inequalities. If one is born into the dominant culture of society, one enjoys good brute luck, whereas those who belong to minority cultures suffer disadvantages in virtue of the bad brute luck of their minority status. Insofar as inequality in access to cultural membership stems from luck (as opposed to individual choices) and one suffers disadvantages as a result of it, members of minority groups can reasonably demand that members of the majority culture must share in bearing the costs of accommodation. Minority group rights are justified, as Kymlicka argues, “within a liberal egalitarian theory...which emphasizes the importance of rectifying unchosen inequalities”.

One might question whether cultural minority groups really are “disadvantaged” and thereby, owed positive accommodations. Why not just enforce antidiscrimination laws, stopping short of any positive accommodations for minority groups? Kymlicka and other liberal theorists of multiculturalism contend that antidiscrimination laws fall short of treating members of minority groups as equals; this is because states cannot be neutral with respect to culture. In culturally diverse societies, we can easily find patterns of state support for some cultural groups over others. While states may prohibit racial discrimination and avoid official establishment of any religion, they cannot avoid establishing one language for public schooling and other state services (language being a paradigmatic marker of culture. Linguistic advantage translates into economic and political advantage since members of the dominant cultural community have a leg up in schools, the workplace, and politics. Linguistic advantage also takes a symbolic form. When state action extends symbolic affirmation to some groups and not others by adopting a particular language or by organ-

izing the work week and public holidays around the calendar of particular religions, it has a normalizing effect, suggesting that one group's language and customs are more valued than those of other groups.

In addition to state support of certain cultures over others, state laws may place constraints on some cultural groups over others. Consider the case of dress code regulations in public schools or the workplace. A ban on religious dress burdens religious individuals, as in the case of Simcha Goldman, a U.S. Air Force officer, who was also an ordained rabbi and wished to wear a yarmulke out of respect to an omnipresent God (*Goldman v. Weinberger*, 475 US 503 (1986)). The case of the French state's ban on religious dress in public schools, which burdens Muslim girls who wish to wear headscarves to school, is another example (Bowen 2007, Laborde 2008). Religion may command that believers dress in a certain way (what Peter Jones calls an "intrinsic burden"), not that believers refrain from attending school or going to work (Jones 1994). Yet, burdens on believers do not stem from the dictates of religion alone; they also arise from the intersection of the demands of religion and the demands of the state ("extrinsic burden"). Individuals must bear intrinsic burdens themselves; bearing the burdens of the dictates of one's faith, such as prayer, worship, and fasting, just is part of meeting one's religious obligations. When it comes to extrinsic burdens, however, liberal multiculturalists argue that justice requires assisting cultural minorities bear the burdens of these unchosen disadvantages.

It is important to note that liberal multiculturalists distinguish among different types of groups. For instance, Kymlicka's theory develops a typology of different groups and different types of rights for each. It offers the strongest form of group-differentiated rights—self-government rights—to indigenous peoples and national minorities for the luck egalitarian reason that their minority status is unchosen: they were coercively incorporated into the larger state. By contrast, immigrants are viewed as voluntary migrants: by choosing to migrate, they relinquished access to their native culture. Immigrant multiculturalism, what Kymlicka calls "polyethnic rights", is understood as a demand for fairer terms of integration into the broader society through the granting of exemptions and accommodations, not a rejection of integration or a demand for collective self-determination.

### **Freedom from domination**

Another set of arguments for multiculturalism rests on the value of freedom. Some theorists such as Phillip Pettit (1997) and Quentin Skinner (1998) have developed the idea of freedom from domination by drawing on the civic republican tradition. Building on this line of argument to argue for recognition, Frank Lovett (2009) maintains that domination presents a serious obstacle to human flourishing. In contrast to the conception of freedom as non-interference dominant in liberal theory, freedom as non-domination, drawn from the civic republic tradition, focuses on a person's "capacity to interfere, on an arbitrary basis, in certain choices that the other is in a position to make" (Pettit 1997, 52). On this view of freedom, we can be unfree even when we are not experiencing any interference as in the case of a slave of a benevolent master. We are subject to domination to the extent that we are dependent on another person or group who can arbitrarily exercise power over us (Pettit 1997, ch. 2).

Frank Lovett has explored the implications of the value of freedom from domination for questions of multicultural accommodation (2010). He begins from the premise that freedom from domination is an important human good and that we have a prima facie obligation to reduce domination. He argues that the state should not accommodate social practices that directly involve domination. Indeed, if freedom from domination is a priority, then one should "aim to bring such practices

to an end as quickly as possible, despite any subjective value they happen to have for their participants” (2010, 256). As for practices that do not involve subjecting individuals to domination, accommodation is permissible but not necessarily required. Accommodation is only required if accommodation would advance the goal of reducing domination. He discusses one stylized example based on a familiar real-world case: the practice among Muslim women and girls of wearing headscarves. Suppose, Lovett suggests, a detailed study of a particular Muslim community in a liberal democratic society is undertaken and it reveals that women’s educational and employment opportunities are discouraged, generating “severe patriarchal domination,” but the study also shows that the practice of wearing headscarves does not (2010, 258). Lovett argues that the practice of wearing headscarves should be accommodated because failure to do so might strengthen the community’s commitment to other shared practices that reinforce patriarchal domination.

A key empirical assumption here is that combating patriarchal practices within minority communities would be easier if the burdens on more benign practices, such as wearing headscarves, are lessened. Cecile Laborde’s analysis of the headscarf controversy in France provides support for this assumption: the effect of preventing Muslim girls from wearing headscarves is to encourage their parents to withdraw their daughters from civic education and send them to religious schools where they would not be exposed to the diversity of world views found in public schools. Formal restrictions on Muslim religious expression in the public sphere may make, in Laborde’s words, “members of dominated groups close ranks around the denigrated practice, precipitating a defensive retreat into conservative cultural forms and identities” (2008, 164).

Another situation in which accommodation is warranted on Lovett’s account is when individuals’ subjective attachment to particular practices makes them vulnerable to exploitation. He discusses the case of Mexican immigrant laborers with limited English language skills and limited knowledge of American laws and policies. Lovett argues that extending “special public measures,” such as exceptions to general rules and regulations and public legal assistance, is required insofar as such measures would reduce the domination of these workers (2010, 260). In contrast to the communitarian or liberal egalitarian arguments considered above, the basis for the special accommodations is not a desire to protect intrinsically valuable cultures or considerations of fairness or equality but the desire to reduce domination.

Mira Bachvarova has also argued for the merits of a non-domination-based multiculturalism as compared to liberal egalitarian approaches. Because of its focus on the arbitrary use of power and the broader structural inequalities within which groups interact, a non-domination approach may be more sensitive to power dynamics in both inter-group and intra-group relations. Also, in contrast to approaches developed out of egalitarian theories of distributive justice that focus on distributing different types of rights, a non-domination approach focuses on the “moral quality of the relationship between the central actors” and insists on continuity of treatment between and within groups.

### **Addressing historical injustice**

Other theorists sympathetic to multiculturalism look beyond liberalism and republicanism, emphasizing instead the importance of grappling with historical injustice and listening to minority groups themselves. This is especially true of theorists writing from a postcolonial perspective. For example, in contemporary discussions of aboriginal sovereignty, rather than making claims based on premises about the value of Native cultures and their connection to individual members’ sense of self-worth as liberal multiculturalists have, the focus is on reckoning with history. Such proponents of indigenous sovereignty emphasize the importance of understanding indigenous claims against the historical background of the denial of equal sovereign status of indigenous groups, the dispos-

session of their lands, and the destruction of their cultural practices. This background calls into question the legitimacy of the state's authority over aboriginal peoples and provides a prima facie case for special rights and protections for indigenous groups, including the right of self-government. Jeff Spinner-Halev has argued that the history of state oppression of a group should be a key factor in determining not only whether group rights should be extended but also whether the state should intervene in the internal affairs of the group when it discriminates against particular members of the group. For example, "when an oppressed group uses its autonomy in a discriminatory way against women it cannot simply be forced to stop this discrimination" (2001, 97). Oppressed groups that lack autonomy should be "provisionally privileged" over non-oppressed groups; this means that "barring cases of serious physical harm in the name of a group's culture, it is important to consider some form of autonomy for the group".

Theorists adopting a postcolonial perspective go beyond liberal multiculturalism toward the goal of developing models of constitutional and political dialogue that recognize culturally distinct ways of speaking and acting. Multicultural societies consist of diverse religious and moral outlooks, and if liberal societies are to take such diversity seriously, they must recognize that liberalism is just one of many substantive outlooks based on a specific view of man and society. Liberalism is not free of culture but expresses a distinctive culture of its own. This observation applies not only across territorial boundaries between liberal and nonliberal states, but also within liberal states and its relations with nonliberal minorities. James Tully has surveyed the language of historical and contemporary constitutionalism with a focus on Western state's relations with Native peoples to uncover more inclusive bases for intercultural dialogue (1995). Bhikhu Parekh contends that liberal theory cannot provide an impartial framework governing relations between different cultural communities (2000). He argues instead for a more open model of intercultural dialogue in which a liberal society's constitutional and legal values serve as the initial starting point for cross-cultural dialogue while also being open to contestation.

More recent work has emphasized the importance of developing more contextual approaches that engage with actual political struggles for recognition and give greater voice to minority groups. Through detailed examination of how national museums in Canada and the U.S. have sought to represent and recognize indigenous groups, Caitlin Tom identifies three principles for the practice of recognition: self-definition, responsiveness, and internal contestation. Whether it be museum officials seeking to exhibit the history and culture of minority groups or government officials deciding whether official apologies for historical injustices are in order, they should respect individual and collective self-definition, respond to demands for recognition on terms that align with the terms of those being recognized, and accommodate internal contestation of group meanings. As Tom argues, practices of recognition guided by these principles come closer to fostering freedom and equality of minority groups than existing approaches.

### **Charles Taylor, "The Politics of Recognition"**

"A number of strands in contemporary politics," Taylor begins, "turn on the need, sometimes the demand, for recognition". In "The Politics of Recognition", Taylor explores these strands, and tries to make sense of their historical emergence and relation to liberalism, in part through an incisive look at their emergence in the Canadian context.

Taylor's essay is a tour de force: intricate, historical and sensitive to many (if not all) of a family of difficult issues; even those inclined to disagree have much to learn from the text's honest treatment of the issues.

## A Historical Step Back

Recognition, Taylor thinks, looms large in contemporary politics. From nationalist movements to demands behalf of minority or subaltern groups in feminism and multiculturalism, the invocation of recognition is a mainstay of politics discourse. And partly for good reason. Our identity is partly shaped by recognition or its absence, and failures of recognition can cause real harms: misrecognition is not just lack of due respect, but “a vital human need”.

In order to examine recognition and its importance, Taylor begins by taking a “step back” to look at “how this discourse of recognition came to seem familiar...to us”. Taylor thinks we can distinguish “two changes” that have made preoccupation with these ideas “inevitable”. First, a “collapse of social hierarchies”, which used to be the basis for “honor”. Honor, in this sense at least, was “intrinsically linked to inequalities”: Taylor is thinking of the sort of honors one lavishes upon a duke, or that one bestows along with “some public award, for example, the Order of Canada”. Instead of honor, we now “have the modern notion of dignity”, which is “universalist and egalitarian”: the underlying premise is that everyone shares it. This latter idea, dignity, is obviously “the only one compatible with a democratic society”. Taylor doesn’t say much about how exactly honor collapsed. Second, “the importance of recognition has been modified and intensified by the new understanding of individual ideality” that emerges in the late 18<sup>th</sup> century. It is not that identity is new, but that “individualized identity” is new, along with “the ideal of authenticity”, of being true to oneself. Taylor says considerably more about how exactly this ideal emerged.

His story begins with the thought that “human beings are endowed with a moral sense, an intuitive feeling” for right and wrong. Earlier, what we needed to be ‘in touch with’ was good. With modernity, however, the source of moral sense moves interior. Authenticity develops by “displacing” the “moral accent” in this idea”: being in touch with our feelings or true selves takes on independent (moral) significance.

Key in this process were Rousseau, Herder (and latter, Hegel). Rousseau, “articulate[ed] something that was in a sense already occurring in the culture” by presenting morality as “following a voice of nature within us”. Herder then adds the idea that “each person has her own ‘measure’; that is, that “there is a certain way of being human that is my way”, and it is of moral important to be in touch with that way. This idea of “originality, for Herder, operates “at two levels”: at the level of the individual person and at the level of ‘culture-bearing’ people [Volk]. We will return to this distinction later.

The need for recognition, however, is not new. Human life is “fundamentally dialogical” in character. Recognition has always been a central need. It is not just a need during a period of “genesis” – say, in childhood—but our need for recognition “continues indefinitely”: though this need may be resisted by some of us, it shows up, for example, in love as a defining commitment that structures one’s identity.

But the development of an ideal of the ‘inward generation’ of identity together with “the decline of hierarchical society” gave recognition a new importance. In the earlier age, a failure of recognition never really arose: “general recognition was built into the socially derived identity by virtue of [being]...based on categories that everyone took for granted”. So recognition, in a way, couldn’t fail. But “original identity” –the kind a person or a Volk generate—doesn’t enjoy this recognition so easily.

In short, “what has come about with the modern age is not the need for recognition but the conditions in which the attempt to be recognized can fail”. That brings us to Hegel, who distinguished “two planes” of recognition. On the intimate plane, our identities are initially formed by “contact with significant others”. On the social plane “the understanding that identities are formed in open dialogue...has made the politics of equal recognition more central and stressful” (36). Taylor will focus on this later form of political recognition.

## **Two Forms of Recognition**

Recognition, he notes, “has come to mean two rather different things”. First, connected with the move from honor to dignity, one form of politics has come to emphasize “the equal dignity of all citizens” in an effort to avoid the existence of first and second class citizens. Here, the emphasis is on equality, similarity and equal (the same) treatment. Second, connected with the development of identity has come a “politics of difference” which emphasizes that everyone is owed “recognition of the unique identity” of each individual or group. This politics has a universal, egalitarian basis –equal recognition for all—but “it asks we give acknowledgment and status to something that is not universal shared”.

Just call these models the politics of dignity and the politics of difference respectively. To proponents of the politics of dignity, the latter model can seem like a negation of their principles. Some arguments are thus made to justify the politics of difference on the basis of dignity. These arguments should be familiar – for example, the claim that affirmative action policies for African Americans are justified “as a temporary measure that will eventually level the playing field and allow the old ‘blind’ rules to come back into force in a way that doesn’t disadvantage anyone”—and Taylor thinks the work “up to a point”.

Where they don’t work is when measures are put in place to “maintain and cherish distinctness” (say, of some cultural minority) “not just now but forever”. We’ll return to case of this kind later. But, for now, given that the two models diverge, Taylor directs us to consider “the underlying intuitions of value” that animate each. The politics of dignity is motivated by “the idea that all humans are equally worthy of respect” because based on a “capacity that all humans share”. Canonically, “our status as rational agents” has been singled out, though there are problems with this justification.

The politics of difference, while it has “a universal potential as its basis, namely, the potential for forming and defining one’s own identity” departs significantly from the former, for it demands (at least recently) “that one accord equal respect to actually evolved cultures”. That is, it demands that whatever a cultural produces, it ought to be accorded equal value. The dialectic between the two thus runs as follows: the politics of dignity requires, it is thought, that we treat people in a difference-blind manner. For the politics of difference, we ought to recognize and foster particularity. The former reproaches the latter for violating the principle of nondiscrimination. The latter reproaches the former, not only by claiming that it “negates identity” but – and this is crucial –by claiming that “the supposedly neutral set of difference-blind principles...is in fact a reflection of one hegemonic culture”. In short, it charges the politics of dignity with “imposing a false homogeneity”. Having laid out the dialectic, Taylor then moves to assess the merits of the various charges.

## **The Politics of Dignity and Liberalism**

The “standard-bearers” of politics of dignity are Kant’s and Rousseau’s accounts. Taylor examines these accounts in order to determine “to what extent they are guilty of...imposing a false homoge-

neity" (44).

## **Rousseau**

Rousseau "begins to think out the importance of equal respect". Rousseau was concerned about individual's "other-dependence" because he thought it made people "slaves to 'opinion'". He was particularly concerned about honor, which was "a positional good" linked to one's social rank (Ibid). But he does not do away the notion of opinion and its important entirely. Rather, he thinks "esteem" – when placed in circumstances of reciprocity, plays an important role in his thought. The remedy to the system of honor is "entering into a quite different system, characterized by equality, reciprocity and unity of purpose". Under this system, "all virtuous citizens are equally honored".

Taylor thinks Rousseau's solution here is "crucially flawed", for links esteem to a "unity of purpose" (in the general will) that is "incompatible with any differentiation". Because all citizens have to be at one in the general will, when opinions and conceptions of the good diverge, the model breaks down.

## **Liberalism**

Thus, if Rousseau's model doesn't work, we might ask whether the Kantian model fares better. These models "simply look to an equality of rights accorded to citizens". Yet this model, too, has been criticized for failing to "give due acknowledgment to distinctness. Taylor then distinguishes two forms of liberalism: a "restrictive view", which can indeed only give limited acknowledgment to distinctness, and an "alternative view", which Taylor will later defend. He discusses both issues "in the contest of the Canadian case", so it is best to outline the case first.

## **The Canadian Case—Two Models of Liberalism**

Taylor's discussion centers on the 1982 Canadian Charter of Rights, which sought to work out how a political system of equal rights and judicial review. In particular, the Charter (1) "defines a set of individual rights" and (2) "guarantees [citizens] equal treatment" of citizens and protects them against discrimination. The issue arose, in discussions of the Charter, about how to balance these aims with the claims of distinctness put forward by Quebecers and aboriginal peoples. Of particular interest was whether the laws Quebec passed regarding were compatible with the aims of the charter. These laws (1) regulated who can send their children to English-language schools (not francophones), and (2) required that businesses of over fifty be run in French. Their aim was to ensure the "collective survival" of French Quebecers, which was enshrined in the "distinct society clause" in the proposed "Meech amendment" to the Charter.

The amendment and the corresponding laws were accused of (1) enshrining collective goals that require violations of individuals rights (the right to decide which school to send your child to, and (2) the provisions were thought of as inherently discriminatory because they favored French-speakers over others. Put philosophically (in Dworkin's language), the Meech amendment was charged with (contra to what liberalism requires), taking an interest in the "substantive" ends of life, as opposed to the merely "procedural" mechanisms for dealing with one another (which traditional liberal rights are thought to represent). Given the diversity of substantive norms in modern society, anything more than the procedural norms might be thought to favor one group over another and thus be unfair. This objection is based on the view that "human dignity largely consists in autonomy"—the ability of each to determine her own conception of the good— and the Quebec model violates this norm by placing collective goals in the citizen in trying to "create members of the community" who will be future French speakers. The Quebec model just violates the "restrictive

tive view” of liberalism mentioned earlier.

Taylor accuses this model of liberalism – which (a) insists on uniform rights across the board, and (b) is suspicious of collective goals – of being guilty of being unable to accommodate difference because it cannot accommodate “what the members of distinct societies really aspire to, which is survival”.

But, he thinks, there is an alternative form of liberalism which fares better. As a matter of fact, Quebeckers tended to put forward a different conception of liberalism. On this view, a liberal society may be “organized around a definition of the good life” but what defines a liberal society is “the way in which it treats minorities”—that is, those who do not share this view. A liberal society accords, not a bare liberty right to its members, but a certain set of fundamental rights: e.g. to life, liberty, free speech, and so on. A liberal society must give these rights equally to all, but it can nevertheless provide some with “privileges and immunities” provided to certain groups that are less fundamental.

### **In short, on this alternative model:**

Liberalism does “call for the invariant defense of certain rights...but [...] distinguish[es] these fundamental rights from the broad range of immunities and presumptions of uniform treatment that have sprung up in modern cultures of judicial review. [This form of liberalism is] willing to weigh the importance of certain forms of uniform treatment against the importance of cultural survival, and [to] opt sometimes in favor of the latter.” Taylor “endorse[s] this kind of model”, and thinks it can be “cleared of the charge of homogenizing difference”.

### **The Charge Reconsidered**

But, Taylor thinks “there is another way of formulating the charge that is harder to rebut” (61). The charge here is that, despite liberalism’s claim to offering “a neutral ground on which people of all cultures can meet and coexist”, liberalism in fact “is not a possible meeting ground for all cultures”. Rather, it is “the political expression of one range of cultures” – certain Western ones, and perhaps many others—but it is “incompatible with other ranges”—certain Muslim societies and cultures, perhaps.

The charge, Taylor thinks is disturbing; but Taylor thinks this charge ought not to be an indictment of liberalism. Indeed, it is true that “liberalism can’t and shouldn’t claim complete cultural neutrality” (62). It is not compatible with all cultures. But, if this is true, what sort of reply should liberals make to non-liberal citizens living in liberal polities? These people often demand that liberals “recognize the equal value of different cultures” (64), not just the equal value of different people in those cultures.

But this, Taylor thinks, is false. We do (perhaps) owe all cultures a “presumption” of equal worth – that is, we should work from the starting hypothesis that all actually existing cultures produce ideas and works of value—“the validity of the claim has to be demonstrated concretely in the actual study of the culture”. This kind of presumption is a way to combat making unjustified judgments about other cultures and avoiding arrogance .

But, for all that, we are not obligated to make the stronger judgment that all actual cultures—and all the ideas in each—are of equal worth. Making that claim is false, and demands for recognition based upon it need not be acknowledged.

## **Will Kymlicka; conception of Minority Rights Introduction**

Today the issue of minority rights is a debating point for many nation-states. It often throws challenges to liberal democratic governments. On one hand communitarian thinkers are critical about liberal theory for its emphasis on individualism. In the wake of identity politics, demands for rights of specific social group/community have not only got currency but have its moral legitimacy on different grounds. Especially the rights of recognition for ethnic, cultural, social, linguistic, religious minorities located in a nation state require a different kind of political and philosophical articulation against the existing political practices and theories. The liberal theory is one such grand political theory based on the principles of individualism, egalitarianism and universalism, has been adopted by the nation states of the world in one form or other. Individualism and individual rights are often viewed as the defining characteristic of liberalism. The liberalism has often been criticized for being excessively individualistic and for not recognizing group rights. The liberal theory is under attack from different fronts such as communitarians, Marxists, feminists and post modernists on different grounds. The autonomy and freedom/rights of the individual have taken a new turn in the context of demands for collective rights. Especially, the struggles of new social movements and claims of ethnic groups, immigrant groups, indigenous and aboriginal groups both in the West and Postcolonial nations have compelled them to reformulate the existing principles of governance.

In recent times, Will Kymlicka, the Canadian philosopher addresses minority rights as group specific rights in multicultural societies in the backdrop of liberal and communitarian debates. He made an attempt to accommodate criticisms against liberal democratic theory by developing a liberal conception of multiculturalism. Kymlicka argues for the cultural specific rights of the minorities rather the rights given or allowed by the liberal state in general. He viewed that it is important to strengthen and to provide protection for the societal culture of the minority groups. The liberal theory has a different context and meaning in India. The postcolonial nation state has addressed the problem of social and religious minorities in its own way against the wish of Hindu majoritarianism. Ambedkar, the Indian philosopher argued for the rights of social minorities by reformulating the liberal theory in his own way to suit the Indian context. This paper is an attempt to revisit Ambedkar's conception of rights of social minorities (dalits) in the light of Kymlicka's conception of minority rights in western liberal multiculturalism.

## **Kymlicka's Conception of Minority Rights**

Will Kymlicka is a contemporary Canadian philosopher known for his contribution to the theoretical understanding of minority rights in contemporary times. In political theory, his works are largely identified with the liberal tradition and had a systematic attempt to defend and expand the liberal view of rights, and the individual and society. His work *Liberalism, Community, and Culture* deals about issues of citizenship and multiculturalism for the federal government by responding to communitarians regarding cultural membership. (Kymlicka 1985). He argues against the popular conception of liberalism as commonly interpreted. The common conception of liberalism is that it gives no independent weight to our cultural membership, and hence demands equal rights of citizenship, regardless of the consequences for the existence of minority cultures. Against this view, he reinterprets the liberal tradition, to show that a respect for minority rights is indeed compatible with liberal equality: Post-war liberal clichés need to be rethought, for they misrepresent the issue, and the liberal tradition itself (Kymlicka 1985:152).

His arguments are further elaborated in *Multicultural Citizenship: A Liberal Theory of Minority*

Rights which theoretically deals with the nexus between individual and society/culture and implied meanings of freedom, liberty and good life by discussing the issues related to aboriginal peoples, Quebec, immigrant groups, and multiculturalism. The debate is centered on the adequacy of the liberal model to deal with group rights (Kymlicka 1995). This has its importance in the context of racial, cultural and ethnic conflicts and social movements focusing on identity and rights. In *Multicultural Citizenship*, Kymlicka staunchly adheres to his long-standing claim that cultural membership must be brought within the locus of liberal justice. He had refashioned the liberal democratic theory in his own way. Will Kymlicka's *Multicultural Odysseys* is an impressive evaluation of the effort to deploy liberal multiculturalism as a model for addressing ethnic and racial hierarchies in Western democracies, post-communist states and post-colonial states (Kymlicka 2007). He proposes liberal multiculturalism in the context of fear of spread of ethnic violence after collapse of communism and postcolonial democracies. He hoped for the possibility of a viable liberal-democratic form of multiculturalism by approaching norms and minority rights such as publicizing best practices, devising minimum legal, liberal norms and formulating case specific solutions. Will Kymlicka argues for minority rights within the tradition of liberalism. In general, liberalism looks on the individual as autonomous and able to act. The liberal theory emphasizes individual freedom. As a political philosophy, liberalism has often been seen as primarily concerned with the relationship between the individual and the state, and with limiting state intrusions on the liberties of citizens. That is, the liberal model is often considered to be concerned exclusively with individual rights.

All rights adhere to the individual, and liberalism has often been criticized for being excessively individualistic. Individualism and individual rights are often viewed as the defining characteristic of liberalism, so that there are minimal or no group rights that are part of collectivities. Against this opinion, Kymlicka argues that liberalism also contains a broader account of the relationship between the individual and society - and, in particular, of the individual's membership in a community and a culture (Kymlicka 1985:1). He argues that group rights are part of liberal thought. Group rights can be viewed as admissible within liberalism and even necessary for freedom and equality. For Kymlicka these are not temporary rights, but are rights that should be recognized on a permanent basis, because these are inherent rights of the national minority. He explained how minority rights relate to the broad political values such as freedom, equality, democracy and citizenship and broader normative frameworks such as liberalism, communitarianism and republicanism. Kymlicka's idea of cultural embeddedness of the individual creates theoretical space for cultural rights, thereby making liberalism hospitable to the moral imperatives of cultural pluralism.

In dealing with minority rights, Kymlicka distinguishes two types of ethno-cultural groups: National minorities in multinational states and Ethnic groups in polyethnic states. National minorities arise from the voluntary or involuntary incorporation of an entire nation, whereas ethnic minorities arise from individual and familial immigration from different nations. Kymlicka argues that immigrant groups are generally ethnic groups, and can be accorded what he calls polyethnic rights in a polyethnic state. National minorities are groups that have in common some or all of history, community, territory, language, or culture. Each of these is sometimes referred to as a nation, people, or culture. Each of these may have become a minority involuntarily through conquest, colonization, or expansion, or it could have voluntarily agreed to enter a federation with one or more other nations, peoples, or cultures. Kymlicka defines national minorities in terms of culture, and argues that if these minorities wish to retain their cultures, they should be recognized as distinct. The group rights that may be associated with national minorities are self-government rights or special representation rights. For Kymlicka these are not temporary rights, but are rights that should be recog-

nized on a permanent basis, because these are inherent rights of the national minority. Although Kymlicka argues that national minorities and ethnic groups both make legitimate claims for minority rights, his most interesting line of argument relates to national minorities. The central justification proceeds in two stages. First, he argues that individual autonomy "is dependent on the presence of a societal culture, defined by language and history, and that most people have a very strong bond to their own culture." The second stage of the argument holds that liberal justice "is not only consistent with, but even requires, a concern with cultural membership." Minority rights can thus be justified not just by a claim but as the rights of these groups. As it is forcefully argued by Kymlicka: [I]t is ... unjust to individuals to say that those who belong to dominant groups can enjoy the attendant advantages and satisfactions, whereas those who belong to non dominant and minority groups must either abandon their culture or accept second-class status. It is not enough for political theorists to contemplate simply the individual and society, or relationships between man and the state. It is time for them to contemplate mankind in its great variety." Insofar as they ensure that the (collective) good of cultural membership is equally protected for the members of cultural minorities and majorities alike. Without such rights, minority members do not have "the same opportunity to live and work in their own culture as members of the majority" (Kymlicka 1995).

Kymlicka argues for minority rights based on his assumption of societal cultures. In *Liberalism, Community and Culture*, the importance of cultural membership was ascribed to a "cultural community" or "cultural structure." In *Multicultural Citizenship*, the focus changes to "societal cultures." The particular culture that it discusses is societal culture, the history, traditions, and conventions that go along with the society, and the set of social practices and institutions that are associated with the societal culture. For Kymlicka, a societal culture is "a culture which provides its members with meaningful ways of life across the full range of human activities, including social, educational, religious, recreational, and economic life, encompassing both public and private spheres." Like nations, societal cultures are typically territorially based and grounded on a common language. Societal cultures thus provide "the everyday vocabulary of social life" which, in the modern world, means they "must be institutionally embodied—in schools, media, economy, government, etc." In essence, then, the societal culture is one that can, in a modern sense, be lived within not in the sense that it is wholly independent, but because it provides a full range of options for a fulfilling human life (Kymlicka 1995).

Kymlicka put forward his idea of minority rights by relating to the specific nature of societal culture. Culture of origin provides a basic resource for people, and integration into a new culture is difficult for people. In these circumstances, it may be important to strengthen the culture and provide protections for various minority groups. But note that this leads in quite different directions for national minorities than for immigrant ethnic groups. The latter generally wish to integrate, the protections may not need be permanent, and are often fairly limited. For national minorities, the argument may lead in the direction of strengthening their societal culture, as a permanent feature, with extensive self-government rights. Kymlicka does not argue for self-government rights for ethnic groups. According to Kymlicka, ethnic groups also have a legitimate claim to minority rights. More specifically, they have a claim to "polyethnic rights," which ensure that they are incorporated into the dominant culture on fair terms, enabling ethnic groups and religious minorities "to express their cultural particularity and pride." Not only should common rights of citizenship be more strictly enforced to eliminate all forms of discrimination and prejudice, but some group-specific rights should also be justified. Further Kymlicka defends group rights as a move towards equality. The equality argument considers that some minority rights actually increase equality, and that true

equality requires different treatment for different groups. To protect these rights of culturally disadvantaged groups, state could not be culturally neutral.

### **Indian liberal democracy: Negotiating the Individual as well as Group Rights**

As Rajeev Bhargava rightly pointed out that for all talk of pluralism and multiculturalism in western political theory, a mention of how these issues arise or are tackled in places such as India is barely mentioned. Worse, political philosophers still show little curiosity about the experience of non-western societies. Further he argues that Indian experience of plurality and affirmative action has a long history and is even older than many western countries. The debates around group rights, self-determination, differentiated citizenship, gendered equality, secularism and constitutionalism are considerably enriched by the Indian experience (Bhargava 2010:58). However, Kymlicka's concerns for minority rights in the multicultural set up of western societies indirectly facilitate the need to recognize rights of oppressed social groups in India. Will Kymlicka's conception of minority rights have different context and different meanings across nations. In European nations, with the struggles of indigenous groups, immigrants, ethnic and other religious groups the debate of minority rights got its importance. There are efforts from the nation states to accommodate these groups in multicultural set up. In Indian context, the conception of minority rights had different meanings. The pluralistic nature of society and its specific historical conditions provide new meaning to the minority as explained in the case of western societies. Indian state is not typically liberal as most of the western states. As Manoranjan Mohanty explains, the rights in Indian constitution are neither individualist in nature in the strict sense of classical liberal theory nor collective in an idealistic sense (Mohanty 2001: 1-13). In the same line Thomas Pantham considers Indian constitutional framework can be appropriately referred to as communitarian-liberal democracy; it is liberal in the sense that in some respects it takes the individual to be prior to the community, and it is communitarian in that in some respects it takes the community to be prior to the individual (Pantham 1995:171).

Gurpreet Mahajan explains how the Indian state considers both the rights of the individual and a group. By focusing on the cultural policies of the state and devising ways by which cultural communities receive equal consideration in the public realm, the Indian constitution deviated from the liberal framework. While it accepted and endorsed the twin ideals of autonomy and non-discrimination, it acted on the assumption that equal treatment to all religious and cultural communities could not be ensured by providing equal political rights or civil liberties to individuals. Consequently the Indian constitution devised a two fold policy. On the one hand it tried to ensure that no community is out rightly excluded or systematically disadvantaged in the public arena, and on the other, it provided autonomy to each religious community to pursue its own way of life (Mahajan 1998: 4). She argues that if individual rights by themselves provide little protection against forces of cultural homogenization, then accommodating diversity through special consideration for vulnerable groups also neglects the primary concerns of individuals as citizens. It is only when both sets of concerns are suitably addressed that democracy is deepened and multicultural polities are nurtured and made more sustainable (Mahajan 2006: 122).

In contemporary times, Will Kymlicka's conception of minority rights renewed the debate of individual versus group rights and argues for reformulation of political theory in the context of multiculturalism. India had its own historical tradition in accommodating the rights of individuals and community. In post independent India, its constitution too ensures the rights of individuals and communities in a broad liberal democratic framework. But the demands for special provisions/rights of oppressed communities, religious and ethnic minorities often came up for debate

with the assertion of these communities. The majoritarian and privileged communities are forcefully negating the claims of these groups in the name of equality or uniformity as informed by liberalism. The complexity of Indian situation in this regard was not theorized properly. Will Kymlicka's claim of minority rights within the liberal context in the west may facilitate to revisit the Indian situation through the political philosophy of Ambedkar. Ambedkar provides the framework for minority rights prior to the initiation of Will Kymlicka. Ambedkar has not only pointed out the weak foundation of liberalism of the West but also recognized the specificity of the Indian context in adopting the liberal wisdom. The way he negotiated individual versus group rights and political theories of liberalism, Marxism, communitarianism enriches our approaches to political theory. His notion of individual, community and religion is strikingly different from that of others in ensuring reason, justice and ultimately a moral community. Ambedkar's conception of rights for scheduled castes and scheduled tribes (Dalit rights) as minority rights provides a different kind of framework to understand individual/group rights debated by liberalism and communitarianism. He treats dalits as a minority in majoritarian hindu society. Dalit rights are viewed as group specific rights for dignity, self-respect and development in all fields of life for realization of fuller human beings. He further maintains that state has to play an interventionist role to protect the rights of dalits rather than being neutral.

### **Ambedkar: Dalit Rights as Minority Rights**

Ambedkar argues for dalit rights in the context where dalits have no rights other than submitting to the majority hindus. He puts a first condition to place depressed classes under a majority rule in self-governing India : The depressed classes must be made free citizens entitled to all the rights of citizenship in common with other citizens of the state (Rodrigues 2002:369). He articulated dalit rights in the name of rights for untouchables, depressed classes, scheduled castes and tribes in a given historical context. There is no doubt that Ambedkar was inspired by the ideals of equality, freedom and democracy prompted by liberalism. He finds the resources for these ideals in Indian tradition. Equality and freedom are treated as core values of liberalism. Ambedkar supplies content to the equality. In the west, the idea of equality is addressed in a limited sense and mostly confined to political equality and is silent about economic equality. He extended the idea of equality to social and economic realms. He argues for equality in the context of a caste ridden society which is based on graded inequality. He argues for the equality of untouchable communities in terms of dignity and self-respect. In principle he argues for one man, one value and equality before law in a hierarchical society. At the same time he demands for special considerations for certain groups based on disadvantages, disability, subordination, oppression and injustice. As Valerian Rodrigues observed Ambedkar was the first major theoretician in India who argued that consideration for the disadvantaged should be the constitutive basis of the state. He developed a complex set of criteria to determine the disadvantage and attempted to specify its various gradations. Untouchability was one such socially engendered disadvantage in case of dalits. He further argues for a need for a system of safeguards for the disadvantaged in general and untouchables in particular (Rodrigues 2002:36). Ambedkar observed that the rights guaranteed by the state is not enough to protect the rights of dalits but also requires social and moral conscience to protect laws. Ambedkar holds a position that which is permitted by society to be exercised can alone be called a right. The right which is guaranteed by law but opposed by society is of no use at all. The untouchables are in more need of social liberty than that which is guaranteed by law (Pritchett 1988).

In addressing the rights of dalits, Ambedkar poses dalits as a minority social community. Ambedkar in *States and Minorities* (1947) explains the rights of minorities and argued for the

mechanism for these rights to be secured in the constitution of free India. Ambedkar's conception of minority goes in the line of Kymlicka, to a certain extent. He differentiates minorities into two categories, religious minorities and social minorities. He treats Dalits as a social minority and provides a broader framework for dalit rights. He addressed dalit rights within the framework of liberal philosophical tradition, but differs from the way it is introduced in the western liberal tradition. In States and Minorities he argues for dalit rights by considering them as cultural minorities against a hindu majority. He was of the view that minorities – Muslims, Dalits, Anglo-Indians or Sikhs in the Indian context – ought to have greater representation in a legislative body than their actual share in the population if the minority were not to be 'crushed and overwhelmed by the communal majority.' He considers dalits too as a minority at par with other minorities such as religious minorities, Muslims, and Sikhs. This has to be read in the context where the Muslims, Sikhs are recognized and represented by the state as a minority but failed to take note of dalits as a distinct social group from hindus. Even Gandhi strongly views dalits as a part of Hinduism and argues against any attempt to consider dalits as a specific community. In his theoretical framework, Ambedkar not only projects dalits as a minority but also demands the state to ensure special rights for dalits. He proposed that Scheduled Castes (dalits) have to get benefit of fundamental rights of citizens, all the benefit of the provisions for the protection of minorities and in addition, special safeguards.

Ambedkar defines and differentiates fundamental rights, minority rights and safeguards for the scheduled castes. He counters the various views on whether to consider scheduled castes as minorities or not. Ambedkar argued that scheduled castes are a minority in a hindu majoritarian society. And at the same time he differentiates them from other religious minorities and demands special safeguards for the scheduled castes. Ambedkar believed that rights are real if they are accompanied by remedies. It is no use giving rights if the aggrieved person has no legal remedy to which he can resort when his rights are invaded. Consequently when the constitution guarantees rights it also becomes necessary to make provisions to prevent the legislature and the executive from overriding them (Ambedkar 1989:406). Ambedkar had the opinion that fundamental rights have no meaning unless until state protects the weak, and the marginalized. In the hindu social order, dalits are often discriminated in everyday life experiences, both in private and in public. Ambedkar argues that discrimination is another menace which must be guarded against if the fundamental rights are to be real rights. In a country like India where it is possible for discrimination to be practiced on a vast scale and in a relentless manner fundamental rights can have no meaning. The remedy follows the lines adopted in the bill which was recently introduced in the congress of USA, the aim of which is to prevent discrimination being practiced against the blacks (Ambedkar 1989:408).

Effective representation for minorities depends upon its being large enough to give the minority the sense of not being entirely overwhelmed by the majority (Ambedkar 1989: 420). For effective representation he proposes separate electorates for the scheduled castes. Against this demand it is argued by the critics that the scheduled castes are not minorities and are Hindus. And separate electorates will perpetuate untouchability and anti-national feelings. Ambedkar replies that to say the scheduled castes are not a minority is to misunderstand the meaning of the word 'minority'. Separation in religion is not the only test of a minority. Nor is it a good and efficient test. Social discrimination constitutes the real test for determining whether a social group is or is not a majority. Even Gandhi thought it logical and practical to adopt this. On the question of scheduled castes being hindus, he counters, to make religious affiliation the determining factor for constitutional safeguards is to overlook the fact that the religious affiliation may be accompanied by an

intense degree of social separation and discrimination. In this connection he argued that muslims are given separate electorates not because they are different from hindus in point of religion. Precisely, it is because muslims are marked by social discrimination (Ambedkar 1989:422). He further argued that it is baseless to say that separate electorates for untouchables will perpetuate separation between them and hindus.

Ambedkar argues that to insist separate electorates create anti-national spirit is contrary to experience. Nationalism and anti-nationalism have nothing to do with the electoral system. They are the result of extra-electoral forces.

Ambedkar points out the advantages and privileges enjoyed by the majority community of the nation against its minorities. The majority's opinions are considered as normal, secular and legitimate whereas opinions of minorities are viewed as negative, illegitimate, anti-national, narrow, communal and religious. By observing this Ambedkar argues for rights of minorities. As he says no country which has the problem of communal majority and communal minority is without some kind of an arrangement whereby they agree to share political powers. He provides South Africa and Canada as examples. Unfortunately for minorities in India, Indian nationalism has developed a new doctrine which may be called the Divine right of the majority to rule the minorities according to the wishes of the majority. Any claim for the sharing of power by the minority is called communalism while the monopolizing of power by the majority is called nationalism. Guided by such political philosophy the majority is not prepared to allow the minorities to share political power. Under these circumstances there is no way left but to have the rights of the scheduled castes embodied in the constitution (Ambedkar 1989:427-428).

Ambedkar concludes that whether scheduled castes are a minority or not has become a matter of controversy. However, the scheduled castes are in a worst position as compared to any other minority in India. As such they required and deserve much more protection than any other minority does. The least one can do is to treat them as minority (Ambedkar 1989: 428).

Ambedkar foresees the connection between rights, social order and economic structure. The purpose is to protect the liberty of the individual from invasion by other individuals which is the object of enacting fundamental rights. The connection between individual liberty and the shape and form of the economic structure of society may not be apparent to every one. Nonetheless the connection between the two is real. There is no economic independence for the untouchables so long as they live in a ghetto as a dependent part of the hindu village. Ambedkar further points out that the majoritarian hindu religion as a code of life gives hindus many privileges and heaps upon the untouchables many indignities which are incompatible with the dignity and sanctity of human life (Ambedkar 1989: 426). Ambedkar's conception of minority rights is very much connected with equality that goes against the unjust social order and oppression ascribed in the name of religion. In other words, his emphasis on recognition of difference or arguing for special provisions for dalits in legislature, education and opportunities is very much internalized in the spirit of liberalism but adapted in the specific context of the Indian nation.

### **Liberal Democracy, Dalit Rights and Moral Theory**

On the issue of recognizing minority rights the liberal theory is facing challenges in contemporary times. The individual autonomy and obligations are incompatible to each other in the liberal framework. There are several attempts to resolve these tensions in contemporary political theory.

This surfaces as the liberal and communitarian debate and individual versus group rights. Moral theory played a critical role in evaluating the merit of each claim. In the West, Kymlicka made an attempt to accommodate the group rights such as minority rights within liberalism. It is confined to cultural rights. In non-western nations such as India, the recognition of group based or community rights has its established tradition in a pluralistic society. Ambedkar provides deeper meaning for minority rights as a move towards equality and social justice in a liberal democracy.

In maintaining that this is a liberal theory of minority rights, Kymlicka is unambiguous in his commitment to "moral individualism"—the belief that what matters most from the moral point of view is the individual person (Mc Donald 1997:306). However, it should be emphasized that Kymlicka does not accept "ontological individualism," a version of individualism often associated with liberalism. Ontological individualists insist that human beings exhaust our understanding of social reality. At one level, moral individualism is little more than the acceptance of the view that our evaluative judgments are ultimately based upon what contributes to the quality of human life. As such, this position is not a complete moral theory in itself, but is "a necessary condition for the acceptability of moral theories." Thus, perhaps what makes Kymlicka's defence of minority rights distinctively liberal is that they are endorsed only "in so far as they are consistent with respect for the freedom or autonomy of individuals." Chandran Kukathas considers Kymlicka's theory seems both to grant cultural minorities too much recognition and to give them too little. It gives them too much insofar as liberal equality does not appear to sanction special rights, and it gives them too little insofar as regarding choice or autonomy as the fundamental liberal commitment disregards the interests of cultural communities which do not value the individual's freedom to choose. If so, then it cannot mount a serious liberal challenge to the individualist view (Kukathas 1992:105-139).

On the other hand, Ambedkar's conception of democracy and the rights of minorities or dalits are different from the West. Ambedkar observed the failure of parliamentary democracy associated with liberalism in the West. He considers that the reason for discontent is due to the realization that it has failed to assure to the masses the right to liberty, property or the pursuit of happiness. The causes for this failure may be found either in wrong ideology or wrong organization or in both. He points out that parliamentary democracy in standing out as a protagonist of liberty has continuously added to economic wrongs of the poor, downtrodden and disinherited class. The wrong ideology which has vitiated parliamentary democracy is the failure to realize that political democracy cannot succeed where there is no social and economic democracy (Roudrigues 2002:62). As Ambedkar argues, social and economic democracy are the tissues and fibre of a political democracy. The tougher the tissue and fiber, the greater the strength of the body.

He further argues that parliamentary democracy developed a passion for liberty. It never made even a nodding acquaintance with equality. It failed to realize the significance of equality and did not even strike a balance between liberty and equality, with the result that liberty swallowed equality and has made democracy a name and farce. Ambedkar accused the western writers that they are superficial and not provided a realistic view of democracy. Ambedkar proposed a written constitution for effective democracy. The habits of constitutional morality may be essential for the maintenance of a constitutional form of government. He puts more emphasis on moral society and its custom than the written legal law in governing people. He heavily invested in social morality for effective functioning of democratic form of government. The framework for Dalit rights has to be viewed in this moral framework and progressive liberalism. Ambedkar is critical about cultural practices which are oppressive, exploitative and inherently violent by using critical reason. He is critical about hindu community which is not recognizing the individual worth and capabilities. At

the same time he proposes a moral community based on the principles of equality, liberty and fraternity. He believes that individuals make sense of their identity in a moral community and proposes reflexive individualism. Individual autonomy and identity are compatible in the normative political framework of Ambedkar.

## **Conclusion**

This is to conclude that Ambedkar's conception of minority rights shares with Kymlicka that minority groups have their own rights and it is the duty of the state to protect the rights rather than being neutral. Kymlicka explores minority rights within the western liberal tradition. In arguing for minority rights, he puts more emphasis on cultural rights of minorities. Ambedkar revised liberalism in the Indian context. In other words, he mediates both liberal and communitarian traditions. He recognizes the individual merit which is negated by the hindu social order and the need to protect the rights of the oppressed groups from the majoritarian hegemony. His conception of dalit rights has evolved from utter helplessness, humiliation, discrimination and exploitation of oppressed community by the dominant caste hindu community. Unlike Kymlicka's minority rights which are more inclined for cultural rights, Ambedkar's conceptions of cultural rights of minority/dalits are very much linked with social and economic equality along with political equality. He substantiates the value of equality and freedom. His conception of minority rights goes beyond western liberalism and offers one kind of liberal and democratic multiculturalism evolved from Indian experience. This may provide fresh insight to revisit the liberal and communitarian debate with reference to individual and group rights.

## **Feminism**

Feminism is a complex set of ideologies and theories, that at its core seeks to achieve equal social, political, and economic rights for women and men. Feminism refers to a diverse variety of beliefs, ideas, movements, and agendas for action. It refers to any actions, especially organized, that promote changes in society to end patterns that have disadvantaged women.

### **The Origin of the Word "Feminism"**

While it is common to see the word "feminist" used for figures such as Mary Wollstonecraft (1759–1797), the terms feminist and feminism were not used in the modern sense until a century after her 1792 book "A Vindication of the Rights of Women" was published. The term first appeared during the 1870s in France as *féminisme*—although there has been some speculation that it may have been used before then. At the time, the word referred to women's freedom or emancipation. In 1882, Hubertine Auclert, a leading French feminist and a campaigner for women's suffrage, used the term *féministe* to describe herself and others working for women's freedom. In 1892, a congress in Paris was described as "feminist." This launched a more widespread adoption of the term in the 1890s, with its use appearing in Great Britain and then America beginning about 1894.

### **Feminism and Society**

Almost all modern societal structures are patriarchal and are constructed in such a way that men are the dominant force in making the majority of political, economic, and cultural decisions. Feminism focuses on the idea that since women comprise one-half of the world population, true social progress can never be achieved without the complete and spontaneous participation of women. Feminist ideals and beliefs focus on what culture is like for women as compared to what the world is like for men. The feminist assumption is that women are not treated equally to men and as a result, women are disadvantaged in comparison to men.

Feminist ideology considers in which ways culture can and should be different between genders: Do different genders have different goals, ideals, and visions? There's a great deal of value placed on the importance of moving from point A (the status quo) to point B (female equality) through a statement of commitment to behavior and action to produce that change.

## **Feminism and Sexuality**

One arena in which women have long been oppressed is with regard to sexuality, which includes behavior, interactions with men, posture, and exposure of the body. In traditional societies, men are expected to be the commanders, standing tall and allowing their physical presence to represent their role in society, while women are expected to be quieter and more subservient. Under such societal conventions, women are not supposed to take up much space at the table, and most certainly, they should not be seen as a distraction to the men around them. Feminism seeks to embrace female sexuality and celebrate it, as opposed to so many societal conventions that condemn women who are sexually aware and empowered. The practice of elevating sexually active men while denigrating sexually women creates a double standard between the genders. Women are shunned for having multiple sexual partners, whereas men are celebrated for the same behaviors. Women have long been subjected to sexual objectification by men. Many cultures still cling to the notion that women must dress so as to not arouse men, and in many societies, women are required to fully cover their bodies.

On the other hand, in some so-called enlightened societies, female sexuality is routinely exploited in the mass media. Scantly clad women in advertising and full nudity in movies and television are commonplace—and yet, many women are shamed for breastfeeding in public. These conflicting views on female sexuality create a confusing landscape of expectations that women and men must navigate on a daily basis.

## **Feminism in the Workforce**

There are many differences within the constellation of feminist ideals, groups, and movements related to workplace unfairness, discrimination, and oppression that result from the real disadvantages women experience. Feminism assumes that sexism, which disadvantages and/or oppresses those identified as women, is not desirable and should be eliminated, however, it continues to be an issue in the workplace.

Unequal salaries are still pervasive in the workforce. Despite the Equal Pay Act of 1963, on average, a woman still earns only 80.5 cents for every dollar a man earns. According to data from the U.S. Census Bureau, women's median annual earnings in 2017 were \$14,910 less than that of their male counterparts.

## **What Feminism Is and What it Isn't**

There is a common misconception that feminists are reverse sexists, however, unlike male sexists who oppress women, feminists do not seek to oppress men. Rather, they seek equal compensation, opportunities, and treatment for both genders.

Feminism seeks to achieve equal treatment and opportunity for women and men in order to achieve similar opportunities across different fields of work and culture and equal respect in a variety of roles. Feminist theorists often explore the concepts with regard to which of women's experiences are taken as normative: Do women of different races, classes, age groups, etc. experience inequality in significantly different ways or is the common experience as women more im-

portant?

The goal of feminism is to create non-discrimination, which is essential for creating equality to ensure that no one is denied their rights due to factors such as race, gender, language, religion, sexual orientation, gender identity, political or other beliefs, nationality, social origin, class, or wealth status.

## **Feminism: Patriarchy**

Patriarchy refers to a **society dominated by men** i.e. society, state and the economy are characterised by systematic, institutionalised and pervasive **gender oppression**.

In a literal sense, **patriarchy means rule by the father**. A patriarchal family is therefore dominated by the father with power transferred down the male line, whereas a **patriarchal society is based upon male dominance**.

All feminists are highly critical of how the various instruments of patriarchy impact adversely upon women. For example, feminists claim that marriage works in favour of the husband because he gains an unpaid servant to take care of both his conjugal needs and the upkeep of the home. The exploitation of women within a marriage reflects deeper structural inequalities within a male-dominated society.

As an ideology, feminism seeks to highlight the disastrous **impact of patriarchy upon women's lives**. They claim that the exploitation and subjugation of women occurs both within the private sphere and the public realm. The socialistfeminist Simone de Beauvoir argued that only man has the freedom to choose and set himself up as essential and subject. In contrast, women are both inessential and object. To address the problem, she advocated a family structure centred upon a balanced couple that displayed "equality in difference, and difference in equality." Eco-feminists such as Carolyn Merchant extend this critique of patriarchy towards the damage done by men to the environment, advocating a more maternal relationship with Mother Earth.

Patriarchal institutions and practices have to some extent been challenged in recent years via legislative measures and changing social attitudes. In the context of the former, workplaces who employ a specific number of employees are under a legal obligation to publish the pay gap between men and women. There are also laws to prevent sexual discrimination in the workplace with employers liable if found guilty. Cases are often heard in employment tribunals in which grievances may be resolved. In terms of the latter, there is also a greater level of sensitivity towards sexist attitudes in the public sphere.

Having said this, patriarchy has shown itself able to reproduce itself from one generation to the next. Sexist attitudes within the classroom, the workplace, the boardroom and those expressed online continue to blight the lives of many females. Sexism is one of the most significant barriers towards fulfilling life chances, and one that many women (and men) would readily identify in their everyday lives. To address the problem of misogyny, liberal feminists advocate a constructive engagement with the political process. In contrast, radical feminists believe that the conventional approach is characterised by sluggish progress towards gender equality. The eradication of a system based upon systematic and institutionalised gender oppression thereby demands a more militant approach.

## **Misogyny, feminism, and sexual harassment**

The term “misogyny” is derived from the Ancient Greek word “mīsoḡunīā” which means hatred towards women. Misogyny has taken shape in multiple forms such as male privilege, patriarchy, gender discrimination, sexual harassment, belittling of women, violence against women, and sexual objectification. The roots of misogyny can be traced back to ancient Greek mythology. According to Hesiod before women came into existence, men were coexisting peacefully as companions to Gods until Prometheus decided to steal the secret of fire from the God which angered Zeus. Zeus punished mankind with an evil thing for their delight called Pandora, the first woman who carried a box which unleashed all evils such as labor, sickness, old age, and death.

As mythology spilled its vices about women, every religion had their own viewpoint. Hinduism presents diverse view about the position of women and some text place women as the highest goddess and some restrict them to the role of a mother, daughter and wife, as described in Manusmriti. Tertullian, the father of Latin Christianity, said that being a female is a curse given by God and they are the Devil's Gateway.[3] In Islam, the holy book Quran has a 4<sup>th</sup> chapter called An-Nisa meaning Women. The 34<sup>th</sup> verse is a key verse in feminist criticism of Islam which reads: Men are in charge of women by [right of] what Allah has given one over the other and what they spend [for maintenance] from their wealth. So righteous women are devoutly obedient... But those [wives] from whom you fear arrogance-[ first] advise them; [then if they persist], forsake them in bed; and [finally], strike them. But if they obey you [once more], seek no means against them.

Misogyny over years has evolved as an ideology which has engulfed the society as a smog which diminishes their site to aurora. Great philosophers, socialist, and thinkers of golden era were subdued by roars of male dominant society which narrowed their vision and made them a supporter of patriarchal society. Aristotle who was an ancient Greek philosopher and scientist was also a misogynist. He thought of women as a deformity, an incomplete male. He preached that men should always command and women should follow as they are the inferior being created by God. Misogyny at its front had male supporters, but over years, few females also supported the ideology as stated by Sociologist Michael Flood.

Over centuries, women have been suppressed, their rights were neglected as a human being, they were treated as an lower part of the society, and their roles were restricted to household chores and birthing. Prolonged oppression raised many voices and collectively led to a concept of feminism which started the longest movement in history which still continues.

Feminism is a gamut of socio political movements and ideologies that share a common goal to delineate, establish, and achieve political, economic, personal, and social equality of sexes. Feminist movements over decades have campaigned for rights of women, including the right to vote, to hold public office, to work, to earn fair wages or equal pay, to own property, to receive education, to enter contracts, to have equal rights within marriage, and to have maternity leave. Feminists have also worked to promote bodily autonomy and integrity and to protect women and girls from brutal crimes such as rape, sexual harassment, and domestic violence.

The modern feminist movement could be divided into four waves. Each wave dealt with different aspects of the same feminist issues. The first wave of feminism started with the “Women's suffrage movement” in 1848 in New York under the leadership of Susan B. Anthony and Elizabeth Cady Stanton. The movement aimed at promoting women's right to vote. The second wave which started somewhere in 1960s campaigned for the legal and social equality for women, it included issues about their reproductive rights, legal inequalities, domestic violence, marital rape and di-

force law. The third wave which began in the 1990s dealt with issues such as sex positive feminism, intersectionality, transfeminism, vegetarian ecofeminism, and postmodern feminism. Sex-positive feminism or sexually liberal feminism, propagates the idea of sexual freedom being an essential component of women's freedom.

The term intersectionality was coined by civil rights advocate Kimberle Williams Crenshaw. This theory considers that various aspects of humanity such as class, race, sexual orientation, and gender are not separate, but are interwoven and their relationships are essential to an understanding of human conditions. It focused on abolishing gender role stereotypes and expanding feminism to include women of various culture. Transfeminism as defined by scholar and activist Emi Koyama constituted a movement for liberation of transwomen. Vegetarian ecofeminism postulates that all types of oppression, like casteism, racism and sexism, are associated with each other. It is a kind of inter human oppression. A major belief of ecofeminism is that there is a strong connection between the domination of women and the domination of nature, and that both must be eradicated in order to end oppression.

Postmodern feminism has two components, i.e., liberal feminism and radical feminism, the former being an individualistic form of feminist theory which focuses on women's ability to maintain their equality by uplifting themselves in the field of academics, and other domains by which they can make better decisions and attain equal political and legal rights. Radical feminism on the other hand demands drastic reordering of society in which male supremacy is eliminated in all social and economic contexts.

The fourth-wave feminism refers to a kind of feminism that began around 2012 which targets sexual harassment, campus sexual harassment, rape culture, workplace discrimination, body shaming, sexist imagery in the media, online misogyny, assault on public transport, and other type of harassment that is associated with the use of social media. The recent issues which were shocking and horrid like Nirbhaya Delhi Gang Rape, Harvey Weinstein allegations, and Bill Cosby allegations gave birth to campaigns like Everyday Sexism Project, No More Page 3, and the recent #Me-Too.

These issues had drawn significant focus and brought legal reforms in issues such as sexual harassment at workplace as many women are employed in private, government, or unorganized sectors. Sexual harassment constitutes a gross violation of human right and women's right to equality and dignity. It is illegal to harass a person because of their gender and sexual harassment includes unwelcome sexual advances, requests for sexual favors, and other verbal or physical harassment of a sexual nature. Workplace sexual harassment, like other forms of violence, is not harmless. It involves serious health, human, and economic and social costs, which manifest themselves in the overall development indices of a nation. Its prevalence and the constant uproar brought legal actions like sexual harassment act 2012 to cease the silent menace.

It is commendable to note the progress made by the women over centuries and the fight will continue until the roots of misogyny is removed from the world. With the wave of liberalization as a part of globalization, it was expected that religious and conservative societies would become more gender sensitive and provide equal access to education and employment. However, in some places, these hopes have been belied, due to rise of religious fundamentalism. It is important to note that even "liberal" Christian societies are yet to attain complete gender equality, so one should not despair at tardy progress in our country. Without equal access to education, equal opportunity, and

economic emancipation, gender equality will remain a chimera.

## **Feminism: Sex and Gender**

The distinction between sex and gender is a highly pertinent one when seeking an understanding of feminist ideology. "**Sex**" reflects biological differences between men and women whereas "**gender**" refers to cultural and social distinctions. A consideration of the biological and cultural dimension casts light upon a major point of departure within feminist ideology. Whereas all feminists seek the emancipation of women from the shackles of a patriarchal society, there is considerable disagreement as to the proper means to secure that change.

Certain feminists emphasise the cultural dimension because they see that as the most appropriate means by which to enable women to benefit from empowerment. For them, the main source of female oppression is via the social construct of femininity because "**women are not born, they are made**" (Simone de Beauvoir). A fundamental change in our conception of gender is essential in order that women escape the confines of patriarchy and journey towards a more fulfilling life.

Essentialists however emphasise **biological differences** as they see it as more appropriate to the goals of the women's movement. They believe that women should rejoice in that which makes them biologically different to men (such as giving birth and the ability to breastfeed). These biological abilities are superior to anything a man could ever do. Either way, there is an underlying assumption that women are biologically superior. On this basis, the psychologist Carol Gilligan claims that women adopt a fundamentally different and superior moral psychology to their male counterparts. Under patriarchy, women are under pressure to achieve an unrealistic goal that means suppression of the true self.

Another leading exponent of the essentialist argument is Mary Daly. She claims that women should be proud of the biological differences between women and men (namely motherhood). Rather than adopting an androgynous ideal advocated by socialist and equality feminists, women should seek a woman-only culture untainted by a patriarchal construction of femininity; thereby enabling women to express their "lusty selves". Post-modern feminists also seek to facilitate women's voyage of self-discovery, thereby allowing a level of separation from male-imposed identities (i.e. how the marital status of a woman is always a part of their formal identification). Rather than pursue gender equality, women must adopt a degree of **separateness** to experience true liberation from male oppression.

## **Liberal Feminism**

In 1983, Alison Jaggar published *Feminist Politics and Human Nature* where she defined four theories related to feminism:

Her analysis was not completely new; the varieties of feminism had begun to emerge as early as the 1960s. Jaggar's contribution was in clarifying, extending and solidifying the various definitions, which are still often used today.

## **Goals of Liberal Feminism**

Jaggar described liberal feminism as theory and work that concentrates more on issues such as equality in the workplace, in education, and in political rights. Liberal feminism also focuses on how private life impedes or enhances public equality.

Thus, liberal feminists tend to support marriage as an equal partnership, and more male involve-

ment in child care. Support for abortion and other reproductive rights have to do with control of one's life and autonomy. Ending domestic violence and sexual harassment remove obstacles to women achieving on an equal level with men.

Liberal feminism's primary goal is gender equality in the public sphere, such as equal access to education, equal pay, ending job sex segregation, and better working conditions. From this standpoint, legal changes would make these goals possible.

Private sphere issues are of concern mainly as they influence or impede equality in the public sphere. Gaining access to and being paid and promoted equally in traditionally male-dominated occupations is an important goal.

### **What do women want? Liberal feminists believe they want the same things men want:**

- to get an education
- to make a decent living
- to provide for one's family.

### **Means and Methods**

Liberal feminism tends to rely on the state to gain equality—to see the state as the protector of individual rights.

Liberal feminists, for example, support affirmative action legislation requiring employers and educational institutions to make special attempts to include women in the pool of applicants, on the assumption that past and current discrimination may simply overlook many qualified women applicants.

Passage of the Equal Rights Amendment (ERA) has been a key goal for liberal feminists. From the original women's suffrage proponents who moved to advocate a federal equality amendment to many of the feminists of the 1960s and 1970s in organizations including the National Organization for Women, each generation viewed the amendment as necessary to create a more just society. The amendment is one state shy of the 38 needed for passage, but ERA supporters in 2019 saw renewed hope as the 100th anniversary of women's suffrage approached.

A vote that could have made Virginia the 38th state to ratify the ERA missed by a single vote in early 2019. But the U.S. Supreme Court upheld new redistricting lines in the state later in 2019 and a move was underway in Congress to officially extend the ratification deadline.

The text of the Equal Rights Amendment, as passed by Congress and sent to the states in the 1970s, is classical liberal feminism: "Equality of rights under the law shall not be denied or abridged by the United States or by any state on account of sex." While not denying there may be biologically-based differences between men and women, liberal feminism cannot see these differences as adequate justification for inequality, such as the wage gap between men and women.

### **Critics**

Critics of liberal feminism point to a lack of critique of basic gender relationships, a focus on state action which links women's interests to those of the powerful, a lack of class or race analysis, and

a lack of analysis of ways in which women are different from men. Critics often accuse liberal feminism of judging women and their success by male standards.

"White feminism" is a kind of liberal feminism which assumes that the issues facing white women are the issues all women face, and unity around liberal feminist goals is more important than racial equality and other such goals. Intersectionality was a theory developed in criticism of liberal feminism's common blindspot on race.

In more recent years, liberal feminism has sometimes been conflated with a kind of libertarian feminism, sometimes called equity feminism or individual feminism. Individual feminism often opposes legislative or state action, preferring to emphasize developing the skills and abilities of women to compete better in the world as it is. This feminism opposes laws that give either men or women advantages and privileges.

## **Socialist Feminism**

The phrase "socialist feminism" was increasingly used during the 1970s to describe a mixed theoretical and practical approach to achieving women's equality. Socialist feminist theory analyzed the connection between the oppression of women and other oppressions in society, such as racism and economic injustice.

## **The Socialist Basis**

Socialists had fought for decades to create a more equal society that did not exploit the poor and the powerless in the same ways that capitalism did. Like Marxism, socialist feminism recognized the oppressive structure of a capitalist society. Like radical feminism, socialist feminism recognized the fundamental oppression of women, particularly in a patriarchal society. However, socialist feminists did not recognize gender and only gender as the exclusive basis of all oppression. Rather, they held and continue to hold that class and gender are symbiotic, at least to some degree, and one cannot be addressed without taking the other into consideration. Socialist feminists wanted to integrate the recognition of sex discrimination within their work to achieve justice and equality for women, for working classes, for the poor and all humanity.

## **A Little History**

The term "socialist feminism" might make it sound as though the two concepts— socialism and feminism—are cemented together and intertwined, but this has not always been the case. Socialist Party leader Eugene V. Debs and Susan B. Anthony were at odds back in 1905, each of them supporting a different end of the spectrum. Decades later, Gloria Steinem suggested that women, and particularly younger women, were eager to throw their support behind socialist Bernie Sanders rather than Hillary Clinton, a concept that became evident in the 2016 national election when Sanders won 53 percent of the female vote in the New Hampshire primary in contrast to Clinton's 46 percent.

## **How Is Socialist Feminism Different?**

Socialist feminism has often been compared to cultural feminism, but they are quite different although there are some similarities. Cultural feminism focuses almost exclusively on the unique traits and accomplishments of the female gender in opposition to those of men. Separatism is a key theme, but socialist feminism opposes this. The goal of socialist feminism is to work with men to achieve a level playing field for both genders. Socialist feminists have referred to cultural feminism as "pretentious." Socialist feminism is also distinctly different from liberal feminism, although

the concept of liberalism has changed over the early decades of the 21st century.

Although liberal feminists seek equality of the sexes, socialist feminists do not believe that is entirely possible within the constraints of current society. The focus of radical feminists is more on the root causes of inequalities that exist. They tend to take the position that sexual discrimination is the sole source of the oppression of women. However, radical feminism may be more closely related than some other forms of feminism are to socialist feminism. Of course, all these types of feminism share similar and often identical concerns, but their remedies and solutions vary.

## **Radical Feminism**

Radical feminism is a philosophy emphasizing the patriarchal roots of inequality between men and women, or, more specifically, the social domination of women by men. Radical feminism views patriarchy as dividing societal rights, privileges, and power primarily along the lines of sex, and as a result, oppressing women and privileging men. Radical feminism opposes existing political and social organization in general because it is inherently tied to patriarchy. Thus, radical feminists tend to be skeptical of political action within the current system and instead tend to focus on culture change that undermines patriarchy and associated hierarchical structures.

### **What Makes It 'Radical'?**

Radical feminists tend to be more militant in their approach (radical as "getting to the root") than other feminists. A radical feminist aims to dismantle patriarchy rather than making adjustments to the system through legal changes. Radical feminists also resist reducing oppression to an economic or class issue, as socialist or Marxist feminism sometimes did or does. Radical feminism opposes patriarchy, not men. To equate radical feminism to man-hating is to assume that patriarchy and men are inseparable, philosophically and politically. (Although, Robin Morgan has defended "man-hating" as the right of the oppressed class to hate the class that is oppressing them.)

### **Roots of Radical Feminism**

Radical feminism was rooted in the wider radical contemporary movement. Women who participated in the anti-war and New Left political movements of the 1960s found themselves excluded from equal power by the men within the movement, despite the movements' supposed underlying values of empowerment. Many of these women split off into specifically feminist groups, while still retaining much of their original political radical ideals and methods. "Radical feminism" became the term used for the more radical edge of feminism.

Radical feminism is credited with the use of consciousness-raising groups to raise awareness of women's oppression. Later radical feminists sometimes added a focus on sexuality, including some moving to radical political lesbianism.

Some key radical feminists were Ti-Grace Atkinson, Susan Brownmiller, Phyllis Chester, Corrine Grad Coleman, Mary Daly, Andrea Dworkin, Shulamith Firestone, Germaine Greer, Carol Hanisch, Jill Johnston, Catherine MacKinnon, Kate Millett, Robin Morgan, Ellen Willis, and Monique Wittig. Groups that were part of the radical feminist wing of feminism include Redstockings, New York Radical Women (NYRW), the Chicago Women's Liberation Union (CWLU), Ann Arbor Feminist House, The Feminists, WITCH, Seattle Radical Women, and Cell 16. Radical feminists organized demonstrations against the Miss America pageant in 1968.

### **Key Issues and Tactics**

## Central issues engaged by radical feminists include:

- Reproductive rights for women, including the freedom to make choices to give birth, have an abortion, use birth control, or get sterilized
- Evaluating and then breaking down traditional gender roles in private relationships as well as in public policies
- Understanding pornography as an industry and practice leading to harm to women, although some radical feminists disagreed with this position
- Understanding rape as an expression of patriarchal power, not a seeking of sex
- Understanding prostitution under patriarchy as the oppression of women, sexually and economically
- A critique of motherhood, marriage, the nuclear family, and sexuality, questioning how much of our culture is based on patriarchal assumptions
- A critique of other institutions, including government and religion, as centered historically in patriarchal power.

Tools used by radical women's groups included consciousness-raising groups, actively providing services, organizing public protests, and putting on art and culture events. Women's studies programs at universities are often supported by radical feminists as well as more liberal and socialist feminists.

Some radical feminists promoted a political form of lesbianism or celibacy as alternatives to heterosexual sex within an overall patriarchal culture. There remains disagreement within the radical feminist community about transgender identity. Some radical feminists have supported the rights of transgender people, seeing it as another gender liberation struggle; some have opposed the transgender movement, seeing it as embodying and promoting patriarchal gender norms.

## Quotes From Radical Feminists

"I didn't fight to get women out from behind vacuum cleaners to get them onto the board of Hoover." – Germaine Greer

"All men hate some women some of the time and some men hate all women all of the time." – Germaine Greer

"The fact is that we live in a profoundly anti-female society, a misogynistic 'civilization' in which men collectively victimize women, attacking us as personifications of their own paranoid fears, as The Enemy. Within this society it is men who rape, who sap women's energy, who deny women economic and political power." – Mary Daly

"I feel that 'man-hating' is an honorable and viable political act, that the oppressed have a right to class-hatred against the class that is oppressing them. – Robin Morgan

"In the long run, Women's Liberation will of course free men—but in the short run it's going to COST men a lot of privilege, which no one gives up willingly or easily."

– Robin Morgan

"Feminists are often asked whether pornography causes rape. The fact is that rape and prostitution caused and continue to cause pornography. Politically, culturally, socially, sexually, and economically, rape and prostitution generated pornography; and pornography depends for its continued existence on the rape and prostitution of women." – Andrea Dworkin

## Ecofeminism

**Ecofeminism**, also called **ecological feminism**, branch of feminism that examines the connections

between women and nature. Its name was coined by French feminist Françoise d'Eaubonne in 1974. Ecofeminism uses the basic feminist tenets of equality between genders, a revaluing of non-patriarchal or nonlinear structures, and a view of the world that respects organic processes, holistic connections, and the merits of intuition and collaboration. To these notions ecofeminism adds both a commitment to the environment and an awareness of the associations made between women and nature. Specifically, this philosophy emphasizes the ways both nature and women are treated by patriarchal (or male-centred) society. Ecofeminists examine the effect of gender categories in order to demonstrate the ways in which social norms exert unjust dominance over women and nature. The philosophy also contends that those norms lead to an incomplete view of the world, and its practitioners advocate an alternative worldview that values the earth as sacred, recognizes humanity's dependency on the natural world, and embraces all life as valuable.

### **Origins Of Ecofeminism**

The modern ecofeminist movement was born out of a series of conferences and workshops held in the United States by a coalition of academic and professional women during the late 1970s and early 1980s. They met to discuss the ways in which feminism and environmentalism might be combined to promote respect for women and the natural world and were motivated by the notion that a long historical precedent of associating women with nature had led to the oppression of both. They noted that women and nature were often depicted as chaotic, irrational, and in need of control, while men were frequently characterized as rational, ordered, and thus capable of directing the use and development of women and nature. Ecofeminists contend that this arrangement results in a hierarchical structure that grants power to men and allows for the exploitation of women and nature, particularly insofar as the two are associated with one another. Thus, early ecofeminists determined that solving the predicament of either constituency would require undoing the social status of both.

Early work on ecofeminism consisted largely of first documenting historical connections between women and the environment and then looking for ways to sever those connections. One founder of ecofeminism, theologian Rosemary Ruether, insisted that all women must acknowledge and work to end the domination of nature if they were to work toward their own liberation. She urged women and environmentalists to work together to end patriarchal systems that privilege hierarchies, control, and unequal socioeconomic relations. Ruether's challenge was taken up by feminist scholars and activists, who began critiquing not only ecological theories that overlooked the effect of patriarchal systems but also feminist theories that did not interrogate the relationship between women and nature as well.

By the late 1980s, ecofeminism had grown out of its largely academic environment and become a popular movement. Many scholars cite the feminist theorist Ynestra King as the cause of that popularization. In 1987 King wrote an article titled "What Is Ecofeminism?" that appeared in *The Nation*. There she challenged all Americans to consider the ways in which their belief systems allow for the exploitative use of the earth and the further oppression of women. With the help of King's article, the concept of ecofeminism grew both in support and philosophical scope.

### **Radical Ecofeminism And Cultural Ecofeminism**

As ecofeminism continued to develop, it witnessed the first of several splinterings. By the late 1980s ecofeminism had begun to branch out into two distinct schools of thought: radical ecofeminism and cultural ecofeminism. Radical ecofeminists contend that the dominant patriarchal society equates nature and women in order to degrade both. To that end, radical ecofeminism builds on

the assertion of early ecofeminists that one must study patriarchal domination with an eye toward ending the associations between women and nature. Of particular interest to those theorists is the ways in which both women and nature have been associated with negative or commodifiable attributes while men have been seen as capable of establishing order. That division of characteristics encourages the exploitation of women and nature for cheap labour and resources.

Cultural ecofeminists, on the other hand, encourage an association between women and the environment. They contend that women have a more intimate relationship with nature because of their gender roles (e.g., family nurturer and provider of food) and their biology (e.g., menstruation, pregnancy, and lactation). As a result, cultural ecofeminists believe that such associations allow women to be more sensitive to the sanctity and degradation of the environment. They suggest that this sensitivity ought to be prized by society insofar as it establishes a more direct connection to the natural world with which humans must coexist. Cultural ecofeminism also has roots in nature-based religions and goddess and nature worship as a way of redeeming both the spirituality of nature and women's instrumental role in that spirituality.

Not all feminists favoured the bifurcation of ecofeminism. Some women, for instance, worried that cultural ecofeminism merely enforces gender stereotypes and could lead to further exploitation. Others wanted a greater emphasis on nature-based religion, while still others insisted that a celebration of Western organized religions could accommodate nature-based worship. Those same groups also differed with regard to the romanticization of nature and the roles that various practices (such as vegetarianism or organic farming) ought to play in the application of ecofeminist principles. As a result, the movement continued to grow and expand in order to accommodate those variations, and most self-identified ecofeminists celebrate the myriad definitions and applications available under the general rubric of ecofeminism.

## **Ecofeminism's Future**

Many women remained unsatisfied with the limits of the movement. Of particular concern was the failure of women in developed countries to acknowledge the ways in which their own lifestyles were leading to further degradation of their counterparts in less-developed countries and of the Earth as a whole. Women from developing countries pointed to the effects of commercial food production, sweatshop labour, and poverty on their families and their landscapes. They accused white ecofeminists of promoting that exploitation by purchasing goods created as a result of inequity. They also took issue with the appropriation of indigenous cultures and religions for the purpose of advancing a philosophical position. Thus, contemporary ecofeminism must be developed to acknowledge the very real effects of race, class, ethnicity, and sexuality on a woman's social position. Women involved in environmental justice issues and women representing minority cultures have worked to establish their own sense of ecofeminism to include local cultures and spirituality, a celebration of their roles as mothers and caretakers, and a recognition of the ways in which Western colonization compromised those beliefs.

Many ecofeminists were also concerned with what they saw as a heterosexual bias in the movement insofar as ecofeminism appeared to privilege the experience of heterosexual women over homosexual women. To correct that problem, an emerging school of ecofeminism emphasized the need to incorporate the tenets of queer theory into the precepts of ecofeminism. They contended that if ecofeminism is indeed committed to fighting against systems of oppression and domination, then the movement must also acknowledge the ways in which sexuality—and, more specifically, responses to that sexuality—also figure as oppressive mechanisms. Thus, the re-

demption of women's roles and opportunities must also include a valuing of sexual differences as well as differences in race, class, and gender.

Ecofeminist scholars often contend that the great plurality of beliefs within ecofeminism is one of the movement's greatest strengths. They note that the myriad definitions and applications, which sometimes complement and sometimes conflict with one another, demonstrate the liberating and inclusive aspects of the movement. They also point to the important commonalities shared within the various schools of ecofeminism. All ecofeminists, they say, work toward the development of theory and action that acknowledge the problems inherent in patriarchal and hierarchical systems. They advocate the revaluing of science to acknowledge the role of subjectivity and intuition. They also support the creation of a new worldview that celebrates all biological systems as inherently valuable. Finally, they insist on solving those problems through affirming and nonviolent means.

# MCQs

1. Who is the author of the book The Republic –
  - a. Plato
  - b. Aristotle
  - c. Kant
  - d. GandhijiAnswer: a
  
2. The idea of Philosopher King introduced by –
  - a. Rousseau,
  - b. Hobbes,
  - c. Locke ,
  - d. PlatoAnswer: d
  
3. Platos ideal state is known as –
  - a. The Republic,
  - b. Polity,
  - c. Oligarchy ,
  - d. AutocracyAnswer: a
  
4. To Aristotle the best form of government is –
  - a. Polity,
  - b. Aristocracy,
  - c. Plutocracy,
  - d. democracyAnswer: a
  
5. “For the people, by the people, of the people” is a statement of –
  - a. Democracy,
  - b. Aristocracy,
  - c. Autocracy,
  - d. None of theseAnswer: a
  
6. “General will” is the concept of –
  - a. Rousseau,
  - b. Webber,
  - c. Gandhiji,
  - d. d) NehruAnswer: a
  
7. “General will” is equal to , a)
  - a. peoples will,
  - b. rulers will,
  - c. workers will,
  - d. none of theseAnswer: a

8. "The web of relations" is a definition of –  
a. state,  
b. society,  
c. government,  
d. group Answer:b
9. Who wrote the book "Justice asFairness"-  
a. John Rawls,  
b. Aruna roy,  
c. Pareto,  
d. LevinasAnswer:a
10. Which is the largest democratic countryin the world-  
a. China,  
b. USA,  
c. India,  
d. Brazil Answer:c
11. When did the United NationsOrganisation establish-  
a. 1945,  
b. 1935,  
c. 1955,  
d. 1947 Answer:a

Logic

## Logic

Though literature is commonly thought to tell some kind of truth, it is surely not one comparable to logic. A time-honoured example: Socrates is a man All men are mortal Therefore Socrates is mortal. Given the premises, we intuitively grasp the conclusion as true. How could it be otherwise? It offends some sense of rightness to deny it, just as we cannot assert that something is at once the case and not the case,  $p$  and not- $p$ . But what is this intuitive sense?

Broadly, there are four views. The first is that the laws of logic are generalized, empirical truths about how things in the world behave, like the laws of science, but more abstract. Few believe this. That "ravens are black" is not an inevitable truth in the way "all bachelors are unmarried" necessarily must be. We accept that ravens are indeed black, but could conceive of some being not so. But a married bachelor is a contradiction in terms, something we can't seriously entertain.

A second theory, is that the laws of logic are not given to us by experience, but are true in ways more fundamental than our sense impressions: they are true because that is how the world is. The mind's power of reason gives us insight into the inherent nature of things: truth is a property of the world rather than our reasoning processes. But what is this property? We don't derive our laws of logic through insight, and there are sufficient conundrums in the physical world (e.g. quantum mechanics where an electron is sometimes a particle and sometimes wave occupying a position with some percentage of probability) for us to doubt if logic can be safely grounded in the outside world.

A third view is that logic is isomorphous with mind functioning, that humans by their constitutions are unable to entertain contradictions once they become apparent. Our brains are simply constructed ("hardwired") so as to reject logical inconsistencies. But logic is not a branch of psychology or physiology; and we have as yet only a rudimentary understanding of brain functioning. A theory so dependent on unknowns is not one securely based.

The fourth view is simpler: the laws of logic are verbal conventions. We learn through social usage the meanings of and, and not, true and false. In one, trivial sense this is undeniably true. But if the terminology is arbitrary, we still cannot rationalize away our sense of truth and correctness in this manner. The sentence " $p$  and not- $p$ " remains a contradiction, whatever term we give it.

## Sentential Logic

Move on, difficulties notwithstanding. Logics that aim to represent situations in simple, context-free sentences are called sentential (also propositional, or propositional calculus), after Gottlob Frege who founded modern mathematical logic. Sentential logic is built with propositions (simple assertions that employ logical constants like not and or, and and and if - then. Such logics cannot deal with expressions like he believed her (which appeal to the common understanding of the human heart) but are very powerful in their own field.

## Symbolic Logic

Indeed, once connectives are used ( $\&$ ,  $\sim$ ,  $\exists$ ,  $\supset$ ,  $\forall$  and, not, some, supposing, all) very complex sentences can be built up where the truth value of the whole sentence is dependent only on the truth values of its components. We arrive not only at secure judgements, but see clearly how the individual propositions systematically play their part in the overall truth or falsity of the sentence.

Symbols are commonly used. Take a sentence like: John exists. We recast that as: There is something that is John, and that something is identical to John. Expressed symbolically that becomes:  $(\exists x) (x = \text{John})$ . Everything is green becomes:  $(\forall x) (\text{Green}(x))$ . Using the negative  $\sim$  we can ex-

press: everything is green as: it is not the case that everything is not green:  $\sim (\exists x) (\sim \text{green}(x))$ .

Is this helpful? Immensely so. Numbers can be defined in this way. Perplexing sentences like: The King of France is bald can be re-expressed as a conjunction of three propositions:

1. There is a King of France,
2. There is not more than one King of France, and
3. Everything that is a King of France is bald. Put another way, this becomes: there is an  $x$ , such that  $x$  is a King of France,  $x$  is bald, and for every  $y$ ,  $y$  is a King of France only if  $y$  is identical with  $x$ . In symbols:  $(\exists x) (K(x) \& b(x) \& (y)(K(y) \supset (y = x)))$ .

## Metalinguages

But how do we handle logical paradoxes like the following: { What is written between these brackets is false.} If what is written between the brackets is false, it is also false that What is written between these brackets is false – i.e. the sentence must be true. But we have accepted it as false. How can we stop sentences referring to themselves? Alfred Tarski's solution was to consider the primary sentence as written in an object language, and that commenting on the primary sentence is in another language altogether, a metalanguage. Both languages had to be logically formulated to avoid the tangles and vagueness of everyday speech, but only the metalanguage could refer to the object language, not the other way about.

## Many-Valued Logics

Are these the only categories of logic? Not at all. There are three-valued systems that operate with true, false and possible/indeterminate. There are systems that use more than three values. And there is a large branch of logic (modal logic) that deals not with simple propositional assertions, but with concepts like possible, impossible, contingent, necessary and absurd. And since what is true today may not have been so yesterday, some have argued that time should come into logic, {7} either by changing our understanding of logical operators, or by extending standard logic. Why have these alternatives been developed, and how do they modify a search for an ideal, logically transparent language?

A two-value system of logic is unsatisfactory in some areas of mathematics on two counts. Certain propositions cannot be declared true or false because that truth or falsity hasn't been demonstrated. Secondly, the adoption of either true and false values for a proposition may lead to contradictions in the mathematical treatment of quantum mechanics and relativity. As an alternative to standard logic, Jan Lukasiewicz developed a three-valued system of logic: true, false and possible, usually denoted as 1, 0 and 1/2 – where the possible was defined by his pupil Tarski in 1921. Once the possible was denoted as 1/2 the way was open to many-valued logics, and such logics are indeed used to solve problems associated with independence, non-contradiction and completeness of axioms.

Much richer than these is the practical or deontic (normative) logic developed by G.H. von Wright, {9} who recognized two aspects of knowledge: theoretical and practical. The last he divided into logics of values, names and imperatives. Four modal categories applied to each of these three logics – truth (necessary, possible or contingent), knowledge (verified, falsified or undecided), obligation (compulsory, permitted, forbidden) and existence (relation of modal logic to quantification). The matter is technical, of course, and contested, but has been applied to legal issues.

If nonstandard logics like modal and the many-valued escape the restrictions of standard logic, are they more widely applicable? Surprisingly, the answer is no. They apply more cogently in certain specific areas (in quantum mechanics, in computer circuitry, or the problems of relay and switching circuits in electrical theory) but lose their universality because the two-valued tautologies no longer apply. Many workers regard them as degraded systems, no more than interesting novelties.

### **Role of Logic and Its Limitations**

So where does logic fit into philosophy? Mostly as a means to an end, i.e. to thinking clearly, and expressing that thought succinctly. The psychologist Jean Piaget certainly regarded thinking as secondary to the actions of the intelligence. For him (as it was for Cassirer) logic was a science of pure forms, structures simply representing the processes of thought. Logic was too narrow, arid and mechanical to properly represent human thought processes. René Poirier argued for an organic logic where modalities operated on various levels: symbolism, experience and mental certitude. Symbolic logic was only the syntactical manipulation of signs empty of content. Logic should start further down, thought Petre Botezatu, by studying the structures of thoughts themselves. Above all, thought Anton Dumitru, we must know directly the fundamental ideas and principles of logic.

### **Reference and Naming**

How could we know these principles? Moreover, to take something more straightforward, how do we even make reference to objects that form the subjects of simple two-value propositions? There is more to it than pointing and uttering a name. Many words denote things abstract, or never seen, or possibly not even existing. And the matter is crucial. However logically transparent the sentences, they will not make sense unless they hook up to the world beyond.

How is this done? What is the answer to literary critics like Derrida who claim that words point not to objects, but to other words, and these to yet more, and so on endlessly? At their simplest, prior to their use in propositions and sentences, words refer to things. But do they need to have meanings, or can they simply denote things – i.e. do they describe or simply point? Russell opted for both: his theory of descriptions combined sense and reference:  $F$  denotes  $x$  iff  $F$  applies to  $x$ . (Additionally, there was a special category of logically proper names that denoted simple objects, these simple objects being the results of direct acquaintance, i.e. of sense impressions.) But in general Russell's ordinary proper names were identified with description, even though different speakers might carry around different descriptions in their heads. And where the simple object denoted did not exist (the King of France) then matters could be arranged so that one at least of the propositions was false.

We can therefore speak meaningfully of things that do not exist. The sentences are simply false, as would be those employing a fiction like Sherlock Holmes. But since there is a distinction between Sherlock Holmes was a detective, and Sherlock Holmes was a woman, subsequent philosophers have often preferred to use a formal language in a domain of fictional entities: the so-called free logics. Many things are not determinable in fiction, moreover (did Sherlock Holmes have an aunt in Leamington Spa?) so that these logics are often multi-valued.

Since a name might not be acceptable to everyone, or might conjure up very different descriptions in different minds, Strawson and Searle suggested that name and reference should be established by a cluster of descriptions, most though not all operating at any one time. But what do we understand by: The man who murdered Sadat was insane? – insane because he murdered Sadat, or in-

sane anyway? To distinguish, Donnellan used the terms attributive and referential respectively.

Saul Kripke is critical of description. Descriptions may fix a reference, but do not give it sense. Some may even turn out later to be false. To preserve a reference from these mishaps what we should employ are rigid designators, entities which have the same reference in all possible worlds. Remember, says Kripke, that references are often borrowed without being understood, and that we may have only the haziest notion of Cicero and the Cataline plot but still wish to refer to them. Let us therefore adopt a causal theory of reference. A name is introduced by dubbing: ostension. People not present at the dubbing can pick up the name later, and in turn pass it on to others: the reference chains are called designating or d-chains. The name thus becomes independent of its first use or user, allows substitution by other words, and needs no elaborate descriptions. No doubt this mimics what actually happens in the world. But each speaker is now responsible for the reference: his meanings, and associations in using the name can all be referred back and checked. Words other than names are more difficult: they require reference fixing and theories for reference borrowing, which is where a good deal of contemporary work continues.

## **Truth**

**Truth**, in metaphysics and the philosophy of language, the property of sentences, assertions, beliefs, thoughts, or propositions that are said, in ordinary discourse, to agree with the facts or to state what is the case.

## **The Correspondence Theory**

The classic suggestion comes from Aristotle: "To say of what is that it is, or of what is not that it is not, is true." In other words, the world provides "what is" or "what is not," and the true saying or thought corresponds to the fact so provided. This idea appeals to common sense and is the germ of what is called the correspondence theory of truth. As it stands, however, it is little more than a platitude and far less than a theory. Indeed, it may amount to merely a wordy paraphrase, whereby, instead of saying "that's true" of some assertion, one says "that corresponds with the facts." Only if the notions of fact and correspondence can be further developed will it be possible to understand truth in these terms.

Unfortunately, many philosophers doubt whether an acceptable explanation of facts and correspondence can be given. Facts, as they point out, are strange entities. It is tempting to think of them as structures or arrangements of things in the world. However, as the Austrian-born philosopher Ludwig Wittgenstein observed, structures have spatial locations, but facts do not. The Eiffel Tower can be moved from Paris to Rome, but the fact that the Eiffel Tower is in Paris cannot be moved anywhere. Furthermore, critics urge, the very idea of what the facts are in a given case is nothing apart from people's sincere beliefs about the case, which means those beliefs that people take to be true.

Thus, there is no enterprise of first forming a belief or theory about some matter and then in some new process stepping outside the belief or theory to assess whether it corresponds with the facts. There are, indeed, processes of checking and verifying beliefs, but they work by bringing up further beliefs and perceptions and assessing the original in light of those. In actual investigations, what tells people what to believe is not the world or the facts but how they interpret the world or select and conceptualize the facts.

## Coherence And Pragmatist Theories

Starting in the mid-19th century, this line of criticism led some philosophers to think that they should concentrate on larger theories, rather than sentences or assertions taken one at a time. Truth, on this view, must be a feature of the overall body of belief considered as a system of logically interrelated components—what is called the “web of belief.” It might be, for example, an entire physical theory that earns its keep by making predictions or enabling people to control things or by simplifying and unifying otherwise disconnected phenomena. An individual belief in such a system is true if it sufficiently coheres with, or makes rational sense within, enough other beliefs; alternatively, a belief system is true if it is sufficiently internally coherent. Such were the views of the British idealists, including F.H. Bradley and H.H. Joachim, who, like all idealists, rejected the existence of mind-independent facts against which the truth of beliefs could be determined.

Yet coherentism too seems inadequate, since it suggests that human beings are trapped in the sealed compartment of their own beliefs, unable to know anything of the world beyond. Moreover, as the English philosopher and logician Bertrand Russell pointed out, nothing seems to prevent there being many equally coherent but incompatible belief systems. Yet at best only one of them can be true.

Some theorists have suggested that belief systems can be compared in pragmatic or utilitarian terms. According to this idea, even if many different systems can be internally coherent, it is likely that some will be much more useful than others. Thus, one can expect that, in a process akin to Darwinian natural selection, the more useful systems will survive while the others gradually go extinct. The replacement of Newtonian mechanics by relativity theory is an example of this process. It was in this spirit that the 19th-century American pragmatist philosopher Charles Sanders Peirce said:

The opinion which is fated to be ultimately agreed to by all who investigate, is what we mean by the truth, and the object represented in this opinion is the real. In effect, Peirce’s view places primary importance on scientific curiosity, experimentation, and theorizing and identifies truth as the imagined ideal limit of their ongoing progress. Although this approach may seem appealingly hard-headed, it has prompted worries about how a society, or humanity as a whole, could know at a given moment whether it is following the path toward such an ideal. In practice it has opened the door to varying degrees of skepticism about the notion of truth. In the late 20th century philosophers such as Richard.

Rorty advocated retiring the notion of truth in favour of a more open-minded and open-ended process of indefinite adjustment of beliefs. Such a process, it was felt, would have its own utility, even though it lacked any final or absolute endpoint.

## Tarski And Truth Conditions

The rise of formal logic (the abstract study of assertions and deductive arguments) and the growth of interest in formal systems (formal or mathematical languages) among many Anglo-American philosophers in the early 20th century led to new attempts to define truth in logically or scientifically acceptable terms. It also led to a renewed respect for the ancient liar paradox (attributed to the ancient Greek philosopher Epimenides), in which a sentence says of itself that it is false, thereby apparently being true if it is false and false if it is true. Logicians set themselves the task of developing systems of mathematical reasoning that would be free of the kinds of self-

reference that give rise to paradoxes such as that of the liar. However, this proved difficult to do without at the same time making some legitimate proof procedures impossible. There is good self-reference (“All sentences, including this, are of finite length”) and bad self-reference (“This sentence is false”) but no generally agreed-upon principle for distinguishing them.

These efforts culminated in the work of the Polish-born logician Alfred Tarski, who in the 1930s showed how to construct a definition of truth for a formal or mathematical language by means of a theory that would assign truth conditions (the conditions in which a given sentence is true) to each sentence in the language without making use of any semantic terms, notably including truth, in that language. Truth conditions were identified by means of “T-sentences.” For example, the English-language T-sentence for the German sentence *Schnee ist weiss* is: “Schnee ist weiss” is true if and only if snow is white. A T-sentence says of some sentence (S) in the object language (the language for which truth is being defined) that S is true if and only if..., where the ellipsis is replaced by a translation of S into the language used to construct the theory (the metalanguage). Since no metalanguage translation of any S (in this case, snow is white) will contain the term true, Tarski could claim that each T-sentence provides a “partial definition” of truth for the object language and that their sum total provides the complete definition.

While the technical aspects of Tarski’s work were much admired and have been much discussed, its philosophical significance remained unclear, in part because T-sentences struck many theorists as less than illuminating. But the weight of philosophical opinion gradually shifted, and eventually this platitudinous appearance was regarded as a virtue and indeed as indicative of the whole truth about truth. The idea was that, instead of staring at the abstract question “What is truth?,” philosophers should content themselves with the particular question “What does the truth of S amount to?”; and for any well-specified sentence, a humble T-sentence will provide the answer.

## Deflationism

Philosophers before Tarski, including Gottlob Frege and Frank Ramsey, had suspected that the key to understanding truth lay in the odd fact that putting “It is true that...” in front of an assertion changes almost nothing. It is true that snow is white if and only if snow is white. At most there might be an added emphasis, but no change of topic. The theory that built on this insight is known as “deflationism” or “minimalism” (an older term is “the redundancy theory”).

Yet, if truth is essentially redundant, why should talk of truth be so common? What purpose does the truth predicate serve? The answer, according to most deflationists, is that true is a highly useful device for making generalizations over large numbers of sayings or assertions. For example, suppose that Winston.

Churchill said many things ( $S_1, S_2, S_3, \dots, S_n$ ). One could express total agreement with him by asserting, for each of these sayings in turn, “Churchill said S, and S,” and then asserting, “And that is all he said.” But even if one could do this—which would involve knowing and repeating every single saying Churchill made—it would be much more economical just to say, “Everything Churchill said was true.” Similarly, “Every indicative sentence is either true or false” is a way of insisting, for each such sentence (S), S or not S.

Despite their contention that the truth predicate is essentially redundant, deflationists can allow that truth is important and that it should be the aim of rational inquiry. Indeed, the paraphrases into which the deflationary view renders such claims help to explain why this is so. Thus, “It is important

to believe that someone is ill only if it is true that he is" becomes "It is important to believe that someone is ill only if he is." Other broad claims that appeal to the notion of truth can likewise be paraphrased in illuminating ways, according to deflationists. "Science is useful because what it says is true" is a way of simultaneously asserting an indefinitely large number of sentences such as "Science is useful because it says that cholera is caused by a bacterium, and it is" and "Science is useful because it says that smoking causes cancer, and it does" and so on.

While deflationism has been an influential view since the 1970s, it has not escaped criticism. One objection is that it takes the meanings of sentences too much for granted. According to many theorists, including the American philosopher Donald Davidson, the meaning of a sentence is equivalent to its truth conditions. If deflationism is correct, however, then this approach to sentence meaning might have to be abandoned (because no statement of the truth conditions of a sentence could be any more informative than the sentence itself). But this in turn is contestable, since deflationists can reply that the best model of what it is to "give the truth conditions" of a sentence is simply that of Tarski, and Tarski uses nothing beyond the deflationists' own notion of truth. If this is right, then saying what a sentence means by giving its truth conditions comes to nothing more than saying what a sentence means.

As indicated above, the realm of truth bearers has been populated in different ways in different theories. In some it consists of sentences, in others sayings, assertions, beliefs, or propositions. Although assertions and related speech acts are featured in many theories, much work remains to be done on the nature of assertion in different areas of discourse. The danger, according to Wittgenstein and many others, is that the smooth notion of an assertion conceals many different functions of language underneath its bland surface. For example, some theorists hold that some assertions are not truth bearers but are rather put forward as useful fictions, as instruments, or as expressions of attitudes of approval or disapproval or of dispositions to act in certain ways. A familiar example of such a view is expressivism in ethics, which holds that ethical assertions (e.g., "Vanity is bad") function as expressions of attitude ("Tsk tsk") or as prescriptions ("Do not be vain!"). Another example is the constructive empiricism of the Dutch-born philosopher Bas van Fraassen, according to which some scientific assertions are not expressions of belief so much as expressions of a lesser state of mind, "acceptance." Accordingly, assertions such as "Quarks exist" are put forward not as true but merely as "empirically adequate." If some such views are correct, however, then an adequate theory of truth will require some means of distinguishing the kinds of assertion to which it should apply—some account, in other words, of what "asserting as true" consists of and how it contrasts, if it does, with other kinds of commitment.

Even if there is this much diversity in the human linguistic repertoire, however, it does not necessarily follow that deflationism—according to which the truth predicate applies redundantly to all assertions—is wrong. The diversity might be identifiable without holding the truth predicate responsible. "Vanity is bad" or "Quarks exist" might contrast with "Snow is white" in important respects without the difference entailing that the first two sentences are without truth value (neither true nor false) or at best true in other senses.

## **Validity**

### **Definition of validity**

One desirable feature of arguments is that the conclusion should follow from the premises. But what does it mean? Consider these two arguments :

- Argument #1 : Barbie is over 90 years old. So Barbie is over 20 years old.
- Argument #2 : Barbie is over 20 years old. So Barbie is over 90 years old.

Intuitively, the conclusion of the first argument follows from the premise, whereas the conclusion of the second argument does not follow from its premise. But how should we explain the difference between the two arguments more precisely? Here is a thought : In the first argument, if the premise is indeed true, then the conclusion cannot be false. On the other hand, even if the premise in the second argument is true, there is no guarantee that the conclusion must also be true. For example, Barbie could be 30 years old.

So we shall make use of this idea to define the notion of a deductively valid argument, or valid argument, as follows: An argument is valid if and only if there is no logically possible situation where all the premises are true and the conclusion is false at the same time.

The idea of validity provides a more precise explication of what it is for a conclusion to follow from the premises. Applying this definition, we can see that the first argument above is valid, since there is no possible situation where Barbie can be over 90 but not over 20. The second argument is not valid because there are plenty of possible situations where the premise is true but the conclusion is false. Consider a situation where Barbie is 25, or one where she is 85. The fact that these situations are possible is enough to show that the argument is not valid, or invalid.

## Validity and truth

What if we have an argument with more than one premise? Here is an example : All pigs can fly. Anything that can fly can swim. So all pigs can swim. Although the two premises of this argument are false, this is actually a valid argument. To evaluate its validity, ask yourself whether it is possible to come up with a situation where all the premises are true and the conclusion is false. (We are not asking whether there is a situation where the premises and the conclusion are all true.) Of course, the answer is 'no'. If pigs can indeed fly, and if anything that can fly can also swim, then it must be the case that all pigs can swim.

## So this example tells us something :

The premises and the conclusion of a valid argument can all be false. Hopefully you will now realize that validity is not about the actual truth or falsity of the premises or the conclusion. Validity is about the **logical connection** between the premises and the conclusion. A valid argument is one where the truth of the premises guarantees the truth of the conclusion, but validity does not guarantee that the premises are in fact true. All that validity tells us is that **if the premises are true, the conclusion must also be true.**

## Showing that an argument is invalid

Now consider this argument :

Adam loves Beth. Beth loves Cathy. So Adam loves Cathy. This argument is not valid, for it is possible that the premises are true and yet the conclusion is false. Perhaps Adam loves Beth but does not want Beth to love anyone else. So Adam actually hates Cathy. The mere possibility of such a situation is enough to show that the argument is not valid. Let us call these situations invalidating counterexamples to the argument. Basically, we are defining a valid argument as an argument with

no possible invalidating counterexamples. To sharpen your skills in evaluating arguments, it is therefore important that you are able to discover and construct such examples.

Notice that a counterexample need not be real in the sense of being an actual situation. It might turn out that in fact that Adam, Beth and Cathy are members of the same family and they love each other. But the above argument is still invalid since the counterexample constructed is a possible situation, even if it is not actually real. All that is required of a counterexample is that the situation is a coherent one in which all the premises of the argument are true and the conclusion is false. So we should remember this :

An argument can be invalid even if the conclusion and the premises are all actually true. To give you another example, here is another invalid argument with a true premise and a true conclusion : "Paris is the capital of France. So Rome is the capital of Italy." . It is not valid because it is possible for Italy to change its capital (say to Milan), while Paris remains the capital of France.

Another point to remember is that **it is possible for a valid argument to have a true conclusion even when all its premises are false**. Here is an example :

All pigs are purple in colour. Anything that is purple is an animal. So all pigs are animals. Before proceeding any further, please make sure you understand why these claims are true and can give examples of such cases.

1. The premises and the conclusion of an invalid argument can all be true.
2. A valid argument should not be defined as an argument with true premises and a true conclusion.
3. The premises and the conclusion of a valid argument can all be false.
4. A valid argument with false premises can still have a true conclusion.

## A reminder

The concept of validity provides a more precise explication of what it is for a conclusion to follow from the premises. Since this is one of the most important concepts in this course, you should make sure you fully understand the definition. In giving our definition we are making a distinction between truth and validity. In ordinary usage "valid" is often used interchangeably with "true" (similarly with "false" and "not valid"). But here validity is restricted to only arguments and not statements, and truth is a property of statements but not arguments. So never say things like "this statement is valid" or "that argument is true"!

## Truth and Validity

The term **validity** (also called **logical truth**, **analytic truth**, or **necessary truth**) as it occurs in logic refers generally to a property of particular statements and deductive arguments. Although **validity** and **logical truth** are synonymous concepts, the terms are used variously in different contexts. Whether or not **logical truth** is **analytic truth** is a matter of clarification.

## Validity of Arguments

When an argument is set forth to prove that its conclusion is true (as opposed to probably true), then the argument is intended to be deductive. An argument set forth to show that its conclusion is probably true may be regarded as inductive. To say that an argument is valid is to say that the conclusion really does follow from the premises. That is, an argument is valid precisely when it cannot possibly lead from true premises to a false conclusion. The following definition is fairly typical: An argument is **deductively valid** if, whenever all premises are true, the conclusion is also necessarily true. An argument that is not valid is said to be "invalid". An example of a valid argument is given

by the following well-known syllogism: All men are mortal. Socrates is a man. Therefore, Socrates is mortal. What makes this a valid argument is not the mere fact that it has true premises and a true conclusion, but the fact of the logical necessity of the conclusion, given the two premises. No matter how the universe might be constructed, it could never be the case that this argument should turn out to have simultaneously true premises but a false conclusion. The above argument may be contrasted with the following invalid one: All men are mortal. Socrates is mortal. Therefore, Socrates is a man.

In this case, the conclusion does not follow inescapably from the premise: a universe is easily imagined in which 'Socrates' is not a man but a woman, so that in fact the above premises would be true but the conclusion false. This possibility makes the argument invalid. (Although whether or not an argument is valid does not depend on what anyone could actually imagine to be the case, this approach helps us evaluate some arguments.)

A standard view is that whether an argument is valid is a matter of the argument's logical form. Many techniques are employed by logicians to represent an argument's logical form. A simple example, applied to the above two illustrations, is the following: Let the letters 'P', 'Q', and 's' stand, respectively, for the set of men, the set of mortals, and Socrates. Using these symbols, the first argument may be abbreviated as:

All P are Q. s is a P.  
Therefore, s is a Q.

Similarly, the second argument becomes:

All P are Q. s is a Q.  
Therefore, s is a P.

These abbreviations make plain the logical form of each respective argument. At this level, notice that we can talk about any arguments that may take on one or the other of the above two configurations, by replacing the letters P, Q and s by appropriate expressions. Of particular interest is the fact that we may exploit an argument's form to help discover whether or not the argument from which it has been obtained is or is not valid. To do this, we define an "interpretation" of the argument as an assignment of sets of objects to the upper-case letters in the argument form, and the assignment of a single individual member of a set to the lower-case letters of the argument form. Thus, letting P stand for the set of men, Q stand for the set of mortals, and s stand for Socrates is an interpretation of each of the above arguments. Using this terminology, we may give a formal analogue of the definition of deductive validity:

An argument is **formally valid** if its form is one such that for each interpretation under which the premises are all true also the conclusion is true. As already seen, the interpretation given above does cause the second argument form to have true premises and false conclusion, hence demonstrating its invalidity.

## **Denotation and connotation**

The terms, **denotation** and **connotation**, are used to convey and distinguish between two different kinds of meanings or extensions of a word. A denotation is the strict, literal, definition of a word, devoid of any emotion, attitude, or color. The connotation of a word or term adds elements of emo-

tion, attitude, or color. The meaning or use of denotation and connotation depends partly on the field of study.

## The meaning of denotation and connotation

- In media-studies terminology, **denotation** is the first level of analysis: What the audience can visually see on a page. Denotation often refers to something literal, and avoids being a metaphor. Here it is usually coupled with connotation, which is the second level of analysis, being what the denotation represents.
- In logic, linguistics, and semiotics, a **denotation** of a word or phrase is a part of its meaning; however, several parts of meaning may take this name, depending on the contrast being drawn:
- Denotation and connotation are either
- in basic semantics and literary theory, the literal and figurative meanings of a word, or,
- in philosophy, logic and parts of linguistics, the extension and intension of a word
- Denotation can be synonymous with **reference**, and connotation with **sense**, in the sense and reference distinction in philosophy of language.
- In Computer science, denotational semantics is contrasted with operational semantics.
- In Semiotics, denotation also has its own meaning.

In logic and semantics, denotation always attracts the extension, meaning "in the pair," but the other element genuinely varies. The distinction between connotation and denotation corresponds roughly to Gottlob Frege's ground-breaking and much-studied distinction between Sinn (sense) and Bedeutung (reference). Bertrand Russell, in 1905, published a seminal article on the topic of denotation, entitled "On Denoting." Denotation often links with symbolism, as the denotation of a particular media text often represents something further; a hidden meaning (or an enigma code) is often hidden in a media text.

## Examples

In order to understand fully the difference between denotation and connotation in media studies and semiotics, it is helpful to examine some examples: The denotation of this example is a red rose with a green stem. The connotation is that it is a **symbol** of passion and love—this is what the rose represents. The denotation is a brown cross. The connotation is a **symbol** of religion, according to the media connotation. To be more specific, this is a **symbol** of Christianity. The denotation is a representation of a cartoon heart. The connotation is a **symbol** of love and affection, not in the way of a rose, but a symbol of true love.

## Definition of Connotation

A connotation is a subjective cultural and/or emotional coloration in addition to the explicit or denotative meaning of any specific word or phrase in a language.

## Usage

Within contemporary society, **connotation** branches into a culmination of different meanings. These could include the contrast of a word or phrase with its primary, literal meaning (known as a denotation), with what that word or phrase specifically denotes. The connotation essentially relates to how anything may be associated with a word or phrase, for example, an implied value judgment or feelings.

- A stubborn person may be described as being either "strong-willed" or "pig-headed." Although

these have the same literal meaning (that is, stubborn), strong-willed connotes admiration for someone's convictions, while pig-headed connotes frustration in dealing with someone. Likewise, "used car" and "previously owned car" have the same literal meaning, but many dealerships prefer the latter, since it is thought to have fewer negative connotations.

- It is often useful to avoid words with strong connotations (especially disparaging ones) when striving to achieve a neutral point of view. A desire for more positive connotations, or fewer negative ones, is one of the main reasons for using euphemisms. (Although, not all theories of linguistic meaning honor the distinction between literal meaning and connotation).

## Logic

In logic and in some branches of semantics, **connotation** is more or less synonymous with intension. Connotation is often contrasted with **denotation**, which is more or less synonymous with extension. A word's extension is the collection of things it refers to; its intension is what it implies about the things it is used to refer to. So, the **denotation** or **extension** of "dog" is just the collection of all the dogs that exist.

The **connotation** or **intension** of "dog" is (something like) "four-legged canine carnivore." Alternatively, the connotation of the word may be thought of as the set of all its possible referents (as opposed to merely the actual ones). So saying, "You are a dog," would imply that the subject was ugly or aggressive rather than a literal canine.

## Difference Between Denotation and Connotation

Understanding the difference between denotation and connotation is important to understanding definitions and how concepts are used. Unfortunately, that is complicated by the fact that these terms can be used in two different ways: grammatical and logical. Even worse, both uses are worth keeping in mind, and both uses are relevant to the project of logical, critical thinking.

## Meanings

In grammar, a word's denotation is whatever the word directly refers to, roughly equivalent to its lexical definition. Thus, the word "atheist" denotes a person who disbelieves in or denies the existence of gods. A word's connotation refers to any subtle nuances that might or might not be intended by its use. For example, one possible connotation for the word "atheist" might be someone who is immoral and wicked, depending upon who is doing the speaking or listening.

Separating grammatical denotation from connotation is important because while one might assume that a word's denotation is fully intended, whether a word's connotations are intended is much more difficult to determine. Connotations are often emotional in nature, and thus if they are intended, it may be for the purpose of swaying a person's emotional reactions rather than the logical evaluation of an argument.

If there are misunderstandings about how a person is using a word in a particular debate, a primary source of that misunderstanding might lie in the word's connotations: people might be seeing something not intended, or the speaker may be intending something people don't see. In constructing your arguments, it's a good idea not merely to look at what your words denote, but also what they connote.

In logic, the uses of denotation and connotation are very different. The denotation, or extension, of a term, is the list of a class of objects referred to by the word (think of it as "how far does this word

extend?"). Thus the word "planet" denotes specific objects such as Venus, Earth, Jupiter, and Neptune. Whether it also denotes an object like "Pluto" is a matter of some debate among astronomers for reasons I will explain shortly. The connotation, or intention, of a word, is the list of attributes shared by all members of the class named by the word (think of it as "by using this word, what do I intend?"). Thus the word "planet" connotes certain characteristics which astronomers have decided to differentiate certain objects from other objects like comets, stars, and asteroids. The debate over whether the word "planet" denotes "Pluto" is because astronomers disagree on what sorts of attributes are connoted by the word "planet," and hence whether "Pluto" has the right attributes to qualify as a planet.

### **Which Comes First?**

The debate over the status of Pluto indicates that whereas the extension of a word is determined by its intention, the reverse is not also true. Put more simply, the list of objects covered by a word is determined by the list of characteristics that word is thought to describe; on the other hand, the list of characteristics described by a word is not determined by the list of things covered by that word. The objects covered by the word "planet" are determined by what characteristics the word "planet" is supposed to describe, but not the other way around.

At least, that's what some philosophers argue. Others disagree and argue the contrary: that a word is used first to describe a list of objects thought to be similar in some important ways and then, once this denotation of the word is established, the connotation is developed by teasing out a set of reasonable characteristics from the list of objects. Thus, the connotation is determined by the denotation.

Who is right? Perhaps they both are. An example of how difficult it is to determine this might be the word "tree." Did people first create a list of tree-like qualities and then later decide which objects go on the list of "trees," or did people first start calling certain objects "trees" and only later decide what "tree-like" qualities justified inclusion in the list of trees? In logic, science, and philosophy – basically, in any field where very careful thought is required – intention should determine extension. In casual usage, however, it may well be that as a practical matter extension can determine intention.

### **Meanings Change**

The meaning of words can change over time because people will simply use them in different ways, but any change in meaning might represent an extensional change (in what the word denotes), an intentional change (in what the word connotes), or both. For example, the word "marriage" doesn't currently denote (for most people) any unions between two members of the same sex. If we started to denote such unions by "marriage," would that require a change in connotation (what characteristics the word intends) or not?

This is, in fact, a key element in the debate over gay marriage. When people disagree over whether gays should be allowed to marry, they disagree in part over the proper intention of the term "marriage." Unless they come to some agreement over the term's intention, they will never see eye-to-eye over its extension.

An intentional definition, however, lists the attributes or characteristics of the concept – for example, listing the qualities that an object must have to qualify as a planet instead of an asteroid. For obvious reasons, this is often easier than an extensional definition because there is no need to list

a long series of examples – a list of attributes is always shorter and quicker.

## Propositions

The term 'proposition' has a broad use in contemporary philosophy. It is used to refer to some or all of the following: the primary bearers of truth-value, the objects of belief and other "propositional attitudes" (i.e., what is believed, doubted, etc.<sup>[1]</sup>), the referents of that-clauses, and the meanings of sentences.

One might wonder whether a single class of entities can play all these roles. If David Lewis (1986, p. 54) is right in saying that "the conception we associate with the word 'proposition' may be something of a jumble of conflicting desiderata," then it will be impossible to capture our conception in a consistent definition.

The best way to proceed, when dealing with quasi-technical words like 'proposition', may be to stipulate a definition and proceed with caution, making sure not to close off any substantive issues by definitional fiat.

Propositions, we shall say, are the sharable objects of the attitudes and the primary bearers of truth and falsity. This stipulation rules out certain candidates for propositions, including thought- and utterance-tokens, which presumably are not sharable, and concrete events or facts, which presumably cannot be false.

These consequences fit well with contemporary usage. Our definition leaves open many of the questions dividing propositionalists: which additional roles are propositions fit to play? would propositions have to be mind-independent or abstract? what individuation conditions would they have? how would they relate to facts? We examine these issues below, as well as the fundamental issue of whether there are propositions at all.

## The Nature and Status of Propositions

Easy Arguments: Mind-Independence and Abstractness Reflection on the proposition role leads many propositionalists to rather dramatic answers to questions about the nature and status of propositions. Below is one standard line of argument, versions of which can be found in Bealer (1998) and Schiffer (2003).

The proposition that there are rocks, which we denote  $\langle \text{there are rocks} \rangle$ , does not entail the existence of any beings that have or are capable of having mental states. It entails this neither in a strictly or broadly logical sense. That is, it is possible in the broadest sense for  $\langle \text{there are rocks} \rangle$  to be true in the absence of all mental states. But now, if this proposition is possibly true in the absence of mental states, then it possibly exists in the absence of all mental states, and so is mind-independent. This is an easy argument for the mind-independence of at least some propositions.

A parallel "easy argument" can be given for the abstractness of at least some propositions.  $\langle 2+2=4 \rangle$  does not entail the existence of concrete entities. So it is possible for it to be true (and so to exist) in the absence of concrete entities. Thus, it is possibly abstract. Assuming, contra Linksy and Zalta (1996), that abstractness is, necessarily, an essential feature of abstract entities, then it follows that  $\langle 2+2=4 \rangle$  is in fact abstract. One might want to extend such arguments to contingent propositions. Consider  $\langle \text{there are trees} \rangle$ . This proposition is false in a world without concrete entities. But if it is false in such a world, it must exist in that world, and so is possibly, and so actually

abstract.

Similar arguments can be constructed for properties. If properties are what we assert of objects and what is true/false of objects, then there are simple arguments for the conclusion that at many properties are mind-independent and abstract. It is dangerous to generalize these sorts of "Easy Arguments" to all propositions (particularly singular propositions). But even if they cannot be fully generalized, they threaten to show that propositions would be mind-independent abstract entities. Now, given that propositions de jure are sharable objects of attitudes, it is antecedently unlikely that they should turn out to be, say, token utterances. But one might have thought that propositions could be identified with natural language sentence types (as in Quine 1960), or with sentence types in the language of thought. But if the Easy Arguments succeed, it seems that to accept propositions, we must accept Platonism. Conceptualism about propositions seems ruled out.

Many philosophers deny that there are propositions precisely because they accept the validity of these Easy Arguments (and the truth of certain attitude ascriptions). There are familiar problems besetting the believer in abstract entities. The two "Benacerraf problems," in particular have received much attention in the literature: the epistemological problem and identification problem. The epistemological problem for abstract propositions, roughly, is this: how can we know about abstract propositions, given that we cannot causally interact with them? The identification problem requires a bit more explanation. If propositions are abstract, then there will be many distinct candidates for propositions which seem to play the proposition role equally well. If certain entities, the Fs, are candidates for being propositions, why won't the entities consisting of an F paired with the number 1 count as adequate candidates as well, so long as we reconstrue predicates for propositions in such a way as to make the number 1 irrelevant? But propositions cannot be both Fs and these new entities, because these new entities are not Fs. Is it simply indeterminate what propositions are? See the entry on platonism: in metaphysics.

The Easy Arguments can appear suspicious. How can the seemingly obvious acknowledgement that there are propositions — i.e., that beliefs have sharable objects which bear truth-values — commit us to there being mind-independent abstract entities? We will discuss two sorts of reply found in the literature. Both are objections to the inference from there being propositions to the claim that propositions have the surprising features. We are putting aside objections to the claim that there are propositions.

### **Reply #1: Truth in a World vs. Truth at a World.**

The Easy Arguments rely on an assumption about entailment and truth, namely:

(Assumption A) If a proposition  $\langle p \rangle$  fails to entail a proposition  $\langle q \rangle$ , then it is possible for  $\langle p \rangle$  to be true while not- $q$ . This assumption is needed to reason from premises about propositions failing to entail other propositions about there being mental states or being concrete entities to the possible truth of those propositions in the absence of mental states and concrete entities.

But how could (A) fail? If a proposition fails to entail that  $q$ , doesn't it follow that there is a possible world in which the former is true and not- $q$ ? Some philosophers (Pollock 1985, King 2007) have argued that principles like (A) have two readings, one clearly acceptable but useless to the Easy Arguments and the other useful to those arguments but false. The two readings correspond to two ways of understanding talk of truth with respect to possible worlds. One way for something to be true with respect to a world requires the truth-bearer to exist in the world and be true there. Another way is for the truth-bearer to "correctly describe" the world, where this does not require existing in

the world. Pollock gives the example of a picture depicting the non-existence of all pictures. The picture could correctly depict a situation even though the situation it depicts is one in which the picture itself does not exist. Similarly, the Medieval philosopher Jean Buridan discusses the example of an utterance of 'there are no negative utterances'. This utterance correctly describes a certain possible situation even though that situation is one in which the utterance would not exist. Following Adams (1981), we may call the former way of being true with respect to a world truth in a world and the latter truth at a world. The conceptualist may claim that propositions can be true at worlds without being true in them, by analogy with the examples from Pollock and Buridan. A proposition like <there are no propositions> is true at certain possible worlds but true in none. Since we do not want to say that such propositions are necessary, we must understand necessity as truth at every possible world. Correspondingly, to preserve the connections between entailment and necessity, we must understand entailment in terms of the entailed proposition being true at every world at which the entailing proposition is true. Given all this, we can distinguish two readings for Assumption A:

(Reading 1) If a proposition <p> fails to entail a proposition <q>, then there is a possible world W such that <p> is true in W and not-q at W. (Reading 2) If a proposition <p> fails to entail a proposition <q>, then there is a possible world W such that <p> is true at W and not-q at W. Given the understanding of entailment in terms of truth at a world, the conceptualist will claim that Reading 1 is false, while Reading 2 is true but useless to the Easy Arguments. Thus, the conclusions of those arguments are blocked.

The plausibility of this response depends on having a good account of what truth at a world amounts to. But this, in turn, depends on issues in the metaphysics of modality. If worlds are concrete particulars ("I and all my surroundings"), as they are for David Lewis (1986), then we could say that a proposition is true at a world if the proposition is about the entities that are parts of that world and is true, and true in a world if true at a world and also part of that world. There may well be difficulties of explaining how a proposition could be part of more than one concrete world (and why it would only be part of some concrete worlds but not all), but this framework seems to make conceptual room for the possibility propositions being true at worlds without being true in them.

Suppose, however, that worlds were conceived as world stories, i.e., as maximal consistent sets of propositions (see Section 2). How, then, might truth at a world be understood? One approach, favored by Adams (1981), is to explain truth at a world in terms of truth in a world, understanding the latter to amount to truth were the world actual (were all its members true). On this approach, we would understand what is true at a world in terms of what is true in it, together with certain facts about the actual world. However, the conceptualist cannot abide this approach. For, on this approach, the members of any world are true in that world. But since the members of any and every world are propositions, it would follow that, contrary to conceptualism, that it is necessary that there are propositions.

A more conceptualist-friendly approach is to reverse the order of explanation, to explain truth in a world in terms of truth at a world + existence in that world. How could truth at a world be understood? A natural proposal is to understand it as membership in a world story. Difficulties emerge with this proposal when we face the question of how to understand consistency of world stories. There are maximal sets of propositions that are not possible worlds because they are not consistent in the relevant sense. But the relevant sense is not easily defined. Following Adams (1981), we might wish to use the concept of possibility to gloss the notion of consistency: a set of propo-

sitions is consistent if and only if those propositions could all be true together. This returns us to the problem noted in the previous paragraph: it again would turn out that necessarily there are propositions (even in mindless worlds). The conceptualist might hope to take the relevant notion of consistency as primitive and reject the gloss in terms of joint possible truth. Still, we should ask about the broader implications of denying the joint possible truth of consistent world stories. Consider, for instance the notion of actuality. Only one of the many possible worlds is actual, although each is actual relative to itself. The actual one, on the world story view, is the one all of whose members are true. But if this is what actuality for worlds amounts to, then assuming possible worlds are possibly actual, it would follow that for each possible world all its members could be true together. Ought we to deny that possible worlds are possibly actual?

The conceptualist might hope to avoid these problems, without falling back on Lewis's concrete realism about possible worlds, by understanding worlds in terms of properties or states of affairs, rather than propositions. Following Stalnaker (1976), one might think of worlds as properties which are ways things could have been. Following Plantinga (1974) and others, one might think of worlds as maximal consistent states of affairs, where these are thought of as distinct from propositions.

However, this retrenchment may end up only shifting the Platonist worries elsewhere. To distinguish the ways that are possible worlds (or possible world-states) from those which are not, it is difficult to avoid appealing to a gloss in terms of being possibly instantiated: the possible worlds are not only maximal but they could be instantiated. Taking this line would require conceding that in every world there are properties. Something similar holds for the conception of possible worlds as maximal consistent states of affairs.

One might think, however, that Platonism about properties is less problematic than Platonism about propositions. The former do not represent the world, whereas the latter, as truth-bearers, do (Jubien 2001, King 2007). However, properties can apply or fail to apply to objects, and can be said to be true or false of objects, and so it is not clear that worries about representation clearly gain more traction for propositions than for properties. Similar considerations apply to states of affairs.

Despite these worries, the conceptualist might be encouraged by the example of singular propositions. Hasn't the truth in vs. truth at distinction been useful in dealing with the modality of singular propositions? For example, consider any singular proposition about Socrates, e.g., the proposition that Socrates was a philosopher. Such propositions, plausibly, depend for their existence on the object they are directly about. One might therefore think that no singular proposition about Socrates could exist unless Socrates existed. Consider, then, the proposition that Socrates does not exist. It is clearly contingent that Socrates exists; things could have been otherwise. But then the proposition that Socrates does not exist would appear to be possible without being possibly true. Unlike the examples from Pollock and Buridan, however, we cannot understand such possibility without possible truth in terms of expressing a possibly true proposition while not being possibly true itself. Propositions do not express propositions, of course, and so we cannot understand their possibility without possible truth in this way (Plantinga 1981).

What is it, then, for such a singular proposition to be possible but not possibly true? Answering this question was one of the key motivations in the development of the distinction between truth in and truth at a world. But while Adams and others attempted to do this by thinking of truth at a world as determined by what is true in that world together with a certain set of facts about the actual world, the conceptualist hopes to kick aside the ladder of truth in a world altogether. Whether

this hope is reasonable or not is an important issue in contemporary work on propositions. (Key recent discussions include King 2007, Soames 2010, and Merricks 2015).

## **Reply #2: Deflationism to the Rescue?**

Another response to the Easy Arguments is, so to speak, to deflate their significance by deflating propositions. The Easy Arguments succeed, but their success marks no great philosophical discovery and raises no hard questions of the sort that have traditionally bothered metaphysicians of a nominalist bent. We will here discuss only Stephen Schiffer's (2003) theory of "pleonastic propositions." Propositions exist, for Schiffer, but unlike rocks or cats, there is nothing more to them than what our concept of a proposition guarantees. One may call them "abstract entities," if one likes, but this label should not encourage the thought that our minds can reach beyond the physical world to make contact with denizens of a Platonic universe. We know about propositions, not by interacting with them, as we do with rocks and cats, but by being participants in certain sorts of linguistic or conceptual practice. It's because we speak or think in certain ways that we are able to know about propositions.

Schiffer argues, in effect, that given our proposition-talk and thought, propositions are, in D. M. Armstrong's phrase, a kind of "ontological free lunch." That is, the key "axioms" of our proposition-talk and thought are guaranteed to be true. These include the instances of the equivalence schema (E) for propositions: The proposition that  $p$  is true iff  $p$ . Given the truth of such axioms, it follows that propositions exist and have the features attributed to them by our axioms. Moreover, because these axioms are constitutive of the concept of a proposition, it follows that, by possessing that concept, we can know the truth of these axioms.

One might concede to Schiffer that the axioms are constitutive of our concept of a proposition. But why think those axioms are true? Schiffer stresses that we do not make the axioms true by saying, thinking, or "stipulating" that they are true. The mind-independence of propositions, after all, is implicit in those axioms. Schiffer's argument for pleonastic propositions is of a piece with his argument for pleonastic entities generally, including fictional entities, events, and properties. A pleonastic entity, for him, is an entity that falls under a pleonastic concept. The latter is the key notion and is defined as follows.

**Definition:** A concept  $F$  is pleonastic iff it implies true something-from-nothing transformations.

A SFN (something-from-nothing) transformation (about  $F$ s) is a statement that allows us to deduce a statement about a kind of entity  $F$ , from a statement that involves no reference to  $F$ s. (61) SFN transformations assert a kind of supervenience condition on  $F$ s: if the relevant non- $F$  conditions obtain,  $F$ s exist and have the relevant features. (E.g., if snow is white, then the proposition that snow is white exists and is true.)

If the concept  $F$  is pleonastic, then there are  $F$ s. We need to know how to tell if a concept is pleonastic. Here is Schiffer's test: Test: A concept  $F$  is pleonastic (and so implies true something-from-nothing transformations) iff adding it to any theory yields a conservative extension of that theory. (57)

## **Schiffer's final formulation of the conservativeness test is:**

For any theory  $T$  and sentence  $S$  expressible in  $T$ , if the theory obtained by adding to  $T_{/\sim F}$  <the theory resulting from restricting quantifiers in  $T$  to  $\sim F$ s> the concept of an  $F$ , together with its something-from-nothing  $F$ -entailment claims, logically entails  $S_{\sim F}$  <the sentence resulting from restricting quantifiers in  $S$  to  $\sim F$ s>, then  $T_{/\sim F}$  logically entails  $S_{\sim F}$ . (p. 57).

One might think the conservativeness test is overly complicated, and that all that matters is that the new entities not interfere with the empirical world. If so, then the test would mention only empirical theories not all theories. But, as Matti Eklund (2007) points out, two kinds of entity that are individually non-interfering with respect to the empirical world might interfere with one another. Schiffer is aware of this problem (see his discussion of anti-fictional entities, pp. 55–6), and this is why he turns to the more complicated account.

Schiffer's picture is this. If a concept satisfies the conservativeness test, then its instantiation would be unproblematic because it would interfere with nothing else. Its instantiation comes for free. If a concept doesn't meet this test, it doesn't come for free. Although Schiffer's view of propositions can be described as deflationary in one sense (because it attempts to deflate questions about the existence and nature of propositions), the meta-ontology underlying Schiffer's approach is, if anything, inflationary: all "non-interfering" kinds of entity are instantiated.

Schiffer's, and other deflationist theories, must, at a minimum, answer the following two questions, in addition to the questions facing all propositionalists:

(1) Why would the non-interference of Fs be evidence for their existence?

Even if Fs would be non-interfering in Schiffer's sense, the postulation of Fs logically conflicts with some consistent theories, e.g., 'There are no Fs'. Schiffer places severer constraints on the denial of entities than on the acceptance of them. Suppose Fs would be non-interfering. Then adding them would not add information about non-Fs. But suppose also that denying Fs would not add information about non-Fs. Why isn't this a reason to deny Fs? So, in this sense, the theory denying Fs passes a corresponding conservativeness test.

(2) How can the deflationist explain how these propositions have truth-conditions?

If the proposition that snow is white is a simple, necessary and eternal object, why does its having a property (truth) have anything to do with concrete snow's having a property (whiteness)? Do instances of the T-schema simply state brute necessary connections between abstract objects and concrete ones? Or do these necessary connections somehow derive from our practices, and if so, how?

### **Reply #3: Propositions as Types**

Another reaction one might have to the Easy Arguments is to accept their conclusions but to give an account of the nature of propositions which will make these conclusions palatable. One promising line of thinking, in this regard, is to think of propositions as types, the tokens of which are mental or linguistic acts or events, and in particular the acts that would be thought to express the proposition. Such views have been developed in recent years by Dummett (1996), Hanks (2011, 2015), and Soames (2010, 2014a, 2015). We focus here on the recent proposals put forth by Hanks and Soames.

The type view is motivated by its answers to otherwise puzzling features of traditional Platonist views of propositions (e.g. Frege (1984)). On this view, belief and other attitudes are understood as relations to already-existing propositions which represent things as being a certain way. The truth or falsity of an individual's belief or other cognitive state is explained by the truth or falsity of the proposition which is the object of that state. If truth consists in a representation's being accurate,

then a proposition is true just in case it accurately represents things as being a certain way. Thus, on the traditional view, thinking subjects represent things as being a certain way (either in thought or language) by standing in appropriate relations to propositions which fundamentally represent things as being a certain way. Two problems arise for the Platonist's position. First, how do cognizers come to be acquainted with such propositions? Second, what explains how propositions represent things as being a certain way? Platonists appear to have no answer to the epistemic question, and presumably accept representation as a primitive feature of propositions. Type theorists, however, explain the relation between a cognizer and a proposition simply as an instance of the general relation between type and token. Consider, as Dummett (1996, p. 259) does, one's humming of a tune. The tune is a species or type of musical performance capable of having multiple performances at differing times or locations, while the humming of it is an act belonging to that type. One might then see the relation of a proposition to a mental or linguistic act as one between the type of act performed and the performance of the act.

What type of acts should one identify with propositions? For both Hanks and Soames, propositions are types of predicative acts. The notion of predication here is simply, for atomic propositions, one of an agent's representing an object *o* as having property *F*. (Hanks (2015, p. 64) characterizes predication as categorization, or the sorting of things into groups according to a rule. Since representation is primarily something done by cognitive agents, according to Hanks and Soames, one might wonder whether the proposition itself is representational, and so possesses truth-conditions, on the type view. Both theorists respond to this concern by claiming that propositions are representational in a secondary, derivative sense. There are many examples of types that inherit features of their tokens (a sonata (type) can be discordant in virtue of performances of it being discordant; a movie can be frightening in virtue of its tokens being so, etc.

Just as an act can be described as intelligent in order to communicate that the agent acted intelligently in performing the act, type theorists will claim that a proposition represents *o* as *F* in a similarly derivative sense wherein any agent who performs the act of predicating *F* of *o* will thereby represent *o* as *F*. One question that arises for such a view is whether propositions are genuinely representational entities with truth-conditions, or whether the claim that a proposition represents things as being a certain way is simply a convenient manner of speaking indirectly about the actual and possible representational acts of thinkers.

As we have seen, the type view reverses the traditional order of explanation concerning the nature of predication, representation, and truth-conditions. On the traditional, Fregean picture, propositions exist as objective, mind-independent entities "waiting" to be entertained, judged or asserted, so to speak. On this view, for a subject *S* to predicate *F* of *o* is for *S* to entertain the proposition that *o* is *F*; for *S* to represent *o* as *F* in thought or language is to have a thought or utterance with the primarily representational proposition that *o* is *F* as its content, etc. On the type view, a proposition's representational and predicative properties are derived from the fundamentally representational and predicative acts of agents.

A concern for the type view is whether there will be "missing propositions" – truths or falsehoods which have never been entertained. One drawn to the type view may allow for the existence of uninstantiated types to account for the existence of these propositions. However, given that propositions are claimed to derive their representational features from their tokens, such uninstantiated types would lack representational features, and so lack truth-conditions. Hanks suggests dealing with such propositions counterfactually. Even if no one had ever predicated eloquence of Clinton,

the proposition that Clinton is eloquent is true iff Clinton is eloquent because if someone were to predicate eloquence of Clinton, the token would be true iff Clinton is eloquent. Predicative types, then, inherit their representation features from both their actual and possible tokens. This response, however, leaves us with the question of truths for which there are not even any merely possible tokens – for example, mathematical truths that are too complicated for any finite mind to grasp. What, if anything, provides the truth-conditions of these propositions?

Hanks (2015, p. 27) allows that propositions are mind-independent and objective entities which do not depend for their existence on having any tokens, just as one might think about a difficult type of dive that has never been performed. Thus, while Hanks' view appears to be a rejection of a traditional Platonism about propositions, it seems nevertheless to accept a Platonism about types by untethering their existence from their tokens. (Compare to Dodd's (2007) defense of Platonism about types.) Soames (2014a,b) also allows for untokened types, but only those whose constituents have been referred to or predicated in other propositions.

For Soames, a proposition  $p$  may exist in  $w$  even if no token of  $p$  has been performed in  $w$ . For Soames, if in  $w$  a predicative event has occurred in which an agent predicates  $n$ -place property  $R$  of  $n$  objects, and in  $w$  events of referring to or thinking of objects  $o_1 \dots o_n$  have occurred, then the proposition that is the type of act of predicating  $R$  of  $o_1 \dots o_n$  exists (even if  $R$  has never been predicated of  $o_1 \dots o_n$  in  $w$ ). Still, it would seem that there can be truths in a world about objects that have never been thought of or referred to in that world. In response to this, Soames claims that a proposition need not exist in a world  $w$  in order to be true in  $w$ . In support of this, Soames appeals to other, albeit controversial, cases in which an object can have a property despite not existing. For instance, Socrates can have the properties of being referred to or being admired despite no longer existing. Thus, Soames' accommodation of our intuitions concerning propositions that have never been thought appears to involve a rejection of Actualism.

The type view has been argued to provide solutions to several traditional problems for propositional thought, including Frege's puzzle, first-person belief, Kripke's puzzle about belief, and the problem of empty names. In responding to these problems, Soames invokes "Millian modes of presentation," or ways of cognizing an object in thought which do not affect the representational content of the act, to preserve a non-Fregean, Millian view of semantic content for names and natural kind terms while individuating propositions finely enough to solve traditional problems in the philosophy of language. Hanks, by contrast, invokes distinct types of referential and expressive acts as the constituents of propositions. On this view, each use of a name falls under several different reference types which differ in their fineness of grain, each associated with a different proposition.

As we have seen, the type view is motivated in large part by the perceived need to explain how propositions represent things as being a certain way on the grounds that a view which accepts primitively representational propositions is objectionably mysterious. Some question, however, whether the representational properties of propositions can (or need to) be explained at all (McGlone 2012, Caplan, et al. 2013, Merricks 2015). Merricks, for example, argues that we should accept that there are fundamentally representational entities, but that we have no reason to favor mental states (such as beliefs) over propositions as being the fundamental bearers of representational properties. For if, e.g., beliefs are fundamentally representational, then it is either a primitive fact about them that they represent what they do, or it is a feature capable of explanation. If it is a primitive fact about them, then the view appears just as mysterious as one which accepts that

propositions are primitively representational. If it is a fact capable of explanation, as the type theorists contend, then it is presumably explained in terms of an agent's ability to predicate properties of objects. But unless there is some explanation of how an agent can engage in predication, predication must itself be a primitive representational ability, and the theory has not made any genuine progress on what was to be explained. A final question worth considering at this stage is whether propositions are representational entities at all. Richard (2013) and Speaks (2014), for instance, each develop views of propositions which deny that they are. Consider the view defended by Richard. Sentences, beliefs, and the like represent things as being a certain way – snow as being white, for example. Put another way, the sentence 'Snow is white' represents snow's being white, where this is simply a way for things to be – a state of affairs or property that is either instantiated or not (but does not represent things as being any way, just as properties are not in general representational). On this approach, the proposition expressed by the sentence is identified with the way that things are represented as being, not as something which has representational properties either primitively or in need of explanation by more fundamental acts of predication. If an approach along these lines is correct, the type view appears to lose one of its central motivations.

## Categorical Syllogism

**He is a true fugitive who flies from reason. "**

– Marcus Aurelius One needs the necessary knowledge in order to make the correct decisions. Likewise, one needs the necessary logic skills, in order to make a correct reasoning. Aristotle is one of the forefathers of modern Logic and Philosophy. Aristotelian Logic, also known as Categorical Syllogism or Term Logic, may well be the earliest works of Formal Logic. A **Categorical Syllogism** is modernly defined as a particular kind of argument containing three categorical propositions, two of them premises, one a conclusion.

A categorical proposition is of the type "This S is P" and "This man is a man", no 'if', no 'but' and no 'either or'. There are other forms of syllogisms in use. Other examples include Disjunctive Syllogism, Hypothetical Syllogism and Polysyllogism. We will only be discussing on Categorical Syllogism in this article (unless otherwise mentioned). The following is an example of a syllogism: Socrates is a man. All men are mortal. Socrates is mortal.

A syllogism will be made up of 3 propositions. Each of the three propositions will have a truth value that is either true or false. No other values are allowed. Human awareness is NOT needed to make a proposition true or false. Truth value is the absolute value whether you know about it or not. That is, you might not know whether a proposition is true or false right now, but may find out later on its value.

Socrates is a man. → PROPOSITION 1  
All men are mortal. → PROPOSITION 2  
Socrates is mortal. → PROPOSITION 3

The first two of the three propositions are **premises** and the last one is a **conclusion**.

Socrates is a man. → PREMISE  
All men are mortal. → PREMISE  
Socrates is mortal. → CONCLUSION

## Structure of a Categorical Proposition

A categorical proposition is an IDEA or concept expressed by a declarative sentence. Propositions are NOT sentences. We express ideas in our minds by sentences. In English grammar a declarative sentence is a type of sentence that can affirm or deny something about reality. Declarative sentences indicate something can be either true or false in reality. If two different sentences express the same idea there is only one proposition expressed. So if we can express the idea that dogs are mammals in English, we can ALSO use the same idea in other languages using different words and different sentences. Even in the English language we can express the same idea with different sentences: you are fired and you are terminated express the same idea and therefore are the same proposition. We don't count every sentence as a proposition if the same idea is expressed. You would be wrong to think propositions are literal sentences because now you would have to count each sentence as a different proposition each time a sentence uses different words - even though you express the same idea to another person. Would you have a new proposition to say a dog is a mammal in Spanish, French, German, etc.? No, in that case the SAME PROPOSITION is expressed regardless of the words or word order of a sentence. A declarative sentence, which is used to usually express a proposition, can be split up into 4 main grammatical parts: the Quantifier, Subject Term, the Copula and the Predicate Term.

### The Subject term

The Subject is the "main noun" in a proposition. It is the main argument of the whole proposition, the actor in the sentence. The Subject can be thought of as the "What we are talking about". Examples include the following: "Socrates" in "**Socrates** is mortal" "Throwers" in "All **throwers** throw something" "Sparrows" in "Virtually all **sparrows** can fly"

### The Predicate term

The Predicate tells us something about the Subject. The Predicate can be thought as the "What we are talking about of the Subject". Examples include the following: "Mortal" in "Socrates is **mortal**" "Something" in "All throwers throw **something**" "Fly" in "Virtually all sparrows can **fly**"

### The Copula

Word or set of words that connect the Subject and Predicate Examples include the following: "Is" in "Socrates **is** mortal" "Throw" in "All throwers **throw** something" "Can" in "Virtually all sparrows **can** fly"

### The Quantifier

The extent or number of the subject. (E.g. All, some, none) Examples include the following: "All" in "**All** throwers throw something" "No" in "**No** fish can fly" "Virtually all" in "**Virtually all** sparrows can fly" And here is how it looks like when we put them together:

Quantifier	Subject	Copula	Predicate
All	S	is	P
All	throwers	throw	something

And that will be the structure of a simple Categorical Proposition.

### Minor/Major Premise and Term

As explained above, a syllogism is made up of 3 propositions, with 2 being premises and 1 as the

conclusion. Of the two premises, one will be the minor premise, whereas the other will be a major premise. In order to differentiate a minor premise from a major premise, we shall first take a look at the conclusion. It has been defined in the last section that a conclusion, being a proposition, will have a subject and a predicate. Although we have already defined a Subject and Predicate, we must also be aware that the Subject and Predicate are also known as **terms**. We can think of a term as a boundary. In *Deductive Logic*, written by St. George, he defined a term as the same thing as a name or noun. A name is a word, or collection of words, which serves as a mark to recall or transmit the idea of a thing, either in itself or through some of its attributes.

As we have seen, there will always be 2 terms in a Categorical Proposition (Subject and Predicate). Therefore, the conclusion of a syllogism will have a Subject and a Predicate as well. Here are two rules to take note of:

1. The **Subject** of a conclusion will be the **Minor Term** of the syllogism.
2. The **Predicate** of a conclusion will be the **Major Term** of the syllogism.

A syllogism is made up of 2 premises and 1 conclusion. So how do we differentiate between one premise from the other? Simple, take a look at the following two rules:

3. The Premise in which the **Minor Term** appears will be called the **Minor Premise**.
4. The Premise in which the **Major Term** appears will be called the **Major Premise**.

But that's not all. A syllogism is actually made up of 3 terms. The third term, or the **Middle Term**, can be thought of as a term used to link the two premises together in forming the conclusion. Here is how Britannica Online Encyclopedia define the 3 terms. The subject and predicate of the conclusion each occur in one of the premises, together with a third term (the middle) that is found in both premises but not in the conclusion. This brings us to a fifth and final rule.

5. The **Middle Term** will appear in both premises but not in the conclusion.

**The following table attempts to summarize the above.**

	<b>Minor Term</b>	<b>Middle Term</b>	<b>Major Term</b>
Minor Premise	0	0	
Major Premise		0	0
Conclusion	0		0

The following syllogism as an example: Socrates is a man. All men are mortal. Socrates is mortal. The conclusion of this syllogism is "Socrates is mortal". The subject here is "Socrates", which is also the minor term. "Socrates" appeared within the premise "Socrates is a man" making it the minor premise in this syllogism. **Socrates** is a man. ← Minor premise All men are mortal. **Socrates** is mortal. The predicate of the conclusion will be "mortal", thus the second proposition, "All men are mortal", will be the major premise. Socrates is a man. All men are **mortal**. ← Major premise Socrates is **mortal**. The middle term will appear in both the minor and major premises, but not in the conclusion. Therefore, the middle term in this syllogism will be "man/men". Socrates is a **man**. All **men** are mortal. Socrates is mortal.

## To summarize:

		Minor Term	Middle Term	Major Term
Minor Premise	"Socrates is a man"	Socrates	Man	-
Major Premise	"All men are mortal"	-	Man	Mortal
Conclusion	"Socrates is mortal"	Socrates	-	Mortal

One must take note that the middle term will not always come after the minor term and before the major term (as in the example above). Rather that the placement of the middle term in the example is only one of the many figures. Figure refers to placement of the middle term in the premises. There are four distinct figures (1-4). Mood is a concept that describes the premise --this is discussed later down below in detail. For now we need to know there are four distinct MOODS (A, E, I and O). Every standard form categorical syllogism has a MOOD and Figure. Argument validity can be determined by MOOD and FIGURE also because this is a FORMAL aspect regardless what the argument is about. This is how the name FORMAL LOGIC came about. Please note an argument may be valid in one mood and figure and that same argument is INVALID in a different mood and figure. Mood and Figure of a syllogism can make a difference between a syllogism being valid or invalid.

## Term Distribution

Quick reference: The standard form to represent an A type of proposition is to use the letters S (for the subject term), P (for the predicate term) and M (for the middle term). So we can shorten this to types of propositions: A type propositions are shortened to "All S are P." E type propositions are shortened to "No S are P."

I- type propositions are shortened to "Some S are P."

O type propositions are shortened to "Some S are not P".

Obviously you will need to substitute S, P and M for real words to make grammatical sentences out of this. The form does not change even-though the subject matter of the sentences can change. With that said, the distribution of a term refers to if an entire class or set is being referred to or not. In each case of a proposition we either have distributed terms or we don't. Here is a run-down of what is distributed among the four types of propositions:

### **A type propositions can distribute only the subject term. A type propositions distribute their subject term whatever that happens to be.**

For example, All Women are human beings indicates the entire classification of the subject is a member of the classification human being. It would be wrong to say all human beings are women. The order in which the terms are in may matter. Another example, all dogs are mammals. This says all dogs fall into the classification of the predicate mammals. Nothing is said of the entire class of the predicate. The predicate may have other members besides what is listed in a premise in front of us. Be warned not to jump to conclusions here.

### **An E type of proposition distributes both the subject term and the predicate terms.**

For example, No cats are dogs. Here we are referring to two classes and we are told both classes are not compatible. That is, the proposition expresses one class is not inside the other class. There are no parts of the class that intersect if we were to diagram this with a picture. No S is P eliminates two classes from joining together and here the order of the subject and predicate do not make a difference. I can swap the predicate and subject term positions and still have the same truth value: No dogs are cats is still a true proposition; No P are S is just as true as No S are P.

### **An I type of proposition does not distribute any terms.**

For example, Some men are married. no entire class is referred to exclude or include an entire set of subjects or predicate. All we know in this context is that Some means AT LEAST one S exists and that S is also in the predicate class whatever that might be. The middle term can't be distributed in this type of proposition. Therefore, a syllogism with two I type propositions and a conclusion is automatically invalid.

### **An O type proposition only distributes the predicate term.**

For example, Some animals are not reptiles. This proposition excludes the possibility of certain types of subjects. The proposition does not exclude All [of a certain subject] animals from being reptiles but at least one. Some here means ATLEAST ONE as it does in an I-type proposition. So an O type proposition excludes the subject term from an entire set of attributes described by the predicate. So we have distribution of the predicate, but not of the subject term. We don't have enough details to also make inferences about the subject. We only go by what we have available in the premise.

## **Rules of Categorical Syllogisms**

The following guidelines can determine validity without using a diagram for a Categorical Syllogism:

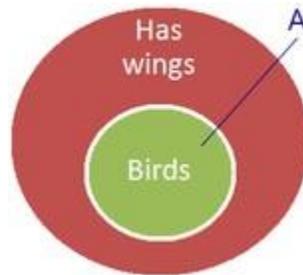

- 1) There must exactly three terms in a syllogism where all terms are used in the same respect & context. That is, no using one word in two different contexts in the same argument. For instance using the term man to represent all humans in one premise and man to represent a single individual later on in a different premise. This would be the fallacy of four terms.
- 2) The subject term and the predicate term ought to be a noun or a noun clause. The predicate should not be an adjective or an adverb. That means the sentence should be detailed as possible. No withholding information being purposely vague or ambiguous to cause a person to draw the wrong conclusion on purpose. No ending premises with adverbs or adjectives. When that occurs you must make those words into a noun or noun clause by adding details. This is usually done when arguments are not in standard categorical form. To place a non-formal argument in standard categorical form, you need to add details; you should turn adjective or adverb into concrete nouns or noun clauses. This eliminates ambiguity, vagueness and a person from backing out of a claim. This is called technically adding PARAMETERS. This helps expose deceptive tactics in the argument. This step is ignored when you get to Mathematical logic (symbolic logic).
- 3) The middle term must be distributed at least once in the premises or the argument is invalid. The fallacy of Undistributed Middle. For example, no conclusion follows from two affirmative particular premises because the middle term is not distributed. This means the link between the premises we have used cannot guarantee our conclusion.

- 4) If a term is distributed in the conclusion that same term must be distributed in a premise or the argument is invalid. This would be the fallacy of Illicit major or Illicit minor depending on the premise where the term in the conclusion is distributed but not in the premise. So if the term is not distributed in the major premise but the same term is distributed in the conclusion this would be the fallacy of illicit Major.
- 5) If the conclusion is negative then there must also be a negative premise.
- 6) No conclusion follows two negative premises. This would be the fallacy of exclusive premises.
- 7) No negative conclusions follows from two affirmative premises.

## Types of Proposition

All forms of Propositions can exist in one of 4 different types. These 4 types are denoted by the code letters A,E,I,O. These code letters are derived from the 2 Latin vowels affirmo and nego.

Code Type	Name	English	Example
Type A	Universal Affirmative	All S is P	All birds have wings
Type E	Universal Negative	No S is P	No birds have gills
Type I	Particular Affirmative	Some S is P	Some birds can fly
Type O	Particular Negative	Some S is not P	Some birds cannot fly

Type A proposition

### Type A - Universal Affirmative proposition

All of the subject will be distributed in the class defined by the predicate. Example:

All birds have wings

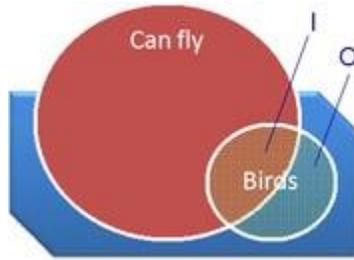

Type E proposition

### Type E - Universal Negative proposition

None of the subject will be distributed in the class defined by the predicate. Example:

No birds have gills

Type I and O proposition

### **Type I - Particular Affirmative proposition**

Some of the subject will be distributed in the class defined by the predicate. Example:  
Some birds can fly.

### **Type O - Particular Negative proposition**

Some of the subject will not be distributed in the class defined by the predicate. Example:  
Some birds cannot fly.

### **Definitions**

A **proposition** in this case will be a literally meaningful statement/sentence that affirms or deny something.

### **Laws of Thought**

**INTRODUCTION:** Some early philosophers defined logic as the science of the laws of thought, and that there are exactly three basic laws of thought which are so fundamental that it is necessary, in order to make correct thinking, that the laws must be obeyed. The formulation and clarification of such rules have a long tradition in the history of philosophy and logic. Any good reasoning is expected to conform to the set of three logical principles that are called "laws of thought".

The laws of thought are a sufficient foundation for logic. All other principles of logic are mere elaborations of the laws of thought. Philosophy is the pursuit of basic understanding through reason. Reasoning mean "thinking using language". That was why Aristotle said that human beings are 'reasoning animals'. Reason is an enquiry into relationships between ideas, and reason is the human being's best hope for discovering hidden truths. Using reason yields the best way of aiming at meaningful thought. So, three articles describe the limits of reason by showing different laws of thought.

**MEANING OF LAWS OF THOUGHT:** The laws of thought are the fundamental principles for human rational thinking. The laws of thought are fundamental axiomatic rules upon which rational discourse itself is often considered to be based. Generally, the laws are taken as the rules that guide and underlie everyone's thinking, thought, expressions, decisions, etc. The laws of thought are laws by which or in accordance with which valid thought proceeds, or that justify valid inference, or to which all valid deduction are reducible. Many logicians believe that intelligible, logically rational thinking is impossible outside the boundaries of three laws:

1. The Law of Identity
2. The Law of Excluded Middle; and
3. The Law of Non-Contradiction

**LAW OF IDENTITY:** The law of identity is also referred to as the Principle of Identity. The Law of Identity asserts that a thing is identical with itself, i.e. everything is the same as itself. In other words, this law states that something is itself and not something else. This is to say that a true statement is not a false statement, but a true one; or that if a statement is true, then it is true. Using philosophical notation, we may rephrase it by saying that the law asserts that for every statement of the form of 'p', implication 'p' must be true; that every such statement is tautology. Symbolically, the Law of Identity states:

- a.  $P \& P$  meaning P and P
- b.  $P \wedge P$  meaning P and P
- c.  $P.P$  meaning P and P
- d.  $P \rightarrow P$  meaning If P is true, then it is true
- e.  $P = P$  meaning P is equal to P
- f.  $P \rightarrow \sim(P \& \sim P)$  meaning If P is true, then it is true; and not P and something else

Basically, what all these formulations of the law of identity is 'every statement is identical with itself. Keys to Symbol:

$\&$ ,  $\wedge$ ,  $.$  = and

$\rightarrow$  = if ... then....  
 $=$  = is equal to  
 $\sim$  = not

In other words, the law asserts that if any statement is true, then it is true; a statement cannot remain the same and change its truth value. 'A' is 'A'. A boy is boy; a girl is a girl. Every proposition implies itself. What ever it, is.

## **LAW OF EXCLUDED MIDDLE**

This is also referred to as the Principle of Exclude Middle. The law of Excluded Middle states that a statement is either true or false, i.e. a logically useful sentence cannot be 'neither true nor false' and cannot simultaneously be 'both true and false'. There is no middle value between truth and falsity. Logical space has only two sides; true and false; yes and no; right and left – like two sides of a coin, a statement stays on one side only at a time; never in the middle. Symbolically the law of Excluded Middle says that:

$P \vee \sim P$  (i.e. 'P or not P', where P represent any statement at all)

In other words, P is either true or P is false. In this context, 'or' is used to mean either one or the other of two things but not both and not none. 'Or' use in this sense, is called "AUT" (Latin) as distinguished from the other sense of it, in which it is called "VEL". In the sense of 'aut', or is said to be used in the exclusive sense, whereas as 'vel' or is used in the inclusive sense in which 'or' means both of them and not neither. Thus, the law of Excluded Middle indicates that either 'P' or ' $\sim P$ ' must be true, there is no third or middle proposition between them, i.e, something either exist or does not exist. Every proposition is either true or false. Everything must either be or not be. For every proposition, either its positive or its negative form is true.

## **LAW OF NON-CONTRADICTION**

This is also referred to as the Principle of Non contradiction or the principle of contradiction. The Law of Non contradiction states that a statement cannot be its own negation, i.e., a statement that purports to be true and false at the same time in the same context is, for that same reason, neither true nor false, and so it is not a statement in logics. In other words, no statement in logic is both true and false. Symbolically, the law of non-contradiction states:  $\sim (P \ \& \ \sim P)$  meaning: P is not 'P and not P', i.e. if it is not P, it is not P; P and 'not P' cannot be the same; it is not possible for both 'P' and 'not P' to be true.

Simply, the law of non contradiction asserts that no statement can be both true and false. Using the philosophical symbol/notation, we may rephrase it by saying that the law of non-contradiction asserts that every statement of the form 'P', and 'not P' must be false, that such statement is self-contradictory. The law asserts that nothing can both 'exist' and 'not exist' at the same time and in the same respect. A person cannot be a boy or a girl at the same time. Nothing, having a given quality, also has the negative of that quality (e.g. every number is either 'even' or 'non-even'). No proposition is both true and false. Nothing can both be and not be. Two or more contradictory statements cannot both be true in the same sense at the same time. One cannot say of something that it is and that it is not in the same respect and at the same time.

## **OPINION OF PHILOSOPHERS ON THE LAWS OF THOUGHT**

Aristotle was the first person to investigate the patterns and processing of reason. He discovered logic. He wrote several extensive works on logic. He did not merely point out ways that people should think; he described the fundamental principles by which thought can occur at all. At the foundation, he marked the three laws of thought, which, till today, are basic in logic. Aristotle regarded the laws of contradiction and the law of excluded middle as examples of axioms. He stated that future contingents, or statements about unsure future events were not part of the law of excluded middle. In other words, it is either true or false that there will be a world war tomorrow, but the complex proposition that either there will be a world war tomorrow or that there will not is true.

In the Western philosophy, the evolution of the laws of thought can be traced to Aristotle. Aristotle described the laws of thought as the basic laws by which human thinking and reasoning can occur. He described the three laws as foundation laws. He identified the laws as the necessary condition of human thought: without them, thought cannot occur. George Boole<sup>1</sup> fully supported the Aristotelian concepts of the laws of thought.

Whitehead and Bertrand Russell considered the law of excluded middle as a theorem in Mathematics, rather than as an axiom. However, L. E. J. Brouwer and his school rejected the law of excluded middle; and they did not accept the use of the law in mathematical proofs involving all members of an infinite class. Jan Lukasiewicz formulated a propositional calculus in which the laws of Non-Contradiction and the law of excluded middle class failed. The calculus had a third truth-value, neither truth nor falsity, for Aristotle's future contingents.

Gottfried Leibniz formulated the additional law of sufficient reason asserting that nothing takes place without sufficient reasons to determine why it is as it is and not otherwise. For example, when a woman gives birth to a baby girl not a boy: and not a piglet, etc. he held that criteria of truth are clarity and absence of contradiction. Thus, in order to test the truths of reason, it was enough to apply the logic of Aristotle (i.e. the laws of identity, of contradiction; and of excluded middle) while the law of sufficient reason was needed to test 'truths of fact'.

The laws of thought gained more prominence through their usage by Boole. Boole used the concept to donate theories of his algebra of logic. His second book was An Investigation of the Laws of Thought on Which are Founded the Mathematical Theories of Logic and Probabilities (1854). People sometimes try to state counter examples to the laws by pointing out how statement can become true or false depending on the conditions e.g.

1. 'It is raining' may be true now, but was false yesterday
2. It is half-way between 'raining' and 'not raining'

However, these counter statements always involve changing the reference of the statement. If the reference of the statement is clear and explicit, it does not seem possible for a statement to make sense and violate these laws. For an example, Bill Clinton, former President of the United States of America tried to fight against the laws of thought when he denied that he had lied to the Congress about whether "there is a relationship with my intern" by saying later "it all depends on what it is". He thought that he could make the truth of this statement change because the relationship had ended. Rather, he was twisting words beyond sense and into deception.

## CONCLUSION

The laws of thought are sometimes misunderstood. The first law does not imply that nothing ever changes. The second law does not mean that a thing can have only one property. The third law does not assert that everything is black and white: it merely indicate that either everything is black or something is not black. The laws of thought are given not just as nice rules of thumb to follow or ways that one should think: they are necessary conditions for thought.

We can see this because logic involves conditions that are common to us all. Even President cannot veto the Laws of Thought.

## PROPOSITIONS INTRODUCTION

Classical logic concerns itself with forms and classifications of propositions. We shall begin with the standard definition of proposition. A proposition is a declarative sentence which is either true or false but not both. Also a proposition cannot be neither true nor false. A proposition is always expressed with the help of a sentence. For example - the same proposition "It is raining" can be expressed in English, Hindi, and Sanskrit and so on. It means that two or more than two sentences may express the same proposition. This is possible only when proposition is taken as the meaning of the sentence which expresses it. Therefore sentence is only the vehicle of or the means of expressing a proposition. It is the unit of thought and logic whereas sentence is the unit of grammar. A sentence may be correct or incorrect; the grammatical rules determine this. A proposition may be true or false, the empirical facts determine the status. The primary thing about a sentence is its grammatical form, but the primary thing about a proposition is its meaning and implication.

The different types of sentences are not different types of propositions. Some types of sentences are not propositions at all. Sentences may be assertive, interrogative, and imperative. Only assertive types of sentences are propositions and rest of them are not. A set of proposition make up an argument. Let us see what role propositions play and how logicians will be concerned in logic by taking a simple example of an argument:

All men are mortal.	proposition1
All kings are men.	proposition2
Therefore all kings are mortal.	proposition3

Given these propositions as true or false, the logician will only find out whether the argument is valid or not by using certain rules that we shall learn later. Before we proceed further, it is of importance that we situate the discussion on "Proposition" in the whole context of the history of Logic itself.

## **HISTORY OF LOGIC AND PROPOSITION**

Aristotle, the classical logician defines proposition as that which contains subject, predicate and a copula. "Rose is red" is a proposition. Here 'Rose' is the subject, 'red' is the predicate and 'is' is the copula. A subject is that about which something is said, a predicate is what is said about the subject and the copula is the link. Further, according to classical logicians copula should be expressed in the form of present tense only. That is why classical logicians talk of reduction of sentences into propositions. According to them all propositions are sentences but all sentences are not propositions. Subject-predicate logic ultimately gave rise to substance-attribute metaphysics in philosophy.

### **Aristotle classifies proposition into four types. They are as follows:**

- Universal affirmative (A);
- Universal negative (E);
- Particular affirmative (I) and
- Particular negative (O).

These propositions are called categorical or unconditional propositions because no condition is stated anywhere in the propositions. Letters within parentheses are standard symbols of respective propositions which are extensively used throughout our study of logic. "All men are mortal" is an example of 'A' proposition. "No men are immortal" is an instance of 'E' proposition. "Some men are intelligent" is an 'I' proposition and "Some men are honest" is an instance of 'O' proposition. Aristotle was the first thinker to devise a logical system. He holds that a proposition is a complex involving two terms, a subject and a predicate. The logical form of a proposition is determined by its quantity (universal or particular) and quality (affirmative or negative). The analysis of logical form, types of inference, etc. constitute the subject matter of logic.

Aristotle may also be credited with the formulation of several metalogical propositions, most notably the Law of Noncontradiction, the Principle of the Excluded Middle, and the Law of Bivalence. These are important in his discussion of modal logic and tense logic. Aristotle referred to certain principles of propositional logic and to reasoning involving hypothetical propositions. He also formulated nonformal logical theories, techniques and strategies for devising arguments (in the Topics), and a theory of fallacies (in the Sophistical Refutations). Aristotle's pupils Eudemus and Theophrastus modified and developed Aristotelian logic in several ways.

The next major innovations in logic are due to the Stoic school. They developed an alternative account of the syllogism, and, in the course of so doing, elaborated a full propositional logic which complements Aristotelian logic. They also investigated various logical antinomies, including the Liar Paradox. The leading logician of this school was Chrysippus, credited with over a hundred works in logic. There were few developments in logic in the succeeding periods, other than a number of handbooks, summaries, translations, and commentaries, usually in a simplified and combined form. The more influential authors include Cicero, Porphyry, and Boethius in the later Roman Empire; the Byzantine scholiast Philoponus; and alFarabi, Avicenna, and Averroes in the Arab

world. The next major logician of proposition is Peter Abelard, who worked in the early twelfth century. He composed an independent treatise on logic, the *Dialectica*, and wrote extensive commentaries. There are discussions of conversion, opposition, quantity, quality, tense logic, a reduction of *de dicto* to *de re* modality, and much else. Abelard also clearly formulates several semantic principles. Abelard is responsible for the clear formulation of a pair of relevant criteria for logical consequences. The failure of his criteria led later logicians to reject relevance implication and to endorse material implication.

Spurred by Abelard's teachings and problems he proposed, and by further translations, other logicians began to grasp the details of Aristotle's texts. The result, coming to fruition in the middle of the thirteenth century, was the first phase of supposition theory, an elaborate doctrine about the reference of terms in various propositional contexts. Its development is preserved in handbooks by Peter of Spain, Lambert of Auxerre, and William of Sherwood. The theory of obligations, a part of non-formal logic, was also invented at this time. Other topics, such as the relation between time and modality, the conventionality of semantics, and the theory of truth, were investigated.

The fourteenth century is the apex of mediæval logical theory, containing an explosion of creative work. Supposition theory is developed extensively in its second phase by logicians such as William of Ockham, Jean Buridan, Gregory of Rimini, and Albert of Saxony. Buridan also elaborates a full theory of consequences, a cross between entailments and inference rules. From explicit semantic principles, Buridan constructs a detailed and extensive investigation of syllogistic, and offers completeness proofs.

## **PROPOSITIONS AND SENTENCES**

Propositions are stated using sentences. However, all sentences are not propositions. Look at a few examples of sentences:

1. Snakes are poisonous.
2. Some students are intelligent.
3. How old are you?
4. May God bless you!
5. What a car!
6. Vote for me.

The first two statements are assertions and we can say of these statements that they may either be true or false. Therefore they are propositions. However, we cannot say whether or not the question, 'How old are you?' is true or false. The answer to the question, 'I am 16 years old' may be true or false. The question is not a proposition, while the answer is a proposition. 'May God bless you' is a ceremonial statement and it is neither true nor false. Therefore, such statements are not propositions.

'What a car!' is exclamatory and has nothing to do with being true or false. Exclamatory statements are not propositions. 'Vote for me' is an appeal or command. We cannot attribute truth or falsity to it. Therefore, evocative statements are not propositions. We therefore need to distinguish between sentences and propositions. The differences are:

1. Propositions must be meaningful (meaningful in logical sense) sentences.
2. Propositions must have a subject, a predicate and a word joining the two, a sentence need not.
3. All propositions are either true or false, but sentences may or may not be.
4. Propositions are units of Logic, sentences are units of Grammar.

## PROPOSITIONS AND JUDGMENTS

Till the nineteenth century, idealistic philosophers used the word, 'Judgment' instead of 'propositions'. Nowadays, a distinction is made between the two words. "Judgment" means 'pronouncing a formal decision'. "Proposition" means 'the result of judging'. Judgment is basically the attitude we take whereas proposition is that which we affirm or deny, accept or reject as true or false. Judgment is a mental act, a process, and an event in time. Proposition is timeinvariant.

When we say 'All kings are mortal', it is a proposition. When we assert 'We believe that all kings are mortal', we are in fact taking an attitude, making a judgment. Sometimes, a statement may appear by itself to be a proposition. However, if one knows the context in which the statement is made, it may turnout that the proposition is really a judgment made. Consider the statement: 'All foreigners are unacceptable'. By itself, it looks like a proposition, but what, if a speech is made and at the end the speaker concludes logically why 'all foreigners are unacceptable'. In such a case the speaker is actually passing a judgment. Sometimes, therefore, we need the context to distinguish a proposition from a judgment. It is only in the beginning of twentieth century that A.N. Whitehead and Bertrand Russell recognize varieties of propositions. According to them subject-predicate logic is only one form of propositions.

## TYPES OF PROPOSITION

Propositions can be viewed from different standpoints and classified into different types:

<b>STANDPOINT</b>	<b>TYPES OF PROPOSITIONS</b>
Composition	Simple, Complex or Compound
Generality	Singular, General
Relation	Categorical, Conditional
Quantity	Universal, Particular
Quality	Affirmative, Negative
Modality	Necessary, Assertoric, Problematic
Significance	Verbal, Real

### Composition - Simple Propositions

**Examples:** Love is happiness. Tiger is ferocious. All white men were dreaded by the red Indians. A simple proposition has only one subject and one predicate. Note that the subject 'All white men' is one subject though it has many words. Similarly 'Red Indians' is one predicate.

### Composition – Complex or Composite Propositions

**Examples:** Violence does not pay and leads to unhappiness.

She is graceful but cannot act. Either he is honest or dishonest. If John comes home, then you must cook chicken. 'She is graceful' is a simple proposition. 'Cannot act' can be written as 'She cannot act', which is a simple proposition again. These simple propositions are connected by a con-

junction 'but'. When two or more simple propositions are combined into a single statement we get a complex or composite proposition.

### **Generality: Singular proposition**

**Examples:** The dog wags its tail. George is my friend.

Kapil Dev is a good cricketer.

When in a proposition the subject refers to a definite, single object, the proposition is said to be singular proposition. A proper noun or a common noun preceded by a definite article 'the' forms the subject of such a proposition.

### **Generality - General Propositions**

**Examples:** Children like chocolate.

All hill stations are health resorts. Some people are funny. Few bikes come with fancy fittings. When in a proposition the subject refers to many objects, the proposition is said to be a general proposition. A common noun forms the subject of such propositions. When it is singular, the indefinite article 'a' is used. 'A dog' means any dog. It generalizes across all dogs. Words like 'some', 'few' refer to more than one object.

### **Relation - Categorical Propositions**

**Examples:** The pillows are soft  
Junk food is not good for health  
Music is the food of love.

A proposition that affirms or denies something without any condition is called a categorical proposition. Recall that a proposition has a subject, a predicate and a joining word. The joining word relates the two together. In the first example the subject, "the pillows" is joined to the predicate "soft" by the joining word "are". In this proposition the softness of the pillow is asserted or affirmed. In the second example it is denied that junk food is good for health.

Simple and general propositions are categorical in nature. In the above examples there are no conditions relating the subject and the predicate. Therefore they are called categorical propositions.

### **Relation: Conditional Propositions**

**Examples:** If you study hard, then you will do well.

Robert is either an athlete or a carpenter.

A conditional proposition consists of two categorical propositions that are so related to each other that one imposes a condition that must be fulfilled if what the other asserts is to be acceptable.

### **There are three types of conditional propositions:**

1. Hypothetical proposition
2. Alternative proposition
3. Disjunctive proposition

#### **1. Hypothetical Proposition**

**Examples:** If (you are hungry), then (you can eat chocolates.) If (it doesn't rain),

then (the harvest will be poor.)

A hypothetical proposition consists of two categorical propositions. They are put within parentheses. The first part is called antecedent and the second part is called consequent. These two propositions are related in such a way that if the first is true then the second must be true if the second is false, then the first also is false. However, if the first part is false, the second part may be true or may be false.

**Example:** If the sun shines then there is light antecedent consequent

## 2. Alternative Proposition

**Examples:** John is either a professor or a musician Either we play football or we play cricket

John is either a doctor or the author of this book.

An alternative proposition consists of two simple categorical propositions connected by 'either – or' and thus suggesting that any one of these two propositions may be true or both may be true. John may be a professor or may be a musician. It is also likely that John is both a professor and a musician. The two parts of an alternative proposition are known as alternants. Either alternant may be true or both may be true. The alternative proposition will be false only when both the alternants are false.

Either (Alternant)	Or (Alternant)	Proposition
John is a professor	John is a musician	
TRUE	TRUE	TRUE
TRUE	FALSE	TRUE
FALSE	TRUE	TRUE
FALSE	FALSE	FALSE

## 3. Disjunctive Proposition

**Examples:** It is not the case that both he is honest and he is dishonest.

It is not the case that both the meat is boiled and roasted

A disjunctive proposition consists of two simple categorical propositions (alternants) which are so related that both cannot be simultaneously true.

**Note:** The fact that both cannot be true at the same time is the only difference between an alternative and disjunctive proposition. Thus there may be examples which are common to both. In symbolic logic we use disjunctive for alternative and the third variety is called negation.

Examples: Either he is in the class or he is in the playground.

Either (Alternant)	Or (Alternant)	Proposition
	John is in class	John is in playground
FALSE	TRUE	TRUE
TRUE	FALSE	TRUE

## Modality: Assertoric Proposition:

**Examples:** The earth moves round the sun.

Objects far away appear small to the eyes.

At zero degree centigrade water turns into ice. Eleven players form a cricket team. The earth is not perfectly round. When the claim or assertion made in a proposition is verifiable it is called an assertoric proposition. The assertion that the earth moves round the sun can be verified by scientific methods. If the result of such verification is true then the proposition is true.

### **Modality: Necessary Proposition:**

**Examples:** Bachelors are unmarried male.

The result of any number multiplied by zero is zero. A point has no dimension.

Propositions which are always true by definition are called necessary propositions.

### **Modality: Problematic Proposition:**

**Examples:** Perhaps he is a rich man.

She may be happier off with him. There may be famine this year.

In a problematic proposition we only guess the truth or falsity and make no definite assertion.

### **Quantity - Universal Proposition:**

**Examples:** All boys in the team are educated.

No politicians are honest. Shillong is a hill station.

When the predicate tells something about the entire class referred to by the subject term, it is called a universal proposition. The predicate term 'educated' refers to the entire class referred to by the subject term 'all boys in the team'.

### **Quantity - Particular Proposition:**

**Examples:** Some girls are beautiful. Some songs are classical. Some men are religious.

When the predicate term tells something about an indefinite part of the class referred to by the subject term, it is called particular proposition.

### **Quality:**

The early discussion on proposition from the standpoint of quantity was based on the subject class being quantified by the word all, some, no etc. When we discuss proposition from the standpoint of quality our focus will be on the 'copula' between the terms. A copula relates the two terms and is of some form of the verb 'to be' - 'is', 'are', 'is not', 'are not'

The copula either affirms or denies the relation between two terms

### **Quality: Affirmative Proposition**

**Examples:** Some fruits are sweet. All computers are fast. Mr. John is bald.

If the relation between the subject term and the predicate term is positive (or affirmative), the proposition is said to be affirmative. In this case the copula is of the form 'is' or 'are'.

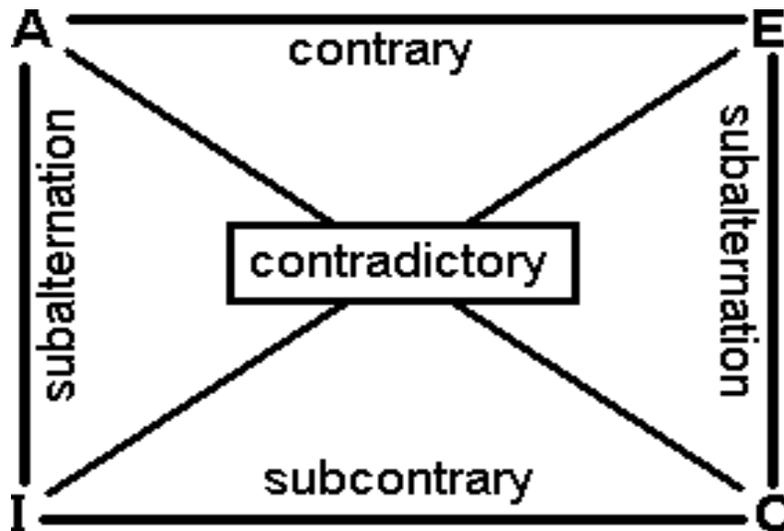

### **Quality: Negative Proposition:**

**Examples:** Some fruits are not sweet.

All computers are not fast. Mr. John is not bald.

If the relation between the subject term and the predicate term is negative (or denied), the proposition is said to be negative. In this case the copula is of the form 'is not' or 'are not'

The four corners of this chart represent the four basic forms of propositions recognized in classical logic:

**A** propositions, or universal affirmatives take the form: All S are P.

**E** propositions, or universal negations take the form: No S are P.

**I** propositions, or particular affirmatives take the form: Some S are P.

**O** propositions, or particular negations take the form: Some S are not P.

Given the assumption made within classical (Aristotelian) categorical logic, that every category contains at least one member, the following relationships, depicted on the square, hold:

Firstly, A and O propositions are **contradictory**, as are E and I propositions. Propositions are contradictory when the truth of one implies the falsity of the other, and conversely. Here we see that the truth of a proposition of the form All S are P implies the falsity of the corresponding proposition of the form Some S are not P. For example, if the proposition "all industrialists are capitalists" (A) is true, then the proposition "some industrialists are not capitalists" (O) must be false. Similarly, if "no mammals are aquatic" (E) is false, then the proposition "some mammals are aquatic" must be true.

Secondly, A and E propositions are **contrary**. Propositions are contrary when they cannot both be true. An A proposition, e.g., "all giraffes have long necks" cannot be true at the same time as the corresponding E proposition: "no giraffes have long necks." Note, however, that corresponding A and E propositions, while contrary, are not contradictory. While they cannot both be true, they can both be false, as with the examples of "all planets are gas giants" and "no planets are gas giants." Next, I and O propositions are **subcontrary**. Propositions are subcontrary when it is impossible for both to be false. Because "some lunches are free" is false, "some lunches are not free" must be true. Note, however, that it is possible for corresponding I and O propositions both to be true, as with "some nations are democracies," and "some nations are not democracies." Again, I and O propositions are subcontrary, but not contrary or contradictory.

Lastly, two propositions are said to stand in the relation of **subalternation** when the truth of the first ("the superaltern") implies the truth of the second ("the subaltern"), but not conversely. A propositions stand in the subalternation relation with the corresponding I propositions. The truth of the A proposition "all plastics are synthetic," implies the truth of the proposition "some plastics are synthetic." However, the truth of the O proposition "some cars are not American-made products" does not imply the truth of the E proposition "no cars are American-made products." In traditional logic, the truth of an A or E proposition implies the truth of the corresponding I or O proposition, respec-

tively. Consequently, the falsity of an I or O proposition implies the falsity of the corresponding A or E proposition, respectively. However, the truth of a particular proposition does not imply the truth of the corresponding universal proposition, nor does the falsity of an universal proposition carry downwards to the respective particular propositions.

The presupposition, mentioned above, that all categories contain at least one thing, has been abandoned by most later logicians. Modern logic deals with uninstantiated terms such as "unicorn" and "ether flow" the same as it does other terms such as "apple" and "orangutan". When dealing with "empty categories", the relations of being contrary, being subcontrary and of subalternation no longer hold. Consider, e.g., "all unicorns have horns" and "no unicorns have horns." Within contemporary logic, these are both regarded as true, so strictly speaking, they cannot be contrary, despite the former's status as an A proposition and the latter's status as an E proposition. Similarly, "some unicorns have horns" (I) and "some unicorns do not have horns" (O) are both regarded as false, and so they are not subcontrary. Obviously then, the truth of "all unicorns have horns" does not imply the truth of "some unicorns have horns," and the subalternation relation fails to hold as well. Without the traditional presuppositions of "existential import", i.e., the supposition that all categories have at least one member, then only the contradictory relation holds. On what is sometimes called the "modern square of opposition" (as opposed to the traditional square of opposition sketched above) the lines for contraries, subcontraries and subalternation are erased, leaving only the diagonal lines for the contradictory relation.

## Truth function

In logic, a **truth function** is a function which accepts truth values as input and produces a unique truth value as output. In other words: The input and output of a truth function are all truth values; a truth function will always output exactly one truth value; and inputting the same truth value(s) will always output the same truth value. The typical example is in propositional logic, wherein a compound statement is constructed using individual statements connected by logical connectives; if the truth value of the compound statement is entirely determined by the truth value(s) of the constituent statement(s), the compound statement is called a **truth function**, and any logical connectives used are said to be **truth functional**.

Classical propositional logic is a truth-functional logic, in that every statement has exactly one truth value which is either true or false, and every logical connective is truth functional (with a correspondent truth table), thus every compound statement is a truth function. On the other hand, modal logic is non-truth-functional.

## Overview

A logical connective is truth-functional if the truth-value of a compound sentence is a function of the truth-value of its sub-sentences. A class of connectives is truth-functional if each of its members is. For example, the connective "and" is truth-functional since a sentence like "Apples are fruits and carrots are vegetables" is true if, and only if each of its sub-sentences "apples are fruits" and "carrots are vegetables" is true, and it is false otherwise. Some connectives of a natural language, such as English, are not truth-functional. Connectives of the form "x believes that ..." are typical examples of connectives that are not truth-functional. If e.g. Mary mistakenly believes that Al Gore was President of the USA on April 20, 2000, but she does not believe that the moon is made of green cheese, then the sentence "Mary believes that Al Gore was President of the USA on April 20, 2000" is true while "Mary believes that the moon is made of green cheese"

is false. In both cases, each component sentence (i.e. "Al Gore was president of the USA on April 20, 2000" and "the moon is made of green cheese") is false, but each compound sentence formed by prefixing the phrase "Mary believes that" differs in truth-value. That is, the truth-value of a sentence of the form "Mary believes that..." is not determined solely by the truth-value of its component sentence, and hence the (unary) connective (or simply operator since it is unary) is non-truth-functional.

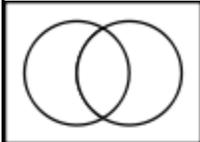

The class of classical logic connectives (e.g.  $\&$ ,  $\rightarrow$ ) used in the construction of formulas is truth-functional. Their values for various truth-values as argument are usually given by truth tables. Truth-functional propositional calculus is a formal system whose formulae may be interpreted as either true or false.

### Table of binary truth functions

In two-valued logic, there are sixteen possible truth functions, also called Boolean functions, of two inputs P and Q. Any of these functions corresponds to a truth table of a certain logical connective in classical logic, including

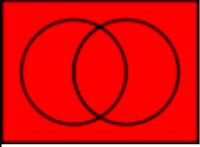

several degenerate cases such as a function not depending on one or both of its arguments. Truth and falsehood is denoted as 1 and 0 in the following truth tables, respectively, for sake of brevity.

#### Contradiction/False

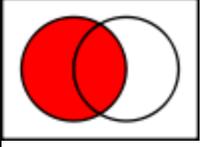

Notation	Equivalent formulas	Truth table	Venn diagram													
"bottom"	$P \wedge \neg P$ $\neg(P \vee Q)$	<table border="1"> <tr> <td></td> <td colspan="2"><b>Q</b></td> </tr> <tr> <td></td> <td>0</td> <td>1</td> </tr> <tr> <td rowspan="2"><b>P</b></td> <td>0</td> <td>0</td> <td>0</td> </tr> <tr> <td>1</td> <td>0</td> <td>0</td> </tr> </table>		<b>Q</b>			0	1	<b>P</b>	0	0	0	1	0	0

## Functional completeness

Because a function may be expressed as a composition, a truth-functional logical calculus does not need to have dedicated symbols for all of the above-mentioned functions to be functionally complete. This is expressed in a propositional calculus as logical equivalence of certain compound statements. For example, classical logic has  $\neg P \vee Q$  equivalent to  $P \rightarrow Q$ . The conditional operator " $\rightarrow$ " is therefore not necessary for a classical-based logical system if " $\neg$ " (not) and " $\vee$ " (or) are already in use.

A minimal set of operators that can express every statement expressible in the propositional calculus is called a minimal functionally complete set. A minimally complete set of operators is achieved by NAND alone  $\{\uparrow\}$  and NOR alone  $\{\downarrow\}$ . The following are the minimal functionally complete sets of operators whose arities do not exceed 2:

### One element

$\{\uparrow\}, \{\downarrow\}$ .

#### Two elements

$\{\vee, \neg\}, \{\wedge, \neg\}, \{\rightarrow, \neg\}, \{\leftarrow, \neg\}, \{\rightarrow, \perp\},$   
 $\{\leftarrow, \perp\}, \{\rightarrow, \leftrightarrow\}, \{\leftarrow, \leftrightarrow\}, \{\rightarrow, \nrightarrow\},$   
 $\{\rightarrow, \leftrightarrow\}, \{\leftarrow, \nrightarrow\}, \{\leftarrow, \leftrightarrow\}, \{\nrightarrow, \neg\},$   
 $\{\leftrightarrow, \neg\}, \{\nrightarrow, \top\}, \{\leftrightarrow, \top\}, \{\nrightarrow, \leftrightarrow\},$   
 $\{\leftrightarrow, \leftrightarrow\}.$

#### Three elements

$\{\vee, \leftrightarrow, \perp\}, \{\vee, \leftrightarrow, \leftrightarrow\}, \{\vee, \leftrightarrow, \top\},$   
 $\{\wedge, \leftrightarrow, \perp\}, \{\wedge, \leftrightarrow, \leftrightarrow\}, \{\wedge, \leftrightarrow, \top\}.$

## Propositional Logic

Propositional logic, also known as sentential logic and statement logic, is the branch of logic that studies ways of joining and/or modifying entire propositions, statements or sentences to form more complicated propositions, statements or sentences, as well as the logical relationships and properties that are derived from these methods of combining or altering statements. In propositional logic, the simplest statements are considered as indivisible units, and hence, propositional logic does not study those logical properties and relations that depend upon parts of statements that are not themselves statements on their own, such as the subject and predicate of a statement. The most thoroughly researched branch of propositional logic is classical truth-functional propositional logic, which studies logical operators and connectives that are used to produce complex statements whose truth-value depends entirely on the truth-values of the simpler statements making them up, and in which it is assumed that every statement is either true or false and not both. However, there are other forms of propositional logic in which other truth-values are considered, or in which there is consideration of connectives that are used to produce statements whose truth-values depend not simply on the truth-values of the parts, but additional things such as their necessity, possibility or relatedness to one another.

## Introduction

A statement can be defined as a declarative sentence, or part of a sentence, that is capable of having a truth-value, such as being true or false. So, for example, the following are statements:

- George W. Bush is the 43rd President of the United States.
- Paris is the capital of France.
- Everyone born on Monday has purple hair.

Sometimes, a statement can contain one or more other statements as parts. Consider for example, the following statement:

- Either Ganymede is a moon of Jupiter or Ganymede is a moon of Saturn.

While the above compound sentence is itself a statement, because it is true, the two parts, "Ganymede is a moon of Jupiter" and "Ganymede is a moon of Saturn", are themselves statements, because the first is true and the second is false. The term proposition is sometimes used synonymously with statement. However, it is sometimes used to name something abstract that two different statements with the same meaning are both said to "express". In this usage, the English sentence, "It is raining", and the French sentence "Il pleut", would be considered to express the same proposition; similarly, the two English sentences, "Callisto orbits Jupiter" and "Jupiter is orbited by Callisto" would also be considered to express the same proposition. However, the nature or existence of propositions as abstract meanings is still a matter of philosophical controversy, and for the purposes of this article, the phrases "statement" and "proposition" are used interchangeably.

Propositional logic, also known as sentential logic, is that branch of logic that studies ways of combining or altering statements or propositions to form more complicated statements or propositions. Joining two simpler propositions with the word "and" is one common way of combining statements. When two statements are joined together with "and", the complex statement formed by them is true if and only if both the component statements are true. Because of this, an argument of the following form is logically valid:

Paris is the capital of France and Paris has a population of over two million. Therefore, Paris has a population of over two million. Propositional logic largely involves studying logical connectives such as the words “and” and “or” and the rules determining the truth-values of the propositions they are used to join, as well as what these rules mean for the validity of arguments, and such logical relationships between statements as being consistent or inconsistent with one another, as well as logical properties of propositions, such as being tautologically true, being contingent, and being self-contradictory. (These notions are defined below.)

Propositional logic also studies way of modifying statements, such as the addition of the word “not” that is used to change an affirmative statement into a negative statement. Here, the fundamental logical principle involved is that if a given affirmative statement is true, the negation of that statement is false, and if a given affirmative statement is false, the negation of that statement is true.

What is distinctive about propositional logic as opposed to other (typically more complicated) branches of logic is that propositional logic does not deal with logical relationships and properties that involve the parts of a statement smaller than the simple statements making it up. Therefore, propositional logic does not study those logical characteristics of the propositions below in virtue of which they constitute a valid argument:

1. George W. Bush is a president of the United States.
2. George W. Bush is a son of a president of the United States.
3. Therefore, there is someone who is both a president of the United States and a son of a president of the United States.

The recognition that the above argument is valid requires one to recognize that the subject in the first premise is the same as the subject in the second premise. However, in propositional logic, simple statements are considered as indivisible wholes, and those logical relationships and properties that involve parts of statements such as their subjects and predicates are not taken into consideration.

Propositional logic can be thought of as primarily the study of logical operators. A logical operator is any word or phrase used either to modify one statement to make a different statement, or join multiple statements together to form a more complicated statement. In English, words such as “and”, “or”, “not”, “if ... then...”, “because”, and “necessarily”, are all operators. A logical operator is said to be truth-functional if the truth-values (the truth or falsity, etc.) of the statements it is used to construct always depend entirely on the truth or falsity of the statements from which they are constructed. The English words “and”, “or” and “not” are (at least arguably) truth-functional, because a compound statement joined together with the word “and” is true if both the statements so joined are true, and false if either or both are false, a compound statement joined together with the word “or” is true if at least one of the joined statements is true, and false if both joined statements are false, and the negation of a statement is true if and only if the statement negated is false.

Some logical operators are not truth-functional. One example of an operator in English that is not truth-functional is the word “necessarily”. Whether a statement formed using this operator is true or false does not depend entirely on the truth or falsity of the statement to which the operator is applied. For example, both of the following statements are true:

- $2 + 2 = 4$ .
- Someone is reading an article in a philosophy.

However, Now consider the corresponding statements modified with the operator “necessarily”:

- Necessarily,  $2 + 2 = 4$ .
- Necessarily, someone is reading an article in a philosophy.

Here, the first example is true but the second example is false. Hence, the truth or falsity of a statement using the operator “necessarily” does not depend entirely on the truth or falsity of the statement modified. Truth-functional propositional logic is that branch of propositional logic that limits itself to the study of truth-functional operators. Classical (or “bivalent”) truth-functional propositional logic is that branch of truth-functional propositional logic that assumes that there are only two possible truth-values a statement (whether simple or complex) can have: (1) truth, and (2) falsity, and that every statement is either true or false but not both.

Classical truth-functional propositional logic is by far the most widely studied branch of propositional logic, and for this reason, most of the remainder of this article focuses exclusively on this area of logic. In addition to classical truth-functional propositional logic, there are other branches of propositional logic that study logical operators, such as “necessarily”, that are not truth-functional. There are also “non-classical” propositional logics in which such possibilities as (i) a proposition’s having a truth-value other than truth or falsity, (ii) a proposition’s having an indeterminate truth-value or lacking a truth-value altogether, and sometimes even (iii) a proposition’s being both true and false, are considered.

## History

The serious study of logic as an independent discipline began with the work of Aristotle (384-322 BCE). Generally, however, Aristotle’s sophisticated writings on logic dealt with the logic of categories and quantifiers such as “all”, and “some”, which are not treated in propositional logic. However, in his metaphysical writings, Aristotle espoused two principles of great importance in propositional logic, which have since come to be called the Law of Excluded Middle and the Law of Contradiction. Interpreted in propositional logic, the first is the principle that every statement is either true or false, the second is the principle that no statement is both true and false. These are, of course, cornerstones of classical propositional logic. There is some evidence that Aristotle, or at least his successor at the Lyceum, Theophrastus (d. 287 BCE), did recognize a need for the development of a doctrine of “complex” or “hypothetical” propositions, that is, those involving conjunctions (statements joined by “and”), disjunctions (statements joined by “or”) and conditionals (statements joined by “if... then...”), but their investigations into this branch of logic seem to have been very minor.

More serious attempts to study statement operators such as “and”, “or” and “if... then...” were conducted by the Stoic philosophers in the late 3rd century BCE. Since most of their original works—if indeed, these writings were even produced—are lost, we cannot make many definite claims about exactly who first made investigations into what areas of propositional logic, but we do know from the writings of Sextus Empiricus that Diodorus Cronus and his pupil Philo had engaged in a protracted debate about whether the truth of a conditional statement depends entirely on it not being the case that its antecedent (if-clause) is true while its consequent (then-clause) is false, or whether

it requires some sort of stronger connection between the antecedent and consequent—a debate that continues to have relevance for modern discussion of conditionals. The Stoic philosopher Chrysippus (roughly 280-205 BCE) perhaps did the most in advancing Stoic propositional logic, by marking out a number of different ways of forming complex premises for arguments, and for each, listing valid inference schemata.

Chrysippus suggested that the following inference schemata are to be considered the most basic:

1. If the first, then the second; but the first; therefore the second.
2. If the first, then the second; but not the second; therefore, not the first.
3. Not both the first and the second; but the first; therefore, not the second.
4. Either the first or the second [and not both]; but the first; therefore, not the second.
5. Either the first or the second; but not the second; therefore the first.

Inference rules such as the above correspond very closely to the basic principles in a contemporary system of natural deduction for propositional logic. For example, the first two rules correspond to the rules of modus ponens and modus tollens, respectively. These basic inference schemata were expanded upon by less basic inference schemata by Chrysippus himself and other Stoics, and are preserved in the work of Diogenes Laertius, Sextus Empiricus and later, in the work of Cicero.

Advances on the work of the Stoics were undertaken in small steps in the centuries that followed. This work was done by, for example, the second century logician Galen (roughly 129-210 CE), the sixth century philosopher Boethius (roughly 480-525 CE) and later by medieval thinkers such as Peter Abelard (1079-1142) and William of Ockham (1288-1347), and others. Much of their work involved producing better formalizations of the principles of Aristotle or Chrysippus, introducing improved terminology and furthering the discussion of the relationships between operators. Abelard, for example, seems to have been the first to clearly differentiate exclusive disjunction from inclusive disjunction, and to suggest that inclusive disjunction is the more important notion for the development of a relatively simple logic of disjunctions.

The next major step forward in the development of propositional logic came only much later with the advent of symbolic logic in the work of logicians such as Augustus DeMorgan (1806-1871) and, especially, George Boole (1815-1864) in the mid-19th century. Boole was primarily interested in developing a mathematical-style “algebra” to replace Aristotelian syllogistic logic, primarily by employing the numeral “1” for the universal class, the numeral “0” for the empty class, the multiplication notation “ $xy$ ” for the intersection of classes  $x$  and  $y$ , the addition notation “ $x + y$ ” for the union of classes  $x$  and  $y$ , etc., so that statements of syllogistic logic could be treated in quasi-mathematical fashion as equations; for example, “No  $x$  is  $y$ ” could be written as “ $xy = 0$ ”. However, Boole noticed that if an equation such as “ $x = 1$ ” is read as “ $x$  is true”, and “ $x = 0$ ” is read as “ $x$  is false”, the rules given for his logic of classes can be transformed into a logic for propositions, with “ $x + y = 1$ ” reinterpreted as saying that either  $x$  or  $y$  is true, and “ $xy = 1$ ” reinterpreted as meaning that  $x$  and  $y$  are both true. Boole’s work sparked rapid interest in logic among mathematicians. Later, “Boolean algebras” were used to form the basis of the truth-functional propositional logics utilized in computer design and programming.

In the late 19th century, Gottlob Frege (1848-1925) presented logic as a branch of systematic in-

quiry more fundamental than mathematics or algebra, and presented the first modern axiomatic calculus for logic in his 1879 work *Begriffsschrift*. While it covered more than propositional logic, from Frege's axiomatization it is possible to distill the first complete axiomatization of classical truth-functional propositional logic. Frege was also the first to systematically argue that all truth-functional connectives could be defined in terms of negation and the material conditional. In the early 20th century, Bertrand Russell gave a different complete axiomatization of propositional logic, considered on its own, in his 1906 paper "The Theory of Implication", and later, along with A. N. Whitehead, produced another axiomatization using disjunction and negation as primitives in the 1910 work *Principia Mathematica*. Proof of the possibility of defining all truth functional operators in virtue of a single binary operator was first published by American logician H. M. Sheffer in 1913, though American logician C. S. Peirce (1839-1914) seems to have discovered this decades earlier. In 1917, French logician Jean Nicod discovered that it was possible to axiomatize propositional logic using the Sheffer stroke and only a single axiom schema and single inference rule.

The notion of a "truth table" is often utilized in the discussion of truth-functional connectives (discussed below). It seems to have been at least implicit in the work of Peirce, W. S. Jevons (1835-1882), Lewis Carroll (1832-1898), John Venn (1834-1923), and Allan Marquand (1853-1924). Truth tables appear explicitly in writings by Eugen Müller as early as 1909. Their use gained rapid popularity in the early 1920s, perhaps due to the combined influence of the work of Emil Post, whose 1921 work makes liberal use of them, and Ludwig Wittgenstein's 1921 *Tractatus Logico-Philosophicus*, in which truth tables and truth-functionality are prominently featured.

Systematic inquiry into axiomatic systems for propositional logic and related metatheory was conducted in the 1920s, 1930s and 1940s by David Hilbert, Paul Bernays, Alfred Tarski, Jan Łukasiewicz, Kurt Gödel, Alonzo Church, and others. It is during this period, that most of the important metatheoretic results such as those discussed in Section VII were discovered. Complete natural deduction systems for classical truth-functional propositional logic were developed and popularized in the work of Gerhard Gentzen in the mid-1930s, and subsequently introduced into influential textbooks such as that of F. B. Fitch (1952) and Irving Copi (1953).

Modal propositional logics are the most widely studied form of non-truth-functional propositional logic. While interest in modal logic dates back to Aristotle, by contemporary standards the first systematic inquiry into this modal propositional logic can be found in the work of C. I. Lewis in 1912 and 1913. Among other well-known forms of non-truth-functional propositional logic, deontic logic began with the work of Ernst Mally in 1926, and epistemic logic was first treated systematically by Jaakko Hintikka in the early 1960s. The modern study of three-valued propositional logic began in the work of Jan Łukasiewicz in 1917, and other forms of non-classical propositional logic soon followed suit.

Relevance propositional logic is relatively more recent; dating from the mid-1970s in the work of A. R. Anderson and N. D. Belnap. Paraconsistent logic, while having its roots in the work of Łukasiewicz and others, has blossomed into an independent area of research only recently, mainly due to work undertaken by N. C. A. da Costa, Graham Priest and others in the 1970s and 1980s.

## **Propositional Logic and the Four Basic Truth Functional Connectives**

**Propositional logic** (also called "sentential logic") is the area of formal logic that deals with the logical relationships between propositions. A **proposition** is simply what I called in section 1.1 a statement. Some examples of propositions are: Snow is white Snow is cold Tom is an astronaut

The floor has been mopped The dishes have been washed We can also connect propositions together using certain English words, such as “and” like this: The floor has been mopped and the dishes have been washed.

This proposition is called a **complex proposition** because it contains the connective “and” which connects two separate propositions. In contrast, “the floor has been mopped” and “the dishes have been washed” are what are called atomic propositions. **Atomic propositions** are those that do not contain any truth-functional connectives. The word “and” in this complex proposition is a truth-functional connective. A **truth-functional connective** is a way of connecting propositions such that the **truth value** of the resulting complex proposition can be determined by the truth value of the propositions that compose it. Suppose that the floor has not been mopped but the dishes have been washed. In that case, if I assert the conjunction, “the floor has been mopped and the dishes have been washed,” then I have asserted something that is false. The reason is that a conjunction, like the one above, is only true when each **conjunct** (i.e., each statement that is conjoined by the “and”) is true. If either one of the conjuncts is false, then the whole conjunction is false. This should be pretty obvious. If Bob and Sally split chores and Bob’s chore was to both vacuum and dust whereas Sally’s chore was to both mop and do the dishes, then if Sally said she mopped the floor and did the dishes when in reality she only did the dishes (but did not mop the floor), then Bob could rightly complain that it isn’t true that Sally both mopped the floor and did the dishes!

What this shows is that conjunctions are true only if both conjuncts are true. This is true of all conjunctions. The conjunction above has a certain form—the same form as any conjunction. We can represent that form using placeholders— lowercase letters like p and q to stand for any statement whatsoever. Thus, we represent the form of a **conjunction** like this:

### **p and q**

Any conjunction has this same form. For example, the complex proposition, “it is sunny and hot today,” has this same form which we can see by writing the conjunction this way:

### **It is sunny today and it is hot today.**

Although we could write the conjunction that way, it is more natural in English to conjoin the adjectives “sunny” and “hot” to get “it is sunny and hot today.” Nevertheless, these two sentences mean the same thing (it’s just that one sounds more natural in English than the other). In any case, we can see that “it is sunny today” is the proposition in the “p” place of the form of the conjunction, whereas “it is hot today” is the proposition in the “q” place of the form of the conjunction. As before, this conjunction is true only if both conjuncts are true. For example, suppose that it is a sunny but bitterly cold winter’s day. In that case, while it is true that it is sunny today, it is false that it is hot today—in which case the conjunction is false. If someone were to assert that it is sunny and hot today in those circumstances, you would tell them that isn’t true. Conversely, if it were a cloudy but hot and humid summer’s day, the conjunction would still be false. The only way the statement would be true is if both conjuncts were true.

In the formal language that we are developing in this chapter, we will represent conjunctions using a symbol called the “dot,” which looks like this: “ $\cdot$ ” Using this symbol, here is how we will represent a conjunction in symbolic notation:

### **p $\cdot$ q**

In the following sections we will introduce four basic truth-functional connectives, each of which

have their own symbol and meaning. The four basic truth-functional connectives are: conjunction, disjunction, negation, and conditional. In the remainder of this section, we will discuss only conjunction. As we've seen, a conjunction conjoins two separate propositions to form a complex proposition.

The conjunction is true if and only if both conjuncts are true. We can represent this information using what is called a **truth table**. Truth tables represent how the truth value of a complex proposition depends on the truth values of the propositions that compose it. Here is the truth table for conjunction:

p	q	$p \cdot q$
T	T	T
T	F	F
F	T	F
F	F	F

Here is how to understand this truth table. The header row lists the atomic propositions, p and q, that the conjunction is composed of, as well as the conjunction itself,  $p \cdot q$ . Each of the following four rows represents a possible scenario regarding the truth of each conjunct, and there are only four possible scenarios: either p and q could both be true (as in row 1), p and q could both be false (as in row 4), p could be true while q is false (row 2), or p could be false while q is true (row 3). The final column (the truth values under the conjunction,  $p \cdot q$ ) represents how the truth value of the conjunction depends on the truth value of each conjunct (p and q). As we have seen, a conjunction is true if and only if both conjuncts are true. This is what the truth table represents. Since there is only one row (one possible scenario) in which both p and q are true (i.e., row 1), that is the only circumstance in which the conjunction is true. Since in every other row at least one of the conjuncts is false, the conjunction is false in the remaining three scenarios.

At this point, some students will start to lose a handle on what we are doing with truth tables. Often, this is because one thinks the concept is much more complicated than it actually is. (For some, this may stem, in part, from a math phobia that is triggered by the use of symbolic notation.) But a truth table is actually a very simple idea: it is simply a representation of the meaning of a truth-functional operator. When I say that a conjunction is true only if both conjuncts are true, that is just what the table is representing. There is nothing more to it than that. (Later on in this chapter we will use truth tables to prove whether an argument is valid or invalid. Understanding that will require more subtlety, but what I have so far introduced is not complicated at all.)

There is more than one way to represent conjunctions in English besides the English word "and." Below are some common English words and phrases that commonly function as truth-functional conjunctions.

but	yet	also	although
however	moreover	nevertheless	still

It is important to point out that many times English conjunctions carry more information than simply that the two propositions are true (which is the only information carried by our symbolic connective, the dot). We can see this with English conjunctions like "but" and "however" which have a contrastive sense. If I were to say, "Bob voted, but Caroline didn't," then I am contrasting what Bob and Caroline did. Nevertheless, I am still asserting two independent propositions.

Another kind of information that English conjunctions represent but the dot connective doesn't is temporal information. For example, in the conjunction:

### **Bob brushed his teeth and got into bed**

There is clearly a temporal implication that Bob brushed his teeth first and then got into bed. It might sound strange to say:

### **Bob got into bed and brushed his teeth**

since this would seem to imply that Bob brushed his teeth while in bed. But each of these conjunctions would be represented in the same way by our dot connective, since the dot connective does not care about the temporal aspects of things. If we were to represent "Bob got into bed" with the capital letter A and "Bob brushed his teeth" with the capital letter B, then both of these propositions would be represented exactly the same, namely, like this:

### **A · B**

Sometimes a conjunction can be represented in English with just a comma or semicolon, like this: While Bob vacuumed the floor, Sally washed the dishes. Bob vacuumed the floor; Sally washed the dishes. Both of these are conjunctions that are represented in the same way. You should see that both of them have the form,  $p \cdot q$ .

Not every conjunction is a truth-function conjunction. We can see this by considering a proposition like the following:

Maya and Alice are married. If this were a truth-functional proposition, then we should be able to identify the two, independent propositions involved. But we cannot. What would those propositions be? You might think two propositions would be these:

Maya is married Alice is married But that cannot be right since the fact that Maya is married and that Alice is married is not the same as saying that Maya and Alice are married to each other, which is clearly the implication of the original sentence. Furthermore, if you tried to add "to each other" to each proposition, it would no longer make sense:

Maya is married to each other Alice is married to each other Perhaps we could say that the two conjuncts are "Maya is married to Alice" and "Alice is married to Maya," but the truth values of those two conjuncts are not independent of each other since if Maya is married to Alice it must also be true that Alice is married to Maya. In contrast, the following is an example of a truth-functional conjunction:

Maya and Alice are women. Unlike the previous example, in this case we can clearly identify two propositions whose truth values are independent of each other:

### **Maya is a woman Alice is a woman**

Whether or not Maya is a woman is an issue that is totally independent of whether Alice is a woman (and vice versa). That is, the fact that Maya is a woman tells us nothing about whether Alice is a woman. In contrast, the fact that Maya is married to Alice implies that Alice is married to Maya. So the way to determine whether or not a conjunction is truth-functional is to ask whether it is formed from two propositions whose truth is independent of each other. If there are two propositions whose truth is independent of each other, then the conjunction is truth-functional; if there are not

two propositions whose truth is independent of each other, the conjunction is not truth-functional.

## Quantification Theory

In this final lesson on symbolic logic, we'll take a very brief look at modern methods of representing the internal structure of propositions in first-order predicate calculus (or quantification theory). Incorporating all of the propositional calculus along with a few new symbols and rules of inference, the predicate calculus provides another way of handling the same logical forms we examined in our study of categorical logic.

## Individuals, Predicates, and Quantifiers

In addition to the familiar symbols of the propositional calculus, quantification theory also employs special symbols of four special sorts:

- individual constants ( a, b, c, etc. ) represent particular individual things—Allison, Bill, or this car, for example.
- predicate constants ( F, G, H, etc. ) represent specific predicates—free, greedy, or heavy, for example.

Writing an individual symbol directly after a predicate symbol signifies that this thing has that property. Thus, using the above examples, Fa, Gb, and Hc would signify "Allison is free," "Bill is greedy," and "This car is heavy" respectively. Since these are complete statements, they can be combined using the statement connectives to form such compound statements as  $Fa \cdot Gb$ ,  $Hg \supset Gb$ , and  $Hc \vee \sim Hc$ .

- individual variables ( x, y, z, etc. ) are employed to refer to any predicate generally.
- quantifiers are logical operators that signify the range of individuals to which individual variables apply, either all (  $\forall x$  ) or some (  $\exists x$  ).

	statement	individual	predicate
constants	A, B, C...	a, b, c...	F, G, H...
variables	p, q, r...	...x, y, z	
operators	$\sim$ , $\&$ , $\vee$ , $\supset$ , $\equiv$	(x) ( $\exists x$ )	

Put together, these symbols can be used to represent each of the four major forms of categorical proposition:

- $(x)(Sx \supset Px)$  corresponds to the **A** proposition, "All S are P."
- $(x)(Sx \supset \sim Px)$  corresponds to the **E** proposition, "No S are P."
- $(\exists x)(Sx \cdot Px)$  corresponds to the **I** proposition, "Some S are P."
- $(\exists x)(Sx \cdot \sim Px)$  corresponds to the **O** proposition, "Some S are not P."

Any of the rules of replacement from the propositional calculus may be applied to these statements of quantification theory. Thus, for example, we can easily demonstrate the converse of an E proposition:

- |  |          |
|--|----------|
| 1. $(x)(Sx \supset \sim Px)$           | premise  |
| 2. $(x)(\sim \sim Px \supset \sim Sx)$ | 1 Trans. |
| 3. $(x)(Px \supset \sim Sx)$           | 2 D.N.   |

### Quantification Rules

In order to prove the validity of syllogisms, however, we first need to strip the quantifiers from each statement, apply the appropriate rules of inference, and then restore quantifiers to each statement. The four quantification rules dictate the conditions under which it is permissible to delete or add a quantifier:

- Using  $\emptyset x$  to represent any expression in which the individual variable "x" appears, Universal Instantiation (UI) can be stated as an argument of the form:

$$\begin{array}{l} (x)(\emptyset x) \\ \emptyset u \end{array}$$

The "u" in this case can be any arbitrarily chosen individual constant or variable. In the context of a proof, for example, the truth of  $(x)[Fx \supset (Gx \vee Hx)]$  could be used to justify that of  $Fb \supset (Gb \vee Hb)$ . If the statement holds for all x, then it certainly must hold for b.

In similar fashion, Universal Generalization (UG) has the form:

$$\begin{array}{l} \emptyset y \\ (x)(\emptyset x) \end{array}$$

In this case, however, it is crucial that the "y" is an arbitrarily chosen individual—that is, an individual that was introduced into the proof by an application of UI.

Only then can we be sure that what holds of it is not some special feature but something that would hold equally well of all "x."

- Removing an existential quantifier requires application of Existential Instantiation (EI), and argument of the form:

$$\begin{array}{l} (\exists x)(\emptyset x) \\ \emptyset u \end{array}$$

In this case, the individual constant "u" must be one which has never been used in any earlier line of the proof; otherwise, we might mistakenly associate two things which have nothing in common. Thus, it is usually best to employ EI as soon as possible (certainly, before any application of UI) in a proof.

- Finally, Existential Generalization (EG) is an argument of the form:

$$\emptyset u (\exists x)(\emptyset x)$$

Here, as in UI, "u" may be any individual constant or variable.

Using these quantification rules together with the inference and replacement rules of the propositional calculus, it is possible to prove the validity of any of the valid categorical syllogisms. For **EIO-1**, for example:

1.  $(x)(Mx \supset \sim Px)$  premise
2.  $(\exists x)(Sx \cdot Mx)$  premise
3.  $Sd \cdot Md$  2 EI
4.  $Md \supset \sim Pd$  1 UI
5.  $Sd$  3 Simp.
6.  $Md \cdot Sd$  3 Comm.
7.  $Md$  6 Simp.
8.  $\sim Pd$  4, 7 M.P.
9.  $Sd \cdot \sim Pd$  5, 8 Conj.
10.  $(\exists x)(Sx \cdot \sim Px)$  9 EG

### Asyllogistic Inferences

Quantification theory makes it possible to prove the validity of many arguments that could not easily be expressed in categorical logic at all. In fact, Russell and Whitehead showed less than a hundred years ago that a higher-order predicate calculus (one that fills in the chart above by including variables and quantifiers for predicates as well as for individuals) is sufficient to provide logical demonstrations of simple arithmetical truths. A few decades later, however, Gödel showed that any such powerful system must contain at least one proposition whose truth or falsity cannot be proven.

### Symbolic Logic

Symbolic logic is the method of representing logical expressions through the use of symbols and variables, rather than in ordinary language. This has the benefit of removing the ambiguity that normally accompanies ordinary languages, such as English, and allows easier operation. There are many systems of symbolic logic, such as classical propositional logic, first-order logic and modal logic. Each may have separate symbols, or exclude the use of certain symbols.

### Logical Symbols

The following table presents several logical symbols, their name and meaning, and any relevant notes. The name of the symbol (under "meaning" links to a page explaining the symbol or term and its use). Note that different symbols have been used by different logicians and systems of logic. For the sake of clarity, this site consistently uses the symbols in the left column, while the "Notes" column may indicate other commonly-used symbols.

Symbol	Meaning	Notes

Operators (Connectives)		
$\neg$	Negation (NOT)	The tilde ( $\sim$ ) is also often used.
$\wedge$	conjunction (AND)	The ampersand ( $\&$ ) or dot ( $\cdot$ ) are also often used.
$\vee$	disjunction (OR)	This is the inclusive disjunction, equivalent to and/or in English.
$\oplus$	exclusive disjunction (XOR)	$\oplus$ means that only one of the connected propositions is true, equivalent to either...or. Sometimes $\underline{\vee}$ is used.
$\downarrow$	alternative denial (NAND)	Means "not both". Sometimes written as $\uparrow$
$\downarrow$	joint denial (NOR)	Means "neither/nor".
$\rightarrow$	conditional (if/then)	Many logicians use the symbol $\supset$ instead. This is also known as material implication.
$\leftrightarrow$	biconditional (iff)	Means "if and only if" $\equiv$ is sometimes used, but this site reserves that symbol for equivalence.
Quantifiers		
$\forall$	universal quantifier	Means "for all", so $\forall xPx$ means that $Px$ is true for every $x$ .
$\exists$	existential quantifier	Means "there exists", so $\exists xPx$ means that $Px$ is true for at least one $x$ .

Relations		
$\supset$	implication	$\alpha \supset \beta$ means that $\beta$ follows from $\alpha$
$\equiv$	equivalence	Also $\Leftrightarrow$ . Equivalence is two-way implication, so $\alpha \equiv \beta$ means $\alpha \supset \beta$ and $\beta \supset \alpha$ .
$\vdash$	provability	Shows provable inference. $\alpha \vdash \beta$ means that from $\alpha$ we can prove that $\beta$ .
$\therefore$	therefore	Used to signify the conclusion of an argument. Usually taken to mean implication, but often used to present arguments in which the premises do not deductively imply the conclusion.
$\Box$	forces	A relationship between possible worlds and sentences in modal logic.
Truth-Values		
$\top$	tautology	May be used to replace any tautologous (always true) formula.
$\perp$	contradiction	May be used to replace any contradictory (always false) formula. Sometimes "F" is used.
Parentheses		

( )	parentheses	Used to group expressions to show precedence of operations. Square brackets [ ] are sometimes used to clarify groupings.
<b>Set Theory</b>		
$\in$	membership	Denotes membership in a set. If $a \in \Gamma$ , then $a$ is a member (or an element) of set $\Gamma$ .
$\cup$	union	Used to join sets. If $S$ and $T$ are sets of formula, $S \cup T$ is a set containing all members of both.
$\cap$	intersection	The overlap between sets. If $S$ and $T$ are sets of formula, $S \cap T$ is a set containing those elements that are members of both.
$\subseteq$	subset	A subset is a set containing some or all elements of another set.
$\subset$	proper subset	A proper subset contains some, but not all,
		elements of another set.
$=$	set equality	Two sets are equal if they contain exactly the same elements.
$\complement$	absolute complement	$\complement(S)$ is the set of all things that are not in the set $S$ . Sometimes written as $\complement(S)$ , $S^c$ or $S^c$ .

-	relative complement	$T - S$ is the set of all elements in $T$ that are not also in $S$ . Sometimes written as $T \setminus S$ .
$\emptyset$	empty set	The set containing no elements.
<b>Modalities</b>		
$\square$	necessarily	Used only in modal logic systems. Sometimes expressed as $\Box$ where the symbol is unavailable.
$\diamond$	possibly	Used only in modal logic systems. Sometimes expressed as $\langle \rangle$ where the symbol is unavailable.

## Propositions, Variables and Non-Logical Symbols

The use of variables in logic varies depending on the system and the author of the logic being presented. However, some common uses have emerged. For the sake of clarity, this site will use the system defined below.

Symbol	Meaning	Notes
<b>A, B, C</b> ... <b>Z</b>	propositions	Uppercase Roman letters signify individual propositions. For example, $P$ may symbolize the proposition "Pat is ridiculous". $P$ and $Q$ are traditionally used in most examples.
<b><math>\alpha, \beta, \gamma</math></b> ... <b><math>\omega</math></b>	formulae	Lowercase Greek letters signify formulae, which may be themselves a proposition ( $P$ ), a formula ( $P \wedge Q$ ) or several connected formulae ( $\phi \wedge \rho$ ).
<b>x, y, z</b>	variables	Lowercase Roman letters towards the end of the alphabet are used to signify variables. In logical systems, these are usually coupled with a quantifier, $\forall$ or $\exists$ , in order to signify some or all of some unspecified subject or object. By convention, these begin with $x$ , but any other letter may be used if needed, so long as they are defined as a variable by a quantifier.
<b>a, b, c,</b> ... <b>z</b>	constants	Lowercase Roman letters, when not assigned by a quantifier, signify a constant, usually a proper noun. For instance, the letter "j" may be used to signify "Jerry". Constants are given a meaning before they are used in logical expressions.
<b>Ax, Bx</b>	predicate symbols	Uppercase Roman letters appear again to indicate predicate relationships between variables and/or constants, coupled with one or more variable places which may be filled by variables or constants. For instance, we may define the relation "x is green" as $Gx$ , and "x

... $Zx$		likes $y$ " as $Lxy$ . To differentiate them from propositions, they are often presented in italics,
		so while $P$ may be a proposition, $Px$ is a predicate relation for $x$ . Predicate symbols are non-logical – they describe relations but have neither operational function nor truth value in themselves.
$\Gamma, \Delta, \dots, \Omega$	sets of formulae	Uppercase Greek letters are used, by convention, to refer to sets of formulae. $\Gamma$ is usually used to represent the first site, since it is the first that does not look like Roman letters. (For instance, the uppercase Alpha ( $A$ ) looks identical to the Roman letter "A")
$\Gamma, \Delta, \dots, \Omega$	possible worlds	In modal logic, uppercase greek letters are also used to represent possible worlds. Alternatively, an uppercase $W$ with a subscript numeral is sometimes used, representing worlds as $W_0, W_1$ , and so on.
$\{ \}$	sets	Curly brackets are generally used when detailing the contents of a set, such as a set of formulae, or a set of possible worlds in modal logic. For instance, $\Gamma = \{ \alpha, \beta, \gamma, \delta \}$

## DECISION PROCEDURES

As the name suggests, symbolic logic is a system of logic, not very different from traditional logic, but concerned with the use of symbols. Therefore, we can say that symbolic logic has two aims– (i) to symbolise the arguments and expressions, and (ii) to evaluate them. We are concerned with the latter objective. In symbolic logic, and more precisely in the logic of propositions, there are many methods to test the validity of arguments and argument forms and also there are ways to test or examine whether statement forms are tautologies or not. Such ways or

methods that examine whether a given argument or statement forms is valid or invalid, whether it is tautologies or not, is called a decision procedure. It is such a procedure, by which we come to a "decision" i.e. we decide if the argument is valid or invalid, a tautology or not.

There are some standard decision procedures in the logic of propositions. These are–

- 1) Truth-Table Method
- 2) Shorter Truth-Table Method
- 3) Method of Reduction to Conjunctive Normal Form (Cnf.)

## DECIDABILITY

The concept of decision procedure is basically concerned with the concept of decidability, whether a well-formed formula (wff) is valid or not, an inference is sound or not. In other words, we decide the validity or invalidity of 'wff' through a procedure. This is what we roughly mean by decidability. So, decidability requires a decision procedure. Decision procedures are effective since they are believed to be stable, reliable and finite "which can be described in advance for providing in a finite number of steps a 'yes' or 'no' answer to any class of questions". Decision procedure is regarded as mechanical. It works like a computer. If a formula, is valid applied correctly, it would at some point give a positive answer. If the formula under consideration is in fact not valid, it would give a negative answer.

## IS PROOF A DECISION PROCEDURE?

Often, we think that proof and decision procedures are synonymous terms. We need to understand that with regard to 'proof', there remains nothing to be proved as false. In case of proving a formula, we know prior to its proving that it is logically true. We need to distinguish between 'proving something' and 'testing something'. To prove something, we have no option to make it false. But in the case of testing something, the 'given' may be either true or false and it is the task of the doer to decide effectively whether the 'given' is true or false. So, this shows that proof establishes logical truth, but cannot establish logical falsity. However, Quine is of the opinion that just because a 'proof' fails to establish logical falsity, this does not prevent us from formulating a procedure to prove validity. But he distinctly shows the difference between a proof and a decision procedure, when he says that 'a decision procedure assures an affirmative and negative answer every time, while a proof procedure assures at best an eventual affirmative answer where an affirmative answer is in order'. Further, according to Quine a complete proof procedure can be distinguished from a decision procedure because a 'complete decision procedure' enables us to give both affirmative and negative answers, while a complete proof procedure give a positive or affirmative answer; it cannot give us negative answers.

Following the argument given above about a 'proof' not being a decision procedure, we can say that both Conditional Proof (CP) and Indirect Proof (IP) are not decision procedures since, the rule of CP is used is dealing with valid arguments. But, at this juncture, we face a confusing situation. Indirect Proof is equated with Reductio Ad Absurdum (RAA). But RAA is considered as a decision procedure. If this be the case, then why IP is not considered as a decision procedure? Why do we say Indirect Proof is similar to Reductio Ad Absurdum?

The similarity between the two is that in either we attempt to draw contradiction of that which is "given" or we make attempts to reduce an absurdity of the "given". Their difference lies in their procedures. In Reductio Ad Absurdum, the absurdity is derived in terms of truth-values; but in case of Indirect Proof, the absurdity is derived in terms of propositions or propositional variables. In both Reductio Ad Absurdum and Indirect Proof, if the given statement is valid, then its negation is a contradiction. Therefore, the "given" has to be a tautology. But what happens when the given statement is not valid? In this case, when the given statement is not valid then its negation does not lead into a contradiction nor it is proved as a tautology. So in such cases, the given statement is either contingent or inconsistent. With regard to the truth-values, RAA helps to productively decide contingent and inconsistent statements. In Indirect Proof, the inferential rules fail to decide if the given statement is contingent or inconsistent. Since, IP as a proof procedure, gives only a positive answer to any statement, but fails to give a negative answer. Indirect Proof (IP) cannot be regarded as a decision procedure.

## **TRUTH-TABLE METHOD**

The Truth-Table method is an ideal example of a decision procedure. This method helps us to show that one function is equivalent to another function by analyzing the components of the truth-tables. The validity of arguments involving the truth-functional compound statements can be tested by this, truth-table method. The phrase 'truth-function is an important concept in the truth-table method. We can define truth-function as a compound expression which contains variable, where the truth-values are determined solely by the truth-values of its component variables. Through the truth-table method logicians decide whether a given compound expression is a tautology or contradictory or contingency. A detail account of these three types of logical expressions will be given in the Chapter on Truth-table. Now let us find out the validity of an argument with the help of the

Truth-table method. We have already stated that the Truth-table method help us to test the validity or invalidity of arguments. Let us consider the following argument.

Premise– If the student works hard, he will be successful.  
 Premise– The student works hard.  
 Conclusion– Therefore, the student will be successful.

The logical form of this argument is:  $p \supset q$   
 $p$   
 $\therefore q$

We can test the validity of the above argument by arranging the premises and conclusion in the following as:  $[(p \supset q) \cdot p] \supset q$

Now Construct a truth-table for the above symbolic expression. In this expression,  $p, q$  are known as variables, and the symbols “ $\cdot$ ”, “ $\supset$ ” are known as constants.

1	2	3	4	5
$P$	$q$	$P \supset q$	$[(p \supset q) \cdot P]$	$[(p \supset q) \cdot P] \supset q$
T	T	T	T	T
T	F	F	F	T
F	T	T	F	T
F	F	T	F	T

The above Truth-table shows that the given symbolic expression is valid, since in the last column (5) of the truth-table, all the Truth-values are Ts (meaning true). This expression is a tautology. Similarly, an expression will be contradictory if the last column in the truth-table shows all the values as Fs (meaning false). A symbolic expression will be contingent, if the last column of the truth-table shows truth-values as having Ts and Fs.

Thus, we can say that the truth-table method is an effective mechanism, a decision procedure to decide if a given expression is valid or invalid. But this procedure may sometimes be inconvenient if we have more than three variables in a well formed formula (wff). But in spite of a symbolic expression being cumbersome, the truth-table method is regarded as an effective decision procedure.

## THE METHOD OF REDUCTION AD ABSURDUM OR THE INDIRECT TRUTH TABLE METHOD

Another convenient method to test the validity of arguments containing large number of statements is the method of Reduction Ad Absurdum, also known as the Indirect Truth-table method. This method is shorter than the ordinary or direct Truth-table method. This method is mechanical and is used to test the validity of expression containing more number of variables and constants. In Indirect Truth-table method we count backwards. In the direct Truth-table method, we reach the main column at the end, but in the Indirect Truth table method, we start with the main column.

In this method of RAA, we begin with the hypothesis or assumption that the given argument is invalid. To do this, we place an 'F' (meaning false) below the main connective conjoining the premises and the conclusion. With the help of the principles governing the construction of the truth-tables, we assign values to the components of the argument. In the course of doing this activity of assigning values, if we find any discrepancies, then our original hypothesis about the given argument as wrong must be invalid. If such be the case, then the argument itself must be valid. But if the case be that there are no discrepancies when we assign values on the basis of our original hypothesis, then argument must be invalid. Now, Apply the technique of RAA to test the validity or invalidity of an argument.

	$(p \supset q) \supset (q \supset p)$					
Step 1						F
	$(p \supset q) \supset (q \supset p)$					
Step 2	T	F				F
	$(p \supset q) \supset (q \supset p)$					
Step 3	T	F	T	F		F
	$(p \supset q) \supset (q \supset p)$					
Step 4	F	T	T	F	T	F

In the above example, we begin with the assumption or hypothesis that the argument is invalid. To do this, we put F under the constant  $\supset$  joining  $p \supset q$  and  $q \supset p$  as shown in Step 1. The Step 2 shows that main column can be F when the antecedent  $(p \supset q)$  is true (T) and the consequent  $(q \supset p)$  is false (F). In Steps 3 and 4 we show that the consequent  $q \supset p$  can be false (F) only if q is true (T) and p is false (F). Here we have the truth-values of p and q as false (F) and true (T) respectively. These values are assigned to p and q in the antecedent  $(p \supset q)$ . After doing so, we find that there is no inconsistency in the expression  $(p \supset q) \supset (q \supset p)$ . So, our original assumption of putting F under main column is justified. But if this assumption is justified and no inconsistency arises thereby, it means that the argument is invalid.

Thus, we have seen that Reductio Ad Absurdum or the Indirect Truth-table method, when applied to argument or argument forms, is a complete decision procedure. It is a simpler method for testing arguments. Therefore, it is a convenient method to test the validity of complex logical expressions. It gives us a concrete answer to a complex logical statement, either as valid or invalid.

## REDUCTION TO CONJUNCTIVE NORMAL FORM (CNF)

Apart from Direct and Indirect truth-table methods, we have another method to test the truth-value of complex logical expressions. This method is the Method of Reduction to Conjunctive Normal Form or what is known in brief as CNF. This method helps us to decide whether a given truth functional expression is a tautology or not. Like the other methods discussed above, this method of CNF is also a decision procedure and be conveniently applied to complex logical expressions having a large number of variables. Here, we need to introduce quite a few reference formulae for purpose of reduction to conjunctive normal form. By reference formulae, we mean equivalent logical expressions which are logically true expressions. The reference formulae are required for CNF in order to reduce a given truth functional expression to its equivalent expression. The reference formulae are:

### 1) Principle of Commutation (Comm.)

$$\text{i) } (p \cdot q) \equiv (q \cdot p)$$

$$\text{ii) } (p \vee q) \equiv (q \vee p)$$

### 2) Principle of Association (Assoc.)

$$\text{i) } (p \cdot (q \cdot r)) \equiv ((p \cdot q) \cdot r)$$

$$\text{ii) } (p \vee (q \vee r)) \equiv ((p \vee q) \vee r)$$

### 3) Principle of Distribution (Dist.)

$$\text{i) } (p \cdot (q \vee r)) \equiv (p \cdot q) \vee (p \cdot r)$$

$$\text{ii) } (p \vee (q \cdot r)) \equiv (p \vee q) \cdot (p \vee r)$$

### 4) Principle of Double Negation (D.N.)

$$\sim\sim p \equiv p$$

### 5) De Morgan's Laws (De.M.)

$$\text{i) } \sim(p \cdot q) \equiv \sim p \vee \sim q$$

$$\text{ii) } \sim(p \vee q) \equiv \sim p \cdot \sim q$$

### 6) Definition of Material Implication (Impl.)

$$p \cdot q \equiv (\sim p \vee q)$$

Understand CNF as a decision procedure by using the Reference Formulae to test the validity of a logical expression.

$$(p \vee q) \cdot \sim p \supset q$$

$$\sim((p \vee q) \cdot \sim p) \vee q \quad \text{—by Impl.}$$

$$(\sim(p \vee q) \vee \sim\sim p) \vee q \quad \text{—by De.M.}$$

$$((\sim p \cdot \sim q) \vee p) \vee q \quad \text{—by De.M., D.N.}$$

$$((p \vee \sim p) \cdot (p \vee \sim q)) \vee q \quad \text{—by Dist}$$

$$((p \vee \sim p) \vee q) \cdot (p \vee (q \vee \sim q)) \quad \text{—by Dist.}$$

In the illustration of the given example through reduction to conjunctive Normal form, we conclude that the given truth – functional expression is a Tautology. Because, the last equivalent expression is a conjunction of two tautological disjunctions –  $((p \vee \sim p) \vee q)$  and  $((p \vee (q \vee \sim q))$ . In CNF, an argu-

ment is considered to be valid if its equivalent expression is a tautological Conjunctive Normal Form (CNF). But the argument will be invalid, if it cannot be reduced to a conjunction of tautologies.

## Testing the Validity of Sentential Logic

The test will involve applying skills that we've already learned: setting up truth tables and computing the truth-values of compounds. First, we must define logical form in SL.

### Logical Form in SL

This will seem trivial, but it is necessary. We're learning how to evaluate arguments expressed in SL. Like any evaluation of deductive arguments, the outcome hinges on the argument's form. So what is the form of an SL argument? Consider an example; here is an argument in SL:

$A \supset B$

$\sim B$  Therefore,  $\sim A$

'A' and 'B' stand for simple sentences in English; we don't care which ones. We're working within SL: given an argument in this language, how do we determine its form? Quite simply, by systematically replacing capital letters with variables (lower-case letters like 'p', 'q', and 'r'). The form of that particular SL argument is this:

$p \supset q$

$\sim q$  Therefore,  $\sim p$

The replacement of capital letters with lower-case variables was **systematic** in this sense: each occurrence of the same capital letter (e.g., 'A') was replaced with the same variable (e.g., 'p').

To generate the logical form of an SL argument, what we do is systematically replace SL sentences with what we'll call **sentence-forms**. An SL sentence is just a well-formed combination of SL symbols—capital letters, operators, and parentheses. A sentence-form is a combination of symbols that would be well-formed in SL, except that it has lower-case variables instead of capital letters.

Again, this may seem like a trivial change, but it is necessary. Remember, when we're testing an argument for validity, we're checking to see whether its form is such that it's possible for its premises to turn out true and its conclusion false.

This means checking various ways of filling in the form with particular sentences. Variables—as the name suggests—can vary in the way we need: they are generic and can be replaced with any old particular sentence. Actual SL constructions feature capital letters, which are actual sentences having specific truth-values. It is conceptually incoherent to speak of checking different possibilities for actual sentences. So we must switch to sentence-forms.

### The Truth Table Test for Validity

To test an SL argument for validity, we identify its logical form, then create a truth table with columns for each of the variables and sentence-forms in the argument's form. Filling in columns of Ts and Fs under each of the operators in those sentence-forms will allow us to check for what we're looking for: an instance of the argument's form for which the premises turn out true and the conclusion turns out false. Finding such an instance demonstrates the argument's invalidity, while failing to find one demonstrates its validity.

To see how this works, it will be useful to work through an example. Consider the following argu-

ment in English: If Democrats take back Congress, lots of new laws will be passed. Democrats won't take back Congress. Therefore, lots of new laws won't be passed.

We'll evaluate it by first translating it into SL. Let 'D' stand for 'Democrats takeback Congress' and 'L' stand for 'Lots of new laws will be passed'. This is the argument in SL:

$D \supset L$   
 $\sim D$  Therefore,  $\sim L$

First, the logical form. Replacing 'D' with 'p' and 'L' with 'q', we get:

$p \supset q$   
 $\sim p$  Therefore,  $\sim q$

Now we set up a truth table, with columns for each of the variables and columns for each of the sentence-forms. To determine how many rows our table needs, we note the number of different variables that occur in the argument-form (call that number 'n'); the table will need  $2^n$  rows. In this case, we have two variables—'p' and 'q'—and so we need  $2^2 = 4$  rows. (If there were three variables, we would need  $2^3 = 8$  rows; if there were four,  $2^4 = 16$ ; and so on.) Here is the table we need to fill in for this example:

p	q	$p \supset q$	$\sim p$	$\sim q$

First, we fill in the "base columns". These are the columns for the variables. We do this systematically. Start with the right-most column (under 'q' in this case), and fill in Ts and Fs alternately: T, F, T, F, T, F, ... as many times as you need—until you've got a truth-value in every row. That gives us this:

p	q	$p \supset q$	$\sim p$	$\sim q$
	T			
	F			
	T			
	F			

Next, we move to the base column to the left of the one we just filled in (under 'p' now), and fill in Ts and Fs by alternating in twos: T, T, F, F, T, T, F, F, ... as many times as we need. The result is this:

<b>p</b>	<b>q</b>	<b><math>p \supset q</math></b>	<b><math>\sim p</math></b>	<b><math>\sim q</math></b>
<b>T</b>	<b>T</b>			
<b>T</b>	<b>F</b>			
<b>F</b>	<b>T</b>			
<b>F</b>	<b>F</b>			

If there were a third base column, we would fill in the Ts and Fs by alternating in fours: T, T, T, T, F, F, F, F. For a fourth base column, we would alternate every other eight. And so on. Next, we need to fill in columns of Ts and Fs under each of the operators in the statement-forms' columns. To do this, we apply our knowledge of how to compute the truth-values of compounds in terms of the values of their components, consulting the operators' truth table definitions. We know how to compute the values of  $p \supset q$ : it's false when p is true and q false; true otherwise. We know how to compute the values of  $\sim p$  and  $\sim q$ : those are just the opposites of the values of p and q in each of the rows. Making these computations, we fill the table in thus:

<b>p</b>	<b>q</b>	<b><math>p \supset q</math></b>	<b><math>\sim p</math></b>	<b><math>\sim q</math></b>
<b>T</b>	<b>T</b>	<b>T</b>	<b>F</b>	<b>F</b>
<b>T</b>	<b>F</b>	<b>F</b>	<b>F</b>	<b>T</b>
<b>F</b>	<b>T</b>	<b>T</b>	<b>T</b>	<b>F</b>
<b>F</b>	<b>F</b>	<b>T</b>	<b>T</b>	<b>T</b>

Once the table is filled in, we check to see if we have a valid or invalid form. The mark of an invalid form is that it's possible for the premises to be true and the conclusion false. Here, the rows of the table are the possibilities—the four possible outcomes of plugging in particular SL sentences for the variables: both true; the first is true, but the second false; the first false but the second true; both false. The reason we systematically fill in the base columns as described above is that the method ensures that our rows will collectively exhaust all these possible combinations.

So, to see if it's possible for the premises to come out true and the conclusion to come out false, we check each of the rows, looking for one in which this happens—one in which there's a T under ' $p \supset q$ ', a T under ' $\sim p$ ', and an F under ' $\sim q$ '. And we have one: in row 3, the premises come out true and the conclusion comes out false. This is enough to show that the argument is invalid:

p	q	$p \supset q$	$\sim p$	$\sim q$
T	T	T	F	F
T	F	F	F	T
F	T	<b>T</b>	<b>T</b>	<b>F</b>
F	F	T	T	T

## INVALID

When we're checking for validity, we're looking for one thing, and one thing only: a row (or rows) in which the premises come out true and the conclusion comes out false. If we find one, we have shown that the argument is invalid. If we don't find one, that indicates that it's impossible for the premises to be true and the conclusion false—and so the argument is valid. Either way, the only thing we look for is a row with true premises and a false conclusion. Every other kind of row is irrelevant. It's common for beginners to mistakenly think they are. The fourth row in the table above, for example, looks significant. Everything comes out true in that row. Doesn't that mean something—something good, like that the argument's valid? No. Remember, each row represents a **possibility**; what row 4 shows is that it's possible for the premises to be true and the conclusion true. But that's not enough for validity. For an argument to be valid, the premises must **guarantee** the conclusion; whenever they're true, the conclusion **must** be true. That it's merely possible that they all come out true is not enough.

Look at a more involved example, to see how the computation of the truth-values of the statement-forms must sometimes proceed in stages. The skill required here is nothing new—it's just identifying main operators and computing the values of the simplest components first—but it takes careful attention to keep everything straight. Consider this SL argument (never mind what its English counterpart is):

$(\sim A \cdot B) \vee \sim XB \rightarrow A$  Therefore,  $\sim X$

To get its form, we replace 'A' with 'p', 'B' with 'q', and 'X' with 'r':

$(\sim p \cdot q) \vee \sim rq \rightarrow p$  Therefore,  $\sim r$

So our truth-table will look like this (eight rows because we have three variables;  $2^3 = 8$ ):

p	q	r	$(\sim p \bullet q) \vee \sim r$	$q \supset p$	$\sim r$

Filling in the base columns as prescribed above—alternating every other one for the column under ‘r’, every two under ‘q’, and every four under ‘p’—we get:

p	q	r	$(\sim p \bullet q) \vee \sim r$	$q \supset p$	$\sim r$
T	T	T			
T	T	F			
T	F	T			
T	F	F			
F	T	T			
F	T	F			
F	F	T			
F	F	F			

Now we turn our attention to the three sentence-forms. We’ll start with the first premise, the compound  $(\sim p \bullet q) \vee \sim r$ . We need to compute the truth-value of this formula. We know how to do this, provided we have the truth-values of the simplest parts; we’ve solved problems like that already. The only difference in the case of truth tables is that there are multiple different assignments of truth-values to the simplest parts. In this case, there are eight different ways of assigning truth-values to ‘p’, ‘q’, and ‘r’; those are represented by the eight different rows of the table. So we’re solving a problem we know how to solve; we’re just doing it eight times.

We start by identifying the main operator of the compound formula. In this case, it’s the wedge: we

have a disjunction; the left-hand disjunct is  $(\sim p \bullet q)$ , and the right-hand disjunct is  $\sim r$ . To figure out what happens under the wedge in our table, we must first figure out the values of these components. Both disjuncts are themselves compound:  $(\sim p \bullet q)$  is a conjunction, and  $\sim r$  is a negation. Let's tackle the conjunction first. To figure out what happens under the dot, we need to know the values of  $\sim p$  and  $q$ . We know the values of  $q$ ; that's one of the base columns. We must compute the value of  $\sim p$ . That's easy: in each row, the value of  $\sim p$  will just be the opposite of the value of  $p$ . We note the values under the tilde, the operator that generates them:

p	q	r	$(\sim p \bullet q) \vee \sim r$	$q \supset p$	$\sim r$
T	T	T	F		
T	T	F	F		
T	F	T	F		
T	F	F	F		
F	T	T	T		
F	T	F	T		
F	F	T	T		
F	F	F	T		

To compute the value of the conjunction, we consider the result, in each row, of the truth-function for dot, where the inputs are the value under the tilde in  $\sim p$  and the value under  $q$  in the base column. In rows 1 and 2, it's  $F \bullet T$ ; in rows 3 and 4,  $F \bullet F$ ; and so on. The results:

p	q	r	$(\sim p \bullet q) \vee \sim r$	$q \supset p$	$\sim r$
T	T	T	F F		
T	T	F	F F		
T	F	T	F F		
T	F	F	F F		
F	T	T	T T		
F	T	F	T T		
F	F	T	T F		
F	F	F	T F		

The column we just produced, under the dot, gives us the range of truth-values for the left-hand disjunct in the first premise. We need the values of the right-hand disjunct. That's just  $\sim r$ , which is easy to compute: it's just the opposite value of  $r$  in every row:

p	q	r	( $\sim p \bullet q$ )	$\sim r$	$q \supset p$	$\sim r$
T	T	T	F	F	F	
T	T	F	F	F	T	
T	F	T	F	F	F	
T	F	F	F	F	T	
F	T	T	T	T	F	
F	T	F	T	T	T	
F	F	T	T	F	F	
F	F	F	T	F	T	

Now we can finally determine the truth-values for the whole disjunction. We compute the value of the wedge's truth-function, where the inputs are the columns under the dot, on the one hand, and the tilde from ' $\sim r$ ' on the other.  $F \vee F$ ,  $F \vee T$ ,  $F \vee F$ , and so on:

p	q	r	( $\sim p \bullet q$ )	$\sim r$	$q \supset p$	$\sim r$
T	T	T	F	F	<b>F</b>	F
T	T	F	F	F	<b>T</b>	T
T	F	T	F	F	<b>F</b>	F
T	F	F	F	F	<b>T</b>	T
F	T	T	T	T	<b>T</b>	F
F	T	F	T	T	<b>T</b>	T
F	F	T	T	F	<b>F</b>	F
F	F	F	T	F	<b>T</b>	T

Since that column represents the range of possible values for the entire sentence-form, we highlight it. When we test for validity, we're looking for rows where the premises as a whole come out true; we'll be looking for the value under their main operators. To make that easier, just so we don't lose track of things visually because of all those columns, we highlight the one under the main operator.

Next, the second premise, which is thankfully much less complex. It is, however, slightly tricky. We need to compute the value of a conditional here. But notice that things are a bit different than usual: the antecedent, 'q', has its base column to the **right** of the column for the consequent, 'p'. That's a bit awkward. We're used to computing conditionals from left-to-right; we'll have to mentally adjust to the fact that ' $q \supset p$ ' goes from right-to-left. (Alternatively, if it helps, you can simply repro-

duce the base columns underneath the variables in the 'q  $\rightarrow$  p' column.) So in the first two rows, we compute T  $\rightarrow$  T; but in rows 3 and 4, it's F  $\rightarrow$  T; in rows 5 and 6, it's T  $\rightarrow$  F (the only circumstance in which conditionals turn out false); and in rows 7 and 8, it's F  $\rightarrow$  F. Here is the result:

p	q	r	$(\sim p \bullet q) \vee \sim r$	$q \supset p$	$\sim r$
T	T	T	F F <b>F</b> F	T	
T	T	F	F F <b>T</b> T	T	
T	F	T	F F <b>F</b> F	T	
T	F	F	F F <b>T</b> T	T	
F	T	T	T T <b>T</b> F	F	
F	T	F	T T <b>T</b> T	F	
F	F	T	T F <b>F</b> F	T	
F	F	F	T F <b>T</b> T	T	

No need to highlight that column, as it's the only one we produced for that premise, so there can be no confusion.

We finish the table by computing the values for the conclusion, which is easy:

p	q	r	$(\sim p \bullet q) \vee \sim r$	$q \supset p$	$\sim r$
T	T	T	F F <b>F</b> F	T	F
T	T	F	F F <b>T</b> T	T	T
T	F	T	F F <b>F</b> F	T	F
T	F	F	F F <b>T</b> T	T	T
F	T	T	T T <b>T</b> F	F	F
F	T	F	T T <b>T</b> T	F	T
F	F	T	T F <b>F</b> F	T	F
F	F	F	T F <b>T</b> T	T	T

Is the argument valid? We look for a row with true premises and a false conclusion. There are none. The only two rows in which both premises come out true are the second and the eighth, and in both we also have a true conclusion. It is impossible for the premises to be true and the conclusion false, so the argument is valid. So that is how we test arguments for validity in SL. It's a straightforward procedure; the main source of error is simple carelessness. Go step by step, keep careful track of what you're doing, and it should be easy. It's worth noting that the truth table test is what logicians call a "decision procedure": it's a rule-governed process (an algorithm) that is guar-

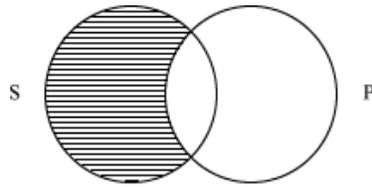

anted to answer your question (in this case: valid or invalid?) in a finite number of steps. It is possible to program a computer to run the truth table test on arbitrarily long SL arguments. This is comforting, since once one gets more than four variables or so, the process becomes unwieldy.

## **Venn diagram**

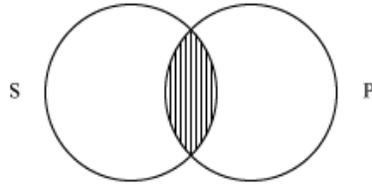

**Venn diagram**, graphical method of representing categorical propositions and testing the validity of categorical syllogisms, devised by the English logician and philosopher John Venn (1834–1923). Long recognized for their pedagogical value, Venn diagrams have been a standard part of the curriculum of introductory logic since the mid-20th century.

Venn introduced the diagrams that bear his name as a means of representing relations of inclusion and exclusion between classes, or sets. Venn diagrams consist of two or three intersecting circles, each representing a class and each labeled with an uppercase letter. Lowercase x's and shading are used to indicate the existence and nonexistence, respectively, of some (at least one) member of a given class.

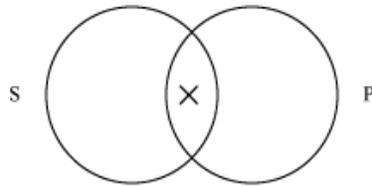

Two-circle Venn diagrams are used to represent categorical propositions, whose logical relations were first studied systematically by Aristotle. Such propositions consist of two terms, or class nouns, called the subject (S) and the predicate (P); the quantifier all, no, or some; and the copula are or are not. The proposition "All S are P," called the universal affirmative, is represented by shading the part of the circle labeled S that does not intersect the circle labeled P, indicating that there is nothing that is an S that is not also a P. "No S are P," the universal negative, is represented by shading the intersection of S and P; "Some S are P," the particular affirmative, is represented by placing an x in the intersection of S and P; and "Some S are not P," the particular negative, is represented by placing an x in the part of S that does not intersect P.

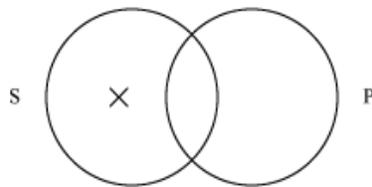

Venn diagram of the categorical proposition "All S are P."

Venn diagram of the categorical proposition "No S are P."

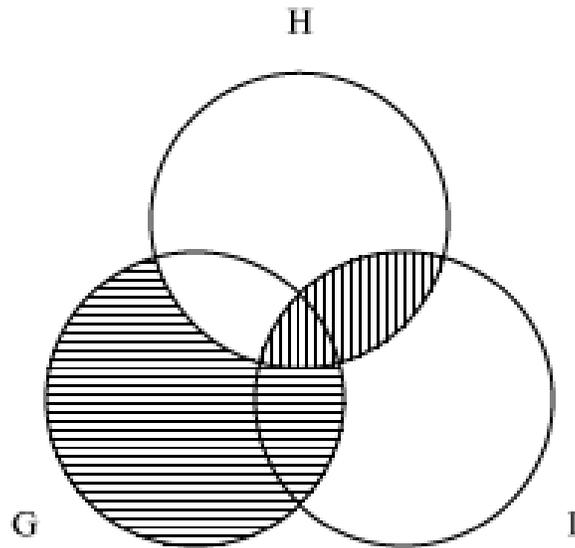

Venn diagram of the categorical proposition "Some S are P."

Venn diagram of the categorical proposition "Some S are not P."

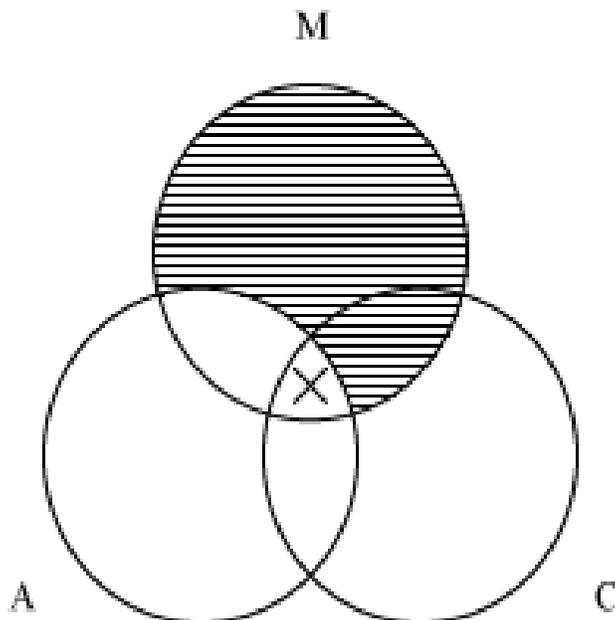

Three-circle diagrams, in which each circle intersects the other two, are used to represent categorical syllogisms, a form of deductive argument consisting of two categorical premises and a categorical conclusion. A common practice is to label the circles with capital (and, if necessary, also lowercase) letters corresponding to the subject term of the conclusion, the predicate term of the conclusion, and the middle term, which appears once in each premise. If, after both premises are diagrammed (the universal premise first, if both are not universal), the conclusion is also represented, the syllogism is valid; i.e., its conclusion follows necessarily from its premises. If not, it is invalid.

Three examples of categorical syllogisms are the following. All Greeks are human. No humans are immortal. Therefore, no Greeks are immortal. Some mammals are carnivores. All mammals are animals. Therefore, some animals are carnivores. Some sages are not seers. No seers are soothsayers. Therefore, some sages are not soothsayers. To diagram the premises of the first syllogism, one shades the part of G ("Greeks") that does not intersect H ("humans") and the part of H that intersects I ("immortal"). Because the conclusion is represented by the shading in the intersection of G and I, the syllogism is valid.

Venn diagram of the syllogism “All Greeks are human;  
no humans are immortal; therefore, no Greeks are immortal.”

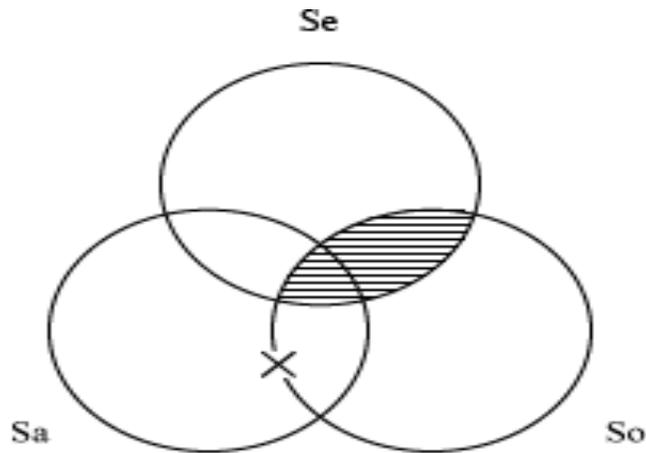

To diagram the second premise of the second example—which, because it is universal, must be diagrammed first—one shades the part of M (“mammals”) that does not intersect A (“animals”). To diagram the first premise, one places an x in the intersection of M and C. Importantly, the part of M that intersects C but does not intersect A is unavailable, because it was shaded in the diagramming of the first premise; thus, the x must be placed in the part of M that intersects both A and C. In the resulting diagram the conclusion is represented by the appearance of an x in the intersection of A and C, so the syllogism is valid.

Venn diagram of the syllogism “Some mammals are carnivores;  
all mammals are animals; therefore, some animals are carnivores.”

To diagram the universal premise in the third syllogism, one shades the part of Se (“seers”) that intersects So (“soothsayers”). To diagram the particular premise, one places an x in Sa (“sages”) on

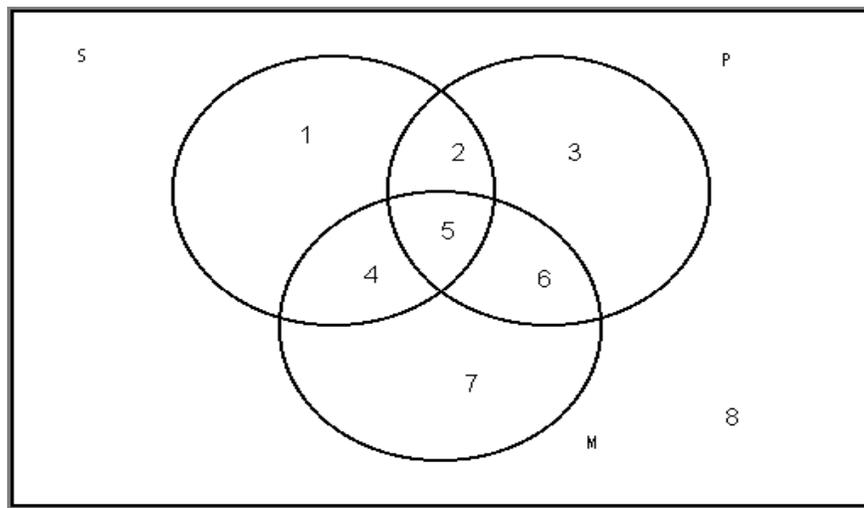

that part of the boundary of So that does not adjoin a shaded area, which by definition is empty. In this way one indicates that the Sa that is not an Se may or may not be an So (the sage that is not a seer may or may not be a soothsayer). Because there is no x that appears in Sa and not in So, the conclusion is not represented, and the syllogism is invalid.

Venn diagram of the syllogism "Some sages are not seers; no seers are soothsayers; therefore, some sages are not soothsayers."

Venn's Symbolic Logic (1866) contains his fullest development of the method of Venn diagrams. The bulk of that work, however, was devoted to defending the algebraic interpretation of propositional logic introduced by the English mathematician George Boole.

### TESTING VALIDITY USING VENN'S DIAGRAMS

To test the validity of a categorical syllogism, one can use the method of Venn diagrams. Since a categorical syllogism has three terms, we need a Venn diagram using three intersecting circles, one representing each of the three terms in a categorical syllogism. A three term diagram has eight regions (the number of regions being  $2^n$  where n is the number of terms).

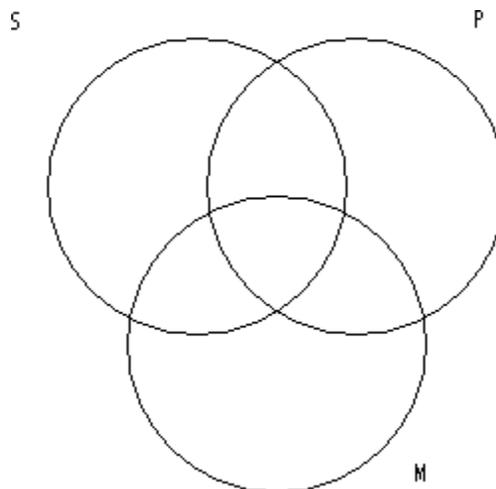

The following chart gives the extension of the predicates in the various regions of the diagram.

Region	S (Minor Term)	P (Major Term)	M (Middle Term)
1	yes	no	no
2	yes	yes	no
3	no	yes	no
4	yes	no	yes
5	yes	yes	yes
6	no	yes	yes
7	no	no	yes
8	no	no	no

In order to use a Venn diagram to test a syllogism, the diagram must be filled in to reflect the contents of the premises. Remember, shading an area means that that area is empty, the term represented has no extension in that area. What one is looking for in a Venn diagram test for validity is an accurate diagram of the **conclusion** of the argument that **logically follows** from a diagram of the premises. Since each of the premises of a categorical syllogism is a categorical proposition, diagram the premise sentences independently and then see whether the conclusion has already been diagrammed. If so, the argument is valid. If not, then it is not.

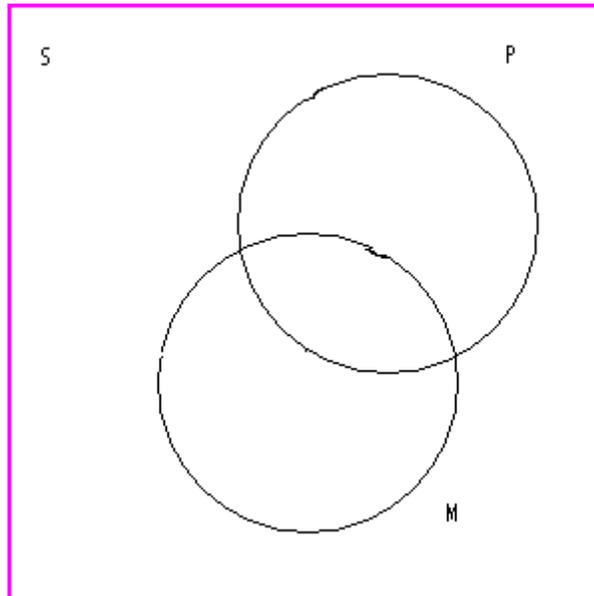

Remember, one definition of validity is that the propositional (informational) content of the conclusion is already expressed in the premises. Venn diagram validity tests provide a graphic tool for using this approach to testing for validity.

A categorical syllogism is valid if, but only if, a diagram of its premises produces a diagram that expresses the propositional content of its conclusion. Begin the process by preparing a three term Venn diagram. As a convention, organize the diagram as above, 2 circles at the top of the diagram, one centered at the bottom. The upper left hand circle should represent the minor term (designated S as this term is the subject of the conclusion). The upper right hand circle should represent the major term (designated P as this term is the predicate of the conclusion). The lower circle should represent the middle term (designated M).

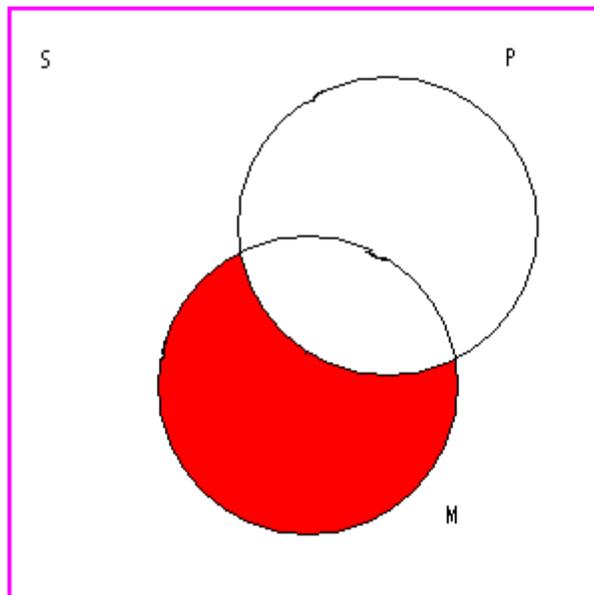

**Consider the following argument:**

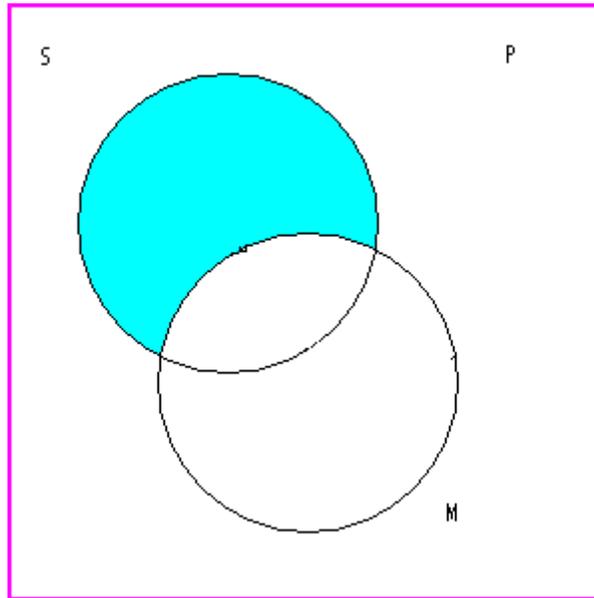

All Greeks are mortal. (All M are P) All Athenians are Greek. (All S are M) So, all Athenians are mortal. (All S are P) Next, diagram each of the premises. When doing this, act as if there are only 2 relevant circles. Begin with the first premise (frequently the premise involving the major term, sometimes called the major premise). In our example you need to diagram the proposition "All M are P". Ignoring for a moment the circle representing the minor term, your diagram should look like this:

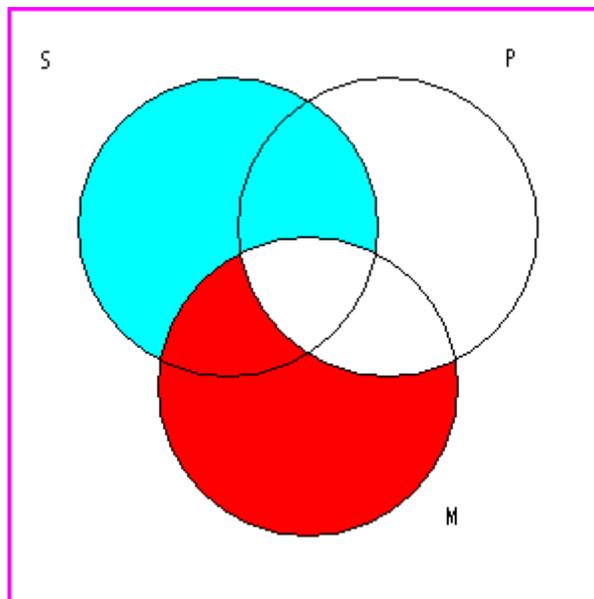

Following the standard conventions we get:

Next, diagram the second premise--"All S are M"-- to get:

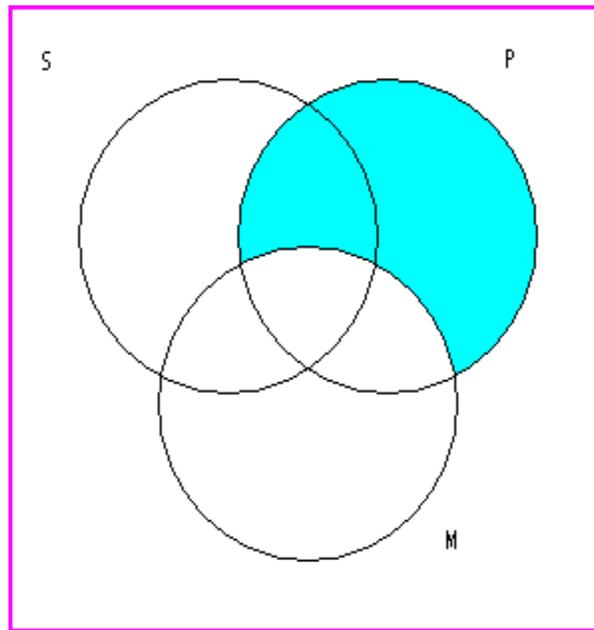

Now, if we overlap the diagrams of the premises we get a diagram of the argument, and we are ready to determine whether the argument is valid or not:

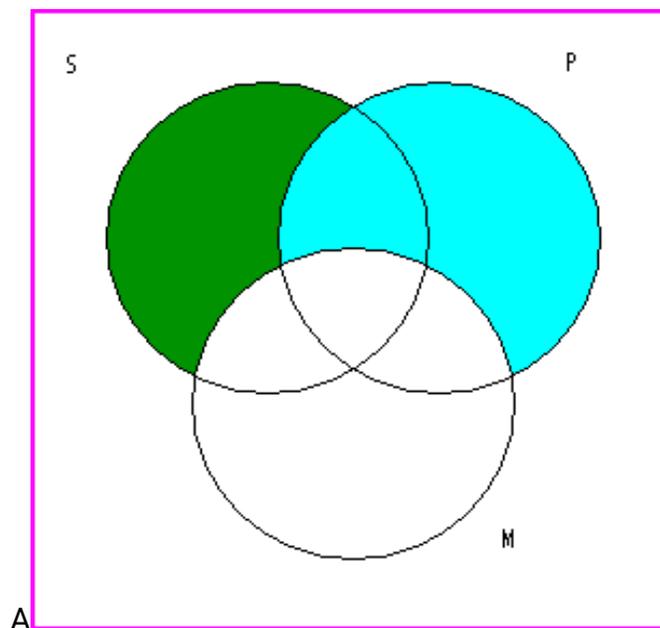

Does this diagram express the informational content of the conclusion of the argument? Yes, all of the S's that remain are in region 5, and everything in region 5 is an S, an M, and a P. Since all the S's are in region 5, all the S's are P's and the argument is VALID.

**Consider another argument:**

All mathematicians are rational. (All P are M) All philosophers are rational. (All S are M)

SO, all philosophers are mathematicians. (All S are P) Beginning with the first premise we get:

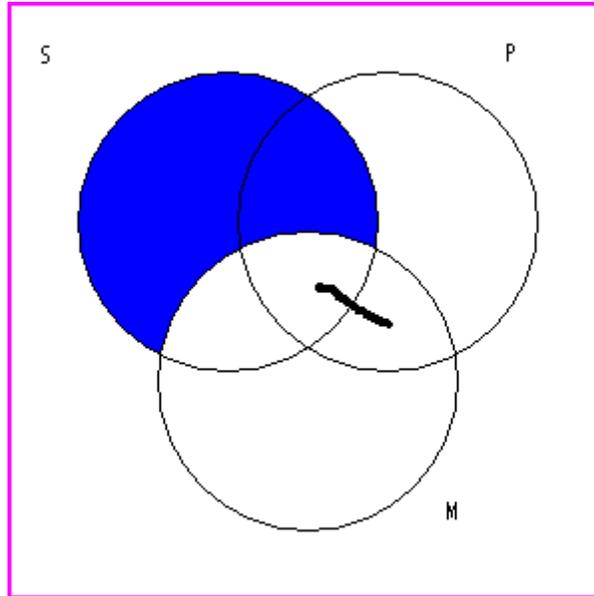

**Adding the second premise we get:**

Does this diagram express the informational content of the conclusion "All S are P"? NO. Region 4 of the diagram is not shaded (not empty) so it is possible that there is an S that is not a P. Accordingly, the argument is NOT VALID.

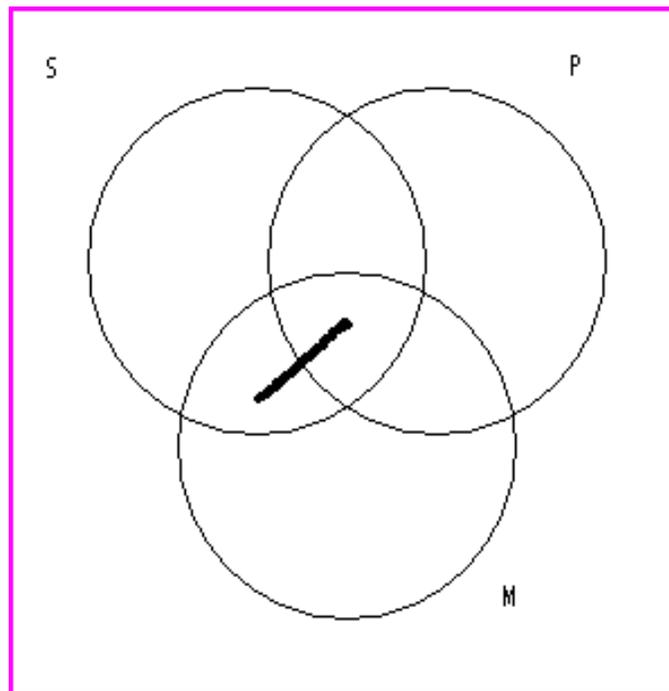

**NOTE:** Whenever a diagram of the premises of an argument produces exactly three shaded regions, the argument is not valid. Exactly three shaded regions indicates that there is a fallacy of distribution. Similarly, if a diagram of the premises indicates 2 or more populated regions, then the argument is not valid.

### Consider the argument:

All philosophers are logical. Some physicists are logical. So, some philosophers are physicists. In the following diagram, the bar that crosses from region 5 into region 6 indicates that the argument is NOT VALID. All that we can be certain of is that there is either an SPM (region 5) or a PM non-S (region 6), but we don't know which. Since we don't know which, the conclusion does not follow logically from the premises.

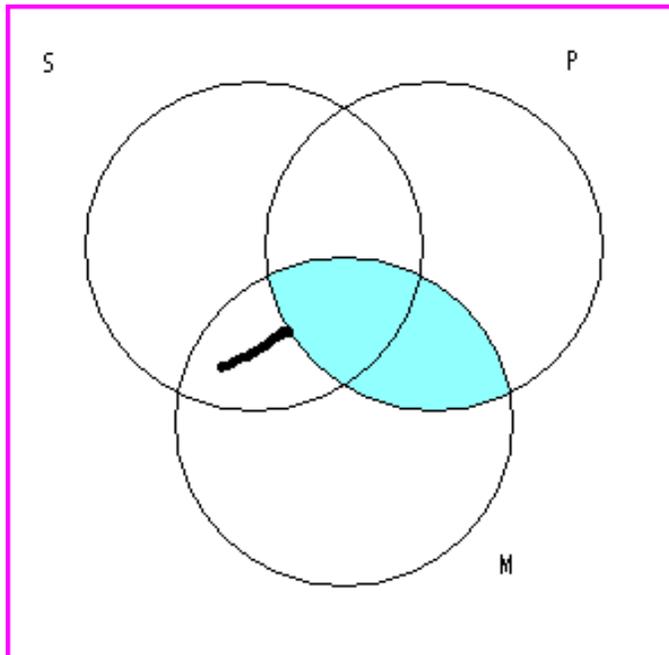

If we modify the previous argument just a little, we see an important distinction. Consider the argument: Some physicists are logical. (Some S are M) No philosophers are logical. (No P are M)

So, some physicists are not philosophers. (Some S are not P) In our new argument, a diagram of the first premise produces:

The second premise, however, rules out the possibility that the S that is M is also a P, because the second premise guarantees that no P's are M's. Our diagram looks like this:

Does this diagram express the informational content of the conclusion "Some S are not P"? Yes, the S that is an M in region 4 is a non-P. So the argument is valid. As useful as Venn's methods are, there are some severe limitations to their usefulness. First, while it is possible to construct a 16 region Venn-type diagram for a 4 term argument, and even a 32 region diagram for a 5 term argument, those diagrams are almost impossible to read or use. What is more, it is impossible to construct a 64 region diagram for a 6 term argument--there is no way to get exactly the right 64 regions in a 2 dimensional diagram, More significantly, though, is that Venn's diagrams cannot capture the logic of quantified sentences that are more complex than simple categorical propositions. Fortunately, we have at our disposal an even more powerful analytical tool--modern predicate logic.

## Fallacies

A fallacy is a kind of error in reasoning. Fallacious arguments should not be persuasive, but they too often are. Fallacies may be created unintentionally, or they may be created intentionally in order to deceive other people.

The vast majority of the commonly identified fallacies involve arguments, although some involve only explanations, or definitions, or other products of reasoning. Sometimes the term "fallacy" is used even more broadly to indicate any false belief or cause of a false belief. The list below includes some fallacies of these sorts, but most are fallacies that involve kinds of errors made while arguing informally in natural language.

A charge of fallacious reasoning always needs to be justified. The burden of proof is on your shoulders when you claim that someone's reasoning is fallacious. Even if you do not explicitly give your reasons, it is your responsibility to be able to give them if challenged. An informal fallacy is fallacious because of both its form and its content. The formal fallacies are fallacious only because of

their logical form. For example, the Slippery Slope Fallacy has the following form: Step 1 often leads to step 2. Step 2 often leads to step 3. Step 3 often leads to ... until we reach an obviously unacceptable step, so step 1 is not acceptable. That form occurs in both good arguments and fallacious arguments. The quality of an argument of this form depends crucially on the probabilities of going from one step to another. The probabilities involve the argument's content, not merely its form. The discussion below that precedes the long alphabetical list of fallacies begins with an account of the ways in which the term "fallacy" is imprecise. Attention then turns to the number of competing and overlapping ways to classify fallacies of argumentation. For pedagogical purposes, researchers in the field of fallacies disagree about the following topics: which name of a fallacy is more helpful to students' understanding; whether some fallacies should be de-emphasized in favor of others; and which is the best taxonomy of the fallacies. Researchers in the field are also deeply divided about how to define the term "fallacy" itself, how to define certain fallacies, and whether any theory of fallacies at all should be pursued if that theory's goal is to provide necessary and sufficient conditions for distinguishing between fallacious and non-fallacious reasoning generally.

Analogously, there is doubt in the field of ethics regarding whether researchers should pursue the goal of providing necessary and sufficient conditions for distinguishing moral actions from immoral ones.

## Introduction

The first known systematic study of fallacies was due to Aristotle in his *De Sophisticis Elenchis* (*Sophistical Refutations*), an appendix to the *Topics*. He listed thirteen types. After the Dark Ages, fallacies were again studied systematically in Medieval Europe. This is why so many fallacies have Latin names. The third major period of study of the fallacies began in the later twentieth century due to renewed interest from the disciplines of philosophy, logic, communication studies, rhetoric, psychology, and artificial intelligence.

The more frequent the error within public discussion and debate the more likely it is to have a name. That is one reason why there is no specific name for the fallacy of subtracting five from thirteen and concluding that the answer is seven, though the error is common. The term "fallacy" is not a precise term. One reason is that it is ambiguous. It can refer either to (a) a kind of error in an argument, (b) a kind of error in reasoning (including arguments, definitions, explanations, and so forth), (c) a false belief, or (d) the cause of any of the previous errors including what are normally referred to as "rhetorical techniques." Philosophers who are researchers in fallacy theory prefer to emphasize (a), but their lead is often not followed in textbooks and public discussion.

Regarding (d), ill health, being a bigot, being hungry, being stupid, and being hypercritical of our enemies are all sources of error in reasoning, so they could qualify as fallacies of kind (d), but they are not included in the list below. On the other hand, wishful thinking, stereotyping, being superstitious, rationalizing, and having a poor sense of proportion are sources of error and are included in the list below, though they wouldn't be included in a list devoted only to faulty arguments. Thus there is a certain arbitrariness to what appears in lists such as this. What have been left off the list below are the following persuasive techniques commonly used to influence others and to cause errors in reasoning:

apple polishing, using propaganda techniques, ridiculing, being sarcastic, selecting terms with strong negative or positive associations, using innuendo, and weasling. All of the techniques are worth knowing about if one wants to reason well. In describing the fallacies below, the custom is

followed of not distinguishing between a reasoner using a fallacy and the reasoning itself containing the fallacy. Real arguments are often embedded within a very long discussion. Richard Whately, one of the greatest of the 19th century researchers into informal logic, wisely said, "A very long discussion is one of the most effective veils of Fallacy; ...a Fallacy, which when stated barely...would not deceive a child, may deceive half the world if diluted in a quarto volume."

## **Taxonomy of Fallacies**

The importance of understanding the common fallacy labels is that they provide an efficient way to communicate criticisms of someone's reasoning. However, there are a variety of ways to label fallacies, and there are a number of competing and overlapping ways to classify fallacies. For example, the fallacies of argumentation can be classified as either formal or informal. A formal fallacy can be detected by examining the logical form of the reasoning, whereas an informal fallacy depends upon the content of the reasoning and possibly the purpose of the reasoning. That is, informal fallacies are errors of reasoning that cannot easily be expressed in our system of formal logic (such as symbolic, deductive, predicate logic). The list below contains very few formal fallacies. Fallacious arguments also can be classified as deductive or inductive, depending upon whether the fallacious argument is most properly assessed by deductive standards or instead by inductive standards. Deductive standards demand deductive validity, but inductive standards require inductive strength such as making the conclusion more likely. Fallacies can be divided into categories according to the psychological factors that lead people to use them, and they can also be divided into categories according to the epistemological or logical factors that cause the error. In the latter division there are three categories: (1) the reasoning is invalid but is presented as if it were a valid argument, or else it is inductively much weaker than it is presented as being, (2) the argument has an unjustified premise, or (3) some relevant evidence has been ignored or suppressed. Regarding (2), a premise can be justified or warranted at a time even if we later learn that the premise was false, and it can be justified if we are reasoning about what would have happened even when we know it didn't happen.

Similar fallacies are often grouped together under a common name intended to bring out how the fallacies are similar. Here are three examples. Fallacies of relevance include fallacies that occur due to reliance on an irrelevant reason. Ad Hominem, Appeal to Pity, and Affirming the Consequent are also fallacies of relevance. Accent, Amphiboly and Equivocation are examples of fallacies of ambiguity. The fallacies of illegitimate presumption include Begging the Question, False Dilemma, No True Scotsman, Complex Question and Suppressed Evidence.

## **Pedagogy**

It is commonly claimed that giving a fallacy a name and studying it will help the student identify the fallacy in the future and will steer them away from using the fallacy in their own reasoning. As Steven Pinker says in *The Stuff of Thought* (p. 129), If a language provides a label for a complex concept, that could make it easier to think about the concept, because the mind can handle it as a single package when juggling a set of ideas, rather than having to keep each of its components in the air separately. It can also give a concept an additional label in long-term memory, making it more easily retrievable than ineffable concepts or those with more roundabout verbal descriptions.

For pedagogical purposes, researchers in the field of fallacies disagree about the following topics: which name of a fallacy is more helpful to students' understanding; whether some fallacies should be de-emphasized in favor of others; and which is the best taxonomy of the fallacies. Fallacy theory is criticized by some teachers of informal reasoning for its over-emphasis on poor reasoning ra-

ther than good reasoning. Do colleges teach the Calculus by emphasizing all the ways one can make mathematical mistakes? The critics want more emphasis on the forms of good arguments and on the implicit rules that govern proper discussion designed to resolve a difference of opinion. But there has been little systematic study of which emphasis is more successful.

## **What is a fallacy?**

Researchers disagree about how to define the very term “fallacy.” Focusing just on fallacies in sense (a) above, namely fallacies of argumentation, some researchers define a fallacy as an argument that is deductively invalid or that has very little inductive strength. Because examples of false dilemma, inconsistent premises, and begging the question are valid arguments in this sense, this definition misses some standard fallacies. Other researchers say a fallacy is a mistake in an argument that arises from something other than merely false premises. But the false dilemma fallacy is due to false premises. Still other researchers define a fallacy as an argument that is not good. Good arguments are then defined as those that are deductively valid or inductively strong, and that contain only true, well-established premises, but are not question-begging. A complaint with this definition is that its requirement of truth would improperly lead to calling too much scientific reasoning fallacious; every time a new scientific discovery caused scientists to label a previously well-established claim as false, all the scientists who used that claim as a premise would become fallacious reasoners. This consequence of the definition is acceptable to some researchers but not to others. Because informal reasoning regularly deals with hypothetical reasoning and with premises for which there is great disagreement about whether they are true or false, many researchers would relax the requirement that every premise must be true. One widely accepted definition defines a fallacious argument as one that either is deductively invalid or is inductively very weak or contains an unjustified premise or that ignores relevant evidence that is available and that should be known by the arguer. Finally, yet another theory of fallacy says a fallacy is a failure to provide adequate proof for a belief, the failure being disguised to make the proof look adequate.

Other researchers recommend characterizing a fallacy as a violation of the norms of good reasoning, the rules of critical discussion, dispute resolution, and adequate communication. The difficulty with this approach is that there is so much disagreement about how to characterize these norms. In addition, all the above definitions are often augmented with some remark to the effect that the fallacies are likely to persuade many reasoners. It is notoriously difficult to be very precise about this vague and subjective notion of being likely to persuade, and some researchers in fallacy theory have therefore recommended dropping the notion in favor of “can be used to persuade.”

Some researchers complain that all the above definitions of fallacy are too broad and do not distinguish between mere blunders and actual fallacies, the more serious errors. Researchers in the field are deeply divided, not only about how to define the term “fallacy” and how to define some of the individual fallacies, but also about whether any general theory of fallacies at all should be pursued if that theory’s goal is to provide necessary and sufficient conditions for distinguishing between fallacious and non-fallacious reasoning generally. Analogously, there is doubt in the field of ethics whether researchers should pursue the goal of providing necessary and sufficient conditions for distinguishing moral actions from immoral ones.

## **Formal Fallacy**

A formal fallacy is an error in logic that can be seen in the argument's form. All formal fallacies are specific types of non sequitur.

- Appeal to probability – a statement that takes something for granted because it would probably be the case (or might be the case).
- Argument from fallacy (also known as the fallacy fallacy) – the assumption that if an argument for some conclusion is fallacious, then the conclusion is false.
- Base rate fallacy – making a probability judgment based on conditional probabilities, without taking into account the effect of prior probabilities.
- Conjunction fallacy – the assumption that an outcome simultaneously satisfying multiple conditions is more probable than an outcome satisfying a single one of them.
- Masked-man fallacy (illicit substitution of identicals) – the substitution of identical designators in a true statement can lead to a false one.<sup>[10]</sup>

## Informal fallacies

Informal fallacies – arguments that are logically unsound for lack of well-grounded premises.

- Argument to moderation (false compromise, middle ground, fallacy of the mean, argumentum ad temperantiam) – assuming that the compromise between two positions is always correct.
- Continuum fallacy (fallacy of the beard, line-drawing fallacy, sorites fallacy, fallacy of the heap, bald man fallacy) – improperly rejecting a claim for being imprecise.
- Correlative-based fallacies
- Suppressed correlative – a correlative is redefined so that one alternative is made impossible (e.g., "I'm not fat because I'm thinner than him").
- Definist fallacy – defining a term used in an argument in a biased manner. The person making the argument expects the listener will accept the provided definition, making the argument difficult to refute.
- Divine fallacy (argument from incredulity) – arguing that, because something is so incredible or amazing, it must be the result of superior, divine, alien or paranormal agency.
- Double counting – counting events or occurrences more than once in probabilistic reasoning, which leads to the sum of the probabilities of all cases exceeding unity.
- Equivocation – using a term with more than one meaning in a statement without specifying which meaning is intended.
- Ambiguous middle term – using a middle term with multiple meanings.
- Definitional retreat – changing the meaning of a word when an objection is raised.
- Motte-and-bailey fallacy – conflating two positions with similar properties, one modest and easy to defend (the "motte") and one more controversial (the "bailey"). The arguer first states the controversial position, but when challenged, states that they are advancing the modest position.
- Fallacy of accent – changing the meaning of a statement by not specifying on which word emphasis falls.
- Persuasive definition – purporting to use the "true" or "commonly accepted" meaning of a term while, in reality, using an uncommon or altered definition.
- (cf. the if-by-whiskey fallacy)
- Ecological fallacy – inferences about the nature of specific individuals are based solely upon aggregate statistics collected for the group to which those individuals belong.
- Etymological fallacy – reasoning that the original or historical meaning of a word or phrase is necessarily similar to its actual present-day usage.
- Fallacy of composition – assuming that something true of part of a whole must also be true of

the whole.

- Fallacy of division – assuming that something true of a thing must also be true of all or some of its parts.
- False attribution – an advocate appeals to an irrelevant, unqualified, unidentified, biased or fabricated source in support of an argument.
- Fallacy of quoting out of context (contextomy, contextomy; quotation mining) – refers to the selective excerpting of words from their original context in a way that distorts the source's intended meaning.
- False authority (single authority) – using an expert of dubious credentials or using only one opinion to sell a product or idea. Related to the appeal to authority.
- False dilemma (false dichotomy, fallacy of bifurcation, black-or-white fallacy) – two alternative statements are held to be the only possible options when in reality there are more.
- False equivalence – describing two or more statements as virtually equal when they are not.
- Feedback fallacy – believing in the objectivity of an evaluation to be used as the basis for improvement without verifying that the source of the evaluation is a disinterested party.
- Historian's fallacy – assuming that decision makers of the past had identical information as those subsequently analyzing the decision. This should not be confused with presentism, in which present-day ideas and perspectives are anachronistically projected into the past.
- Historical fallacy – a set of considerations is thought to hold good only because a completed process is read into the content of the process which conditions this completed result.
- Baconian fallacy – using pieces of historical evidence without the aid of specific methods, hypotheses, or theories in an attempt to make a general truth about the past. Commits historians "to the pursuit of an impossible object by an impracticable method".
- Homunculus fallacy – using a "middle-man" for explanation; this sometimes leads to regressive middle-men. It explains a concept in terms of the concept itself without explaining its real nature (e.g.: explaining thought as something produced by a little thinker – a homunculus – inside the head simply identifies an intermediary actor and does not explain the product or process of thinking).
- Inflation of conflict – arguing that, if experts in a field of knowledge disagree on a certain point within that field, no conclusion can be reached or that the legitimacy of that field of knowledge is questionable.
- If-by-whiskey – an argument that supports both sides of an issue by using terms that are selectively emotionally sensitive.
- Incomplete comparison – insufficient information is provided to make a complete comparison.
- Inconsistent comparison – different methods of comparison are used, leaving a false impression of the whole comparison.
- Intentionality fallacy – the insistence that the ultimate meaning of an expression must be consistent with the intention of the person from whom the communication originated (e.g. a work of fiction that is widely received as a blatant allegory must necessarily not be regarded as such if the author intended it not to be so).
- Lump of labour fallacy – the misconception that there is a fixed amount of work to be done within an economy, which can be distributed to create more or fewer jobs.
- Kettle logic – using multiple, jointly inconsistent arguments to defend a position.
- Ludic fallacy – the belief that the outcomes of non-regulated random occurrences can be encapsulated by a statistic; a failure to take into account that unknown unknowns have a role in determining the probability of events taking place.
- McNamara fallacy (quantitative fallacy) – making a decision based only on quantitative obser-

uations, discounting all other considerations.

- Mind projection fallacy – subjective judgments are "projected" to be inherent properties of an object, rather than being related to personal perceptions of that object.
- Moralistic fallacy – inferring factual conclusions from purely evaluative premises in violation of fact–value distinction. For instance,
  - inferring is from ought is an instance of moralistic fallacy. Moralistic fallacy is the inverse of naturalistic fallacy defined below.
- Moving the goalposts (raising the bar) – argument in which evidence presented in response to a specific claim is dismissed and some other (often greater) evidence is demanded.
- Nirvana fallacy (perfect-solution fallacy) – solutions to problems are rejected because they are not perfect.
- Proof by assertion – a proposition is repeatedly restated regardless of contradiction; sometimes confused with argument from
  - repetition (argumentum ad infinitum, argumentum ad nauseam)
- Prosecutor's fallacy – a low probability of false matches does not mean a low probability of some false match being found.
- Proving too much – an argument that results in an overly-generalized conclusion (e.g.: arguing that drinking alcohol is bad because in some instances it has led to spousal or child abuse).
- Psychologist's fallacy – an observer presupposes the objectivity of their own perspective when analyzing a behavioral event.
- Referential fallacy – assuming all words refer to existing things and that the meaning of words reside within the things they refer to, as opposed to words possibly referring to no real object or that the meaning of words often comes from how they are used.
- Reification (concretism, hypostatization, or the fallacy of misplaced concreteness) – treating an abstract belief or hypothetical construct as if it were a concrete, real event or physical entity (e.g.: saying that evolution selects which traits are passed on to future generations; evolution is not a conscious entity with agency).
- Retrospective determinism – the argument that because an event has occurred under some circumstance, the circumstance must have made its occurrence inevitable.
- Slippery slope (thin edge of the wedge, camel's nose) – asserting that a proposed, relatively small, first action will inevitably lead to a chain of related events resulting in a significant and negative event and, therefore, should not be permitted.
- Special pleading – the arguer attempts to cite something as an exemption to a generally accepted rule or principle without justifying the exemption (e.g.: a defendant who murdered his parents asks for leniency because he is now an orphan).

## **Improper premise**

- Begging the question (petitio principii) – using the conclusion of the argument in support of itself in a premise (e.g.: saying that smoking cigarettes is deadly because cigarettes can kill you; something that kills is deadly).
- Loaded label – while not inherently fallacious, use of evocative terms to support a conclusion is a type of begging the question fallacy. When fallaciously used, the term's connotations are relied on to sway the argument towards a particular conclusion. For example, an organic foods advertisement that says "Organic foods are safe and healthy foods grown without any pesticides, herbicides, or other unhealthy additives." Use of the term "unhealthy additives" is used as support for the idea that the product is safe.

- Circular reasoning (circulus in demonstrando) – the reasoner begins with what he or she is trying to end up with (e.g.: all bachelors are unmarried males).
- Fallacy of many questions (complex question, fallacy of presuppositions, loaded question, plurium interrogationum) – someone asks a question that presupposes something that has not been proven or accepted by all the people involved. This fallacy is often used rhetorically so that the question limits direct replies to those that serve the questioner's agenda.

### Argument Forms Substitution-Instances

Since the statements of the propositional calculus are propositions, they can be combined to form logical arguments, complete with one or more premises and a single conclusion that may follow validly from them. Thus, for example, each of the following is an argument expressed in the language of symbolic logic:

$A \supset B$	$(D \cdot B) \supset \sim E$	$(A \vee E) \supset (D \equiv B)$
A	$D \cdot B$	$A \vee E$
B	$\sim E$	$D \equiv B$

What is more, notice that all three of these arguments share a common structure: the first premise of each is a  $\supset$  statement; the second premise is the antecedent of that statement; and the conclusion is its consequent. We can exhibit this common structure more clearly by using statement variables to express the argument form involved:

$$p \supset q$$

$$p$$

Each of the three arguments above is a substitution instance of this argument form, since each of them results from the substitution of an appropriate (simple or compound) statement for each of the statement variables in the argument form. Notice that these substitutions must be consistent in each application; once we've put  $D \cdot B$  in the place of  $p$  in the first premise of the second argument, for example, we must also put it in the place of  $p$  in the second premise. In the same way, the first and third arguments above—along with indefinitely many others—can be shown to be substitution-instances of the same argument form. Most arguments are substitution-instances of several distinct argument forms, each of which can be no more complex in structure than the argument itself.

### Testing for Validity

Recognizing individual arguments as substitution-instances of more general argument forms is an important skill because, as we've already seen, the validity of any argument depends solely upon its logical form. An argument in the propositional calculus is valid whenever it is a substitution-instance of an argument form in which it is impossible for the premises to be true and the conclusion false. Since the argument form reliably leads from premises of a certain general structure to a conclusion of a different structure, every substitution-instance of that argument form must express a valid argument.

Thus, the same truth-tables we used to define the statement connectives provide an effective decision procedure for determining the validity of arguments in the propositional calculus. We simply chart the truth-values of each premise and the conclusion of an argument form for every possible

combination of truth-values for the statement variables involved, and look to see what happens on those lines of the truth-table in which all of the premises are true. If the conclusion is also true on each of these lines, then the inference captured by the argument form is a valid one, and arguments of this form must all be valid. If, however, there is even a single line on which all of the premises are true but the conclusion is false, then the inference is invalid, and we cannot be sure whether arguments of this form are valid or invalid. (They certainly are not valid because of this form, but of course some of them may happen to be substitution-instances of other argument forms whose inferences are valid.)

## Modus Ponens

Consider, for example, what happens when we construct a truth-table that lists each of the four combinations of truth-values that the component statements could exhibit in the simple argument form that we identified at the top of this page.

$p \supset q$   
 $p$   
 $q$

		1st Premise	2nd Premise	Conclusion
$p$	$q$	$p \supset q$	$p$	$q$
T	T	T	T	T
T	F	F	T	F
F	T	T	F	T
F	F	T	F	F

This truth-table shows that (no matter what statements we substitute for  $p$  and  $q$ ) both of the premises of the argument will be true only on the first line (when both component statements are true). But on that line, the conclusion is also true, so the inference is valid. Whenever we come across an argument that shares this basic structure, we can be perfectly certain of its logical validity. In fact, arguments of this form are so common that the form itself has a name, Modus Ponens, which we will usually abbreviate as M.P.

On the other hand, consider what happens when we construct a truth-table for testing the validity of a distinct, though superficially similar, argument form:

$p \supset q$   
 $q$   
 $p$

		1st Premise	2nd Premise	Conclusion
$p$	$q$	$p \supset q$	$q$	$p$
T	T	T	T	T
T	F	F	F	T
F	T	T	T	F
F	F	T	F	F

In arguments of this form, both premises are true on the first and on the third lines of the truth-table. While the conclusion is true on the first line, on the third line it is false. Since it is therefore possible for the premises to be true while the conclusion is false, the inference is invalid. This unreliable argument form is called the fallacy of affirming the consequent. Although it might be mistaken for M.P. at a casual glance, the fallacy—unlike its valid cousin—does not guarantee the truth of its conclusion.

## Modus Tollens

Another common argument form with a valid inference is Modus Tollens (abbreviated as M.T.), which has the form:

$p \supset q$   
 $\sim q$   
 $\sim p$

		1st Premise	2nd Premise	Conclusion
<b>p</b>	<b>q</b>	<b><math>p \supset q</math></b>	<b><math>\sim q</math></b>	<b><math>\sim p</math></b>
<b>T</b>	<b>T</b>	<b>T</b>	<b>F</b>	<b>F</b>
<b>T</b>	<b>F</b>	<b>F</b>	<b>T</b>	<b>F</b>
<b>F</b>	<b>T</b>	<b>T</b>	<b>F</b>	<b>T</b>
<b>F</b>	<b>F</b>	<b>T</b>	<b>T</b>	<b>T</b>

As the truth-table shows, the premises are true only when both of the component statements are false, in which case the conclusion is also true. There is no line on which both premises are true and the conclusion false, so the inference is valid, as are all substitution-instances of this argument form.

As with M.P., there is an argument form superficially similar to M.T. that yields entirely different results.

$p \supset q$   
 $\sim p$   
 $\sim q$

		1st Premise	2nd Premise	Conclusion
<b>p</b>	<b>q</b>	<b><math>p \supset q</math></b>	<b><math>\sim p</math></b>	<b><math>\sim q</math></b>
<b>T</b>	<b>T</b>	<b>T</b>	<b>F</b>	<b>F</b>
<b>T</b>	<b>F</b>	<b>F</b>	<b>F</b>	<b>T</b>
<b>F</b>	<b>T</b>	<b>T</b>	<b>T</b>	<b>F</b>
<b>F</b>	<b>F</b>	<b>T</b>	<b>T</b>	<b>T</b>

This is the fallacy of denying the antecedent. As the truth-table to the right clearly shows, it is an unreliable inference, since it is possible (on the third line) for both of its premises to be true while its conclusion is false. Substitution-instances of this argument form may not be valid.

## Hypothetical Syllogism

			1st Premise	2nd Premise	Conclusion
<b>p</b>	<b>q</b>	<b>r</b>	<b><math>p \supset q</math></b>	<b><math>q \supset r</math></b>	<b><math>p \supset r</math></b>
<b>T</b>	<b>T</b>	<b>T</b>	<b>T</b>	<b>T</b>	<b>T</b>
<b>T</b>	<b>T</b>	<b>F</b>	<b>T</b>	<b>F</b>	<b>F</b>
<b>T</b>	<b>F</b>	<b>T</b>	<b>F</b>	<b>T</b>	<b>T</b>
<b>T</b>	<b>F</b>	<b>F</b>	<b>F</b>	<b>T</b>	<b>F</b>
<b>F</b>	<b>T</b>	<b>T</b>	<b>T</b>	<b>T</b>	<b>T</b>
<b>F</b>	<b>T</b>	<b>F</b>	<b>T</b>	<b>F</b>	<b>T</b>
<b>F</b>	<b>F</b>	<b>T</b>	<b>T</b>	<b>T</b>	<b>T</b>
<b>F</b>	<b>F</b>	<b>F</b>	<b>T</b>	<b>T</b>	<b>T</b>

A larger truth-table is required to demonstrate the validity of the argument form called Hypothetical Syllogism (H.S.), since it involves three statement variables instead of two, and we must consider all eight of the possible combinations of their truth-values:

**$p \supset q$**

**$q \supset r$**

**$p \supset r$**

Despite its greater size, this truth-table establishes validity in exactly the same way as its more compact predecessors: both premises are true only on the first, fifth, seventh, and eighth lines, and the conclusion is also true on each of these lines. It follows that all arguments sharing in this general form must be valid.

## Disjunctive Syllogism

Finally, consider the argument form known as Disjunctive Syllogism or D.S.

$p \vee q$

$\sim p$

Q

		1st Premise	2nd Premise	Conclusion
<b>p</b>	<b>q</b>	<b><math>p \vee q</math></b>	<b><math>\sim p</math></b>	<b>q</b>
<b>T</b>	<b>T</b>	<b>T</b>	<b>F</b>	<b>T</b>
<b>T</b>	<b>F</b>	<b>T</b>	<b>F</b>	<b>F</b>
<b>F</b>	<b>T</b>	<b>T</b>	<b>T</b>	<b>T</b>
<b>F</b>	<b>F</b>	<b>F</b>	<b>T</b>	<b>F</b>

The truth-table demonstration of its validity should look familiar by now. Whenever the premises are true (on the third line of the truth table), so is the conclusion.

Once again, however, there is a similar form that embodies an invalid inference, the fallacy of affirming the alternative:

$p \vee q$

p

$\sim q$

		1st Premise	2nd Premise	Conclusion
<b>p</b>	<b>q</b>	<b><math>p \vee q</math></b>	<b>p</b>	<b><math>\sim q</math></b>
<b>T</b>	<b>T</b>	<b>T</b>	<b>T</b>	<b>F</b>
<b>T</b>	<b>F</b>	<b>T</b>	<b>T</b>	<b>T</b>
<b>F</b>	<b>T</b>	<b>T</b>	<b>F</b>	<b>F</b>
<b>F</b>	<b>F</b>	<b>F</b>	<b>F</b>	<b>T</b>

In this case, the first line of the truth-table shows that (with our inclusive sense of the  $\vee$ ) it is possible for the premises to be true and the conclusion false.

## Axiomatic systems

In mathematics and set theory, an **axiomatic system** is any set of specified axioms from which some or all of those axioms can be used, in conjunction along with derivation rules or procedures, to logically derive theorems. A mathematical theory or set theory consists of an axiomatic system and all its derived theorems. An axiomatic system that is completely described is a special kind of formal system; usually, however, the effort towards complete formalization brings diminishing returns in certainty and a lack of readability for humans. Therefore discussion of axiomatic systems is normally only semi-formal. A **formal theory** typically means an axiomatic system, for example formulated within model theory. A **formal proof** is a complete rendition of a mathematical or set-

theoretical proof within a formal system.

## Properties

An axiomatic system is said to be consistent if it lacks contradiction (i.e. it is not possible to derive both a statement and its negation from the system's axioms).

In an axiomatic system, an axiom is called independent if it is not a theorem that can be derived from other axioms in the system. A system will be called independent if each of its underlying axioms is independent.

The most important criterion for assessment of an axiomatic system is that particular system's consistency. Inconsistency in an axiomatic system is universally regarded as being a fatal flaw for that system. Independence is also a desirable property, but its lack is not a fatal flaw. Lack of independence means that the system has redundancy in its axioms, meaning that one or more of its axioms is not needed. This is usually considered to be a flaw because reducing the number of axioms of a system to the minimum necessary for deriving all the needed or desired theorems of that system is considered to be a virtue, because axioms are unproved and unprovable; having as little of that as possible means that as few unproved assumptions as possible are being made in that system.

An axiomatic system will be called complete if for every statement, either itself or its negation, is derivable in that system. This is very difficult to achieve, however, and as shown by the combined works of Gödel and Coen, impossible for axiomatic systems involving infinite sets. So, along with consistency, relative consistency is also the mark of a worthwhile axiom system. This occurs when the undefined terms of a first axiom system are given definitions from a second, such that the axioms of the first are theorems of the second.

A good example is the relative consistency of neutral geometry, or absolute geometry, with respect to the theory of the real number system. Lines and points are undefined terms in absolute geometry, but assigned meanings in the theory of real numbers in a way that is consistent with both axiom systems.

## Models

A model for an axiomatic system is a well-defined set, which assigns meaning for the undefined terms presented in the system, in a manner that is correct with the relations defined in the system. The existence of a concrete model proves the consistency of a system.

A model is called concrete if the meanings assigned are objects and relations from the real world, as opposed to an abstract model which is based on other axiomatic systems. The first axiomatic system was Euclidean geometry.

Models can also be used to show the independence of an axiom in the system. By constructing a valid model for a subsystem without a specific axiom, we show that the omitted axiom is independent if its correctness does not necessarily follow from the subsystem.

Two models are said to be isomorphic if a one-to-one correspondence can be found between their elements, in a manner that preserves their relationship. An axiomatic system for which every model is isomorphic to another is called categorial (sometimes categorical), and the property of categori-

ality (categoricity) ensures the completeness of a system.

## **Axiomatic method**

The **axiomatic method** is often discussed as if it were a unitary approach, or uniform procedure. With the example of Euclid to appeal to, it was indeed treated that way for many centuries. Up until the beginning of the nineteenth century it was generally assumed in European mathematics and philosophy (for example in Spinoza's work) that the heritage of Greek mathematics represented the highest standard of intellectual finish (development more geometrico, in the style of the geometers). That approach, in which axioms were supposed to be self-evident and thus indisputable, was swept away during the course of the nineteenth century. One important episode in this was the development of Non-Euclidean geometry, based on denial of Euclid's parallel postulate (or axiom). It was found that consistent geometries can be constructed by denying that postulate, taking as an axiom that more than one parallel to a given line can be drawn through a point outside that line, or a different axiom that no parallel can be drawn—both of those result in different and consistent geometric systems that may or may not be applicable to an experienced world.

Other challenges to the supposed self-evidence of axioms came from the foundations of real analysis, from Georg Cantor's set theory, and from the failure of Frege's work on foundations. Russell was able to derive a paradox—a kind of contradiction—from Frege's axioms for set theory, thus showing that Frege's axiomatic system was not consistent, and this showed that the supposed self-evidence of Frege's axioms was mistaken.

Another challenge came from David Hilbert's 'new' use of axiomatic method as a research tool. For example, group theory was first put on an axiomatic basis towards the end of that century. Once the axioms were clarified (that inverse elements should be required, for example), the subject could proceed autonomously without reference to the transformation group's origins of those studies.

Therefore, there are at least three 'modes' of axiomatic method current in mathematics, and in the fields it influences. In caricature, possible attitudes are:

1. Accept my axioms and you must accept their consequences;
2. I reject one of your axioms and accept extra models;
3. My set of axioms defines a research program.

The first case is the classic deductive method. The second goes by the slogan be wise, generalise; it may go along with the assumption that concepts can or should be expressed at some intrinsic 'natural level of generality'. The third was very prominent in the mathematics of the twentieth century, in particular in subjects based around homological algebra.

It is easy to see that the axiomatic method has limitations outside mathematics and set theory. For example, in political philosophy axioms that lead to unacceptable conclusions are likely to be rejected wholesale; so that no one really assents to version 1 above.

## **Axiomatic systems in science**

Historically, the most important purpose of an axiom system was to reach an overview of some science or part of science. Euclid succeeded in doing that for geometry. Beyond its successful use

in set theory and mathematics, there have been attempts to use the axiomatic method in physics (by Ludwig Boltzmann, Heinrich Hertz, and some members of the Vienna Circle), biology (by J. H. Woodger), quantum mechanics (by Günther Ludwig), and possibly other sciences.

Those attempts have been at best only partly successful. If such efforts at axiomatization for sciences were to be successful, this would make it possible to study these sciences simply by drawing logical inferences from the axioms, without needing any new empirical input. When conclusions are drawn from general scientific laws or principles that method is in fact employed, empirical testing of such theoretical derivations is still always needed. Thus, the axiomatization and formalization of the system is incomplete and does not solve the problem of whether the system yields actual scientific knowledge.

## Consistency

A set of statements is logically consistent if they can all be true at the same time. A set of statements is logically inconsistent if they cannot all be true at the same time. It may also be helpful to think of logical consistency as a set of beliefs that do not contradict each other (regardless of whether they are true). When evaluating logical consistency, assume the statements are true and think about whether they fit together like the pieces of a puzzle. That is, consistency is about understanding the relationships between your beliefs, not proving a belief true.

Logic is concerned with the consistency of sets of sentences (used to represent beliefs) and with consistent outcomes to processing logical formulae containing operands and operatives. A set of sentences is said to be **consistent** if and only if **there is at least one possible situation in which they are all true**. So, the following set of sentences is consistent:

1. Grass is green.
2. It is not the case that the moon is green.
3. Most humans have ten fingers.
4. Grasshoppers have six legs and dogs have four.
5. Earth is a cube.

Note that not all of the sentences are true (sentence 5). However, if the Earth were a cube, it need not be that any of the other sentences are false. There is a possible situation in which they are all true. In this way, logicians are not interested as such in the actual **truth value** of a sentence (whether it is in fact true or false), but more in a sentence's possible truth values.

## Consider the following English sentences:

1. The moon is entirely constituted from cheese.
2. The moon is only partly constituted from cheese.

There is no possible situation in which 1 and 2 are both true, that is to say, it is impossible for them both to be true at the same moment. Such a pair of sentences are said to be inconsistent. A set of sentences is said to be **inconsistent** if there is **no possible situation in which they are all true**.

A set of sentences may consist of only one sentence. In which case, if there is a possible situation in which that sentence is true, the sentence is said to be consistent. If there is no such situation, the sentence is said to be inconsistent.

For example, "grass is green" and "snow is blue" are examples of consistent sentences (and the set containing them and only them is consistent). The sentences "grass is green" and "grass is blue" (when taken individually) are consistent sentences, but any set containing them both is inconsistent. The sentence "2+2=5" is inconsistent. There is no situation in which it is true. If two sentences cannot be both true and cannot be both false, they are said to be **contradictory**. For example, "Socrates was a philosopher" and "Socrates was not a philosopher" are contradictory statements. If two sentences cannot be both true at the same time (form an inconsistent set), they are said to be contrary. For example, "I have exactly 10 fingers" and "I have exactly 9 fingers" are contrary (both statements cannot be true, but both could be false). All contradictory statements are contrary.

## Completeness

The term **complete** with respect to meta-logic is used to describe a system of logic for which every logical implication in that system is provable. In other words, if something true can be expressed in that system, it is provable in that system.

Formally, a logic is complete when for every  $\Gamma \subset \varphi$ , it is also true that  $\Gamma \vdash \varphi$ . A complete logical system leaves no logical truth that can be formulated within it unprovable, or undecidable. For instance, a system of number theory for the natural numbers, which contains the language elements needed to express  $2 + 2 = 4$ , but cannot be used to express  $2 + 2 = 4$  is incomplete.

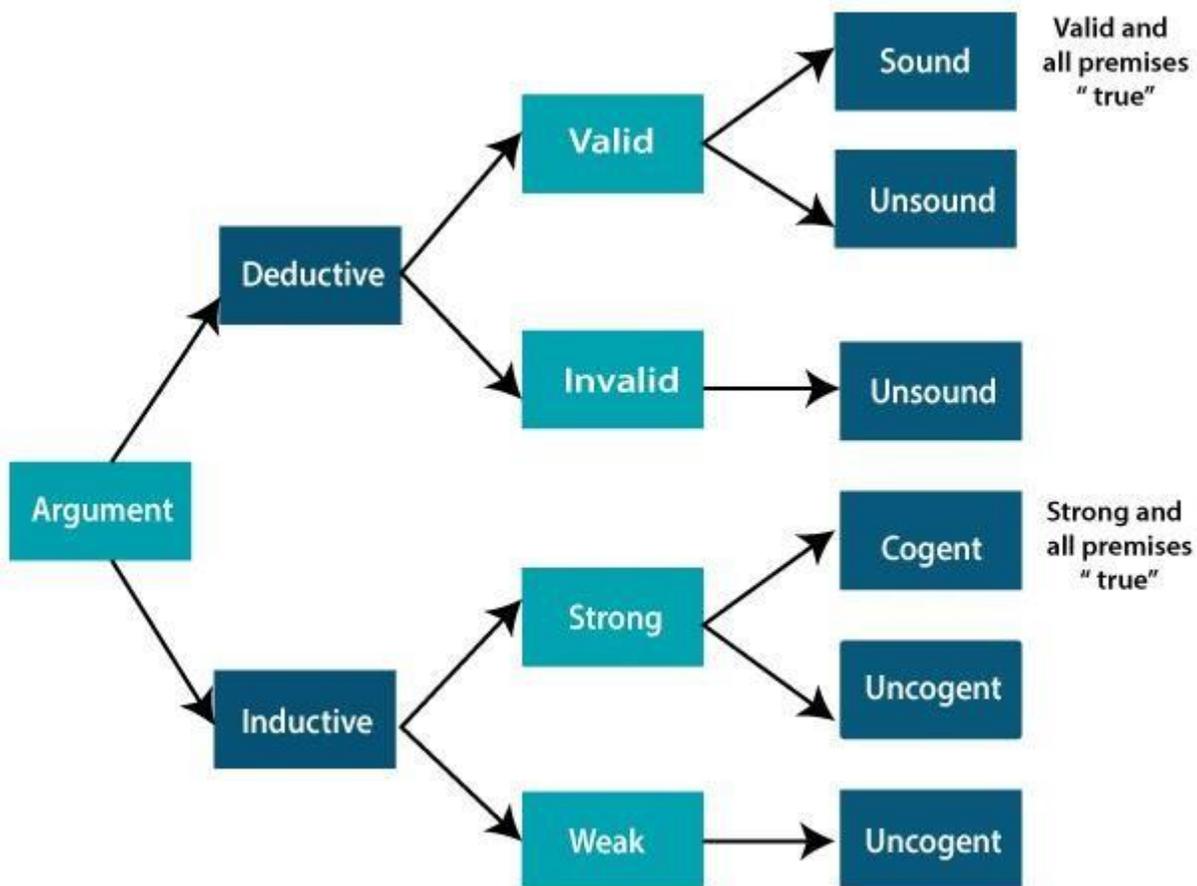

Completeness is an important property of a logical system, but unlike soundness, it is not necessary for a logical system to be complete to be useful. For example, second-order logic is sound but not complete. Kurt Gödel famously provided incompleteness theorems for systems of mathematical logic.

## Difference between Inductive and Deductive reasoning

Reasoning in artificial intelligence has two important forms, Inductive reasoning, and Deductive reasoning. Both reasoning forms have premises and conclusions, but both reasoning are contradictory to each other. Following is a list for comparison between inductive and deductive reasoning:

- Deductive reasoning uses available facts, information, or knowledge to deduce a valid conclusion, whereas inductive reasoning involves making a generalization from specific facts, and observations.
- Deductive reasoning uses a top-down approach, whereas inductive reasoning uses a bottom-up approach.
- Deductive reasoning moves from generalized statement to a valid conclusion, whereas Inductive reasoning moves from specific observation to a generalization.
- In deductive reasoning, the conclusions are certain, whereas, in Inductive reasoning, the conclusions are probabilistic.
- Deductive arguments can be valid or invalid, which means if premises are true, the conclusion must be true, whereas inductive argument can be strong or weak, which means conclusion may be false even if premises are true.

The differences between inductive and deductive can be explained using the below diagram on the basis of arguments:

## Comparison Chart:

Basis for Comparison	Deductive Reasoning	Inductive Reasoning
<b>Definition</b>	Deductive reasoning is the form of valid reasoning, to deduce new information or conclusion from known related facts and information.	Inductive reasoning arrives at a conclusion by the process of generalization using specific facts or data.
<b>Approach</b>	Deductive reasoning follows a top-down approach.	Inductive reasoning follows a bottom-up approach.
<b>Starts from</b>	Deductive reasoning starts from Premises.	Inductive reasoning starts from the Conclusion.
<b>Validity</b>	In deductive reasoning conclusion must be true if the premises are true.	In inductive reasoning, the truth of premises does not guarantee the truth of conclusions.
<b>Usage</b>	Use of deductive reasoning is difficult, as we need facts which must be true.	Use of inductive reasoning is fast and easy, as we need evidence instead of true facts. We often use it in our daily life.
<b>Process</b>	Theory → hypothesis → patterns → confirmation.	Observations → patterns → hypothesis → Theory.
<b>Argument</b>	In deductive reasoning, arguments may be valid or invalid.	In inductive reasoning, arguments may be weak or strong.
<b>Structure</b>	Deductive reasoning reaches from general facts to specific facts.	Inductive reasoning reaches from specific facts to general facts.

# MCQs

1. Logic is a----- science
  - a) Positive science
  - b) Normative science
  - c) Descriptive science
  - d) None of these
  
2. Logic is the Science of -----
  - a) Plants
  - b) Thought
  - c) Wealth
  - d) Society
  
3. In Symbolic logic,\_\_\_\_\_do not change their value.
  - a) Constants
  - b) Negation
  - c) Variables
  - d) Inference
  
4. In\_\_\_\_\_proposition, two simplepropositions are combined by 'either-- or'.
  - a) Disjunctive c
  - b) Negative
  - c) Conjunctive
  - d) Implication
  
5. 'Socrates is a Philosopher' is a ----- proposition
  - a) Compound
  - b) Simple
  - c) General
  - d) None of these
  
6. 'If it is raining then the ground will be wet' is an example of \_\_\_\_\_.
  - a) Negation
  - b) Conjunction
  - c) Disjunction
  - d) Implication
  
7. A curl is also called\_\_\_\_\_.
  - a) Tilde

- b) Dot
- c) Wedge
- d) Horseshoe

8. 'If p, then q and r' is symbolized as-.

- a)  $p \cdot (q \cdot r)$
- b)  $(p \cdot q) \cdot r$
- c)  $(\sim p \cdot q) \cdot r$
- d)  $p \supset (q \cdot r)$

9. 'Ram is tall and Das is short' is an example of proposition

- a) Compound
- b) Simple
- c) General
- d) None of these

10. Symbolic expression of 'p implies q' is

- a)  $p \cdot q$
- b)  $p \vee q$
- c)  $p \supset q$
- d)  $p \equiv q$  Answers: 1-10

1 b 2 b 3 a 4 a 5 b 6 d 7 a 8 d 9 a 10c

11 changes its value from argument to argument.

- a) Variable
- b) Constant
- c) both (a) and (b)
- d) None of these

12. Wedge symbol denotes \_\_\_\_\_ function.

- a) Negation
- b) Conjunction
- c) Disjunction
- d) Implication

13 symbol stands for 'if --then' relationship.

- a)  $\cdot$
- b)  $\supset$
- c)  $\vee$
- d)  $\sim$

14. In the compound statement ' $p \supset q$ ', 'p' and 'q' are.

- a) Constants
- b) Bi conditionals

- c) Variables
  - d) None of these
15. 'Raju is not honest' is an example of a \_\_\_\_ proposition.
- a) Bi conditional
  - b) Conjunctive
  - c) Disjunctive
  - d) Negative
16. The known propositions in an inference is called
- a) Conclusion
  - b) Predicate
  - c) Premises
  - d) None of these
17. The composite proposition formed by the combination of two or more simple propositions using 'If Then' is called.
- a) Disjunction
  - b) Implication
  - c) Conjunction
  - d) None of these
18. '~' is \_\_\_\_\_ symbol
- a) Disjunction
  - b) Implication
  - c) Negation
  - d) None of these
19. In conjunctive propositions, two simple propositions are joined by the word \_\_\_\_.
- a) Either – or
  - b) And
  - c) If -- then
  - d) Either – or
20. The language used with the purpose of giving information is called --- function of language
- a) Expressive
  - b) Informative
  - c) Directive
  - d) None of these

Answers: 11-20  
 11 a 12 c 13 b 14 c 15 d 16 b 17 b 18 c  
 19 b 20 b

21. 'Logic is the study of correct reasoning' is an example for ----function of language
- a) Informative

- b) Expressive
  - c) Directive
  - d) None of these
22. By using \_\_\_\_\_, the logical form of an argument becomes explicit.
- a) Truth tables
  - b) Truth values
  - c) Symbols
  - d) None of these
23. The constant symbol ' ' stands for \_\_. v
- a) Disjunction
  - b) Implication
  - c) Negation
  - d) None of these
24. The use of language for expressing one's feelings and emotions and thoughts are called ----
- a) Informative
  - b) Expressive
  - c) Directive
  - d) None of these
25. 'That is really great' is an example of use of language
- a) Informative
  - b) Expressive
  - c) Directive
  - d) None of these
26. The use of language that seeks for guide or to command is function of language
- a) Expressive
  - b) Informative
  - c) Directive
  - d) None of these
27. 'Shut the door' is an example of ----- function of language
- a) Informative
  - b) Expressive
  - c) Directive
  - d) None of these
28. By using \_\_\_\_\_, the validity of an argument can be determined more accurately.
- a) Numbers
  - b) linguistic expressions
  - c) Symbols

d) all these

29. The new proposition derived from premises in an Inference is called

- a) Premises
- b) Conclusion
- c) Copula
- d) Predicate

30. A compound proposition in which simple propositions are combined using 'and' is called

- a) Bi conditionals
- b) Disjunction
- c) Conjunction
- d) None of these

Answers: 21-30

21 a 22 c 23 a 24 b 25 b 26 c 27 c 28 c

29 b 30 c

31. 'p q' is a \_\_\_\_\_ proposition. v

- a) Disjunction
- b) Implication
- c) Negation
- d) None of these

32. \_\_\_\_\_ is an important work of Russell in collaboration with Whitehead that introduced symbolic logic.

- a) Principia Mathematica
- b) Language, Truth and Logic,
- c) Philosophical Investigations
- d) none of these

33. 'The Mathematical Analysis of Logic' is the work of ----

- a) Whitehead
- b) A J Ayer
- c) Russell
- d) George Boole

34. 'An Investigation of the Laws of Thought' is the work of ----

- a) George Boole
- b) A J Ayer
- c) Russell
- d) Whitehead

35. In collaboration with A.N. Whitehead, published Principia Mathematica

- a) Whitehead
- b) A J Ayer

- c) Russell
- d) George Boole

36. \_\_\_\_\_ is a truth-functional connective.

- a) Dot
- b) Wedge
- c) Horseshoe
- d) All these

37. The symbol for conjunction is -----

- a) Dot
- b) Wedge
- c) Horseshoe
- d) All these

38. The 'If' part in a Hypothetical proposition is called

- a) Alternative
- b) Consequence
- c) Antecedent
- d) None of these

39. The Dot symbol stands for -----

- a) Bi conditionals
- b) Disjunction
- c) Conjunction
- d) None of these

40. The 'Then' part in a Hypothetical proposition is called

- a) Alternative
- b) Consequence
- c) Antecedent
- d) None of these

Answers: 31-40  
 31 a 32 a 33 d 34 a 35 c 36 d 37 a 38 c  
 39 c 40 b

41. \_\_\_\_\_ symbol stands for 'either - or' relationship.

- a)  $\cdot$
- b)  $\supset$
- c)  $\vee$
- d)  $\sim$

42. ' $\equiv$ ' is the symbol for \_\_\_\_\_.

- a) Negation

- b) Conjunction
- c) Implication
- d) None of these

43. 'If a and b, then c' is symbolized as \_\_\_.

- a)  $[(a \cdot b) \supset c]$
- b)  $[a \supset (b \cdot c)]$
- c)  $[(\sim a \supset b) \cdot c]$
- d)  $[(a \supset b) \vee c]$

44. 'You will pass the exam only if you work hard' is symbolized as \_.

- a)  $P \supset W$
- b)  $P \cdot W$
- c)  $P \vee W$
- d) None of these

45. \_\_\_\_\_ symbol stands for 'if and only if' relationship.

- a)  $\cdot$
- b)  $\supset$
- c)  $\vee$
- d)  $\equiv$

46.  $p \cdot q$  is the symbolic expression of

- a) Either p or q
- b) p implies q
- c) p and q
- d) p if and only if q

47. The horseshoe symbol indicates ----- function

- a) Negation
- b) Conjunction
- c) Implication
- d) Material equivalence

48. 'Ram and Dinesh will not both be elected' is symbolized as

- a).  $(R \cdot D)$
- b).  $(\sim R \cdot D)$
- c).  $\sim (R \cdot D)$
- d).  $(\sim R \cdot \sim D)$

49. 'Either Alice or Betty will be elected' is symbolized as

- a)  $A \cdot B$
- b)  $A \vee B$
- c)  $A \equiv B$

d)  $A \supset B$

50. 'Neither Alice nor Betty will be elected' is symbolized as

a)  $\sim (A \cdot B)$

b)  $\sim (A \vee B)$

c)  $(A \equiv B)$

d)  $\sim (A \supset B)$  Answers: 41-50

41 c 42 d 43 a 44 a 45 d 46 c 47 c 48 c

49 b 50 b

51. 'Ram is not honest' is symbolized as ---

a)  $\sim R$

b)  $R$

c)  $R \cdot H$

d)  $R \supset H$

52. 'Anu is short and Balu is tall' is symbolized as ---

a)  $A \vee B$

b)  $A \cdot B$

c)  $A \equiv B$

d)  $A \supset B$

53. ' $\sim \sim$ ' is the symbol for \_\_\_\_\_.

a) Bi conditionals

b) Disjunction

c) Double Negation

d) None of these

54. 'Anu is not short and Balu is not tall' is symbolized as ---

a)  $A \vee B$

b)  $A \cdot B$

c)  $\sim A \cdot \sim B$

d) None of these

55. 'p and negation q' is symbolized as

a)  $p \vee \sim q$

b)  $p \cdot q$

c)  $p \supset \sim q$

d)  $p \cdot \sim q$

56. In Conjunction the word ----- is used to conjoin statements

a) Either or

b) And

- c) If ---Then
- d) None of these

57. Conjunction is a \_\_\_\_\_ statement

- a) Simple
- b) Compound
- c) General
- d) None of these

58. \_\_\_\_\_ symbol is used to form an implicative statement.

- a) Horseshoe
- b) Wedge
- c) Dot
- d) None of these

59. 'Ram and Dinesh will both not be elected' is symbolized as

- a)  $R \cdot D$
- b)  $(\sim R \cdot D)$
- c)  $\sim(R \cdot D)$
- d)  $(\sim R) \cdot (\sim D)$

60. Disjunction is a compound proposition in which the word is used to connect statements.

- a) Either or
- b) And
- c) If -- Then
- d) None of these

Answers: 51-60

51 a 52 b 53 c 54 c 55 d 56 b 57 c 58 a

59 d 60 a

61. 'If Raju attend the class, then Damu will not attend the class' can be symbolized as ----

- a)  $\sim (R \cdot D)$
- b)  $\sim (R \vee D)$
- c)  $(\sim R \supset D)$
- d)  $R \supset \sim D$

62. The word 'And' is used in -----

- a) Negation
- b) Conjunction
- c) Implication
- d) Material equivalence

63. In Conjunction, if p is false and q is true  $p \cdot q$  is -----

- a) True

- b) False
  - c) Cannot be determined
  - d) None of these
64. The statement form  $p \vee \sim p$  is a
- a) Tautology
  - b) Contingent
  - c) Contradictory
  - d) None of these
65. In implication, if p is true and q is false  $p \supset q$  is -----
- a) True
  - b) False
  - c) Cannot be determined
  - d) None of these
66. The statement form  $p \cdot \sim p$  is a ---
- a) Tautology
  - b) Contingent
  - c) Contradictory
  - d) None of these
67. In Disjunction, if p is false and q is false  $p \vee q$  is -----
- a) False
  - b) True
  - c) Cannot be determined
  - d) None of these
68. The statement form  $p \cdot q$  is a ---
- a) Tautology
  - b) Contingent
  - c) Contradictory
  - d) None of these
69. In Conjunction, if p is true and q is true  $p \cdot q$  is -----
- a) True
  - b) False
  - c) Cannot be determined
  - d) None of these
70. The truth value of a false statement is -----
- a) True
  - b) False
  - c) Cannot be determined

d) None of these Answers: 61-70

61 d 62 b 63 b 64 a 65 b 66 c 67 a 68  
b 69 a 70 b

71. In implication, if p is false and q is false,  $p \supset q$  is -----

- a) True
- b) False
- c) Cannot be determined
- d) None of these

72. The truth value of a true statement is -----

- a) False
- b) True
- c) Cannot be determined
- d) None of these

73. In Disjunction, if p is true and q is false,  $p \vee q$  is -----

- a) False
- b) True
- c) Cannot be determined
- d) None of these

74. The specific form of the statement  $B \vee \sim B$  is ----

- a) p
- b)  $p \vee \sim p$
- c) Cannot be determined
- d) None of these

75. In Conjunction if p is true and q is false,  $p \cdot q$  is -----

- a) True
- b) False
- c) Cannot be determined
- d) None of these

76. The specific form of the statement  $A \supset (B \vee C)$  is ----

- a) p
- b)  $p \supset q$
- c)  $p \supset (q \vee r)$
- d) None of these

77. In implication, if p is false and q is true,  $p \supset q$  is -----

- a) True
- b) False

- c) Cannot be determined
- d) None of these

78. Which of the following is the substitution instance of the statement form  $p \cdot \sim p$

- a)  $C \vee \sim C$
- b)  $C \cdot \sim C$
- c)  $C \supset \sim C$
- d) None of these

79. In Disjunction, if p is false and q is true,  $p \vee q$  is -----

- a) False
- b) True
- c) Cannot be determined
- d) None of these

80. A statement or statement form of the pattern  $p \equiv q$  is called ----

- a) Biconditional
- b) Disjunction
- c) Double Negation
- d) None of these

Answers: 71-80  
 71 a 72 b 73 b 74 b 75 b 76 c 77 a 78  
 b 79 b 80 a

81. In Conjunction if p is false and q is false,  $p \cdot q$  is -----

- a) True
- b) False
- c) Cannot be determined
- d) None of these

82. The statement form  $p \supset \sim p$  is a ----

- a) Tautology
- b) Contingent
- c) Contradictory
- d) None of these

83. In implication if p is true and q is true,  $p \supset q$  is -----

- a) True
- b) False
- c) Cannot be determined
- d) None of these

84. 'If Anil wins his first game, then both Cohen and Das win their first games' is symbolized as ----

- a)  $(A \supset C) \supset D$
- b)  $(A \vee C) \supset D$
- c)  $A \supset (C \cdot D)$
- d) None of these

85. In Disjunction if p is true and q is true,  $p \vee q$  is -----

- a) False
- b) True
- c) Cannot be determined
- d) None of these

86. If A and B are true statements and X and Y are false statements, the truth value of  $(A \vee B) \cdot (X \vee Y)$  is

- a) False
- b) True
- c) Cannot be determined
- d) None of these

87. 'Ramesh is honest and Dinesh is intelligent' is a proposition.

- a) General
- b) Simple
- c) Compound
- d) None of these

88. Which word is used to form the disjunction of two statements?

- a) Either or
- b) And
- c) If -- Then
- d) None of these

89. What is the truth value of a conjunction, if both of its conjuncts are true ?

- a) False
- b) True
- c) Cannot be determined
- d) None of these

90.  $p \cdot q \therefore p$  This rule of inference is known as -----

- a) Modus Ponens
- b) Modus Tollens
- c) Simplification
- d) None of these

Answers: 81-90  
 81 b 82b 83 a 84 c 85 b 86 a 87 c 88 a  
 89 b 90 c

91. The negation of a true statement is ..
- False
  - True
  - Cannot be determined
  - None of these
92. A valid argument with all true premises is termed as      argument
- Cogent
  - Sound
  - Cannot be determined
  - None of these
93. The falsehood of conclusion in an argument does not guarantee the ----- of an argument
- Validity
  - Invalidity
  - Both a and b
  - None of these
94. 'Roses are red and Violets are blue' is a      statement
- Negation
  - Conjunctive
  - Implication
  - Material equivalence
95.      A conjunction is true if both of its conjuncts are -----
- False
  - True
  - Cannot be determined
  - None of these
96. If A and B are true and X and Y are false , then the truth value of the compound statement (A.B) . (X.Y) is -----
- False
  - True
  - Cannot be determined
  - None of these
97. 'Shiv is tall and Ramu is short' is a----- statement
- Simple
  - Compound
  - General
  - None of these

98. 'Roses are red and Violets are not blue' is symbolized as -----

- a)  $R \cdot V$
- b)  $R \cdot \sim V$
- c)  $R \vee V$
- d) None of these

99. If A and B are true and X and Y are false, then the truth value of the compound statement  $A \vee [X \cdot (B \vee Y)]$

- a) False
- b) True
- c) Cannot be determined
- d) None of these

100. If B is true, Y is false, then the truth value of the compound statement  $\sim (B \cdot \sim Y)$  is -----

- a) False
- b) True
- c) Cannot be determined
- d) None of these

Answers: 91-100  
91 a 92 b 93 b 94 b 95 b 96 a 97 a 98  
b 99 b 100 a

101. 'Either P or Q will be selected' is symbolized as

- a)  $P \cdot Q$
- b)  $P \vee Q$
- c)  $P \supset Q$
- d) None of these

102. If A is true, X is false, then the truth value of the compound statement  $\sim (A \vee X)$  is -----

- a) False
- b) True
- c) Cannot be determined
- d) None of these

103. Bi-conditional proposition is a ----- proposition

- a) Implication
- b) Disjunction
- c) Simple
- d) Compound

104. \_\_\_\_\_ symbol is used to connect statements conjunctively.

- a) Horseshoe
- b) Wedge
- c) Tilde

d) None of these

105. Two statements are logically equivalent when their material equivalence is a ----

- a) Contradiction
- b) Contingent
- c) Conjunction
- d) Tautology

106. 'I will go to the cinema if and only if my friend comes with me' is a --- proposition

- a) Implication
- b) Disjunction
- c) Negation
- d) Biconditional

107. The statement form with only false substitution instances is called \_\_\_\_.

- a) Contradiction
- b) Contingent
- c) Conjunction
- d) Tautology

108. Find out the rule used in the following inference.  $p \supset q$  /  $P$  /  $\therefore q$

- a) Modus ponens
- b) Modus Tollens
- c) Disjunctive syllogism
- d) Hypothetical syllogism

109. The statement form with only true substitution instances is called \_\_\_\_.

- a) Contradiction
- b) Contingent
- c) Conjunction
- d) Tautology

110. 'p v q' is false if \_\_\_\_\_.

- a) only p is false
  - b) both p and q are true
  - c) both p and q are false
  - d) None of these
- Answers: 101-110

101 b 102 a 103 d 104 d 105 d 106 d

107 a 108 a 109 d 110 c

111. 'Arjun is honest but Ganesh is sincere' is symbolized as----

- a)  $A \vee G$
- b)  $A \cdot G$

- c)  $A \supset \sim G$
- d) None of these

112. '  $\supset$  ' is the symbol for \_\_\_\_\_.

- a) Negation
- b) Conjunction
- c) Implication
- d) None of these

113. 'If antecedent, then consequent' is a general form of \_\_\_\_.

- a) Implication
- b) Disjunction
- c) Negation
- d) Argument

114. '  $\vee$  ' is the symbol for -----  $\vee$

- a) Implication
- b) Conjunction
- c) Disjunction
- d) None of these

115. The components of a disjunction are called -----

- a) Terms
- b) Disjuncts
- c) Conjuncts
- d) None of these

116. Find the odd one out.

- a) Implication
- b) Disjunction
- c) Negation
- d) Argument

117. The components of conjunction are called\_.

- a) Terms
- b) Disjuncts
- c) Conjuncts
- d) None of these

118. Find out the rule used in the following inference.  $P \therefore p \vee q$

- a) Modus ponens
- b) Addition
- c) Disjunctive syllogism
- d) None of these

119. 'It is not the case that Raju is honest' is a proposition

- a) Atomic
- b) Compound
- c) General
- d) None of these

120. The statement form with both true and false substitution instances is called\_.

- a) Contradiction
- b) Contingent
- c) Conjunction
- d) Tautology

111 b 112 c 113 a 114 c 115 b 116 d

117 c 118 b 119 b 120 b

121. Find out the rule used in the following inference.  $p \vee q, \sim p \therefore q$

- a) Modus ponens
- b) Modus Tollens
- c) Disjunctive syllogism
- d) Hypothetical syllogism

122. Modus Tollens means denying the\_\_.

- a) Antecedent
- b) Consequent
- c) both (a) and (b)
- d) None of these

123. Find out the rule used in the following inference.  $p \supset q, \sim q \therefore \sim p$

- a) Modus ponens
- b) Modus Tollens
- c) Disjunctive syllogism
- d) Hypothetical syllogism

124. 'It is not the case that Ramesh is honest' is symbolised as ----

- a) R
- b)  $\sim R$
- c) R . H
- d) None of these

125. If we can construct a formal proof, the argument is\_\_\_\_\_.

- a) Invalid
- b) False
- c) True
- d) Valid

126. Find out the rule used in the following inference.  $P \supset q \therefore p \supset q$

- a) Modus ponens
- b) Addition
- c) Disjunctive syllogism
- d) Conjunction

127. Modus Ponens means \_\_\_\_\_ the antecedent and the consequent.

- a) Affirming
- b) Constructing
- c) Denying
- d) None of these

128. Name the following valid argument form.  $p \supset q \quad q \supset r \therefore p \supset r$

- a) Modus ponens
- b) Modus Tollens
- c) Disjunctive syllogism
- d) Hypothetical syllogism

129. Compound propositions are also known as.

- a) Negative
- b) Particular
- c) Affirmative
- d) None of these

130. We can construct the formal proof of validity through\_\_\_\_.

- a) Truth tables
  - b) Rules of inference
  - c) Rules of replacement
  - d) both (b) and (c)
- Answers: 121-130

121 c 122 c 123 b 124 b 125 d 126 d

127 a 128 d 129 d 130 d

131. Simple propositions are also known as \_\_\_\_\_ propositions

- a) Affirmative
- b) Universal
- c) General
- d) None of these

132. An argument is valid if and only if it is not possible for all of its premises to be true and its conclusion\_\_\_\_\_.

- a) False
- b) True
- c) Contradictory

d) Tautology

133. Compound propositions are also known as.

- a) Molecular
- b) Atomic
- c) General
- d) None of these

134. In disjunction, two simple propositions are combined by -----

- a) If -- then
- b) And
- c) 'either -- or'.
- d) If and only if

135. Find the odd one out.

- a) Logic
- b) Ethics
- c) Aesthetics
- d) Economics

136 is generally regarded as the science of thought

- a) Logic
- b) Ethics
- c) Aesthetics
- d) None of these

137 is an example for normative science

- a) Economics
- b) Psychology
- c) Physics
- d) Logic

138. \_\_\_\_\_ is the symbolic expression for 'p or q'.

- a)  $p \cdot q$
- b)  $p \vee q$
- c)  $p \supset q$
- d)  $p \cdot \sim q$

139. Disjunction is a----- proposition

- a) Simple
- b) General
- c) Compound
- d) None of these

140. Simple propositions are also known as \_\_\_\_\_ propositions

- a) Molecular
- b) Atomic
- c) General
- d) None of these

131 d 132 a 133 a 134 c 135 d 136 a  
137 d 138 b 139 c 140 b

141. 'v' symbol connects\_\_.

- a) Disjuncts
- b) Conjuncts
- c) Biconditionals
- d) None of these

142 symbol indicates Implication function

- a)  $\cdot$
- b)  $\supset$
- c)  $\vee$
- d)  $\sim$

143. Implication is a----- proposition

- a) Simple
- b) General
- c) Compound
- d) None of these

144. '≡' is the symbol for\_\_\_\_\_.

- a) Material equivalence
- b) affirmation
- c) Implication
- d) None of these

145. \_\_\_\_\_ is a truth-functionalconnective.

- a) Dot
- b) Wedge
- c) Horseshoe
- d) All these

146. Find the odd one out.

- a) Dot
- b) Wedge
- c) Horseshoe
- d) Term

147. \_\_\_\_\_ is the symbolic expression for 'p and negation q'.

- a)  $p \cdot q$
- b)  $p \cdot q$
- c)  $p \vee \sim q$
- d)  $p \sim q \vee \supset$

148. \_\_\_\_\_ is not a truth-functional connective.

- a) Dot
- b) Horseshoe
- c) Wedge
- d) None of these

149. Negation is indicated by \_\_\_\_ symbol.

- a) Tilde
- b) Dot
- c) Horseshoe
- d) Wedge

150. The symbol \_\_\_\_\_ indicates material equivalence.

- a) Tilde
  - b) Three bar
  - c) Horseshoe
  - d) Wedge
- Answers: 141-150

141 a 142 b 143 c 144 a 145 d 146 d

147 c 148 d 149 a 150 b

151. If C is true, Z is false, then the truth value of the compound statement  $(C \supset (Z \sim \supset$

- a) False
- b) True
- c) Cannot be determined
- d) None of these

152. 'John will win the superbowl unless Andrews wins his Championship' is symbolised as ---

- a)  $J \vee A$
- b)  $J \cdot \sim A$
- c)  $J \supset \sim A$
- d) None of these

153. Which one of the following is logically equivalent to 'p'

- a)  $\sim p$
- b)  $\sim \sim p$
- c) Cannot be determined
- d) None of these

154. If A is true, X is false, then the truth value of the compound statement  $(A \cdot \sim X)$

- a) False
- b) True
- c) Cannot be determined
- d) None of these

155. Who introduced into logic the important notion of variable.

- a) Plato
- b) Socrates
- c) Aristotle
- d) None of these

156. 'You will fail in the exam unless you study well' is symbolized as ---

- a)  $F \cdot S$
- b)  $F \vee S$
- c)  $F \cdot \sim S$
- d) None of these

157. If A is true, X is false, then the truth value of the compound statement  $(A \vee \sim X)$

- a) False
- b) True
- c) Cannot be determined
- d) None of these

158. The foundations of logic were laid by \_\_\_\_\_ in the fourth century B.C.

- a) Plato
- b) Socrates
- c) Aristotle
- d) None of these

159. A truth functional argument form is valid, if and only if, the conditional statement of it is a -----

- a) Contradictory
- b) Tautology
- c) Contingent
- d) None of these

160. \_\_\_\_\_ is valid if and only if it has no substitution instances with true premises and false Conclusion

- a) Argument
  - b) Argument form
  - c) Statement
  - d) None of these
- Answers: 151-160

151 b 152 a 153 b 154 b 155 c 156 b  
157 b 158 c 159 b 160 b

161. If A and B are true, X and Y are false , then the truth value of the compound Statement  $[(A \supset B) \cdot (Y \cdot X)]$
- False
  - True
  - Cannot be determined
  - None of these
162. is invalid if and only if it has at least one substitution instance with true premises and False Conclusion
- Argument
  - Argument form
  - Statement
  - None of these
163. A and B are true, X and Y are false , then the truth value of the compound Statement  $[(A \cdot X) \cdot (B \cdot Y)]$
- True
  - False
  - Cannot be determined
  - None of these
164. The truth value of the negation of any true statement is ----
- True
  - False
  - Cannot be determined
  - None of these
165. An argument is valid if and only if the of that argument is a valid argument Form
- Specific form
  - Argument form
  - Statement
  - None of these
166. The truth value of the negation of any false statement is ----
- True
  - False
  - Cannot be determined
  - None of these
167. 'p v q' is false if p is ----- and q is
- True – false
  - False - false
  - false - true

d) None of these

168. 'p  $\supset$  q' is false if p is ----- and q is false

- a) True
- b) False
- c) Cannot be determined
- d) None of these

169. 'p . q' is false if p is ---- q is ----

- a) True - false
- b) False - false
- c) false - true
- d) All of these

170. 'p  $\vee$  q' is true if p is----- and q is --

- a) True - False
  - b) False - True
  - c) True - True
  - d) All of these
- Answers: 161-170

161 a 162 b 163 b 134 b 165 a 166 a  
167 b 168 a 169 d 170 d

171. 'Railways will win the footballcup unless Mohan Bagan wins the football championship'

- a) R . B
- b) R  $\vee$  B
- c) B. R
- d) None of these

172. If B is true, Y is false , then the truth value of the compound statement ( $\sim Y \vee \sim B$ )

- a) True
- b) False
- c) Cannot be determined
- d) None of these

173. A and B are true, X and Y are false , then the truth value of the compound Statement [ ( $\sim A$ .  $\sim X$ ) . (B $\vee$ Y)]

- a) True
- b) False
- c) Cannot be determined
- d) None of these

174. ' p is a sufficient condition for q' is symbolised as ----

- a) p . q

- b)  $p \supset q$
- c)  $q \cdot p$
- d) None of these

175. If A is true, X is false, then the truth value of the compound statement  $(\sim A \vee \sim X)$

- a) True
- b) False
- c) Cannot be determined
- d) None of these

176. The words Truth / Falsity refer to

- a) Arguments
- b) Terms
- c) Copula
- d) None of these

177. 'p only if q' is symbolised as ----

- a)  $p \cdot q$
- b)  $p \supset q$
- c)  $q \cdot p$
- d) None of these

178. If B is true, Y is false, then the truth value of the compound statement  $(\sim B \cdot \sim Y)$

- a) True
- b) False
- c) Cannot be determined
- d) None of these

179. The terms Validity/ Invalidity refers to

- a) Propositions
- b) Terms
- c) Copula
- d) Arguments

180. A and B are true, X and Y are false, then the truth value of the compound Statement  $[(A \vee B) \cdot (X \vee Y)]$

- a) True
  - b) False
  - c) Cannot be determined
  - d) None of these
- Answers: 171-180

171 b 172 a 173 b 174 b 175 a 176 d  
177 b 178 b 179 d 180 b

181. 'Either Railways or Navy will win the Football championship' is symbolised as ---
- $R \cdot N$
  - $R \supset N$
  - $R \vee N$
  - None of these
182. A and B are true, X and Y are false, then the truth value of the compound Statement  $[(A \cdot B) \vee (X \cdot Y)]$
- True
  - False
  - Cannot be determined
  - None of these
183. 'If Tata wins its first game, then Birla or Reliance wins its first game' is symbolised as ---
- $T \cdot (B \supset R)$
  - $T \vee (B \cdot R)$
  - $T \supset (B \vee R)$
  - None of these
184. If A is true, X is false, and P is unknown, then the truth value of the compound statement  $(A \vee \sim X) \vee P$  is
- True
  - False
  - Cannot be determined
  - None of these
185. 'If p then q' is symbolised as ----
- $p \cdot q$
  - $p \supset q$
  - $q \cdot p$
  - None of these
186. Truth / Falsity refers to
- Propositions
  - Terms
  - Copula
  - None of these
187. If A and B are true, X and Y are false, then the truth value of the compound Statement  $[(A \cdot Y) \vee (B \cdot X)]$
- True
  - False
  - Cannot be determined
  - None of these

188 of a statement is defined as that statement form from which the statement results by the substitution of a different simple statement for each different statement variable.

- a) Validity
- b) Inference
- c) Specific form
- d) None of these

189. Validity/ Invalidity refers to

- a) Propositions
- b) Terms
- c) Copula
- d) None of these

190.  $(p \supset q)$  is an example for ---statement forms

- a) Contradictory
  - b) Tautology
  - c) Contingent
  - d) None of these
- Answers: 181-190

181 c 182 a 183 c 184 a 185 b 186 a  
187 b 188 c 189 d 190 c

191. A and B are true, X and Y are false, then the truth value of the compound Statement  $[(A \cdot X) \vee (B \cdot Y)]$

- a) True
- b) False
- c) Cannot be determined
- d) None of these

192. The specific form of the given statement  $W \cdot \sim W$  is ----

- a)  $p \cdot \sim q$
- b)  $p \cdot \sim p$
- c) Cannot be determined
- d) None of these

193. If A is true, X is false, and P is unknown, then the truth value of the compound statement  $(\sim A \cdot X) \cdot P$  is

- a) True
- b) False
- c) Cannot be determined
- d) None of these

194. Find out the odd one

- a) Modus ponens

- b) Argument
- c) Simplification
- d) Addition

195. The specific form of the given statement  $L \supset W$  is ----

- a)  $p \vee q$
- b)  $q \cdot p$
- c)  $p \supset q$
- d) None of these

196. If A is true, X is false, and P is unknown, then the truth value of the compound statement  $P \supset (A \vee X)$  is

- a) False
- b) True
- c) Cannot be determined
- d) None of these

197. An argument is proved invalid by displaying at least one row of its truth tables in which all its premises are true, but its conclusion is ----

- a) False
- b) True
- c) True/false
- d) None of these

198.  $(p \cdot q)$  is an example for ---statement forms

- a) Contradictory
- b) Tautology
- c) Contingent
- d) None of these

199. Find out the rule  $p \supset q \therefore p \supset (p \cdot q)$

- a) Commutation
- b) Absorption
- c) Exportation
- d) De Morgan's Theorems

200. 'Raju is intelligent' is symbolized as

- a) I. R
  - b) R. I
  - c) R
  - d) None of these
- Answers: 191-200

191b 192 b 193 b 194 b 195 c 196 b

197 c 198 c 199 b 200 c

201. The meaning of the term 'LOGIC' is

- a) Ethos
- b) mythos
- c) Logos
- d) Logicos

202. Logic deals with

- a) Will
- b) Feel
- c) Archeological survey
- d) Thought

203. Verbal expression of Concept is called

- a) Word
- b) Sentence
- c) Action
- d) Judgement

204. Logic is the Science of

- a) Living beings
- b) Thought
- c) Women
- d) Plants

205. Inference expressed through language is called

- a) Proposition
- b) Sentence
- c) Word
- d) Argument

206. Who among the following is regarded as Father of Logic

- a) Kanada
- b) Aristotle
- c) Spinoza
- d) Kant

207. Logic is a----- Science

- a) Natural
- b) Biological
- c) Theological
- d) Normative

208. Deductive Logic is

- a) Formal Logic
- b) Material Logic
- c) Narrative Logic
- d) Fiction

209. Word which acts as Subject or Predicate of a Proposition is called

- a) Argument
- b) Judgement
- c) Term
- d) Inference

210. \_\_\_\_\_ sentences are used as Propositions

- a) Declarative
- b) Exclamatory
- c) Imperative
- d) Interrogative

211. The word which used to connect subject and predicate in a proposition is called

- a) Argument
- b) Premise
- c) Conclusion
- d) Copula

212. The known proposition in an Inference is called

- a) Subject
- b) Predicate
- c) Premises
- d) Copula

213. The new proposition derived from premises in an Inference is called

- a) Copula
- b) Conclusion
- c) Subject
- d) Predicate

214. The term which refer to an object within the limits of sense organs is called

- a) Composite term
- b) Simple term
- c) Abstract term
- d) Concrete term

215. . The term which refer to an object which is beyond the limits of sense organs is called

- a) Composite term

- b) Simple term
- c) Abstract term
- d) Concrete term

216. The term which refers to the attributes of the subject is called

- a) Simple
- b) Connotative
- c) Denotative
- d) Composite

217. The term which does not refer to the attributes of the subject is called

- a) a. Non-Composite
- b) b. Connotative
- c) c. Non-Connotative
- d) d. Composite

218. A term is said to be ----- if its meaning is complete in itself

- a) Abstract
- b) Absolute
- c) Concrete
- d) Relative

219. A term is said to be ----- if it depends on some other term for the completion of its meaning

- a) Abstract
- b) Absolute
- c) Concrete
- d) Relative

220. A term which refers to a class of objects in the same sense is called

- a) a. General
- b) Collective
- c) Singular
- d) Concrete

221. A term which consists of one word is called

- a) Concrete
- b) Abstract
- c) Simple
- d) Composite

222. A term which consists of a group of words is called

- a) Concrete
- b) Abstract
- c) Simple

d) Composite

223. Which term among the following implies presence of a quality

- a) Positive term
- b) Negative term
- c) Privative term
- d) None of these

224. Which term among the following implies absence of a quality

- a) Positive term
- b) Negative term
- c) Privative term
- d) None of these

225. Which term among the following implies absence of a quality which that object is expected to possess

- a) Positive term
- b) Negative term
- c) Privative term
- d) None of these

226. The statement which affirms or denies the relation between two terms is called

- a) Proposition
- b) Argument
- c) Syllogism
- d) None of the above

227. Two or more simple propositions joined together forms

- a) Complex Proposition
- b) Compound Proposition
- c) C. Complicate Proposition
- d) d. Subjectless Proposition

228. A compound proposition in which simple propositions are combined using 'And' is called

- a) Implication
- b) Disjunction
- c) Conjunction
- d) Equivalence

229. The composite proposition formed by the combination of two or more simple propositions using 'Either...Or' is called

- a) Conjunction
- b) Disjunction
- c) Implication

d) None of these

230. The composite proposition formed by the combination of two or more simple propositions using 'If....Then' is called

- a) Conjunction
- b) Disjunction
- c) Implication
- d) None of these

Answers:

231. The 'IF' part in a Hypothetical proposition is called

- a) Alternative
- b) Consequence
- c) Antecedent
- d) None of these

232. The 'THEN' part in a Hypothetical proposition is called

- a) Alternative
- b) Consequence
- c) Antecedent
- d) None of these

233. A proposition which states the relation between two terms without any condition is called

- a) Hypothetical proposition
- b) Disjunctive proposition
- c) Conditional proposition
- d) Categorical proposition

234. A proposition which states the relation between two terms based on some condition is called

- a) Simple proposition
- b) Complex proposition
- c) Conditional proposition
- d) Categorical proposition

235. Which one among the following is not a Conditional proposition

- a) Hypothetical
- b) Disjunction
- c) Conjunction
- d) Implication

236. The proposition which does not contain any other component or part is called

- a) Simple Proposition
- b) Complex Proposition
- c) Complicate Proposition

d) Compound Proposition

237. The object about which the proposition mentioning is called

- a) Subject term
- b) Predicate term
- c) Copula
- d) None of these

238. The term which refers to the attributes of the subject in a proposition is called

- a) Subject term
- b) Predicate term
- c) Copula
- d) None of these

239. Traditional classification of propositions is based on

- a) Relation between subject & predicate
- b) Position of Subject
- c) Position of Predicate
- d) None of these

240. Verbal expression of Judgement is called

- a) Word
- b) Judgement
- c) Inference
- d) proposition

241. Which among the following is not a Normative Science

- a) Logic
- b) Ethics
- c) Astrology
- d) Aesthetics

242. A Normative Science deals with

- a) 'What ought to be'
- b) 'What is'
- c) 'What will be'
- d) None of these

243. A Positive Science is ----- in nature

- a) Axiological
- b) Factual
- c) Imperative
- d) None of these

244. The knowledge derived through sense experience is called

- a) Conception
- b) Inference
- c) Perception
- d) Judgement

245. Mental image of the perceived object is called

- a) Percept
- b) Concept
- c) Judgement
- d) Inference

246. The process of deriving a new truth from one or more known truths is called

- a) Percept
- b) Concept
- c) Judgement
- d) Inference

247. The fundamental aim of Logic is

- a) Search of Truth
- b) Search of Beauty
- c) Search of Morality
- d) None of these

248. The Proposition formed by the combination of two or more simple proposition is called

- a) Simple Proposition
- b) Complex Proposition
- c) Complicate Proposition
- d) Compound Proposition

249. Which among the following is not a compound Proposition

- a) Subjectless Proposition
- b) Hypothetical Proposition
- c) Disjunctive Proposition
- d) Conjunctive Proposition

250. The portion of Logic which deals with Form of Thought is called

- a) Induction
  - b) Injection
  - c) Direction
  - d) Deduction
- Answers:

251. The portion of Logic which deals with Matter of Thought is called

- a) Induction

- b) Injection
- c) Direction
- d) Deduction

252. The Argument in which an Universal conclusion is derived from Particular Premises is

- a) Universal argument
- b) Particular argument
- c) Deductive argument
- d) Inductive argument

253. The Argument in which a Particular conclusion is derived from Universal Premises is

- a) Universal argument
- b) Particular argument
- c) Deductive argument
- d) Inductive argument

254. Logically correct argument is called

- a) True argument
- b) False argument
- c) Valid argument
- d) Invalid argument

255. Logically incorrect argument is called

- a) True argument
- b) False argument
- c) Valid argument
- d) Invalid argument

256. The argument which contains only true propositions is called

- a) Sound argument
- b) Unsound argument
- a) Barren argument
- b) None of these

257. Argument containing true premises and false conclusion is called

- a) Sound argument
- b) Valid argument
- c) Invalid argument
- d) True argument

258. Which among the following is not considered as a Law of Thought

- a) Law of Identity
- b) Law of Excluded Middle

- c) Law of Uniformity of Nature
- d) Law of Non-Contradiction

259. Which Law of thought states 'AIS A'

- a) Law of Identity
- b) Law of Excluded Middle
- c) Law of Sufficient Cause
- d) Law of Non-Contradiction

260. Which Law of thought states 'A cannot be both B and 'Not B' at the Same time''

- a. Law of Identity
  - b. Law of Excluded Middle
  - c. Law of Sufficient Cause
  - d. Law of Non-Contradiction
- Answers:

261. Which Law of thought states 'A can be Either B Or 'Not B'

- a. Law of Identity
- b. Law of Excluded Middle
- c. Law of Sufficient Cause
- d. Law of Non-Contradiction

262. Which Law of thought states 'Whatever happens in this world should have a Sufficient Cause'

- a) Law of Identity
- b) Law of Excluded Middle
- c) Law of Sufficient Cause
- d) Law of Non-Contradiction

263. Classification means 'Division based on

- a) Principle
- b) Position
- c) Place
- d) Objects

264. The 'Subject term' in a Proposition is symbolically represented as

- a) 'S'
- b) 'P'
- c) 'A'
- d) 'O'

265. The 'Predicate term' in a Proposition is symbolically represented as

- a) 'S'
- b) 'P'
- c) 'A'
- d) 'O'

266. Unconditional Propositions are also known as

- a) Imperative
- b) Authoritative
- c) Categorical
- d) Hypothetical

267. Based on Quality, Categorical propositions are classified into

- a) 2
- b) 3
- c) 4
- d) 5

268. Based on Quantity, Categorical propositions are classified into

- a) 2
- b) 3
- c) 4
- d) 5

269. Based on Quality, Categorical propositions are classified into

- a) Affirmative & Negative
- b) Affirmative and Universal
- c) Negative & Particular
- d) Universal & Particular

270. Based on Quantity, Categorical propositions are classified into

- a) Affirmative & Negative
  - b) Affirmative and Universal
  - c) Negative & Particular
  - d) Universal & Particular
- Answers:

271. The categorical proposition in which the Predicate affirms the Subject class is called

- a) Affirmative proposition
- b) Negative proposition
- c) Universal proposition
- d) Particular proposition

272. The categorical proposition in which the Predicate denies the Subject class is called

- a) Affirmative proposition
- b) Negative proposition
- c) Universal proposition
- d) Particular proposition

273. The categorical proposition in which the Predicate affirms or denies the whole class of Subject is called
- a) Affirmative proposition
  - b) Negative proposition
  - c) Universal proposition
  - d) Particular proposition
274. The categorical proposition in which the Predicate affirms or denies a part class of Subject is called
- a) Affirmative proposition
  - b) Negative proposition
  - c) Universal proposition
  - d) Particular proposition
275. The categorical proposition in which the Predicate affirms the whole class of Subject is called
- a) Universal Affirmative
  - b) Universal Negative
  - c) Particular Affirmative
  - d) Particular Negative
276. The categorical proposition in which the Predicate denies the whole class of Subject is called
- a) Universal Affirmative
  - b) Universal Negative
  - c) Particular Affirmative
  - d) Particular Negative
277. The categorical proposition in which the Predicate affirms a part of the class of Subject is called
- a) Universal Affirmative
  - b) Universal Negative
  - c) Particular Affirmative
  - d) Particular Negative
278. The categorical proposition in which the Predicate denies a part of the class of Subject is called
- a) Universal Affirmative
  - b) Universal Negative
  - c) Particular Affirmative
  - d) Particular Negative
279. 'Universal Affirmative Proposition' is symbolically represented as
- a) 'A' Proposition
  - b) 'E' Proposition
  - c) 'I' Proposition

d) 'O' Proposition

280. 'Universal Negative' Proposition is symbolically represented as

- a) 'A' Proposition
- b) 'E' Proposition
- c) 'I' Proposition
- d) 'O' Proposition

Answers:

281. 'Particular Affirmative' Proposition is symbolically represented as

- a) 'A' Proposition
- b) 'E' Proposition
- c) 'I' Proposition
- d) 'O' Proposition

282. 'Particular Negative' Proposition is symbolically represented as

- a) 'A' Proposition
- b) 'E' Proposition
- c) 'I' Proposition
- d) 'O' Proposition

283. The proposition which states about the inclusion of the whole class of Subject is called

- a) Universal Affirmative
- b) Universal Negative
- c) Particular Affirmative
- d) Particular Negative

284. The proposition which states about the exclusion of the whole class of Subject is called

- a) Universal Affirmative
- b) Universal Negative
- c) Particular Affirmative
- d) Particular Negative

285. The proposition which states about the inclusion of a part of the class of Subject is called

- a) Universal Affirmative
- b) Universal Negative
- c) Particular Affirmative
- d) Particular Negative

286. The proposition which states about the exclusion of a part of the class of Subject is called

- a) Universal Affirmative
- b) Universal Negative
- c) Particular Affirmative
- d) Particular Negative

287. The extension of a term is called its

- a) Connotation
- b) Denotation
- c) Both of these
- d) None of these

288. The intension of a term is called its

- a) Connotation
- b) Denotation
- c) Both of these
- d) None of these

289. Distribution of terms is based on

- a) Connotation
- b) Denotation
- c) Both of these
- d) None of these

290. When a term is used in its entire extension referring to all objects denoted by that term, it is said to be

- a) Distributed
  - b) Undistributed
  - c) Both of these
  - d) None of these
- Answers:

291. 'A' proposition distributes

- a) Subject only
- b) Predicate only
- c) Both Subject & Predicate
- d) Both Subject & Predicate are undistributed

292. 'E' proposition distributes

- a) Subject only
- b) Predicate only
- c) Both Subject & Predicate
- d) Both Subject & Predicate are undistributed

293. 'I' proposition distributes

- a) Subject only
- b) Predicate only
- c) Both Subject & Predicate
- d) Both Subject & Predicate are undistributed

294. 'O' proposition distributes

- a) Subject only
- b) Predicate only
- c) Both Subject & Predicate
- d) Both Subject & Predicate are undistributed

295. Name the Logician who illustrated distribution of terms in A,E,I & O propositions through Venn Diagram

- a) Socrates
- b) Frege
- c) Euler
- d) Leibniz

296. Proposition affirms or denies the relation between

- a) Subject & Predicate
- b) Two Subjects
- c) Two Predicates.
- d) Subject & Copula

297. The Inference in which a conclusion is derived from one premise

- a) Immediate
- b) Mediate
- c) Judgement
- d) Proposition

298. The Inference in which a conclusion is derived from two premises

- a) Immediate
- b) Mediate
- c) Judgement
- d) Proposition

299. Syllogism is a

- a) Immediate Inference
- b) Mediate Inference
- c) Opposition
- d) Eduction

300. In Immediate Proposition, there are propositions

- a) 2
- b) 3
- c) 4
- d) 5

301. Which one among the following is not an immediate Inference

- a) Contrary
- b) Obversion
- c) Conversion
- d) Syllogism

302. Which one of the following is not an Opposition

- a) Contrary
- b) Contradictory
- c) Subaltern
- d) Conversion

303. Which Opposition states the relation between A & E

- a) Contrary
- b) Contradictory
- c) Sub-contrary
- d) Subaltern

304. Which Opposition states the relation between I & O

- a) Contrary
- b) Contradictory
- c) Sub-contrary
- d) Subaltern

305. Which Opposition states the relation between A & I and E & O

- a) Contrary
- b) Contradictory
- c) Sub-contrary
- d) Subaltern

306. Which Opposition states the relation between A & O and E & I

- a) Contrary
- b) Contradictory
- c) Sub-contrary
- d) Subaltern

307. A syllogism consists of -----terms

- a) 2
- b) 3
- c) 4
- d) 5

308. A syllogism consists of -----propositions

- a) 2
- b) b.3
- c) c.4
- d) 5

309. The Predicate of the conclusion in a Syllogism is called

- a) Major term
- b) Minor term
- c) Middle term
- d) First term

310. The Subject of the conclusion in a Syllogism is called

- a) Major term
- b) Minor term
- c) Middle term
- d) First term

311. The term which present only in the premises and not in the conclusion of a Syllogism is called

- a) Major term
- b) Minor term
- c) Middle term
- d) First term

312. Which among the following is not a proposition of a Syllogism

- a) Major premise
- b) Minor premise
- c) Conclusion
- d) Middle premise

313. Logical error is called

- a) Syllogism
- b) Opposition
- c) Fallacy
- d) Eduction

314. Which among the following is not a fallacy of Ambiguity

- a) Fallacy of ambiguous First term
- b) Fallacy of ambiguous Major
- c) Fallacy of ambiguous Minor
- d) Fallacy of ambiguous Middle

315. State the fallacy in the following Syllogism All Monkeys are Mammals All Donkeys are Mammals All Donkeys are Monkeys.

- a) Fallacy of Ambiguity
- b) Fallacy of Undistributed Middle
- c) Fallacy of Illicit
- d) Fallacy of two Negative Premises

316. Which among the following is a Fallacy of Illicit

- a) Fallacy of Illicit Middle
- b) Fallacy of Illicit Premises
- c) Fallacy of Illicit Major
- d) Fallacy of Illicit Conclusion

317. A Syllogism which contains both categorical and Conditional propositions is called

- a) Universal Syllogism
- b) General Syllogism
- c) Major Syllogism
- d) Mixed Syllogism

318. Which among the following is not a mixed Syllogism

- a) Mixed Hypothetical Syllogism
- b) Mixed Disjunctive Syllogism
- c) Dilemma
- d) Mixed Categorical Syllogism

319. Modus ponens is a

- a) Mixed Hypothetical Syllogism
- b) Mixed Disjunctive Syllogism
- c) Dilemma
- d) Mixed Categorical Syllogism

320. Modus tollens is a

- a) Mixed Hypothetical Syllogism
- b) Mixed Disjunctive Syllogism
- c) Dilemma
- d) Mixed Categorical Syllogism

321. Modus ponens tollens is a

- a) Mixed Hypothetical Syllogism
- b) Mixed Disjunctive Syllogism
- c) Dilemma
- d) Mixed Categorical Syllogism

322. Modus tollens ponens is a

- a) Mixed Hypothetical Syllogism

- b) Mixed Disjunctive Syllogism
- c) Dilemma
- d) Mixed Categorical Syllogism

323. If the conclusion of a Dilemma is Categorical proposition I, it is called

- a) Simple Dilemma
- b) Complex Dilemma
- c) Compound Dilemma
- d) Complicated Dilemma

324. If the conclusion of a Dilemma is Disjunctive proposition, it is called

- a) Simple Dilemma
- b) Complex Dilemma
- c) Compound Dilemma
- d) Complicated Dilemma

325. Which among the following is not a Dilemma

- a) Simple Constructive Dilemma
- b) Compound Constructive dilemma
- c) Complex Constructive Dilemma
- d) Complex Destructive Dilemma

326. Dilemma only can be Rebutted

- a) Simple Constructive Dilemma
- b) Simple Destructive Dilemma
- c) Complex Constructive Dilemma
- d) Complex Destructive Dilemma

327. Inductive Logic is also known as

- a) Formal Logic
- b) Material Logic
- c) Symbolic Logic
- d) None of these

328. Conclusion drawn from the premises by counting particular instances is in

- a) Analogy
- b) Scientific Induction
- c) Enumerative Induction
- d) None of these

329. Conclusion drawn from the premises based on the similarities among the particular facts is in

- a) Analogy
- b) Scientific Induction

- c) Enumerative Induction
- d) None of these

330. Scientific Induction has ----- stages

- a) 3
- b) 4
- c) 5
- d) 6

331. Scientific Induction starts with

- a) Theory
- b) Law
- c) Observation
- d) Formulation of Hypothesis

332. Experiment is

- a) Natural Observation
- b) Controlled Observation
- c) Both
- d) None of these

333. The guess about the cause of an event is called

- a) Observation
- b) Analysis
- c) Study
- d) Hypothesis

334. Induction is ----- process

- a) Ascending
- b) Descending
- c) Parallel.
- d) Cycle

335. In a Syllogism, if one premise is negative, then the conclusion will be

- a) Negative
- b) Affirmative
- c) No conclusion
- d) None of these

336. We cannot derive any conclusion from

- a) Two Affirmative premises
- b) Two Universal premises
- c) Two particular premises

d) One universal and one particular

337. In a Syllogism, if one of the premises is Particular, then the conclusion will be

- a) Universal
- b) Particular
- c) Affirmative
- d) Negative

338. In a Syllogism, if one of the premises is Negative, then the conclusion will be

- a) Universal
- b) Particular
- c) Affirmative
- d) Negative

339. Which among the following is a method for collection of facts in Scientific Induction

- a) Formulation of Hypothesis
- b) Verification of Hypothesis
- c) Observation
- d) Proving the Hypothesis

340. Conclusion drawn from the premises by counting all particular instances is in

- a) Direct enumeration
- b) Perfect enumeration
- c) Indirect enumeration
- d) Imperfect enumeration

341. Conclusion drawn from the premises by counting some particular instances is in

- a) Direct enumeration
- b) Perfect enumeration
- c) Indirect enumeration
- d) Imperfect enumeration

342. The process of jumping from 'Some to All' is called

- a) Deductive leap
- b) Logical Jump
- c) Circle leap
- d) Inductive leap

343. Verification of Hypothesis is possible through

- a) Perfect or imperfect method
- b) Direct or Indirect method
- c) Positive or Negative method
- d) Analytical or Synthetic method

344. Observation under man made condition is called

- a) Natural
- b) Synthetic
- c) Experiment
- d) Examination

345. Verified Hypothesis is called

- a) Fact
- b) Theory
- c) Law
- d) Rule

346. Proved Hypothesis is called

- a) Fact
- b) Theory
- c) Law
- d) Rule

347. The Hypothesis which cannot be verified is called

- a) Hidden hypothesis
- b) Evolved Hypothesis
- c) Barren Hypothesis
- d) Vague Hypothesis

348. Which among the following is not a Postulate of Induction

- a) Law of Universal Causation
- b) Law of Excluded Middle
- c) Law of Uniformity of Nature
- d) Law of Unity of Nature

349. Postulates of Induction is also known as

- a) Laws of Thought
- b) Laws of Aristotle
- c) Laws of Nature
- d) Laws of Leibniz

350. The Law of Universal Causation states that

- a) Some events have no cause
- b) Every event has a cause
- c) All events occur without cause
- d) Cause is not necessary for events to occur

351. Which Law states that 'Same cause will produce same effect under same condition'

- a) Law of Universal Causation
- b) Law of Uniformity of Nature
- c) Law of Identity
- d) Law of Non-Contradiction

352. The Hypothesis which is accepted temporarily is called

- a) Barren Hypothesis
- b) Ad hoc Hypothesis
- c) Add on Hypothesis
- d) Selective Hypothesis

353. Logic is a ----- Science

- a) Positive
- b) Normative
- c) Descriptive
- d) Natural

354. The proposition, 'Either the umbrella is black or the umbrella is blue' is called

- a) Hypothetical
- b) Categorical
- c) Disjunctive
- d) None of these

355. The Problem of Induction is

- a) How Induction is possible
- b) How Inductive Leap is possible
- c) How Analogy is possible
- d) How Observation is possible

356. Opposition is a ----- Inference

- a) Indirect
- b) Direct
- c) Concrete
- d) Immediate

357. Education is a ----- Inference

- a) Abstract
- b) Absurd
- c) Immediate
- d) Mediate

358. Which among the following is an Education

- a) Contrary
- b) Obversion
- c) Contradictory
- d) Subaltern

359. How many propositions are there in an Opposition

- a) 6
- b) 5
- c) 2
- d) 3

360. Deduction and Induction are two main forms of

- a) Beliefs
- b) Concepts
- c) Reasoning
- d) Assumptions

361. Which among the following are two kinds of propositions

- a) Concrete- Abstract
- b) Deductive- Inductive
- c) Connotative- Denotative
- d) Categorical- Conditional

362. The Proposition 'If you work hard then you will succeed' is

- a) Categorical
- b) Hypothetical
- c) Disjunctive
- d) None of these

363. The proposition 'Some Indians are not jealous' is a

- a) Universal Affirmative
- b) Universal Negative
- c) Particular Affirmative
- d) Particular Negative

364. When a term refers only to a part of the class of things denoted by that term said to be

- a) Distributed
- b) Undistributed
- c) Abstract
- d) Absurd

365. When a term refers only to the whole class of things denoted by that term said to be

- a) Distributed

- b) Undistributed
- c) Abstract
- d) Absurd

366. The following argument is Gold melts when heated Silver melts when heated Iron melts when heated Copper melts when heated Brass melts when heated. ∴ All metals melts when heated.

- a) Deductive
- b) Inductive.
- c) Both
- d) None of these

367. The relation between two Universal propositions having same subject, same predicate but differ only in quality is

- a) Contrary
- b) Contradictory
- c) Subalternation
- d) Sub-contrary

368. The relation between two Particular propositions having same subject, same predicate but differ only in quality is

- a) Contrary
- b) Contradictory
- c) Subalternation
- d) Sub-contrary

369. The relation between two propositions having same subject, same predicate but differ only in quantity is

- a) Contrary
- b) b. Contradictory
- c) Subalternation
- d) Sub-contrary

370. The relation between two propositions having same subject, same predicate but differ both in quantity and in quality is

- a) Contrary
- b) Contradictory
- c) Subalternation
- d) Sub-contrary

371. The relation between two propositions having same subject, same predicate but differ in quality or in quantity or both in quality and quantity is called

- a) eduction
- b) Opposition
- c) Syllogism

d) Conversion

372. Euler's Circles are diagrams representing of terms

- a) Distribution
- b) Meaning
- c) Quality
- d) Quantity

373. The quantity of 'A' proposition is

- a) Universal
- b) Particular
- c) Affirmative
- d) Negative

374. The quantity of 'E' proposition is

- a) Universal
- b) Particular
- c) Affirmative
- d) Negative

375. The quantity of 'I' proposition is

- a) Universal
- b) Particular
- c) Affirmative
- d) Negative

376. The quantity of 'O' proposition is

- a) Universal
- b) Particular
- c) Affirmative
- d) Negative

377. The quality of 'A' proposition is

- a) Universal
- b) Particular
- c) Affirmative
- d) Negative

378. The quality of 'E' proposition is

- a) Universal
- b) Particular
- c) Affirmative
- d) Negative

379. The quality of 'I' proposition is

- a) Universal
- b) Particular
- c) Affirmative
- d) Negative

380. The quality of 'O' proposition is

- a) Universal
- b) Particular
- c) Affirmative
- d) Negative

381. The contrary opposition of 'A' proposition is

- a) A
- b) E
- c) I
- d) O

382. The Sub-contrary opposition of 'I' proposition is

- a) A
- b) E
- c) I
- d) O

383. The Subaltern opposition of 'A' proposition is

- a) A
- b) E
- c) I
- d) O

384. The Subaltern opposition of 'E' proposition is

- a) A
- b) E
- c) I
- d) O

385. The Contradictory opposition of 'A' proposition is

- a) A
- b) E
- c) I
- d) O

386. The Contradictory opposition of 'E' proposition is

- a) A

- b) E
- c) I
- d) d. O

387. The proposition 'No men are perfect' is

- a) Universal affirmative
- b) Universal Negative
- c) Particular Affirmative
- d) Particular Negative

388. The fallacy occurs when the syllogism uses its Major term in one sense in the Major premise and in another sense in the conclusion

- a) Fallacy of Ambiguous Major
- b) fallacy of Ambiguous Minor
- c) Fallacy of Ambiguous Middle
- d) Fallacy of Illicit Major

389. The fallacy occurs when the syllogism uses its Minor term in one sense in the Minor premise and in another sense in the conclusion

- a) Fallacy of Ambiguous Major
- b) Fallacy of Ambiguous Minor
- c) Fallacy of Ambiguous Middle
- d) Fallacy of Illicit Major

390. The fallacy occurs when the syllogism uses its Middle term in one sense in the Major premise and in another sense in the Minor premise

- a) Fallacy of Ambiguous Major
- b) Fallacy of Ambiguous Minor
- c) Fallacy of Ambiguous Middle
- d) Fallacy of Illicit Major

391. The fallacy occurs when the Major term in a syllogism remains 'Undistributed' in the Major premise while it is 'Distributed' in the conclusion.

- a) a. Fallacy of Ambiguous Major
- b) Fallacy of Ambiguous Minor
- c) Fallacy of Illicit Major
- d) Fallacy of Illicit Minor

392. The fallacy occurs when the Minor term in a syllogism remains 'Undistributed' in the Minor premise while it is 'Distributed' in the conclusion.

- a) Fallacy of Ambiguous Major
- b) Fallacy of Ambiguous Minor
- c) Fallacy of Illicit Major

d) Fallacy of Illicit Minor

393. All men are Politicians All men are Indians  $\therefore$  All Indians are Politicians The fallacy committed the above syllogism is

- a) Fallacy of Ambiguous Major
- b) Fallacy of Ambiguous Minor
- c) Fallacy of Illicit Major
- d) Fallacy of Illicit Minor

394. All men are Selfish No Apes are men  $\therefore$  No Apes are Selfish The fallacy committed the above syllogism is

- a) Fallacy of Ambiguous Major
- b) Fallacy of Ambiguous Minor
- c) Fallacy of Illicit Major
- d) Fallacy of Illicit Minor

395. Modus ponens is also known as

- a) Constructive Hypothetical syllogism
- b) Simple Dilemma
- c) Destructive hypothetical Syllogism
- d) Complex Dilemma

396. Modus Tollens is also known as

- a) Constructive Hypothetical syllogism
- b) c Simple Dilemma
- c) b Destructive hypothetical Syllogism
- d) Complex Dilemma

397. Which among the following is not a Dilemma

- a) Simple Constructive Dilemma
- b) Complex Constructive Dilemma
- c) Simple Destructive Dilemma
- d) Simple complex Dilemma

398. Scientific Induction establishes

- a) A Particular Fact
- b) A Concrete Fact
- c) An Abstract fact
- d) A General Law

399. All men are mortal All kings are men  $\therefore$  All kings are mortal State the Major Term in the above Syllogism

- a) Men

- b) King
- c) Mortal
- d) Are

400. Ad hoc hypothesis is also known as

- a) Everlasting hypothesis
- b) Working hypothesis
- c) Artificial hypothesis
- d) analogical hypothesis

Answers: 201-400

- 1. Ans: c. Logos
- 2. Ans: d. Thought
- 3. Ans: a. Word
- 4. Ans : b. Thought
- 5. Ans: d. Argument
- 6. Ans: Aristotle
- 7. Ans: d. Normative
- 8. Ans: a. Formal Logic
- 9. Ans: c. Term
- 10. Ans: a. Declarative
  
- 11. Ans: d. Copula.
- 12. Ans: c. Premise
- 13. Ans: b. Conclusion.
- 14. Ans: d. Concrete term
- 15. Ans: c. Abstract term
- 16. Ans: b. Connotative

17. Ans: a.Non-Connotative
18. Ans: b. Absolute
19. Ans: d.Relative
20. Ans: a. General
21. Ans: c. Simple
22. Ans: d. Composite
23. Ans: a. Positive term
24. Ans: b. Negative term
25. Ans: c. Privative term
26. Ans: a. Proposition
27. Ans: d. Subjectless Proposition
28. Ans: c. Conjunction
29. Ans: b. Disjunction
30. Ans: b. Implication
31. Ans: c. Antecedent
32. Ans: b. Consequence
33. Ans: d. Categorical proposition
34. Ans:c. Conditional proposition
35. Ans: c. Conjunction
36. Ans : a. Simple Proposition
37. Ans: Subject term
38. Ans: b Predicate term

39. Ans: a. Relation between

subject & predicate

40. Ans: d. proposition

41. Ans : c. Astrolog

42. Ans: a. 'What ought to be'

43. Ans: b. Factual

44. Ans: c. Perception

45. Ans: b. Concept

46. Ans: d. Inference

47. Ans: a. Search of Truth

48. Ans : d. Compound Proposition

49. Ans : a. Subjectless Proposition

50. Ans : d. Deduction

51. Ans : a. Induction

52. Ans: d. Inductive argument

53. Ans: c. Deductive argument

54. Ans : c. Valid argument

55. Ans : d. Invalid argument

56. Ans : a. Sound argument

57. Ans : c. Invalid argument

58. Ans : c. Law of Nature

59. Ans: a. Law of Identity

60. Ans: d. Law of Non-

#### Contradiction

61. Ans: b. Law of Excluded Middle

62. Ans: c. Law of Sufficient Cause

63. Ans : a. Principle

64. Ans: a. 'S'

65. Ans: b. 'P'

66. Ans: c. Categorical

67. Ans: 2

68. Ans: 2

69. Ans: a. Affirmative & Negative

70. Ans: d. Universal & Particular

71. Ans: .a. Affirmative proposition

72. Ans: b. Negative proposition

73. Ans: c. Universal proposition

74. Ans: d. Particular proposition.

75. Ans: a. Universal Affirmative

76. Ans: b. Universal Negative

77. Ans: c. Particular Affirmative

78. Ans: d. Particular Negative

79. Ans: a. 'A' Proposition

80. Ans: b. 'E' Proposition

81. Ans: c. 'I' Proposition
82. Ans: d. 'O' Proposition
83. Ans: a. Universal Affirmative
84. Ans: b. Universal Negative
85. Ans: c. Particular Affirmative
86. Ans : d. Particular Negative
- 
87. Ans: b. Denotation
88. Ans: a. Connotation
89. Ans: b. Denotation
90. Ans: a. Distributed
91. Ans : a. Subject only
92. Ans : c. Both Subject & Predicate
93. Ans : d. Both Subject & Predicate are undistributed
94. Ans : b. Predicate only
95. Ans: c. Euler
- 
96. Ans: a. Subject & Predicate
97. Ans: a. Immediate
98. Ans: b. Mediate
99. Ans : b. Mediate Inference

100. Ans: a. 2
101. Ans: d. Syllogism
102. Ans: d. Conversion
103. Ans: a. Contrary
104. Ans: c. Sub-contrary
105. Ans: d. Subaltern
106. Ans: b. Contradictory
107. Ans: b. 3
108. Ans: b. 3
109. Ans: a. Major term
110. Ans: b. Minor term
111. Ans: b. Middle term
112. Ans: d. Middle premise
113. Ans : c. Fallacy
- 114 Ans : a.Fallacy of ambiguousFirst term
- 115 Ans : b. Fallacy ofUndistributed Middle
116. Ans : c. Fallacy of Illicit Major
117. Ans : d. Mixed Syllogism
118. Ans : d. Mixed Categorical

### Syllogism

119. Ans : a. Mixed HypotheticalSyllogism
120. Ans : a. Mixed HypotheticalSyllogism

121. Ans : Mixed DisjunctiveSyllogism
122. Ans : Mixed DisjunctiveSyllogism
123. Ans : a. Simple Dilemma
124. Ans : b. Complex Dilemma
125. Ans : b. CompoundConstructive dilemma
126. Ans : c. Complex ConstructiveDilemma
127. Ans: a. Formal Logic
128. Ans : c. Enumerative Induction
129. Ans : a. Analogy
130. Ans: b. 4
131. Ans: c. Observation
132. Ans : b. Controlled Observation
133. Ans : d. Hypothesis
134. Ans : a. Ascending
135. Ans : a. Negative
- 136 Ans : c. Two particular premises
137. Ans : b. Particular
138. Ans : d. negative
139. Ans : c. Observation
140. Ans : b. Perfect enumeration
141. Ans : d. Imperfect enumeration
142. Ans: d. Inductive leap
143. Ans : b. Direct or Indirectmethod

144. Ans : c. Experiment  
145. Ans : b. Theory  
146. Ans : c. Law  
147. Ans : c. Barren Hypothesis  
148. Ans: b. Law of Excluded Middle  
149. Ans : c. Laws of Nature  
150. Ans : b. Every event has a cause  
151. Ans : b. Law of Uniformity of Nature

#### Possible

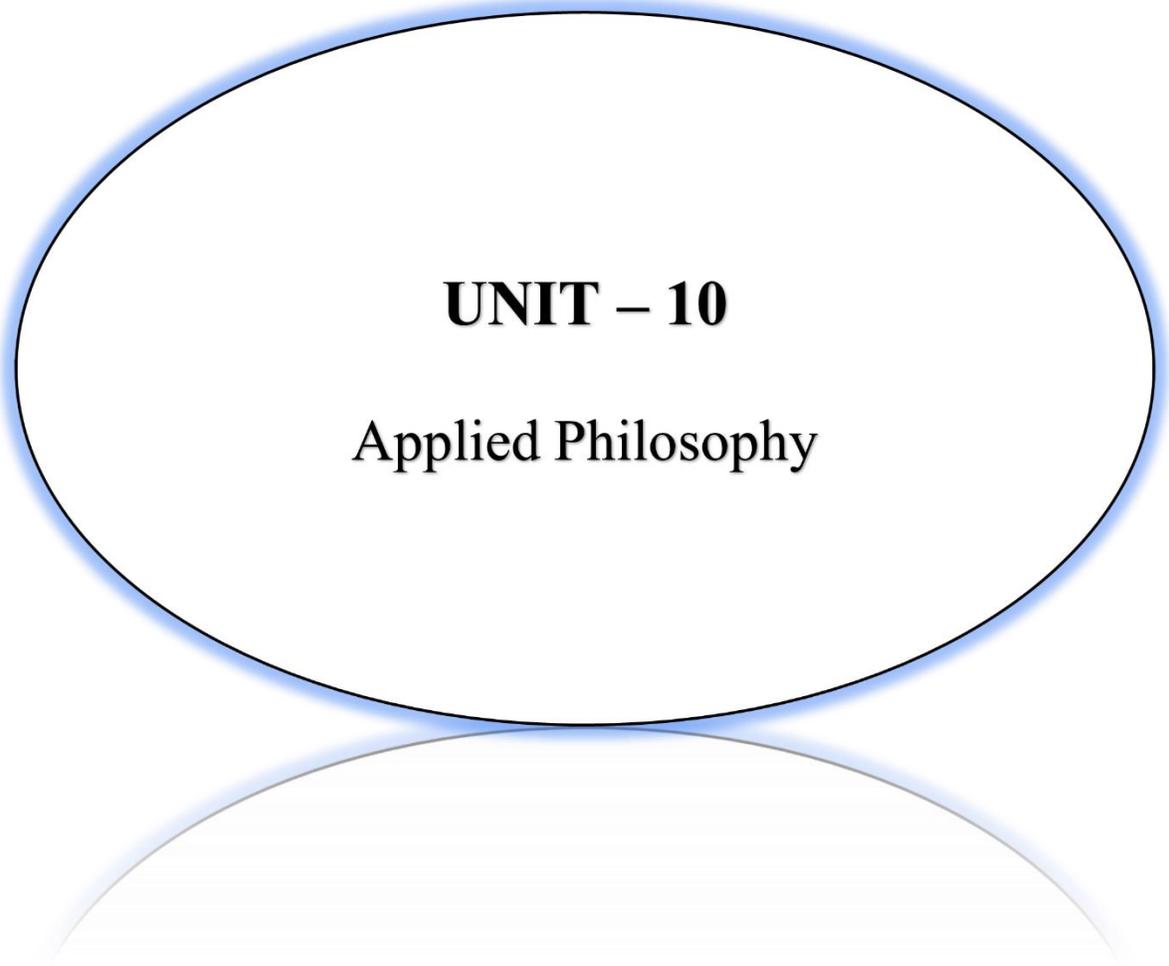

152. Ans : b. Ad hoc Hypothesis  
153. Ans : b Normative  
154. Ans : c. Disjunctive  
155. Ans: b. How Inductive Leap is
156. Ans : d. Immediate  
157. Ans : c. Immediate  
158. Ans : b. Obversion  
159. Ans : c. 2  
160. Ans : c. Reasoning  
161. Ans : d. Categorical-Conditional  
162. Ans : b. Hypothetical  
163. Ans : d. Particular Negative  
164. Ans: .b. Undistributed

165. Ans: a. Distributed
166. Ans : b. Inductive.
167. Ans : a. Contrary
168. Ans : d. Sub-contrary
169. Ans : c. Subalternation
170. Ans : b. Contradictory
171. Ans: b. Opposition
172. Ans : a. Distribution
173. Ans: a. Universal
- 
174. Ans : a. Universal
175. Ans : b. Particular
176. Ans : b. Particular
177. Ans : c. Affirmative
178. Ans : d. Negative
179. Ans : c. Affirmative
180. Ans : d. Negative
181. Ans : b. E
182. Ans : d. O
183. Ans : c. I
184. Ans : d. O
- 
185. Ans : d. O
186. Ans : c. I
187. Ans: b. Universal Negative
188. Ans: a. Ambiguous Major

189. Ans: b. Ambiguous Minor
190. Ans : c. Ambiguous Middle
191. Ans: c. Fallacy of Illicit Major
192. Ans: d. Fallacy of Illicit Minor
193. Ans: d. Fallacy of Illicit Minor
194. Ans: c. Fallacy of Illicit Major
195. Ans : a. Constructive

#### Hypothetical syllogism

196. Ans : b Destructivehypothetical Syllogism
197. Ans: d. Simple complexDilemma
198. Ans: d. A General Law
199. Ans: c. Mortal
200. Ans: b. Working hypothesis

**UNIT – 10**

*Applied Philosophy*

## **Applied Philosophy**

Applied philosophy is marked out from philosophy in general by its focus on matters of practical concern. It is often identified with applied ethics, but although this forms a large part of the area of applied philosophy, the broader term includes discussion of philosophical problems, some metaphysical, some epistemological, in fields such as law, education or art, that are not strictly or uniquely ethical. Applied ethics also includes the area of professional ethics; it examines the ethical dilemmas and challenges met with by workers in health-care, business and other areas where specific ethical issues such as confidentiality and truth-telling may arise.

## **The Proper Preoccupations of Philosophy**

Philosophy is often regarded as the most abstract of studies, so the term 'applied philosophy' needs some explanation. It represents the claim that it is possible to build bridges between theory and practice and, in particular, that philosophy is not only an internal movement in philosophy but that it can and should play a role in public debate. This should not be seen, though, as a bid to claim expertise on the part of philosophers but rather as a reassertion of the traditional conception of the philosopher, not as an expert, but as an honest and open seeker after truth. This search involves accepting the possibility of rational argument about normative directions. It does not mean, though, maintaining a posture of uninvolved neutrality. As philosophy, indeed, it involves a prior commitment to the values of rationality, impartiality and equality of respect for individuals, and these provide the foundation for the moral values and range of rights that are fundamental to applied ethics. Applied philosophy, then, is part of a whole view of the human condition and takes a broad view of ethical decision-making. It can therefore accept as part of its task the identification and discussion of values capable of securing widespread acceptance in the contemporary world. For philosophy has traditionally been concerned, not only with abstract reflection but also with questions about how we should live and how we should conduct our social life and political affairs.

Today's applied philosophy, then, marks a return to what have always been proper preoccupations of philosophers. Some of these preoccupations are old and could be said to have a perennial interest - intimate relationships and family life, for example, or global issues of peace and war. Others are the product of new technologies, revolutions in communication, new weapons of indiscriminate destruction, and an unprecedented increase in the impact of humans on their environment and support systems. Applied philosophy and especially applied ethics yields scope and space for discussion of these issues of public policy. To all these debates, it can bring clarity, openness, critical analysis, and respect for careful evaluation of arguments. At the same time, it represents a shift from the view that philosophy can only analyse and clarify problems but is not able to take on the task of seeking answers to them.

Applied philosophy differs in style and approach from some mainstream philosophy in other ways, too. It gives greater attention to context and to the detailed texture of complex situations and it is also more holistic in approach - that is to say, it is much more ready to include the insights of psychology, sociology and other relevant areas of knowledge in its deliberations, and to allow the facts it finds there to influence its conclusions. Its method of reasoning could be compared to that of a designer who starts with a blueprint, but has to adapt it to the materials to hand and to the situations in which it is required. The origins and background of applied philosophy can be traced back to the first of the early Greek philosophers, Thales (c.585 BCE), who could well qualify as the first applied philosopher. Having been scorned for his speculative and impractical interests - he was so preoccupied with studying the stars that he fell down a well! - he decided, very successfully, to go into business and use those observations to make a fortune, thus demonstrating that phil-

osophical abstraction had its uses, and even a potential cash-value.

Later schools of philosophy in ancient times - Pythagoreans, Epicureans, Stoics - offered their followers principles for living and guidance on life-style. Socrates (469-399 BCE.), too, while he avoided preaching any dogma, did offer in his own approach to life and also to death an example of a way of living appropriate to the pursuit of philosophy.

Plato (c.430-347 BCE), the chronicler of Socrates' discussions, described his own blueprint for the good society in his dialogue the Republic, which covered not only political arrangements, but also the way social life should be organised. He set out there his ideals for education, for sexual relations and reproduction, for art, literature and censorship.

In the modern period, too, many philosophers have applied their philosophical insights to practical issues. St. Thomas Aquinas (1225-74) treated such topics as marriage and the family in his *Summa Theologiae*. John Locke (1632-1704) wrote on toleration, and also on education; his political theory also provided the philosophical underpinning of the American Declaration of Independence. The principle of human dignity formulated by Immanuel Kant (1724-1804) is central to most modern conventions of human rights, and Kant also treated the subject of suicide, and the question of whether it is ever right to tell a lie from benevolent motives - questions which continue to be important for medical ethics. Utilitarians like Jeremy Bentham (1748-1832) and John Stuart Mill (1806-73) have a continued if not always acknowledged influence on public policy, while Karl Marx's (1818-83) political philosophy has played a dramatic role in the shaping of the modern world. Applied philosophy, then, is not a new subject. Nevertheless, it suffered a period of neglect as the pendulum in philosophy swung from the speculative metaphysics of the nineteenth century to the materialistic scientism of the twentieth.

A number of factors contributed to the return to applied ethics, dating from approximately the mid-twentieth century. Perhaps the most important of these was the development of new kinds of medical technology, particularly those involving new methods of reproduction, and those affecting the end of life; another has been controversy about war and international relations. The publication of Peter Singer's *Animal Liberation* (1975) prompted increased academic debate about the relationship between humans and the animal world, and at the same time, there was a dawning public awareness of environmental threats on a global scale. Finally, interest in business and corporate ethics has grown, in reaction to scandals of public and business life. For all these reasons, then, and many others, applied philosophy has today entered a new, more self-conscious and better-defined phase of development.

## **PHILOSOPHY OF TECHNOLOGY**

The philosophy of technology brings logical, metaphysical, epistemological, ethical, and political philosophical questions to bear on the making and using of artifacts. The particular balance among these questions will differ within related regionalizations of philosophy, such as the philosophy of science or the philosophy of art. In the philosophy of technology, for instance, epistemology typically plays a lesser role than in the philosophy of science but a greater role than in the philosophy of art. Any philosophical assessment of technology is thus partially defined by its own inner balance in relation to philosophy as a whole.

## **Historical Emergence**

Although limited discussions of *techne* and associated or derivative phenomena can be found in ancient, medieval, and early modern philosophy, it was not until the late nineteenth and early twen-

tieth centuries that technology, as something distinct from technics or technique, became a subject for theoretical examination. Among the earliest contributing texts, the mechanical engineer Franz Reuleaux's *Theoretische Kinematik* (1875) developed an extended conceptual analysis of different types of tools and machines. More generally, Ernst Kapp's *Grundlinien einer Philosophie der Technik* (1877), in the first book to use "philosophy of technology" in its title, outlined a theory of culture grounded in technics understood as the extension and differentiation of human anatomy and physiology. The hammer, for instance, functions as an extension of the fist, the camera as an extension of the eye, and the railroad as an extension of the circulatory system; and vice versa, the fist can be said to be like a hammer, the eye like a camera, and rail lines like blood vessels. Elaborations of this view of technology as organ projection are representative of a school of what Carl Mitcham (1994) calls engineering philosophy of technology, an approach that was further developed in the work of thinkers as diverse as the Russian Peter Englemeier, the German Friedrich Dessauer, the Frenchman Gilbert Simondon, and the Spaniard Juan David García Bacca (all of whom have been largely ignored in Anglo American philosophy).

The research engineer Dessauer, for instance, developed a neo-Kantian critique of the transcendental possibility of technological invention that sees technology as bringing noumenal power into the world. Dessauer was also instrumental in promoting philosophical discussion within the *Verein Deutscher Ingenieure* (VDI; Society of German Engineers). The psychologist Simondon explored relations among parts, artifacts, and technical systems and the evolutionary manifestation of what he called technicity. The engineer Englemeier and the philosopher García Bacca both saw technological change engendering world-historical transformations that were at once humanizing and transcending of the merely organically human. Additional contributions to this school can be found in theoretical discussions about cybernetics and artificial intelligence. Also illustrative of achievements in engineering-oriented philosophy of technology are the scientific philosopher Mario Bunge's (1985) systematic metaphysics, epistemology, and ethics of technology and the engineer Billy Vaughn Koen's (2003) brief for engineering as the one right method for problem solving.

In its emergence, however, philosophy of technology was more commonly associated with what might be called a counterphilosophy that interprets technology not as extending but as encroaching on or narrowing the dimensions of human experience. Following Immanuel Kant's attempt "to deny [scientific] knowledge, in order to make room for faith," this humanities philosophy of technology has sought to limit technological thought and practice to make room for human culture in all its rich diversity. A case in point is the public intellectual Lewis Mumford's (1967) criticism of what he calls monotecnics, the technics of power, in contrast to poly- or biotechnics. The problem with monotecnics is that it promotes the pursuit of physical power and control at the expense of other aspects of human flourishing such as friendship and art. For Mumford the "myth of the machine" is to think that power is the source of all human benefit. In fact, it constitutes an unrealistic narrowing of human activity. Some version of this argument has been promoted especially by the continental European philosophical tradition in the works of José Ortega y Gasset (1939), Martin Heidegger (1954), and Jacques Ellul (1954). Indeed, even more broadly, the relation between technology and life—whether in the sense of *zoe* (organic existence) or *bios* (human flourishing)—has become one of the most crucial issues in both the metaphysics and ethics of technology. Until the latter half of the twentieth century, the argument for delimitation had the unintended side effect of relegating technology to marginal status in professional philosophy. Only as technology became more than an engineering interest or a social problem has it begun to be a mainstream topic in philosophy. One of the challenges in the twenty-first century will be to pursue the professional development of philosophical reflection on technology in ways that bridge the oppositions inherent in its bimodal historical origins without compromising their basic if divergent

concerns.

## **Ethical and Political Issues**

Because of their prominence in public affairs, the philosophy of technology properly highlights ethical and political issues. Indeed, contemporary work in practical or applied ethics—as in nuclear, environmental, biomedical, and computer ethics—emphasizes the moral challenges of technology, although in ways that sometimes reduce the field to an aggregate of different ethics for different technologies. Such subspecialization can deprive ethics of possible synergistic strengths. Access equity issues, for instance, occur in both biomedicine and computers, and the concepts and principles for dealing with one might well inform or enhance the other. Speaking generally, then, one can identify at least six competing and overlapping interpretations of technology as an ethical or political problem. Three of these arose initially before World War II, although they have continued to cast a shadow of concern, often in new and distinctive forms.

First, there is a problem of the just distribution of technological products and powers—that is, technology as a political issue. Since the Industrial Revolution the social-justice question has found numerous expressions in authoritarian and democratic regimes, in developing and developed countries. Authoritarian regimes have often justified themselves as acting to promote access to technological benefits against entrenched special scientific, technical, or corporate interests or against those whose commitment to equality undermines the invention and production of goods and services. Democratic regimes have placed more emphasis on promoting equality by means of due process and regulatory agencies. One aspect of due process that has been given special philosophical attention concerns the legal protocols to promote free and informed consent, extending the concept from human experimentation to engineering at large (Martin and Schinzinger 2005). With the engineered design of new products and processes social justice issues have often taken special form in association with some otherwise morally neutral concepts. The advent of electronic computer and Internet communications, for instance, has helped impart ethical significance to questions of privacy and the so-called "digital divide." Additionally, according to Ulrich Beck (1992), concerns for the fair distribution of goods and services were, during the late twentieth century, superseded by those dealing with the fair distribution of dangers and risks, thus giving social justice debates a special twist. One of the strongest criticisms of some of the resulting twists and turns has been Kristin S. Shrader-Frechette's (1991) careful dissecting of the antidemocratic assumptions of much risk-cost-benefit analysis.

Second is the problem of the alienation of workers from their labor in the industrial means of production, which has been presented especially by Marxists as an economic and by some non-Marxist social scientists as a psychological issue. Langdon Winner's (1977) analysis of the theory of autonomous technology or the idea that technology as resistant to human control is a more general statement of the issue. Critical theory work by Herbert Marcuse (1964) and Andrew Feenberg (1991, 1999) extended the classic Marxist discussion into situations reconfigured by consumerist culture and globalization. Opposing Marcuse's pessimism about transformation, Feenberg (especially 1995) has been more optimistic about alternative possibilities. Environmentalists, however, have further argued that technology in general alienates human beings from nature.

Don Ihde's (1990) phenomenology of the techno-lifeworld offers another take on this issue through an analysis of human—technology—world relations. Two fundamental types of such engagements are instrumental relations, in which the technology is integrated into the human sensorium as its extension (the blind man's cane), and hermeneutic relations, in which the technology becomes part of the world to be interpreted (a thermometer). Both engagements manifest an invariant structure

that amplifies some aspect of the world (exact metric of temperature) while simultaneously reducing others (general sense of climate). The former tends to bring humans closer to the world, the latter to distance (or alienate) them from it.

Third is the problem of the destruction or transformation of culture by modern science and technology—either directly through new weapons and forms of military conflict or indirectly through the impact of new means of transportation, communication, and media. The destruction of World War I, the most violent in human history, was a manifestation of technology that only became worse during World War II with the development of nuclear weapons. The long cold war practice of nuclear deterrence and the early twenty-first-century challenges of terrorism present special problems for learning to manage the destructive potential in technology.

Between the two world wars concern for the more indirect technological transformation of culture took on special salience, as variously illustrated by the cultural lag theory of the American sociologist William Fielding Ogburn, the elegiac ruminations of the Catholic theologian Romano Guardini, or the active nihilistic enthusiasms of Ernst Jünger. In the latter half of the twentieth century the issue found small-scale manifestation in personal efforts to come to terms with new choices (e.g., in diet, drugs, and consumer lifestyle options) and large-scale manifestation in debates about the dynamics of sociotechnical change (e.g., the role of technology in economic development and technological determinism versus social constructionism). Questions can also arise about the transformed character of cultural life under the influence of information and image technologies, from television to the Internet and virtual reality machines.

Since World War II three more issues have emerged to ethical and political prominence. One is that of democratic participation. An anticipatory version of this issue emerged in interwar proposals for technocracy. For some theorists (such as Thorstein Veblen) rule by technical elites offered a better alternative than rule by economic or political elites. However, in the postwar revival of democratic theory, and with recognition that technology (like law) is a creation that also influences the creators, it was argued that the principle of "no taxation without representation" should be extended to "no innovation without representation" (Goldman 1992). Winner, for instance, describes "technologies as forms of life" and calls for the abandonment of "technological somnambulism" (1986, p. 10) in favor of public debate about the design of technological projects as diverse as highway bridges, tomato harvesters, and nuclear power plants. Efforts to determine how such democratic participation should be structured both within communities of technical expertise and in the negotiations between technical experts and the nontechnical public have been the subject of ongoing debates.

Fifth is the industrial pollution of the natural environment, which has contributed to attempts to develop an appropriate environmental or ecological ethics. What is the difference between artifice and nature—and the moral status of wilderness or the nonhuman environment? As nature is humanly transformed, to what extent should contemporary technological action take into account the welfare of future generations, whether human or nonhuman? What is the relation between values that are divided between the anthropocentric and ecocentric, extrinsic or instrumental and intrinsic? Another morally relevant concept, closely related to issues of both participation and environmentalism, is that of unintended consequences. To what extent are scientists and engineers responsible for the unexpected and perhaps even unforeseeable results of their technological actions? Two attempts to deal with the plethora of environmental issues, especially in relation to the challenge of unintended consequences, are those associated with sustainable development and the precautionary principle—with competing interpretations of both becoming major themes of

moral and political deliberations.

Finally, there is the issue of responsibility: How are humans to respond ethically to the power placed in their hands by modern technology? Such a question has personal, professional, and policy dimensions. At the personal level, quantitatively and qualitatively enhanced choices, with expanding knowledge production relevant to such choices (scientific research and consumer reports), place existential pressures on individuals to increase conscious reflection. The principle of free and informed consent appears to require not only that medical professionals inform the subjects of human experimentation about the risks and benefits of their participation but also that medical patients of all sorts become reflective participants in their own treatment—and that consumers of any technological goods or services weigh multiple costs and benefits as if they were engineers designing their lives. Are such demands both reasonable and possible?

At the professional level, scientists and engineers, falling under similar existential pressures to expand the conscious exercise of responsibility, have formulated codes of conduct for technical practices related to both research and design. In engineering ethics, for instance, the primacy of protecting public safety, health, and welfare is now a well-established general principle. In what sense, however, are engineers qualified to make such judgments? Does technical expertise provide any basis for determining appropriate levels of public safety, health, or welfare?

Finally, at the level of public policy, responsibility takes two closely related forms. Policy for science and technology seeks out the best ways to fund or regulate developments in science and technology. Science and technology for policy searches for the best ways to bring scientific knowledge to bear on political decision making while making technological power most effectively available for political action. Responding to and exemplifying these dual drives scientific and technological research agencies such as the U.S. National Science Foundation, the Human Genome Project, and the National Nanotechnology Initiative have created specific programs to promote ethical reflection on the creation and use of new scientific knowledge and technological products, processes, and systems.

Again speaking broadly, it is possible to identify two fundamental attitudes toward this spectrum of ethical and political issues. One attempts to explain modern technology as rooted in human nature and culture (engineering philosophy of technology), the other interprets modern technical methods and effects as deformations of human action, however preferable in particular instances to those of nature (humanities philosophy of technology). The engineering approach in its expansive confidence calls in one way or another for more and better technology, the humanities approach in its restrictive questioning for some relinquishment or delimitation of technology. The tensions between such alternative attitudes repeatedly come to the fore in analysis of such key concepts as privacy, risk, participation, and the environment, and in assessments of new opportunities in virtual reality construction, biotechnological design, and nanotechnological research and development.

There is also a tendency for the engineering school to make alliances with the Anglo American analytic tradition in philosophy, and for the humanities school to find a convenient partner in the European phenomenological tradition. The former, viewing technology as a complex amalgam of artifacts, knowledge, activities, and volitions, each with diverse structural features scattered across historical epochs and societal contexts, prefers to deal on a case-by-case basis with one technology after another. The latter strives for bolder generalizations about technology as a whole, at least across each historical or societal context. From the phenomenological perspective, too great an emphasis on individual technological rocks can obscure the extent to which such geological spec-

imens are constituents of mountains extended in both space and time.

## Metaphysical Issues

The attempt to speak of technology rather than technologies rests on an attempt to identify some inner or essential feature of diverse technologies. This hypothetical essential feature may be termed technicity. One can then immediately note that, before the modern period, technicity was at a minimum scattered throughout and heavily embedded within a diversity of human engagements, and indeed that philosophy took a stand against any separating of technicity from its embedding context. Plato's argument in the *Gorgias* is precisely an argument against disembedding *techne* from social or cultural contexts and traditions, not to mention ideas of the good. For Aristotle, *techne* is an intellectual virtue, and thus properly subordinate to the flourishing of human nature. What is distinctive about modern philosophy, by contrast, is the attempt, beginning with Galileo Galilei, Francis Bacon, and René Descartes to disembed technics from particular human activities, to study them in systematic ways, and thus to create technology.

John Stuart Mill in his *Logic* (1843) already assumes the success of this disembedding project when he explains the practical value of science. For Mill the rationality of any art is grounded in a corresponding science. The art proposes to itself an end to be attained, defines the end, and hands it over to the science. The science receives it, considers it as a phenomenon or effect to be studied, and, having investigated its causes and conditions, sends it back to art with a theorem of the combinations of circumstances by which it could be produced. Art then examines these combinations or circumstances, and according as any of them are or are not in human power, pronounces the end attainable or not. (*logic*, book 6, ch. 12, section 2)

Remarkably, Mill's analysis does not recognize art (or traditional technics) as including any knowledge of means. Art is concerned solely with determining an end, to achieve which it deploys appropriate means as determined by science. It is the scientific study of means that constitutes what even during Mill's lifetime was coming to be called technology. Modern technicity may thus be defined as a systematic or scientific study of means that suspends examination of ends. Does such an approach have distinctive social and cultural implications, independent of any particular technologies and contexts?

Among the first philosophers to analyze such a disembedding of means from ends was Ortega. In the English translation of his *La rebelión de las masas* (1929), Ortega writes that "[t]hree principles have made possible [the] new world: liberal democracy, scientific experiment, and industrialism. The two latter may be summed up in one word: technicism" (1939, p. 56). Ortega himself actually uses the word *técnica*, but the term technicism is significant, and this in fact constitutes one of its first English occurrences with this sense. (Before the 1930s, technicism simply meant excessive reliance on technical terminology. The previous decade Max Scheler used the cognate *Technizismus* to name the industrial ethos.)

As part of a further "Meditación de la técnica" (1939), Ortega outlined a historical movement from the chance inventions that characterize archaic societies, through the trial-and-error techniques of the artisan, to the scientific technologies of the engineer. According to Ortega, the difference between these three forms of making lies in the way they create the means to realize a human project—that is, in the kind of technicity involved. In the first epoch, technical discoveries are accidental; in the second, techniques emerge from intuitive skill. In both instances they are preserved and elaborated within the confines of myth and craft traditions. In the third, however, the engineer

undertakes scientific studies of technics and, as a result, "prior to the possession of any [particular] technics, already possesses technics [itself]" (Obras, 5:369). It is this third type of technicity that constitutes modern technicism (and here Ortega himself uses the term *tecnicismo*).

But technicism, understood here as the science of how to generate all possible technical means, disembedded from any lived making and using, creates a unique challenge. Before the modern period human beings were commonly limited by circumstances, within which they inherited a way of life and the technical means to achieve it. Now, however, they are given in advance many possible ways to live and a plethora of technical means but little in the way of a substantive vision of human flourishing. "To be an engineer and only an engineer is to be everything possibly and nothing actually," all form and no content (Obras, 5:366). There is in the midst of modern technicism what Ortega describes as a hidden ethical challenge to imagination and choice. Insofar as people can be anything they want, why should they take the trouble to be any one thing at all? Will not some extranatural motivation (not to say fanaticism) not be needed to help Buridan's cyborgs select among (rejecting some) the equally liberal options that surround them?

According to Heidegger modern technology is a challenge not just to ethics but to ontology. For Heidegger (1954) scientific technics constitutes a new kind of truth: truth not as correspondence, not as coherence, and not as functional knowledge, but as disclosure or revelation. Technology discloses Being in a historically unique way: as *Bestand* or resource. A castle constructed with traditional technics on a cliff overlooking the Rhine makes more fully present than before the stone that invests the landscape with its particular contours, while it sets off the curve of the river against the backdrop of its walls and towers. It invites people to settle near and experience the particularities of this place. By contrast, a poured concrete, hydroelectric power station compels the river to become an energy resource and converts the landscape into, not a place of human habitation, but a machine for the generation of electricity. It encourages people to draw on its energy for multitasking business in production and travel. The distinctly modern technicity that manifests itself in the disclosure of nature as resource Heidegger names *Gestell* (enframing).

*Gestell* at first sight appears to be a human work, something human beings in the course of history have chosen to practice for their own benefit. It gives them power over nature. However, as it digitalizes nature physically (dimensioned vectors), geographically (longitude and latitude), chemically (molecules, atoms, and subatomic particles), and biologically (genetic mapping), it also transforms language (computer signal processing) and art (pixel imaging) so that impact outstrips original intentions. Hidden in the midst of *Gestell* is Being as event, that which lets this dominating transformation come to pass. *Gestell* is at once destiny and, precisely because it appears so clearly to be the result of a human activity, an obscuring of the transhuman imparting of a destiny that is its ground.

In the same year that Heidegger's *Die Frage nach der Technik* appeared, Jacques Ellul published *La Technique*, later translated into English as *The Technological Society* (1954). For Ellul, too, what is happening is something transhuman, or at least transindividual, the emergence of a new social order in which people give themselves up to the systematic analysis of actions into constituent means that are then evaluated in terms of output/input metrics. The scientific analysis of techniques extends technoscientific methods into economics, politics, education, leisure, and elsewhere creating what he calls the technical milieu. After the milicux of nature and of society, technology is the third great epoch of human history. Ellul's characterology of this new reality—describing its rationality, artificiality, self-directedness, self-augmentation, indivisibility, universality, and autonomy—reveals the technical milieu as something more than simply human. Although more

hospitable to human biological existence, it nevertheless also manifests certain inexorable laws of artifice (such as those of economics). Just as the natural milieu once provided a framework for human life, a differentiated but overriding order to which human beings adapted in a variety of ways, so now a much more homogeneous technical milieu presents itself, not simply as a realm of freedom that human beings have constructed, but as that which also constructs and constrains them even when they fail to recognize it.

### **From Metaphysics to Ethics**

Efforts to make phenomenological metaphysics fruitful for ethics can be found in the work of two German American philosophers, Hans Jonas and Albert Borgmann. Jonas's (1966) work begins with a fundamental inquiry into the phenomenon of life, arguing that in the organic world there emerges a new kind of being. For Jonas the key features of human inner life (introspection and subjectivity) are present in embryo in the most primitive organisms, and in metabolism there emerges the primordial form of freedom. In metabolism a detachment enters the world insofar as being becomes distinguished from physical identity. However, in the materialism of modern science this uniqueness is easily overlooked. Adopting a teleological approach to ontology, Jonas argues that only from the perspective of the more fully realized freedom manifest in humans can the reality of the organic as a whole be recognized for what it is. On this ontological basis Jonas (1984) undertakes an extended philosophical scrutiny of the technological projects of nuclear weapons and biomedical health care. In the presence of technical powers to end or alter human life Jonas reformulates the Kantian categorical imperative as: "Act so that the effects of your action are compatible with the permanence of genuine human life" (p. 11). Such a reformulation of the fundamental deontological principle constitutes an attempt at the re-embedding of technology in moral philosophy.

More broadly and in sustained dialogue with a range of discussions about the place of technology in human affairs, Borgmann's (1984) work draws a fundamental distinction between two kinds of artifice and action. On the one side are technological devices that obscure their inner functions to deliver without engagement commodities for easy and effortless consumption. This constitutes what Borgmann calls the device paradigm, an ideal type at which the products and processes of modern technology aim. On the other are focal things and practices whose workings are more transparent and that demand of their users some reordering of interests if they are to be used. The model for the first is the central heating system that only needs its thermostat set, for the second the wood-fired hearth.

In a series of studies arguing the nondeterminist importance of material culture to ethics and politics, Borgmann (1992, 1999) calls on citizens in the high-tech world to reconsider their ways of life to develop a deeper sense for the possibilities of human flourishing in the midst of liberal options for self-determined self-fulfillment. For Borgmann the ideal is not a forced return to the past but a voluntary recovery of the commanding presence of things in the technological present. As he concludes in a volume devoted to the critical assessment of his thought:

Science makes reality ever more transparent, and technology makes it more and more controllable. But at the end of our inquiries and manipulations there is always something that reflects rather than yields to our searchlight and presents itself as given to us rather than constructed by us. It is intelligible not because we have seen through it or designed it but because it speaks to us [in the form of] an unforthinkable and uncontrollable reality. (Higgs, Lights, and Strong 2000, pp. 368–

369).

It is such a reality to which human flourishing is ultimately in thrall even in the midst of its highest exercises of insight and mastery.

### **Epistemological Issues**

Epistemology has often been treated as a stepchild in the philosophy of technology family of philosophical interests. Technological forms of knowledge are commonly thought to be derivative of scientific knowledge, so that any attempt to bring the theory of knowledge to bear in the examination of technology has regularly been part of a discussion of the relation between technology and science. At the same time this common privileging of science has been philosophically criticized, although the criticism has taken different forms in the European phenomenological and in the Anglo American analytic philosophical traditions.

From a phenomenological perspective the argument has been that technology is not so much applied science as science is theoretical technology. In his historico-philosophical studies of the scientific and technological revolutions of the seventeenth century and after, for instance, Jonas (1974) argues that from its origins modern science was animated by a technological interest that gives it an inherently applicable or technological character. Related studies of the dependency of science on technological instrumentation, from Galileo's telescopes to particle accelerators and PCR (polymerase chain reaction) machines suggest that science might even be described as applied technology. This approach to the epistemology of technology has parallels with the pragmatic tradition of conceiving scientific knowledge in fundamentally instrumentalist terms. The Venezuelan phenomenologist Ernesto Mayz Vallenilla (2004) likewise offers a more Husserlian-based but complementary effort to describe the unique epistemological features of what he calls meta-technical instruments.

From the analytic perspective there has been more of an effort to identify distinctive types of knowledge operative in technology. Summarizing the results from such an approach, Mitcham (1994) draws attention to at least four types of distinctly technological knowledge: sensorimotor skills, technical maxims (including rules of thumb and recipes), descriptive laws or technological rules (which take an "if A then B" form), and technological theories (either grounded in scientific theory or bringing scientific method to bear on human-technology interactions). German philosophers of technology such as Hans Lenk, Gunter Ropohl, and Bernhard Irrgang, all associated with the VDI promotion of philosophical reflection on technology, are pursuing efforts to develop epistemological analyses of the engineering sciences. And Joseph C. Pitt (2000) makes a determined effort to identify the distinctive forms of technological and engineering knowledge, drawing especially on the careful analyses of aeronautical engineering history by Walter G. Vincenti (1990) to argue that engineering design possesses its own cognitive features.

Important issues for any theory of technological knowledge remain the characterization of whatever basic epistemic criteria might be analogous to those operative in science such as truth, simplicity, coherence, and explanation. There may be distinctive technological forms of such criteria. But two major candidates for uniquely technological criteria are effectiveness and efficiency. Certainly, many propositions of engineering knowledge are assessed in terms of effectiveness and efficiency more than truth or explanation. A further epistemological challenge is to explicate the distinctive character of models and modeling in the technological and engineering contexts. The relevance of such epistemological analyses nevertheless remains of problematic relevance to ethics and politics.

## **Empirical, Anthropological, and Policy Turns**

Concern for the adequacy of metaphysical definitions of technology—and perhaps exhaustion with endless ethical and political difficulties (with hopes that new approaches might prove more fruitful)—has given rise to what has been called an empirical turn in the philosophy of technology. As advocated by the Dutch philosophers Peter Kroes and Anthonie Meijers, this program argues that "philosophical reflection should be based on empirically adequate descriptions reflecting the richness and complexity of modern technology" (2000, p. xix) and promotes a greater analysis of what technologists and engineers actually do over any extended exegesis of texts, whether those of other philosophers of technology or even engineers and technicians. As such, a natural alliance has developed with social constructivist approaches to science, technology, and society studies in the pursuit of richer metaphysical or ontological understandings of artifacts, epistemological analyses of technical practice, and even ethical decision making among professional engineers. From the perspective of Jozef Keulartz et al. (2002), this also provides a solid opportunity for advancing a pragmatist ethics for technological culture.

Two topics of prominence in the empirical turn from the interpretation of texts to the interpretation of technical artifacts have been those of design and function. Design is often identified as the essence of engineering, and there have been numerous technical studies of design methodology. At the same time engineering design must be distinguished from aesthetic design as well as design by means of evolutionary processes in nature. Even within the realm of engineering design, studies such as those by Vincenti (1990), Louis Bucciarelli (1994), and Richard Buchanan and Victor Margolin (1995) have very different implications for assessing proposals for consumer, green, sustainable, or participatory design. With regard to technical functions, analyses have focused on the relation between functions in organisms, social institutions, and artifacts; on the relation between functional and physical descriptions of artifacts; and on the extent to which functions are determined by design or use.

A different sense for new beginnings has emerged in relation to prospects in the development of the new fields of bioengineering and biotechnology—especially when applied to humans. The leader in this case is the medical scientist and philosopher Leon Kass, the chair of the Bush administration's President's Council on Bioethics. In his turn Kass has tried to go outside the boundaries of standard bioethics in at least four ways: to promote thinking that enrolls more than professional bioethicists, that does more than piecemeal or specialized analyses, that references human nature as a norm, and that builds toward policy results. As in *Beyond Therapy: Biotechnology and the Pursuit of Happiness* (2003), Kass et al. at the council seek to raise broad issues about what it means to be human in the presence of possibilities for the reengineering not just of the external world but of the inner world of human birth, growth, and experience. He has been especially concerned about the possibilities for the deformation of humanity not from above by totalitarian governmental use of technology but from below by positive consumer endorsement of behaviors that would from a traditional perspective be assessed as temptations.

Beyond the policy-oriented work of Kass and colleagues, policy questions have become increasingly central not just as aspects of ethical responsibility but as issues in their own right. What precisely is technological policy, as opposed to technological politics? Does policy decision making take different forms in relation to science and to engineering? How are policies to be formulated and assessed?

The extent to which these turns in the philosophy of technology will define its future are questions that the professional community must examine. Any such examination will also need to include a

self-criticism that considers the special responsibilities of a regionalization in philosophy that, more than the philosophy of science or of art, has as part of its heritage public responsibilities and a large measure of ethical concerns.

### **(The Nature of) Technology?**

The question, What is technology? or What is the nature of technology?, is both a central question that philosophers of technology aim to answer and a question the answer to which determines the subject matter of philosophy of technology. One can think of philosophy of technology as the philosophical examination of technology, in the same way as the philosophy of science is the philosophical examination of science and the philosophy of biology the philosophical study of a particular subdomain of science. However, in this respect the philosophy of technology is in a similar situation as the philosophy of science finds itself in.

Central questions in the philosophy of science have long been what science is, what characterizes science and what distinguishes science from non-science (the demarcation problem). These questions have recently somewhat moved out of focus, however, due to the lack of acceptable answers. Philosophers of science have not been able to satisfactorily explicate the nature of science or to specify any clear-cut criterion by which science could be demarcated from non-science or pseudo-science. As philosopher of science Paul Hoyningen-Huene (2008: 168) wrote: "fact is that at the beginning of the 21<sup>st</sup> century there is no consensus among philosophers or historians or scientists about the nature of science."

The nature of technology, however, is even less clear than the nature of science. As philosopher of science Marx Wartofsky put it, "'Technology' is unfortunately too vague a term to define a domain; or else, so broad in its scope that what it does define includes too much. For example, one may talk about technology as including all artifacts, that is, all things made by human beings. Since we 'make' language, literature, art, social organizations, beliefs, laws and theories as well as tools and machines, and their products, such an approach covers too much" (Wartofsky, 1979: 176). More clarity on this issue can be achieved by looking at the history of the term (for example, Nye, 2006: Chapter 1; Misa, 2009; Mitcham & Schatzberg, 2009) as well as at recent suggestions to define it.

Jacob Bigelow, an early author on technology, conceived of it as a specific domain of knowledge: technology was "an account [...] of the principles, processes, and nomenclatures of the more conspicuous arts" (Bigelow, 1829, quoted in Misa, 2009: 9; Mitcham & Schatzberg, 2009: 37). In a similar manner, Günter Ropohl (1990: 112; 2009: 31) defined "technology" as the 'science of technics' ("Wissenschaft von der Technik", where "Technik" denotes the domain of crafts and other areas of manufacturing, making, etc.). The important aspect of Bigelow's and Ropohl's definitions is that "technology" does not denote a domain of human activity (such as making or designing) or a domain of objects (technological innovations, such as solar panels), but a domain of knowledge. In this respect, their usage of the term is continuous with the meaning of the Greek "techne" (Section 1.a).

A review of a number of definitions of "technology" (Li-Hua, 2009) shows that there is not much overlap between the various definitions that can be found in the literature. Many definitions conceive of technology in Bigelow's and Ropohl's sense as a particular body of knowledge (thus making the philosophy of technology a branch of epistemology), but do not agree on what kind of knowledge it is supposed to be. On some definitions it is seen as firm-specific knowledge about design and production processes, while others conceive of it as knowledge about natural phenom-

ena and laws of nature that can be used to satisfy human needs and solve human problems (a view which closely resembles Francis Bacon's).

Philosopher of science Mario Bunge presented a view of the nature of technology along the latter lines (Bunge, 1966). According to Bunge, technology should be understood as constituting a particular subdomain of the sciences, namely "applied science", as he called it. Note that Bunge's thesis is not that technology is applied science in the sense of the application of scientific theories, models, etc. for practical purposes. Although a view of technology as being "just the totality of means for applying science" (Scharff, 2009: 160) remains present among the general public, most engineers and philosophers of technology agree that technology cannot be conceived of as the application of science in this sense. Bunge's view is that technology is the subdomain of science characterized by a particular aim, namely application. According to Bunge, natural science and applied science stand side by side as two distinct modes of doing science: while natural science is scientific investigation aimed at the production of reliable knowledge about the world, technology is scientific investigation aimed at application. Both are full-blown domains of science, in which investigations are carried out and knowledge is produced (knowledge about the world and how it can be applied to concrete problems, respectively). The difference between the two domains lies in the nature of the knowledge that is produced and the aims that are in focus. Bunge's statement that "technology is applied science" should thus be read as "technology is science for the purpose of application" and not as "technology is the application of science."

Other definitions reflect still different conceptions of technology. In the definition accepted by the United Nations Conference on Trade and Development (UNCTAD), technology not only includes specific knowledge, but also machinery, production systems and skilled human labor force. Li-Hua (2009) follows the UNCTAD definition by proposing a four-element definition of "technology" as encompassing technique (that is, a specific technique for making a particular product), specific knowledge (required for making that product; he calls this technology in the strict sense), the organization of production and the end product itself. Friedrich Rapp, in contrast, defined "technology" even more broadly as a domain of human activity: "in simplest terms, technology is the reshaping of the physical world for human purposes" (Rapp, 1989: xxiii).

Thus, attempts to define "technology" in such a way that this definition would express the nature of technology, or only some of the principal characteristics of technology, have not led to any generally accepted view of what technology is. In this context, historian of science and technology Thomas J. Misa observed that historians of technology have so far resisted defining "technology" in the same way as "no scholarly historian of art would feel the least temptation to define "art", as if that complex expression of human creativity could be pinned down by a few well-chosen words" (Misa, 2009: 8). The suggestion clearly is that technology is far too complex and too diverse a domain to define or to be able to talk about the nature of technology. Nordmann (2008: 14) went even further by arguing that not only can the term "technology" not be defined, but also it should not be defined. According to Nordmann, we should accept that technology is too diverse a domain to be caught in a compact definition. Accordingly, instead of conceiving of "technology" as the name of a particular fixed collection of phenomena that can be investigated, Nordmann held that "technology" is best understood as what Grunwald & Julliard (2005) called a "reflective concept". According to the latter authors, "technology" should simply be taken to mean whatever we mean when we use the term. While this clearly cannot be an adequate definition of the term, it still can serve as a basis for reflections on technology in that it gives us at least some sense of what it is that we are reflection on. Using "technology" in this extremely loose manner allows us to connect reflections on very different issues and phenomena as being about – in the broadest sense –

the same thing. In this way, “technology” can serve as the core concept of the field of philosophy of technology.

Philosophy of technology faces the challenge of clarifying the nature of a particular domain of phenomena without being able to determine the boundaries of that domain. Perhaps the best way out of this situation is to approach the question on a case-by-case basis, where the various cases are connected by the fact that they all involve technology in the broadest possible sense of the term. Rather than asking what technology is, and how the nature of technology is to be characterized, it might be better to examine the natures of particular instances of technology and in so doing achieve more clarity about a number of local phenomena. In the end, the results from various case studies might to some extent converge – or they might not.

## **Dominance**

**Theory of Technology Dominance** Main dependent construct(s)/factor(s) TTD has two dependent factors:

1. Reliance - The extent to which an individual applies the intelligent decision aid and integrates the recommendations of that aid into his or her judgment.
2. Dominance - The state of decision making where the intelligent decision aid, as opposed to its user, takes primary control of a decision making process.

## **Main independent construct(s)/factor(s)**

TTD has four independent factors:

1. Task Experience - The level of experience a decision maker has regarding the completion of a task as well as the extent to which the decision maker has developed strategies for completing that particular task.
2. Task Complexity - The extent to which the cognitive abilities of the decision maker are challenged with completing a certain task. (In psychology this is often termed Task Difficulty.)
3. Decision Aid Familiarity - The extent to which the decision maker is comfortable with the intelligent decision aid based on prior experience and/or significant training with the aid (or similar aids).
4. Cognitive Fit – The extent to which the cognitive processes used with the decision aid to complete a task match the cognitive processes normally applied by the decision maker using the aid.

## **Concise description of theory**

The Theory of Technology Dominance (TTD) posits that a decision maker may become reliant on an intelligent decision aid under two conditions:

1. The decision maker is low in task experience.
2. The decision maker is high in all factors (task experience, task complexity, decision aid familiarity, and cognitive fit).

According to TDD, reliance on an intelligent decision aid can create a long-term, de-skilling effect in the user as well as hinder that user’s growth of knowledge and advancement in his or her domain. Furthermore, TDD states that a negative relationship exists between the user’s expertise level and the risk of poor decision making when the expertise of the user and intelligent decision aid are

mismatched. When the expertise of the user and the aid are matched, however, a positive relationship exists between reliance on the aid and improved decisions making.

Conceptually, TTD can be divided into three sections which are built on a total of eight testable propositions. The three sections are:

- Section 1: Addresses the factors that determine the likelihood that a decision maker will rely on an intelligent decision aid.
- Section 2: Addresses the conditions under which a decision maker is vulnerable to being dominated by the intelligent decision aid.
- Section 3: Addresses the long-term impact of intelligent decision aid use on de-skilling domain experts and impeding epistemological evolution.
- The eight testable propositions are (Arnold & Sutton, 1998):

### **Section 1 - Factors influencing reliance**

- Proposition 1: "When users have a low to moderate level of experience, there is a negative relationship between task experience and reliance on a decision aid."
- Proposition 2: "There is a positive relationship between task complexity and reliance on a decision aid."
- Proposition 3: "When task experience and perceived task complexity are high, there is a positive relationship between decision aid familiarity and reliance on the decision aid."
- Proposition 4: "When task experience and perceived task complexity are high, there is a positive relationship between cognitive fit and reliance on the decision aid."

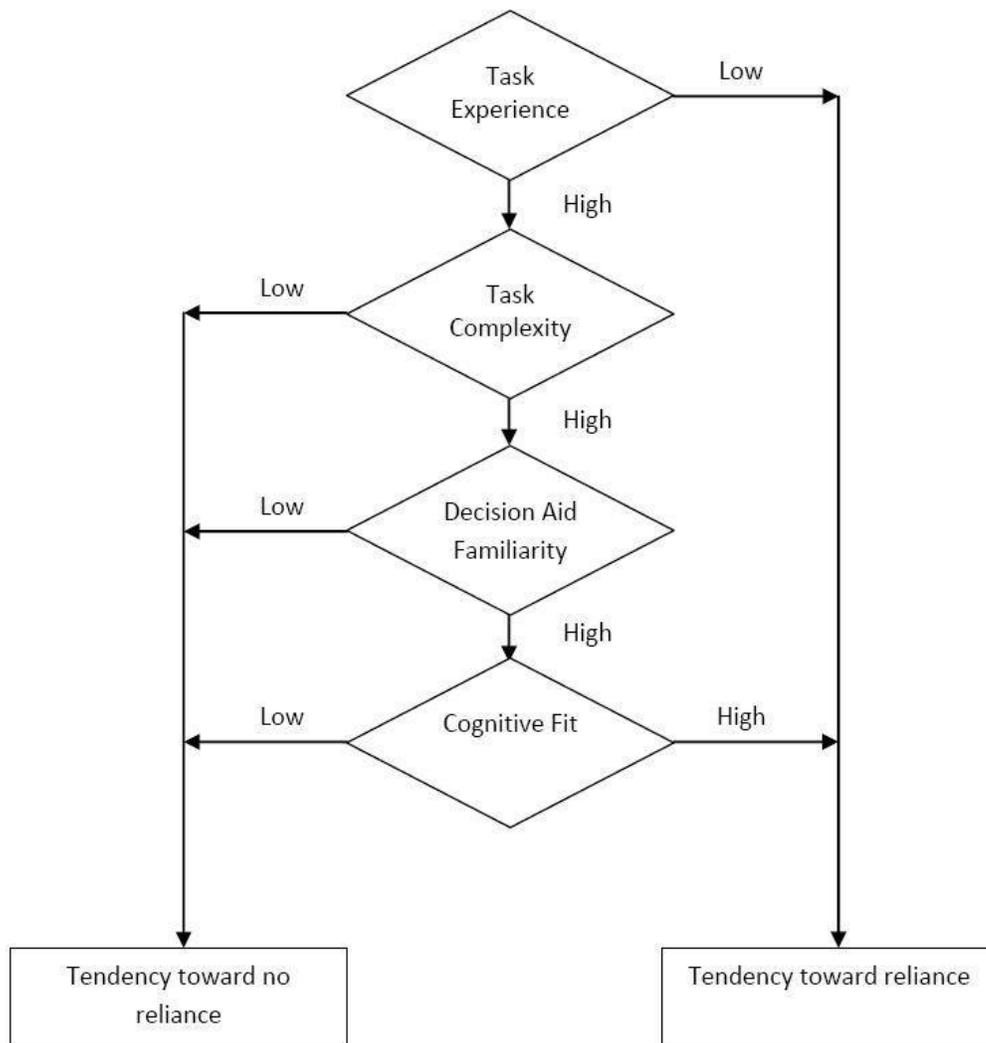

### **Section 2 – Conditions favorable for dominance**

- Proposition 5: "When the expertise of the user and intelligent decision aid are mismatched, there is a negative relationship between the user's expertise level and the risk of poor decision making."
- Proposition 6: "When the expertise level of the user and intelligent decision aid are matched, there is a positive relationship between reliance on the aid and improved decisions making."

### **Section 3 – Long-term effects**

- Proposition 7: "There is a positive relationship between continued use of an intelligent decision aid and the de-skilling of auditors' abilities for the domain in which the aid is used."
- Proposition 8: "There is negative relationship between the broad-based, long-term use of an intelligent decision aid in a given problem domain and the growth in knowledge and advancement of the domain."

### **Diagram/schematic of theory**

Recreated from Arnold and Sutton (1998)

## Power and Social inequalities

Power and inequality determine the socioeconomic conditions of different classes.

## Key Points

- Social stratification is a concept involving the classification of persons into groups based on shared socioeconomic conditions.
- Conflict theories, such as Marxism, focus on the inaccessibility of resources and lack of social mobility found in stratified societies.
- Social stratification has been shown to cause many social problems, including homicide, infant mortality, obesity, teenage pregnancies, emotional depression, teen suicide, and a high prison population.
- In modern Western societies, stratification is broadly organized into three main layers: upper class, middle class, and lower class.
- Conflict theories, such as Marxism, point to the inaccessibility of resources and lack of social mobility found in stratified societies.
- In Marxist theory, the capitalist mode of production consists of two main economic parts: the

- substructure and the Superstructure. Marx
- Social stratification has been shown to cause many social problems.

## Key Terms

- **Marxist Theory:** An economic and sociopolitical worldview and method of socioeconomic inquiry centered upon a materialist interpretation of history, a dialectical view of social change, and an analysis–critique of the development of capitalism.
- **Conflict Theories:** Perspectives in social science that emphasize the social, political, or material inequality of a social group, critique the broad socio-political system, or otherwise detract from structural functionalism and ideological conservatism.
- **Weberian:** Of or relating to Max Weber (1864–1920), influential German sociologist and political economist.

## Power and Inequality

In social science and politics, power is the ability to influence the behavior of people. The term authority is often used for power perceived as legitimate by the social structure. Power can be seen as evil or unjust, but the exercise of power is accepted as endemic to (or regularly found in) humans as social beings. French philosopher Michel Foucault (1926–1984) saw power as “a complex strategic situation in a given society social setting”. Power may be held through authority, social class (material wealth), personal charisma, expertise or knowledge, persuasion, force (such as law or violence), and a myriad of other dynamics.

Because power operates both relationally and reciprocally, sociologists speak of the balance of power between people in a relationship. All parties to all relationships have some power; the sociological examination of power concerns itself with discovering and describing the relative strengths – equal or unequal, stable or subject to periodic change. Given that power is not innate and can be granted to others, to acquire power you must possess or control a form of power currency (such as wealth, social status, authority, etc.).

## Social inequality and stratification

Social inequality refers to relational processes in society that have the effect of limiting or harming a group’s social status, social class, and social circle. Areas of social inequality include access to voting rights, freedom of speech and assembly, the extent of property rights and access to education, health care, quality housing, traveling, transportation, vacationing and other social goods and services.

The reasons for social inequality can vary, but are often broad and far reaching. Social inequality can emerge through a society’s understanding of appropriate gender roles, or through the prevalence of social stereotyping. They can also be established through discriminatory legislation. Social inequalities exist between ethnic or religious groups, classes and countries, making the concept a global phenomenon. In sociology, social stratification is a concept involving the classification of persons into groups based on shared socioeconomic conditions; it is a relational set of inequalities with economic, social, political and ideological dimensions. Theories of social stratification are based on four basic principles:

- Social stratification is a trait of society, not simply a reflection of individual differences.

- Social stratification carries over from generation to generation.
- Social stratification is universal but variable.
- Social stratification involves not just inequality but beliefs as well.

## **Classifications of stratification**

In modern Western societies, stratification is broadly organized into three main layers: upper class, middle class, and lower class. The upper class in modern societies is the social class composed of the wealthiest members of society, who also wield the greatest political power. The upper class is generally contained within the wealthiest 1–2 percent of the population, with wealth passed from generation to generation. In Weberian socioeconomic terms, the middle class is the broad group of people in contemporary society who fall socioeconomically between the working class and upper class. The common measures of what constitutes middle class vary significantly between cultures. The working class describes the group of people employed in lower tier jobs, often including those in unemployment or otherwise possessing below-average incomes. Working classes are mainly found in industrialized economies and in urban areas of non-industrialized economies.

## **Social Stratification and Marxism**

Conflict theories, such as Marxism, focus on the inaccessibility of resources and lack of social mobility found in stratified societies. Many sociological theorists have criticized the extent to which the working classes are unlikely to advance socioeconomically; the wealthy tend to hold political power which they use to exploit the proletariat inter-generationally.

In Marxist theory, the capitalist mode of production consists of two main economic parts: the substructure and the superstructure. Marx saw classes as defined by people's relationship to the means of production in two basic ways: either they own productive property or they labor for others. The base comprehends the forces and relations of production: employer-employee work conditions, the technical division of labor, and property relations—into which people enter to produce the necessities and amenities of life. These relations determine society's other relationships and ideas, which are described as its superstructure. The superstructure of a society includes its culture, institutions, political power structures, roles, rituals, and state.

Social stratification has been shown to cause many social problems. A comprehensive study of major world economies revealed that homicide, infant mortality, obesity, teenage pregnancies, emotional depression, teen suicide, and prison population all correlate with higher social inequality.

## **There are three common characteristics of stratified systems:**

1. Rankings apply to social categories of people who share a common characteristic without necessarily interacting or identifying with each other. The process of being ranked can be changed by the person being ranked, and it can differ based on race, gender, and social class.
2. People's life experiences and opportunities depend on their social category. This characteristic can be changed by the amount of work a person can put into their interests. The use of resources can influence others.
3. The ranks of different social categories change slowly over time. This has occurred frequently in the United States ever since the American revolution—the U.S. Constitution has been altered several times to specify rights for everyone.

## **Democratization of technology**

**Democratization of technology** refers to the process by which access to technology rapidly continues to become more accessible to more people. New technologies and improved user experiences have empowered those outside of the technical industry to access and use technological products and services. At an increasing scale, consumers have greater access to use and purchase technologically sophisticated products, as well as to participate meaningfully in the development of these products. Industry innovation and user demand have been associated with more affordable, user-friendly products. This is an ongoing process, beginning with the development of mass production and increasing dramatically as digitization became commonplace.

Thomas Friedman argued that the era of globalization has been characterized by the democratization of technology, democratization of finance, and democratization of information. Technology has been critical in the latter two processes, facilitating the rapid expansion of access to specialized knowledge and tools, as well as changing the way that people view and demand such access.

## **History**

Scholars and social critics often cite the invention of the printing press as a major invention that changed the course of history. The force of the printing press rested not in its impact on the printing industry or inventors, but on its ability to transmit information to a broader public by way of mass production. This event is so widely recognized because of its social impact – as a democratizing force. The printing press is often seen as the historical counterpart to the Internet.

After the development of the Internet in 1969, its use remained limited to communications between scientists and within government, although use of email and boards gained popularity among those with access. It did not become a popular means of communication until the 1990s. In 1993 the US federal government opened the Internet to commerce and the creation of HTML formed the basis for universal accessibility.

## **Major innovations**

The Internet has played a critical role in modern life as a typical feature of most Western households, and has been key in the democratization of knowledge. It not only constitutes arguably the most critical innovation in this trend thus far; it has also allowed users to gain knowledge of and access to other technologies. Users can learn of new developments more quickly, and purchase high-tech products otherwise only actively marketed to recognized experts. Some have argued that cloud computing is having a major effect by allowing users greater access through mobility and pay-as-you-use capacity.

Social media has also empowered and emboldened users to become contributors and critics of technological developments. The open-source model allows users to participate directly in development of software, rather than indirect participation, through contributing opinions. By being shaped by the user, development is directly responsive to user demand and can be obtained for free or at a low cost. In a comparable trend, arduino and littleBits have made electronics more accessible to users of all backgrounds and ages. The development of 3D printers has the potential to increasingly democratize production.

## **Cultural impact**

This trend is linked to the spread of knowledge of and ability to perform high-tech tasks, challeng-

ing previous conceptions of expertise. Widespread access to technology, including lower costs, was critical to the transition to the new economy. Similarly, democratization of technology was also fuelled by this economic transition, which produced demands for technological innovation and optimism in technology-driven progress.

Since the 1980s, a spreading constructivist conception of technology has emphasized that the social and technical domains are critically intertwined. Scholars have argued that technology is non-neutral, defined contextually and locally by a certain relationship with society.

Andrew Feenberg, a central thinker in the philosophy of technology, argued that democratizing technology means expanding technological design to include alternative interests and values. When successful in doing so, this can be a tool for increasing inclusiveness. This also suggests an important participatory role for consumers if technology is to be truly democratic. Feenberg asserts that this must be achieved by consumer intervention in a liberated design process. Improved access to specialized knowledge and tools has been associated with an increase in the "do it yourself" (DIY) trend. This has also been associated with consumerization, whereby personal or privately owned devices and software are also used for business purposes. Some have argued that this is linked to reduced dependence on traditional information technology departments.

Astra Taylor, the author of the book *The People's Platform: Taking Back Power and Culture in the Digital Age*, argues, "The promotion of Internet-enabled amateurism is a lazy substitute for real equality of opportunity."

### **Industry impact**

In some ways, democratization of technology has strengthened this industry. Markets have broadened and diversified. Consumer feedback and input is available at a very low or no cost. However, related industries are experiencing decreased demand for qualified professionals as consumers are able to fill more of their demands themselves. Users of a range of types and status have access to increasingly similar technology. Because of the decreased costs and expertise necessary to use products and software, professionals (e.g. in the audio industry) may experience loss of work.

In some cases, technology is accessible but sufficiently complex that most users without specialized training are able to operate it without necessarily understanding how it works. Additionally, the process of consumerization has led to an influx in the number of devices in businesses and accessing private networks that IT departments cannot control or access. While this can lead to lowered operating costs and increased innovation, it is also associated with security concerns that most businesses are unable to address at the pace of the spread of technology.

### **Political impact**

At a demonstration at BMVIT, banners read, "Democracy needs anonymity – stop data retention" (left) and "Liberty dies with security" (right). Some scholars have argued that technological change will bring about a third wave of democracy. The Internet has been recognized for its role in promoting increased citizen advocacy and government transparency. Jesse Chen, a leading thinker in democratic engagement technologies, distinguishes the democratizing effects of technology from democracy itself. Chen has argued that, while the Internet may have democratizing effects, the Internet alone cannot deliver democracy at all levels of society unless technologies are purposely designed for the nuances of democracy, specifically the engagement of large groups of people in

between elections in and beyond government.

The spread of the Internet and other forms of technology has led to increased global connectivity. Many scholars believe that it has been associated in the developing world not only with increased Western influence, but also with the spread of democracy through increased communication, efficiency, and access to information. Scholars have drawn associations between the level of technological connectedness and democracy in many nations.

Technology can enhance democracy in the developed world as well. In addition to increased communication and transparency, some electorates have implemented online voting to accommodate an increased number of citizens.

### **Public evaluation of science and technology**

Although there was much technological progress in the Roman empire and during the Middle Ages, philosophical reflection on technology did not grow at a corresponding rate. Comprehensive works such as Vitruvius' *De architectura* (first century BC) and Agricola's *De re metallica* (1556) paid much attention to practical aspects of technology but little to philosophy.

In the realm of scholastic philosophy, there was an emergent appreciation for the mechanical arts. They were generally considered to be born of—and limited to—the mimicry of nature. This view was challenged when alchemy was introduced in the Latin West around the mid-twelfth century. Some alchemical writers such as Roger Bacon were willing to argue that human art, even if learned by imitating natural processes, could successfully reproduce natural products or even surpass them (Newman 2004). The result was a philosophy of technology in which human art was raised to a level of appreciation not found in other writings until the Renaissance. However, the last three decades of the thirteenth century witnessed an increasingly hostile attitude by religious authorities toward alchemy that culminated eventually in the denunciation *Contra alchymistas*, written by the inquisitor Nicholas Eymeric in 1396 (Newman 2004).

The Renaissance led to a greater appreciation of human beings and their creative efforts, including technology. As a result, philosophical reflection on technology and its impact on society increased. Francis Bacon is generally regarded as the first modern author to put forward such reflection. His view, expressed in his fantasy *New Atlantis* (1627), was overwhelmingly positive. This positive attitude lasted well into the nineteenth century, incorporating the first half-century of the industrial revolution.

For example, Karl Marx did not condemn the steam engine or the spinning mill for the vices of the bourgeois mode of production; he believed that ongoing technological innovation were necessary steps toward the more blissful stages of socialism and communism of the future.

A turning point in the appreciation of technology as a socio-cultural phenomenon is marked by Samuel Butler's *Erewhon* (1872), written under the influence of the Industrial Revolution, and Darwin's *On the Origin of Species* (1859). Butler's book gave an account of a fictional country where all machines are banned and the possession of a machine or the attempt to build one is a capital crime. The people of this country had become convinced by an argument that ongoing technical improvements are likely to lead to a 'race' of machines that will replace mankind as the dominant species on earth.

During the last quarter of the nineteenth century and most of the twentieth century a critical attitude predominated in philosophical reflection on technology. The representatives of this attitude were, overwhelmingly, schooled in the humanities or the social sciences and had virtually no first-hand knowledge of engineering practice. Whereas Bacon wrote extensively on the method of science and conducted physical experiments himself, Butler, being a clergyman, lacked such first-hand knowledge. Ernst Kapp, who was the first to use the term 'philosophy of technology' in his book *Eine Philosophie der Technik* (1877 [2018]), was a philologist and historian. Most of the authors who wrote critically about technology and its socio-cultural role during the twentieth century were philosophers of a general outlook, such as Martin Heidegger (1954 [1977]), Hans Jonas (1979 [1984]), Arnold Gehlen (1957 [1980]), Günther Anders (1956), and Andrew Feenberg (1999). Others had a background in one of the other humanities or in social science, such as literary criticism and social research in the case of Lewis Mumford (1934), law in the case of Jacques Ellul (1954 [1964]), political science in the case of Langdon Winner (1977, 1980, 1983) and literary studies in the case of Albert Borgmann (1984). The form of philosophy of technology constituted by the writings of these and others has been called by Carl Mitcham (1994) "humanities philosophy of technology", because it takes its point of departure from the social sciences and the humanities rather than from the practice of technology, and it approaches technology accepting "the primacy of the humanities over technologies" (1994: 39), since technology originates from the goals and values of humans.

Humanities philosophers of technology tend to take the phenomenon of technology itself largely for granted; they treat it as a 'black box', a given, a unitary, monolithic, inescapable phenomenon. Their interest is not so much to analyze and understand this phenomenon itself but to grasp its relations to morality (Jonas, Gehlen), politics (Winner), the structure of society (Mumford), human culture (Ellul), the human condition (Hannah Arendt), or metaphysics (Heidegger). In this, these philosophers are almost all openly critical of technology: all things considered, they tend to have a negative judgment of the way technology has affected human society and culture, or at least they single out for consideration the negative effects of technology on human society and culture. This does not necessarily mean that technology itself is pointed out as the principal cause of these negative developments. In the case of Heidegger, in particular, the paramount position of technology in modern society is rather a symptom of something more fundamental, namely a wrongheaded attitude towards Being which has been on the rise for almost 25 centuries. It is therefore questionable whether Heidegger should be considered as a philosopher of technology, although within the traditional view he is considered to be among the most important ones. Much the same could be said about Arendt, in particular her discussion of technology in *The Human Condition* (1958), although her position in the canon of humanities philosophy of technology is not as prominent. To be sure, the work of these founding figures of humanities philosophy of technology has been taken further by a second and third generation of scholars— in particular the work of Heidegger remains an important source of inspiration— but who in doing so have adopted a more neutral rather than overall negative view of technology and its meaning for human life and culture. Notable examples are Ihde (1979, 1993) and Verbeek (2000 [2005]).

In its development, humanities philosophy of technology continues to be influenced not so much by developments in philosophy (e.g., philosophy of science, philosophy of action, philosophy of mind) but by developments in the social sciences and humanities. Although, for example, Ihde and those who take their point of departure with him, position their work as phenomenologist or postphenomenologist, there does not seem to be much interest in either the past or the present of this diffuse notion in philosophy, and in particular not much interest in the far from easy question

to what extent Heidegger can be considered a phenomenologist. Of particular significance has been the emergence of 'Science and Technology Studies' (STS) in the 1980s, which studies from a broad social- scientific perspective how social, political, and cultural values affect scientific research and technological innovation, and how these in turn affect society, politics, and culture. For a detailed treatment Mitcham's 1994 book provides an excellent overview. Olsen, Selinger and Riis (2008) offer a collection of more recent contributions; Scharff and Dusek (2003 [2014]) and Kaplan (2004 [2009]) present comprehensive anthologies of texts from this tradition.

### **A Basic Ambiguity in the Meaning of Technology**

Mitcham contrasts 'humanities philosophy of technology' to 'engineering philosophy of technology', where the latter refers to philosophical views developed by engineers or technologists as "attempts ... to elaborate a technological philosophy" (1994: 17). Mitcham discusses only a handful of people as engineering philosophers of technology, however: Ernst Kapp, Peter Engelmeier, Friedrich Dessauer, and much more briefly Jacques Lafitte, Gilbert Simondon, Hendrik van Riessen, Juan David García Bacca, R. Buckminster Fuller and Mario Bunge. The label raises serious questions, however: several of them hardly classify as 'engineers or technologists' and it is also not very clear how the notion of 'a technological philosophy' should be understood. As philosophers these authors seem all to be rather isolated figures, whose work shows little overlap and who seem to be sharing mainly the absence of a 'working relation' with established philosophical disciplines. It is not so clear what sort of questions and concerns underlie the notion of 'engineering philosophy of technology'. A larger role for systematic philosophy could bring it quite close to some examples of humanities philosophy of technology, for instance the work of Jacques Ellul, where the analyses would be rather similar and the remaining differences would be ones of attitude or appreciation.

In the next section we discuss in more detail a form of philosophy of technology that we consider to occupy, currently, the position of alternative to the humanities philosophy of technology. It emerged in the 1960s and gained momentum in the past fifteen to twenty years. This form of the philosophy of technology, which may be called 'analytic', is not primarily concerned with the relations between technology and society but with technology itself. It expressly does not look upon technology as a 'black box' but as a phenomenon that should be studied in detail. It regards technology perhaps not in its entirety as a practice but as something grounded in a practice, basically the practice of engineering. It analyses this practice, its goals, its concepts and its methods, and it relates its findings to various themes from philosophy.

In focusing on technology as a practice sustained by engineers, similar to the way philosophy of science focuses on the practice of science as sustained by scientists, analytic philosophy of technology could be thought to amount to the philosophy of engineering. Indeed many of the issues related to design, could be singled out as forming the subject matter of the philosophy of engineering. The very title of *Philosophy of Technology and Engineering Sciences* (Meijers 2009), an extensive up-to-date overview, which contains contributions to all of the topics treated in the next section, expresses the view that technology and engineering do not coincide. Which is not to say, however, that the book offers a clear conception of what makes technology different from engineering, or more than engineering. In fact, the existence of humanities philosophy of technology and analytic philosophy of technology next to each other reflects a basic ambiguity in the notion of technology that the philosophical work that has been going on has not succeeded in clarifying. Technology can be said to have two 'cores' or 'dimensions', which can be referred to as instrumentality and productivity. Instrumentality covers the totality of human endeavours to control their lives and their environments by interfering with the world in an instrumental way, by using things in

a purposeful and clever way. Productivity covers the totality of human endeavours to bring new things into existence that can do certain things in a controlled and clever way. For the study of instrumentality, however, it is in principle irrelevant whether or not the things that are made use of in controlling our lives and environments have been made by us first; if we somehow could rely on natural objects to always be available to serve our purposes, the analysis of instrumentality and its consequences for how we live our lives would not necessarily be affected. Likewise, for the analysis of what is involved in the making of artifacts, and how the notion of artifact and of something new being brought into existence are to be understood, it is to a large extent irrelevant how human life, culture and society are changed as a result of the artifacts that are in fact produced. Clearly, humanities philosophy of technology has until now been more attracted by the instrumentality core whereas analytic philosophy of technology has mainly gone for the productivity core. But technology as one of the basic phenomena of modern society, if not the most basic one, clearly is constituted by the processes centering on and involving both cores. It has proved difficult, however, to come to an overarching approach in which the interaction between these two dimensions of technology are adequately dealt with—no doubt partly due to the great differences in philosophical orientation and methodology associated with the two traditions and their separate foci. To improve this situation is arguably the most urgent challenge that the field of philosophy of technology as a whole is facing, since the continuation of the two orientations leading their separate lives threatens its unity and coherence as a discipline in the first place. Notwithstanding its centrality and urgency, the ambiguity noted here seems hardly to be confronted directly in the literature. It is addressed by Lawson (2008, 2017) and by Franssen and Koller (2016).

After presenting the major issues of philosophical relevance in technology and engineering that are studied by analytic philosophers of technology in the next section, we discuss the problems and challenges that technology poses for the society in which it is practiced in the third and final section.

## **Analytic Philosophy of Technology**

**Introduction:** Philosophy of Technology and Philosophy of Science as Philosophies of Practices It may come as a surprise to those new to the topic that the fields of philosophy of science and philosophy of technology show such great differences, given that few practices in our society are as closely related as science and technology. Experimental science is nowadays crucially dependent on technology for the realization of its research set-ups and for gathering and analyzing data. The phenomena that modern science seeks to study could never be discovered without producing them through technology.

Theoretical research within technology has come to be often indistinguishable from theoretical research in science, making engineering science largely continuous with 'ordinary' or 'pure' science. This is a relatively recent development, which started around the middle of the nineteenth century, and is responsible for great differences between modern technology and traditional, craft-like techniques. The educational training that aspiring scientists and engineers receive starts off being largely identical and only gradually diverges into a science or an engineering curriculum. Ever since the scientific revolution of the seventeenth century, characterized by its two major innovations, the experimental method and the mathematical articulation of scientific theories, philosophical reflection on science has focused on the method by which scientific knowledge is generated, on the reasons for thinking scientific theories to be true, or approximately true, and on the nature of evidence and the reasons for accepting one theory and rejecting another. Hardly ever have philosophers of science posed questions that did not have the community of scientists, their concerns, their aims,

their intuitions, their arguments and choices, as a major target. In contrast it is only recently that the philosophy of technology has discovered the community of engineers.

It might be claimed that it is up to the philosophy of technology, and not the philosophy of science, to target first of all the impact of technology—and with it science—on society and culture, because science affects society only through technology. This, however, will not do. Right from the start of the scientific revolution, science affected human culture and thought fundamentally and directly, not with a detour through technology, and the same is true for later developments such as relativity, atomic physics and quantum mechanics, the theory of evolution, genetics, biochemistry, and the increasingly dominating scientific world view overall. Philosophers of science overwhelmingly give the impression that they leave questions addressing the normative, social and cultural aspects of science gladly to other philosophical disciplines, or to historical studies. There are exceptions, however, and things may be changing; Philip Kitcher, to name but one prominent philosopher of science, has since 2000 written books on the relation of science to politics, ethics and religion (Kitcher 2001, 2011).

There is a major difference between the historical development of modern technology as compared to modern science which may at least partly explain this situation, which is that science emerged in the seventeenth century from philosophy itself. The answers that Galileo, Huygens, Newton, and others gave, by which they initiated the alliance of empiricism and mathematical description that is so characteristic of modern science, were answers to questions that had belonged to the core business of philosophy since antiquity. Science, therefore, kept the attention of philosophers. Philosophy of science is a transformation of epistemology in the light of the emergence of science. The foundational issues—the reality of atoms, the status of causality and probability, questions of space and time, the nature of the quantum world—that were so lively discussed during the end of the nineteenth and the beginning of the twentieth century are an illustration of this close relationship between scientists and philosophers. No such intimacy has ever existed between those same philosophers and technologists; their worlds still barely touch. To be sure, a case can be made that, compared to the continuity existing between natural philosophy and science, a similar continuity exists between central questions in philosophy having to do with human action and practical rationality and the way technology approaches and systematizes the solution of practical problems. To investigate this connection may indeed be considered a major theme for philosophy of technology. This continuity appears only by hindsight, however, and dimly, as the historical development is at most a slow convening of various strands of philosophical thinking on action and rationality, not a development into variety from a single origin. Significantly it is only the academic outsider Ellul who has, in his idiosyncratic way, recognized in technology the emergent single dominant way of answering all questions concerning human action, comparable to science as the single dominant way of answering all questions concerning human knowledge (Ellul 1954 [1964]). But Ellul was not so much interested in investigating this relationship as in emphasizing and denouncing the social and cultural consequences as he saw them. It is all the more important to point out that humanities philosophy of technology cannot be differentiated from analytic philosophy of technology by claiming that only the former is interested in the social environment of technology. There are studies which are rooted in analytic philosophy of science but address specifically the relation of technology to society and culture, and equally the relevance of social relations to practices of technology, without taking an evaluative stand with respect to technology; an example is B. Preston 2012.

## **The Relationship Between Technology and Science**

The close relationship between the practices of science and technology may easily keep the important differences between the two from view. The predominant position of science in the philosophical field of vision made it difficult for philosophers to recognize that technology merits special attention for involving issues that do not emerge in science. This view resulting from this lack of recognition is often presented, perhaps somewhat dramatically, as coming down to a claim that technology is 'merely' applied science.

A questioning of the relation between science and technology was the central issue in one of the earliest discussions among analytic philosophers of technology. In 1966, in a special issue of the journal *Technology and Culture*, Henryk Skolimowski argued that technology is something quite different from science (Skolimowski 1966). As he phrased it, science concerns itself with what is, whereas technology concerns itself with what is to be. A few years later, in his well-known book *The Sciences of the Artificial* (1969), Herbert Simon emphasized this important distinction in almost the same words, stating that the scientist is concerned with how things are but the engineer with how things ought to be. Although it is difficult to imagine that earlier philosophers were blind to this difference in orientation, their inclination, in particular in the tradition of logical empiricism, to view knowledge as a system of statements may have led to a conviction that in technology no knowledge claims play a role that cannot also be found in science. The study of technology, therefore, was not expected to pose new challenges nor hold surprises regarding the interests of analytic philosophy.

In contrast, Mario Bunge (1966) defended the view that technology is applied science, but in a subtle way that does justice to the differences between science and technology. Bunge acknowledges that technology is about action, but an action heavily underpinned by theory—that is what distinguishes technology from the arts and crafts and puts it on a par with science. According to Bunge, theories in technology come in two types: substantive theories, which provide knowledge about the object of action, and operative theories, which are concerned with action itself. The substantive theories of technology are indeed largely applications of scientific theories. The operative theories, in contrast, are not preceded by scientific theories but are born in applied research itself. Still, as Bunge claims, operative theories show a dependence on science in that in such theories the method of science is employed. This includes such features as modeling and idealization, the use of theoretical concepts and abstractions, and the modification of theories by the absorption of empirical data through prediction and retrodiction.

In response to this discussion, Ian Jarvie (1966) proposed as important questions for a philosophy of technology what the epistemological status of technological statements is and how technological statements are to be demarcated from scientific statements. This suggests a thorough investigation of the various forms of knowledge occurring in either practice, in particular, since scientific knowledge has already been so extensively studied, of the forms of knowledge that are characteristic of technology and are lacking, or of much less prominence, in science. A distinction between 'knowing that'—traditional propositional knowledge—and 'knowing how'—non-articulated and even impossible-to-articulate knowledge—had been introduced by Gilbert Ryle (1949) in a different context. The notion of 'knowing how' was taken up by Michael Polanyi under the name of tacit knowledge and made a central characteristic of technology (Polanyi 1958). However, emphasizing too much the role of unarticulated knowledge, of 'rules of thumb' as they are often called, easily underplays the importance of rational methods in technology. An emphasis on tacit knowledge may also be ill-fit for distinguishing the practices of science and technology because the role of tacit knowledge in science may well be more important than current philosophy of science

acknowledges, for example in concluding causal relationships on the basis of empirical evidence. This was also an important theme in the writings of Thomas Kuhn on theory change in science (Kuhn 1962).

## **The Centrality of Design to Technology**

To claim, with Skolimowski and Simon, that technology is about what is to be or what ought to be rather than what is may serve to distinguish it from science but will hardly make it understandable why so much philosophical reflection on technology has taken the form of socio-cultural critique. Technology is an ongoing attempt to bring the world closer to the way one wishes it to be. Whereas science aims to understand the world as it is, technology aims to change the world. These are abstractions, of course. For one, whose wishes concerning what the world should be like are realized in technology? Unlike scientists, who are often personally motivated in their attempts at describing and understanding the world, engineers are seen, not in the least by engineers themselves, as undertaking their attempts to change the world as a service to the public.

The ideas on what is to be or what ought to be are seen as originating outside of technology itself; engineers then take it upon themselves to realize these ideas. This view is a major source for the widely spread picture of technology as being instrumental, as delivering instruments ordered from 'elsewhere', as means to ends specified outside of engineering, a picture that has served further to support the claim that technology is neutral with respect to values. This view involves a considerable distortion of reality, however. Many engineers are intrinsically motivated to change the world; in delivering ideas for improvement they are, so to speak, their own best customers. The same is true for most industrial companies, particularly in a market economy, where the prospect of great profits is another powerful motivator. As a result, much technological development is 'technology-driven'.

To understand where technology 'comes from', what drives the innovation process, is of importance not only to those who are curious to understand the phenomenon of technology itself but also to those who are concerned about its role in society. Technology or engineering as a practice is concerned with the creation of artifacts and, of increasing importance, artifact-based services. The design process, the structured process leading toward that goal, forms the core of the practice of technology. In the engineering literature, the design process is commonly represented as consisting of a series of translational steps; At the start are the customer's needs or wishes. In the first step these are translated into a list of functional requirements, which then define the design task an engineer, or a team of engineers, has to accomplish.

The functional requirements specify as precisely as possible what the device to be designed must be able to do. This step is required because customers usually focus on just one or two features and are unable to articulate the requirements that are necessary to support the functionality they desire. In the second step, the functional requirements are translated into design specifications, which the exact physical parameters of crucial components by which the functional requirements are going to be met. The design parameters chosen to satisfy these requirements are combined and made more precise such that a blueprint of the device results. The blueprint contains all the details that must be known such that the final step to the process of manufacturing the device can take place. It is tempting to consider the blueprint as the end result of a design process, instead of a finished copy being this result. However, actual copies of a device are crucial for the purpose of prototyping and testing. Prototyping and testing presuppose that the sequence of steps making up the design process can and will often contain iterations, leading to revisions of the design parame-

ters and/or the functional requirements. Even though, certainly for mass-produced items, the manufacture of a product for delivery to its customers or to the market comes after the closure of the design phase, the manufacturing process is often reflected in the functional requirements of a device, for example in putting restrictions on the number of different components of which the device consists. The complexity of a device will affect how difficult it will be to maintain or repair it, and ease of maintenance or low repair costs are often functional requirements. An important modern development is that the complete life cycle of an artifact is now considered to be the designing engineer's concern, up till the final stages of the recycling and disposal of its components and materials, and the functional requirements of any device should reflect this.

From this point of view, neither a blueprint nor a prototype can be considered the end product of engineering design. The biggest idealization that this scheme of the design process contains is arguably located at the start. Only in a minority of cases does a design task originate in a customer need or wish for a particular artifact. First of all, as already suggested, many design tasks are defined by engineers themselves, for instance, by noticing something to be improved in existing products. But more often than not design starts with a problem pointed out by some societal agent, which engineers are then invited to solve. Many such problems, however, are ill-defined or wicked problems, meaning that it is not at all clear what the problem is exactly and what a solution to the problem would consist in. The 'problem' is a situation that people—not necessarily the people 'in' the situation—find unsatisfactory, but typically without being able to specify a situation that they find more satisfactory in other terms than as one in which the problem has been solved. In particular it is not obvious that a solution to the problem would consist in some artifact, or some artifactual system or process, being made available or installed. Engineering departments all over the world advertise that engineering is problem solving, and engineers easily seem confident that they are best qualified to solve a problem when they are asked to, whatever the nature of the problem. This has led to the phenomenon of a technological fix, the solution of a problem by a technical solution, that is, the delivery of an artifact or artifactual process, where it is questionable, to say the least, whether this solves the problem or whether it was the best way of handling the problem.

A candidate example of a technological fix for the problem of global warming would be the currently much debated option of injecting sulfate aerosols into the stratosphere to offset the warming effect of greenhouse gases such as carbon dioxide and methane. Such schemes of geoengineering would allow us to avoid facing the—in all likelihood painful—choices that will lead to a reduction of the emission of greenhouse gases into the atmosphere, but will at the same time allow the depletion of the Earth's reservoir of fossil fuels to continue. See for a discussion of technological fixing, e.g., Volti 2009: 26–32. Given this situation, and its hazards, the notion of a problem and a taxonomy of problems deserve to receive more philosophical attention than they have hitherto received.

These wicked problems are often broadly social problems, which would best be met by some form of 'social action', which would result in people changing their behavior or acting differently in such a way that the problem would be mitigated or even disappear completely. In defense of the engineering view, it could perhaps be said that the repertoire of 'proven' forms of social action is meager. The temptation of technical fixes could be overcome—at least that is how an engineer might see it—by the inclusion of the social sciences in the systematic development and application of knowledge to the solution of human problems. This however, is a controversial view. Social engineering is to many a specter to be kept at as large a distance as possible instead of an ideal to be

pursued. Karl Popper referred to acceptable forms of implementing social change as 'piecemeal social engineering' and contrasted it to the revolutionary but completely unfounded schemes advocated by, e.g., Marxism. In the entry on Karl Popper, however, his choice of words is called 'rather unfortunate'. The notion of social engineering, and its cogency, deserves more attention than it is currently receiving.

An important input for the design process is scientific knowledge: knowledge about the behavior of components and the materials they are composed of in specific circumstances. This is the point where science is applied. However, much of this knowledge is not directly available from the sciences, since it often concerns extremely detailed behavior in very specific circumstances. This scientific knowledge is therefore often generated within technology, by the engineering sciences. But apart from this very specific scientific knowledge, engineering design involves various other sorts of knowledge. In his book *What Engineers Know and How They Know It* (Vincenti 1990), the aeronautical engineer Walter Vincenti gave a six-fold categorization of engineering design knowledge (leaving aside production and operation as the other two basic constituents of engineering practice). Vincenti distinguishes.

1. Fundamental design concepts, including primarily the operational principle and the normal configuration of a particular device;
2. Criteria and specifications;
3. Theoretical tools;
4. Quantitative data;
5. Practical considerations;
6. Design instrumentalities.

The fourth category concerns the quantitative knowledge just referred to, and the third the theoretical tools used to acquire it. These two categories can be assumed to match Bunge's notion of substantive technological theories. The status of the remaining four categories is much less clear, however, partly because they are less familiar, or not at all, from the well-explored context of science. Of these categories, Vincenti claims that they represent prescriptive forms of knowledge rather than descriptive ones. Here, the activity of design introduces an element of normativity, which is absent from scientific knowledge. Take such a basic notion as 'operational principle', which refers to the way in which the function of a device is realized, or, in short, how it works. This is still a purely descriptive notion. Subsequently, however, it plays a role in arguments that seek to prescribe a course of action to someone who has a goal that could be realized by the operation of such a device. At this stage, the issue changes from a descriptive to a prescriptive or normative one. An extensive discussion of the various kinds of knowledge relevant to technology is offered by Houkes (2009).

Although the notion of an operational principle—a term that seems to originate with Polanyi (1958)—is central to engineering design, no single clear-cut definition of it seems to exist. The issue of disentangling descriptive from prescriptive aspects in an analysis of the technical action and its constituents is therefore a task that has hardly begun. This task requires a clear view on the extent and scope of technology. If one follows Joseph Pitt in his book *Thinking About Technology* (1999) and defines technology broadly as 'humanity at work', then to distinguish between technological action and action in general becomes difficult, and the study of technological action must absorb all descriptive and normative theories of action, including the theory of practical rationality, and much of theoretical economics in its wake. There have indeed been attempts at such

an encompassing account of human action, for example Tadeusz Kotarbinski's Praxiology (1965), but a perspective of such generality makes it difficult to arrive at results of sufficient depth. It would be a challenge for philosophy to specify the differences among action forms and the reasoning grounding them in, to single out three prominent fields of study, technology, organization and management, and economics.

A more restricted attempt at such an approach is Ilkka Niiniluoto's (1993). According to Niiniluoto, the theoretical framework of technology as the practice that is concerned with what the world should be like rather than is, the framework that forms the counterpoint to the descriptive framework of science, is design science. The content of design science, the counterpoint to the theories and explanations that form the content of descriptive science, would then be formed by technical norms, statements of the form 'If one wants to achieve X, one should do Y'. The notion of a technical norm derives from Georg Henrik von Wright's Norm and Action (1963). Technical norms need to be distinguished from anankastic statements expressing natural necessity, of the form 'If X is to be achieved, Y needs to be done'; the latter have a truth value but the former have not. Von Wright himself, however, wrote that he did not understand the mutual relations between these statements. Ideas on what design science is and can and should be are evidently related to the broad problem area of practical rationality—see this entries on practical reason and instrumental rationality—and also to means-ends reasoning, discussed.

### **Methodological Issues: Design as Decision Making**

Design is an activity that is subject to rational scrutiny but in which creativity is considered to play an important role as well. Since design is a form of action, a structured series of decisions to proceed in one way rather than another, the form of rationality that is relevant to it is practical rationality, the rationality incorporating the criteria on how to act, given particular circumstances. This suggests a clear division of labor between the part to be played by rational scrutiny and the part to be played by creativity. Theories of rational action generally conceive their problem situation as one involving a choice among various course of action open to the agent.

Rationality then concerns the question how to decide among given options, whereas creativity concerns the generation of these options. This distinction is similar to the distinction between the context of justification and the context of discovery in science. The suggestion that is associated with this distinction, however, that rational scrutiny only applies in the context of justification, is difficult to uphold for technological design. If the initial creative phase of option generation is conducted sloppily, the result of the design task can hardly be satisfactory. Unlike the case of science, where the practical consequences of entertaining a particular theory are not taken into consideration, the context of discovery in technology is governed by severe constraints of time and money, and an analysis of the problem how best to proceed certainly seems in order. There has been little philosophical work done in this direction; an overview of the issues is given in Kroes, Franssen, and Bucciarelli (2009).

The ideas of Herbert Simon on bounded rationality (see, e.g., Simon 1982) are relevant here, since decisions on when to stop generating options and when to stop gathering information about these options and the consequences when they are adopted are crucial in decision making if informational overload and calculative intractability are to be avoided. However, it has proved difficult to further develop Simon's ideas on bounded rationality since their conception in the 1950s. Another notion that is relevant here is means-ends reasoning. In order to be of any help here, theories of means-ends reasoning should then concern not just the evaluation of given means with respect to

their ability to achieve given ends, but also the generation or construction of means for given ends. A comprehensive theory of means-ends reasoning, however, is not yet available; for a proposal on how to develop means-ends reasoning in the context of technical artifacts. In the practice of technology, alternative proposals for the realization of particular functions are usually taken from 'catalogs' of existing and proven realizations. These catalogs are extended by ongoing research in technology rather than under the urge of particular design tasks.

When engineering design is conceived as a process of decision making, governed by considerations of practical rationality, the next step is to specify these considerations. Almost all theories of practical rationality conceive of it as a reasoning process where a match between beliefs and desires or goals is sought. The desires or goals are represented by their value or utility for the decision maker, and the decision maker's problem is to choose an action that realizes a situation that, ideally, has maximal value or utility among all the situations that could be realized. If there is uncertainty concerning the situations that will be realized by a particular action, then the problem is conceived as aiming for maximal expected value or utility. Now the instrumental perspective on technology implies that the value that is at issue in the design process viewed as a process of rational decision making is not the value of the artifacts that are created. Those values are the domain of the users of the technology so created. They are supposed to be represented in the functional requirements defining the design task. Instead the value to be maximized is the extent to which a particular design meets the functional requirements defining the design task. It is in this sense that engineers share an overall perspective on engineering design as an exercise in optimization. But although optimization is a value-orientated notion, it is not itself perceived as a value driving engineering design.

The functional requirements that define most design problems do not prescribe explicitly what should be optimized; usually they set levels to be attained minimally. It is then up to the engineer to choose how far to go beyond meeting the requirements in this minimal sense. Efficiency, in energy consumption and use of materials first of all, is then often a prime value. Under the pressure of society, other values have come to be incorporated, in particular safety and, more recently, sustainability. Sometimes it is claimed that what engineers aim to maximize is just one factor, namely market success. Market success, however, can only be assessed after the fact. The engineer's maximization effort will instead be directed at what are considered the predictors of market success. Meeting the functional requirements and being relatively efficient and safe are plausible candidates as such predictors, but additional methods, informed by market research, may introduce additional factors or may lead to a hierarchy among the factors.

Choosing the design option that maximally meets all the functional requirements (which may but need not originate with the prospective user) and all other considerations and criteria that are taken to be relevant, then becomes the practical decision-making problem to be solved in a particular engineering-design task. This creates several methodological problems. Most important of these is that the engineer is facing a multi-criteria decision problem. The various requirements come with their own operationalizations in terms of design parameters and measurement procedures for assessing their performance. This results in a number of rank orders or quantitative scales which represent the various options out of which a choice is to be made. The task is to come up with a final score in which all these results are 'adequately' represented, such that the option that scores best can be considered the optimal solution to the design problem. Engineers describe this situation as one where trade-offs have to be made: in judging the merit of one option relative to other options, a relative bad performance on one criterion can be balanced by a relatively good perfor-

mance on another criterion. An important problem is whether a rational method for doing this can be formulated. It has been argued by Franssen (2005) that this problem is structurally similar to the well-known problem of social choice, for which Kenneth Arrow proved his notorious impossibility theorem in 1950, implying that no general rational solution method exists for this problem. This poses serious problems for the claim of engineers that their designs are optimal solutions, since Arrow's theorem implies that in most multi-criteria problems the notion of 'optimal' cannot be rigorously defined.

This result seems to except a crucial aspect of engineering activity from philosophical scrutiny, and it could be used to defend the opinion that engineering is at least partly an art, not a science. Instead of surrendering to the result, however, which has a significance that extends much beyond engineering and even beyond decision making in general, we should perhaps conclude instead that there is still a lot of work to be done on what might be termed, provisionally, 'approximative' forms of reasoning. One form of reasoning to be included here is Herbert Simon's bounded rationality, plus the related notion of 'satisficing'. Since their introduction in the 1950s (Simon 1957) these two terms have found wide usage, but we are still lacking a general theory of bounded rationality. It may be in the nature of forms of approximative reasoning such as bounded rationality that a general theory cannot be had, but even a systematic treatment from which such an insight could emerge seems to be lacking.

Another problem for the decision-making view of engineering design is that in modern technology almost all design is done by teams. Such teams are composed of experts from many different disciplines. Each discipline has its own theories, its own models of interdependencies, its own assessment criteria, and so forth, and the professionals belonging to these disciplines must be considered as inhabitants of different object worlds, as Louis Bucciarelli (1994) phrases it. The different team members are, therefore, likely to disagree on the relative rankings and evaluations of the various design options under discussion. Agreement on one option as the overall best one can here be even less arrived at by an algorithmic method exemplifying engineering rationality. Instead, models of social interaction, such as bargaining and strategic thinking, are relevant here. An example of such an approach to an (abstract) design problem is presented by Franssen and Bucciarelli (2004).

To look in this way at technological design as a decision-making process is to view it normatively from the point of view of practical or instrumental rationality. At the same time it is descriptive in that it is a description of how engineering methodology generally presents the issue how to solve design problems. From that somewhat higher perspective there is room for all kinds of normative questions that are not addressed here, such as whether the functional requirements defining a design problem can be seen as an adequate representation of the values of the prospective users of an artifact or a technology, or by which methods values such as safety and sustainability can best be elicited and represented in the design process.

### **Metaphysical Issues: The Status and Characteristics of Artifacts**

Understanding the process of designing artifacts is the theme in philosophy of technology that most directly touches on the interests of engineering practice. This is hardly true for another issue of central concern to analytic philosophy of technology, which is the status and the character of artifacts. This is perhaps not unlike the situation in the philosophy of science, where working scientists seem also to be much less interested in investigating the status and character of models and theories than philosophers are.

Artifacts are man-made objects: they have an author. The artifacts that are of relevance to technology are, in particular, made to serve a purpose. This excludes, within the set of all man-made objects, on the one hand byproducts and waste products and on the other hand works of art. Byproducts and waste products result from an intentional act to make something but just not precisely, although the author at work may be well aware of their creation. Works of art result from an intention directed at their creation (although in exceptional cases of conceptual art, this directedness may involve many intermediate steps) but it is contested whether artists include in their intentions concerning their work an intention that the work serves some purpose. A further discussion of this aspect belongs to the philosophy of art. An interesting general account has been presented by Diptert (1993).

Technical artifacts, then, are made to serve some purpose, generally to be used for something or to act as a component in a larger artifact, which in its turn is either something to be used or again a component. Whether end product or component, an artifact is 'for something', and what it is for is called the artifact's function. Several researchers have emphasized that an adequate description of artifacts must refer both to their status as tangible physical objects and to the intentions of the people engaged with them. Kroes and Meijers (2006) have dubbed this view "the dual nature of technical artifacts"; its most mature formulation is Kroes 2012. They suggest that the two aspects are 'tied up', so to speak, in the notion of artifact function. This gives rise to several problems. One, which will be passed over quickly because little philosophical work seems to have been done concerning it, is that structure and function mutually constrain each other, but the constraining is only partial. It is unclear whether a general account of this relation is possible and what problems need to be solved to arrive there. There may be interesting connections with the issue of multiple realizability in the philosophy of mind and with accounts of reduction in science; an example where this is explored is Mahner and Bunge 2001.

It is equally problematic whether a unified account of the notion of function as such is possible, but this issue has received considerably more philosophical attention. The notion of function is of paramount importance for characterizing artifacts, but the notion is used much more widely. The notion of an artifact's function seems to refer necessarily to human intentions. Function is also a key concept in biology, however, where no intentionality plays a role, and it is a key concept in cognitive science and the philosophy of mind, where it is crucial in grounding intentionality in non-intentional, structural and physical properties. Up till now there is no accepted general account of function that covers both the intentionality-based notion of artifact function and the non-intentional notion of biological function—not to speak of other areas where the concept plays a role, such as the social sciences. The most comprehensive theory, that has the ambition to account for the biological notion, cognitive notion and the intentional notion, is Ruth Millikan's 1984. The collection of essays edited by Ariew, Cummins and Perlman (2002) presents a recent introduction to the general topic of defining the notion of function in general, although the emphasis is, as is generally the case in the literature on function, on biological functions.

Against the view that, at least in the case of artifacts, the notion of function refers necessarily to intentionality, it could be argued that in discussing the functions of the components of a larger device, and the interrelations between these functions, the intentional 'side' of these functions is of secondary importance only. This, however, would be to ignore the possibility of the malfunctioning of such components. This notion seems to be definable only in terms of a mismatch between actual behavior and intended behavior. The notion of malfunction also sharpens an ambiguity in the general reference to intentions when characterizing technical artifacts. These artifacts usually

engage many people, and the intentions of these people may not all pull in the same direction. A major distinction can be drawn between the intentions of the actual user of an artifact for a particular purpose and the intentions of the artifact's designer. Since an artifact may be used for a purpose different from the one for which its designer intended it to be used, and since people may also use natural objects for some purpose or other, one is invited to allow that artifacts can have multiple functions, or to enforce a hierarchy among all relevant intentions in determining the function of an artifact, or to introduce a classification of functions in terms of the sorts of determining intentions. In the latter case, which is a sort of middle way between the two other options, one commonly distinguishes between the proper function of an artifact as the one intended by its designer and the accidental function of the artifact as the one given to it by some user on private considerations. Accidental use can become so common, however, that the original function drops out of memory.

Closely related to this issue to what extent use and design determine the function of an artifact is the problem of characterizing artifact kinds. It may seem that we use functions to classify artifacts: an object is a knife because it has the function of cutting, or more precisely, of enabling us to cut. On closer inspection, however, the link between function and kind-membership seems much less straightforward. The basic kinds in technology are, for example, 'knife', 'aircraft' and 'piston'. The members of these kinds have been designed in order to be used to cut something with, to transport something through the air and to generate mechanical movement through thermodynamic expansion. However, one cannot create a particular kind of artifact just by designing something with the intention that it be used for some particular purpose: a member of the kind so created must actually be useful for that purpose. Despite innumerable design attempts and claims, the perpetual motion machine is not a kind of artifact. A kind like 'knife' is defined, therefore, not only by the intentions of the designers of its members that they each be useful for cutting but also by a shared operational principle known to these designers, and on which they based their design. This is, in a different setting, also defended by Thomasson, who in her characterization of what she in general calls an artifactual kind says that such a kind is defined by the designer's intention to make something of that kind, by a substantive idea that the designer has of how this can be achieved, and by his or her largely successful achievement of it (Thomasson 2003, 2007). Quasi-sorts of kinds in which artifacts can be grouped, a distinction must therefore be made between a kind like 'knife' and a corresponding but different kind 'cutter'. A 'knife' indicates a particular way a 'cutter' can be made. One can also cut, however, with a thread or line, a welding torch, a water jet, and undoubtedly by other sorts of means that have not yet been thought of. A 'cutter' would then refer to a truly functional kind. As such, it is subject to the conflict between use and design: one could mean by 'cutter' anything that can be used for cutting or anything that has been designed to be used for cutting, by the application of whatever operational principle, presently known or unknown.

This distinction between artifact kinds and functional kinds is relevant for the status of such kinds in comparison to other notions of kinds. Philosophy of science has emphasized that the concept of natural kind, such as exemplified by 'water' or 'atom', lies at the basis of science. On the other hand it is generally taken for granted that there are no regularities that all knives or airplanes or pistons answer to. This, however, is loosely based on considerations of multiple realizability that fully apply only to functional kinds, not to artifact kinds. Artifact kinds share an operational principle that gives them some commonality in physical features, and this commonality becomes stronger once a particular artifact kind is subdivided into narrower kinds. Since these kinds are specified in terms of physical and geometrical parameters, they are much closer to the natural

kinds of science, in that they support law-like regularities;. A recent collection of essays that discuss the metaphysics of artifacts and artifact kinds is Franssen, Kroes, Reydon and Vermaas 2014.

## **Ethics of Technology**

It was not until the twentieth century that the development of the ethics of technology as a systematic and more or less independent subdiscipline of philosophy started. This late development may seem surprising given the large impact that technology has had on society, especially since the industrial revolution. A plausible reason for this late development of ethics of technology is the instrumental perspective on technology. This perspective implies, basically, a positive ethical assessment of technology: technology increases the possibilities and capabilities of humans, which seems in general desirable. Of course, since antiquity, it has been recognized that the new capabilities may be put to bad use or lead to human hubris. Often, however, these undesirable consequences are attributed to the users of technology, rather than the technology itself, or its developers. This vision is known as the instrumental vision of technology resulting in the so-called neutrality thesis. The neutrality thesis holds that technology is a neutral instrument that can be put to good or bad use by its users. During the twentieth century, this neutrality thesis met with severe critique, most prominently by Heidegger and Ellul, but also by philosophers from the Frankfurt School, such as Horkheimer and Adorno (1947 [2002]), Marcuse (1964), and Habermas (1968 [1970]).

The scope and the agenda for ethics of technology to a large extent depend on how technology is conceptualized. The second half of the twentieth century has witnessed a richer variety of conceptualizations of technology that move beyond the conceptualization of technology as a neutral tool, as a world view or as a historical necessity. This includes conceptualizations of technology as a political phenomenon (Winner, Feenberg, Sclove), as a social activity (Latour, Callon, Bijker and others in the area of science and technology studies), as a cultural phenomenon (Ihde, Borgmann), as a professional activity (engineering ethics, e.g., Davis), and as a cognitive activity (Bunge, Vincenti). Despite this diversity, the development in the second half of the twentieth century is characterized by two general trends. One is a move away from technological determinism and the assumption that technology is a given self-contained phenomenon which develops autonomously to an emphasis on technological development being the result of choices (although not necessarily the intended result). The other is a move away from ethical reflection on technology as such to ethical reflection of specific technologies and to specific phases in the development of technology. Both trends together have resulted in an enormous increase in the number and scope of ethical questions that are asked about technology. The developments also imply that ethics of technology is to be adequately empirically informed, not only about the exact consequences of specific technologies but also about the actions of engineers and the process of technological development. This has also opened the way to the involvement of other disciplines in ethical reflections on technology, such as Science and Technology Studies (STS) and Technology Assessment (TA).

## **Approaches in the Ethics of Technology**

Not only is the ethics of technology characterized by a diversity of approaches, it might even be doubted whether something like a subdiscipline of ethics of technology, in the sense of a community of scholars working on a common set of problems, exists. The scholars studying ethical issues in technology have diverse backgrounds (e.g., philosophy, STS, TA, law, political science) and they do not always consider themselves (primarily) ethicists of technology. To give the reader an overview of the field, three basic approaches or strands that might be distinguished in the ethics of technology will be discussed.

## **Cultural and political approaches**

Both cultural and political approaches build on the traditional philosophy and ethics of technology of the first half of the twentieth century. Whereas cultural approaches conceive of technology as a cultural phenomenon that influences our perception of the world, political approaches conceive of technology as a political phenomenon, i.e., as a phenomenon that is ruled by and embodies institutional power relations between people.

Cultural approaches are often phenomenological in nature or at least position themselves in relation to phenomenology as post-phenomenology. Examples of philosophers in this tradition are Don Ihde, Albert Borgmann, Peter-Paul Verbeek and Evan Selinger (e.g., Borgmann 1984; Ihde 1990; Verbeek 2000 [2005], 2011). The approaches are usually influenced by developments in STS, especially the idea that technologies contain a script that influences not only people's perception of the world but also human behavior, and the idea of the absence of a fundamental distinction between humans and non-humans, including technological artifacts (Akrich 1992; Latour 1992, 1993; Ihde & Selinger 2003). The combination of both ideas has led some to claim that technology has (moral) agency.

Political approaches to technology mostly go back to Marx, who assumed that the material structure of production in society, in which technology is obviously a major factor, determined the economic and social structure of that society. Similarly, Langdon Winner has argued that technologies can embody specific forms of power and authority (Winner 1980). According to him, some technologies are inherently normative in the sense that they require or are strongly compatible with certain social and political relations. Railroads, for example, seem to require a certain authoritative management structure. In other cases, technologies may be political due to the particular way they have been designed. Some political approaches to technology are inspired by (American) pragmatism and, to a lesser extent, discourse ethics. A number of philosophers, for example, have pleaded for a democratization of technological development and the inclusion of ordinary people in the shaping of technology (Winner 1983; Sclove 1995; Feenberg 1999).

Although political approaches have obviously ethical ramifications, many philosophers who have adopted such approaches do not engage in explicit ethical reflection on technology. An interesting recent exception, and an attempt to consolidate a number of recent developments and to articulate them into a more general account of what an ethics of technology should look like, is the volume *Pragmatist Ethics for a Technological Culture* (Keulartz et al. 2002). In this volume, the authors plead for a revival of the pragmatist tradition in moral philosophy because it is better fit to deal with a number of moral issues in technology. Instead of focusing on how to reach and justify normative judgments about technology, a pragmatist ethics focuses on how to recognize and trace moral problems in the first place. Moreover, the process of dealing with these problems is considered more important than the outcome.

## **Engineering ethics**

Engineering ethics is a relatively new field of education and research. It started off in the 1980s in the United States, merely as an educational effort. Engineering ethics is concerned with "the actions and decisions made by persons, individually or collectively, who belong to the profession of engineering" (Baum 1980: 1). According to this approach, engineering is a profession, in the same way as medicine is a profession.

Although there is no agreement on how a profession exactly should be defined, the following characteristics are often mentioned:

- A profession relies on specialized knowledge and skills that require a long period of study;
- The occupational group has a monopoly on the carrying out of the occupation;
- The assessment of whether the professional work is carried out in a competent way is done by, and it is accepted that this can only be done by, professional peers;
- A profession provides society with products, services or values that are useful or worthwhile for society, and is characterized by an ideal of serving society;
- The daily practice of professional work is regulated by ethical standards, which are derived from or relate to the society-serving ideal of the profession.

Typical ethical issues that are discussed in engineering ethics are professional obligations of engineers as exemplified in, for example, codes of ethics of engineers, the role of engineers versus managers, competence, honesty, whistle-blowing, concern for safety and conflicts of interest (Davis 1998, 2005; Martin & Schinzinger 2005; Harris, Pritchard, & Rabins 2008).

Recently, a number of authors have pleaded for broadening the traditional scope of engineering ethics (e.g., Herkert 2001; van de Poel & Royakkers 2011). This call for a broader approach derives from two concerns. One concern is that the traditional micro-ethical approach in engineering ethics tends to take the context in which engineers have to work for given, while major ethical issues pertain to how this context is 'organized'. Another concern is that the traditional micro-ethical focus tends to neglect issues relating to the impact of technology on society or issues relating to decisions about technology. Broadening the scope of engineering ethics would then, among others, imply more attention for such issues as sustainability and social justice.

## **Ethics of specific technologies**

The last decades have witnessed an increase in ethical inquiries into specific technologies. This may now be the largest of the three strands discussed, especially given the rapid growth in technology-specific ethical inquiries in the last two decades. One of the most visible new fields is probably computer ethics (e.g., Moor 1985; Floridi 2010; Johnson 2009; Weckert 2007; van den Hoven & Weckert 2008), with more recently a focus on robotics, artificial intelligence, machine ethics, and the ethics of algorithms (Lin, Abney, & Jenkins 2017; Nucci & Santoni de Sio 2016; Mittelstadt et al. 2016; Bostrom & Yudkowsky 2014; Wallach & Allen 2009). But biotechnology has spurred dedicated ethical investigations as well (e.g., Sherlock & Morrey 2002; P. Thompson 2007). More traditional fields like architecture and urban planning have also attracted specific ethical attention (Fox 2000). More recently, nanotechnology and so-called converging technologies have led to the establishment of what is called nanoethics (Allhoff et al. 2007). Other examples are the ethics of nuclear deterrence (Finnis et al. 1988), nuclear energy (Taebi & Roeser 2015) and geoengineering (C. Preston 2016).

Obviously the establishment of such new fields of ethical reflection is a response to social and technological developments. Still, the question can be asked whether the social demand is best met by establishing new fields of applied ethics. This issue is in fact regularly discussed as new fields emerge. Several authors have for example argued that there is no need for nanoethics because nanotechnology does not raise any really new ethical issues (e.g., McGinn 2010). The alleged absence of newness here is supported by the claim that the ethical issues raised by nanotechnology are a variation on, and sometimes an intensification of, existing ethical issues, but hardly really new, and by the claim that these issues can be dealt with the existing theories and

concepts from moral philosophy. For an earlier, similar discussion concerning the supposed new character of ethical issues in computer engineering.

The new fields of ethical reflection are often characterized as applied ethics, that is, as applications of theories, normative standards, concepts and methods developed in moral philosophy. For each of these elements, however, application is usually not straightforward but requires a further specification or revision. This is the case because general moral standards, concepts and methods are often not specific enough to be applicable in any direct sense to specific moral problems. 'Application' therefore often leads to new insights which might well result in the reformulation or at least refinement of existing normative standards, concepts and methods. In some cases, ethical issues in a specific field might require new standards, concepts or methods. Beauchamp and Childress for example have proposed a number of general ethical principles for biomedical ethics (Beauchamp & Childress 2001). These principles are more specific than general normative standards, but still so general and abstract that they apply to different issues in biomedical ethics. In computer ethics, existing moral concepts relating to for example privacy and ownership has been redefined and adapted to deal with issues which are typical for the computer age (Johnson 2003). New fields of ethical application might also require new methods for, for example, discerning ethical issues that take into account relevant empirical facts about these fields, like the fact that technological research and development usually takes place in networks of people rather than by individuals (Zwart et al. 2006). Another more general issue that applies to many new technologies is how to deal with the uncertainties about (potential) social and ethical impacts that typically surround new emerging technologies. Brey's (2012) proposal for an anticipatory ethics may be seen as a reply to this challenge. The issue of anticipation is also one of the central concerns in the more recent interdisciplinary field of responsible innovation (e.g., Owen et al. 2013).

Although different fields of ethical reflection on specific technologies might well raise their own philosophical and ethical issues, it can be questioned whether this justifies the development of separate subfields or even subdisciplines. One obvious argument might be that in order to say something ethically meaningful about new technologies, one needs specialized and detailed knowledge of a specific technology. Moreover such subfields allow interaction with relevant non-philosophical experts in for example law, psychology, economy, science and technology studies (STS) or technology assessment (TA). On the other side, it could also be argued that a lot can be learned from interaction and discussion between ethicists specializing in different technologies, and a fruitful interaction with the two other strands discussed above (cultural and political approaches and engineering ethics). Currently, such interaction in many cases seems absent, although there are of course exceptions.

## **Some Recurrent Themes in the Ethics of Technology**

We now turn to the description of some themes in the ethics of technology. We focus on a number of general themes that provide an illustration of general issues in the ethics of technology and the way these are treated.

### **Neutrality versus moral agency**

One important general theme in the ethics of technology is the question whether technology is value-laden. Some authors have maintained that technology is value-neutral, in the sense that technology is just a neutral means to an end, and accordingly can be put to good or bad use (e.g., Pitt 2000). This view might have some plausibility in as far as technology is considered to be just a bare physical structure. Most philosophers of technology, however, agree that technological

development is a goal-oriented process and that technological artifacts by definition have certain functions, so that they can be used for certain goals but not, or far more difficulty or less effectively, for other goals. This conceptual connection between technological artifacts, functions and goals makes it hard to maintain that technology is value-neutral. Even if this point is granted, the value-ladenness of technology can be construed in a host of different ways. Some authors have maintained that technology can have moral agency. This claim suggests that technologies can autonomously and freely 'act' in a moral sense and can be held morally responsible for their actions.

The debate whether technologies can have moral agency started off in computer ethics (Bechtel 1985; Snapper 1985; Dennett 1997; Floridi & Sanders 2004) but has since broadened. Typically, the authors who claim that technologies (can) have moral agency often redefine the notion of agency or its connection to human will and freedom (e.g., Latour 1993; Floridi & Sanders 2004, Verbeek 2011). A disadvantage of this strategy is that it tends to blur the morally relevant distinctions between people and technological artifacts. More generally, the claim that technologies have moral agency sometimes seems to have become shorthand for claiming that technology is morally relevant. This, however, overlooks the fact technologies can be value-laden in other ways than by having moral agency (see, e.g., Johnson 2006; Radder 2009; Illies & Meijers 2009; Peterson & Spahn 2011). One might, for example, claim that technology enables (or even invites) and constrains (or even inhibits) certain human actions and the attainment of certain human goals and therefore is to some extent value-laden, without claiming moral agency for technological artifacts. A good overview of the debate can be found in Kroes and Verbeek 2014.

The debate about moral agency and technology is now particularly salient with respect to the design of intelligent artificial agents. James Moor (2006) has distinguished between four ways in which artificial agents may be or become moral agents:

1. Ethical impact agents are robots and computer systems that ethically impact their environment; this is probably true of all artificial agents.
2. Implicit ethical agents are artificial agents that have been programmed to act according to certain values.
3. Explicit ethical agents are machines that can represent ethical categories and that can 'reason' (in machine language) about these.
4. Full ethical agents in addition also possess some characteristics we often consider crucial for human agency, like consciousness, free will and intentionality.

It might perhaps never be possible to technologically design full ethical agents, and if it were to become possible it might be questionable whether it is morally desirable to do so (Bostrom & Yudkowsky 2014). As Wallach and Allen (2009) have pointed out, the main problem might not be to design artificial agents that can function autonomously and that can adapt themselves in interaction with the environment, but rather to build enough, and the right kind of, ethical sensitivity into such machines.

## **Responsibility**

Responsibility has always been a central theme in the ethics of technology. The traditional philosophy and ethics of technology, however, tended to discuss responsibility in rather general terms and were rather pessimistic about the possibility of engineers to assume responsibility for the technologies they developed. Ellul, for example, has characterized engineers as the high priests of technology, who cherish technology but cannot steer it. Hans Jonas (1979 [1984]) has argued that

technology requires an ethics in which responsibility is the central imperative because for the first time in history we are able to destroy the earth and humanity.

In engineering ethics, the responsibility of engineers is often discussed in relation to code of ethics that articulate specific responsibilities of engineers. Such codes of ethics stress three types of responsibilities of engineers: (1) conducting the profession with integrity and honesty and in a competent way, (2) responsibilities towards employers and clients and (3) responsibility towards the public and society. With respect to the latter, most US codes of ethics maintain that engineers 'should hold paramount the safety, health and welfare of the public'.

As has been pointed out by several authors (Nissenbaum 1996; Johnson & Powers 2005; Swierstra & Jelsma 2006), it may be hard to pinpoint individual responsibility in engineering. The reason is that the conditions for the proper attribution of individual responsibility that have been discussed in the philosophical literature (like freedom to act, knowledge, and causality) are often not met by individual engineers. For example, engineers may feel compelled to act in a certain way due to hierarchical or market constraints, and negative consequences may be very hard or impossible to predict beforehand. The causality condition is often difficult to meet as well due to the long chain from research and development of a technology till its use and the many people involved in this chain. Davis (2012) nevertheless maintains that despite such difficulties individual engineers can and do take responsibility.

One issue that is at stake in this debate is the notion of responsibility. Davis (2012), and also for example Ladd (1991), argue for a notion of responsibility that focuses less on blame and stresses the forward-looking or virtuous character of assuming responsibility. But many others focus on backward-looking notions of responsibility that stress accountability, blameworthiness or liability. Zandvoort (2000), for example has pleaded for a notion of responsibility in engineering that is more like the legal notion of strict liability, in which the knowledge condition for responsibility is seriously weakened. Doorn (2012) compares three perspectives on responsibility ascription in engineering—a merit-based, a right-based and a consequentialist perspective—and argues that the consequentialist perspective, which applies a forward-looking notion of responsibility, is most powerful in influencing engineering practice.

The difficulty of attributing individual responsibility may lead to the Problem of Many Hands (PMH). The term was first coined by Dennis Thompson (1980) in an article about the responsibility of public officials. The term is used to describe problems with the ascription of individual responsibility in collective settings. Doorn (2010) has proposed a procedural approach, based on Rawls' reflective equilibrium model, to deal with the PMH; other ways of dealing with the PMH include the design of institutions that help to avoid it or an emphasis on virtuous behavior in organizations (van de Poel, Royakers, & Zwart 2015).

## **Design**

In the last decades, increasingly attention is paid not only to ethical issues that arise during the use of a technology, but also during the design phase. An important consideration behind this development is the thought that during the design phase technologies, and their social consequences, are still malleable whereas during the use phase technologies are more or less given and negative social consequences may be harder to avoid or positive effects harder to achieve.

In computer ethics, an approach known as Value Sensitive Design (VSD) has been developed to

explicitly address the ethical nature of design. VSD aims at integrating values of ethical importance in engineering design in a systematic way (Friedman & Kahn 2003). The approach combines conceptual, empirical and technical investigations. There is also a range of other approaches aimed at including values in design. 'Design for X' approaches in engineering aim at including instrumental values (like maintainability, reliability and costs) but they also include design for sustainability, inclusive design, and affective design (Holt & Barnes 2010). Inclusive design aims at making designs accessible to the whole population including, for example, handicapped people and the elderly (Erlandson 2008). Affective design aims at designs that evoke positive emotions with the users and so contributes to human well-being. Van de Hoven, Vermaas, and van de Poel 2015 gives a good overview of the state-of-the art of value sensitive design for various values and application domains.

If one tries to integrate values into design one may run into the problem of a conflict of values. The safest car is, due to its weight, not likely to be the most sustainability. Here safety and sustainability conflict in the design of cars. Traditional methods in which engineers deal with such conflicts and make trade-off between different requirements for design include cost-benefit analysis and multiple criteria analysis. Such methods are, however, beset with methodological problems like those discussed (Franssen 2005; Hansson 2007). Van de Poel (2009) discusses various alternatives for dealing with value conflicts in design including the setting of thresholds (satisficing), reasoning about values, innovation and diversity.

## **Technological risks**

The risks of technology are one of the traditional ethical concerns in the ethics of technology. Risks raise not only ethical issues but other philosophical issues, such as epistemological and decision-theoretical issues as well (Roeser et al. 2012). Risk is usually defined as the product of the probability of an undesirable event and the effect of that event, although there are also other definitions around (Hansson 2004b). In general it seems desirable to keep technological risks as small as possible. The larger the risk, the larger either the likeliness or the impact of an undesirable event is. Risk reduction therefore is an important goal in technological development and engineering codes of ethics often attribute a responsibility to engineers in reducing risks and designing safe products. Still, risk reduction is not always feasible or desirable.

It is sometimes not feasible, because there are no absolutely safe products and technologies. But even if risk reduction is feasible it may not be acceptable from a moral point of view. Reducing risk often comes at a cost. Safer products may be more difficult to use, more expensive or less sustainable. So sooner or later, one is confronted with the question: what is safe enough? What makes a risk (un)acceptable?

The process of dealing with risks is often divided into three stages: risk assessment, risk evaluation and risk management. Of these, the second is most obviously ethically relevant. However, risk assessment already involves value judgments, for example about which risks should be assessed in the first place (Shrader-Frechette 1991). An important, and morally relevant, issue is also the degree of evidence that is needed to establish a risk. In establishing a risk on the basis of a body of empirical data one might make two kinds of mistakes. One can establish a risk when there is actually none (type I error) or one can mistakenly conclude that there is no risk while there actually is a risk (type II error). Science traditionally aims at avoiding type I errors. Several authors have argued that in the specific context of risk assessment it is often more important to avoid type II errors (Cranor 1990; Shrader-Frechette 1991). The reason for this is that risk assessment not just

aims at establishing scientific truth but has a practical aim, i.e., to provide the knowledge on basis of which decisions can be made about whether it is desirable to reduce or avoid certain technological risks in order to protect users or the public.

Risk evaluation is carried out in a number of ways (see, e.g., Shrader-Frechette 1985). One possible approach is to judge the acceptability of risks by comparing them to other risks or to certain standards. One could, for example, compare technological risks with naturally occurring risks. This approach, however, runs the danger of committing a naturalistic fallacy: naturally occurring risks may (sometimes) be unavoidable but that does not necessarily make them morally acceptable. More generally, it is often dubious to judge the acceptability of the risk of technology A by comparing it to the risk of technology B if A and B are not alternatives in a decision.

A second approach to risk evaluation is risk-cost benefit analysis, which is based on weighing the risks against the benefits of an activity. Different decision criteria can be applied if a (risk) cost benefit analysis is carried out (Kneese, Ben-David, and Schulze 1983). According to Hansson (2003: 306), usually the following criterion is applied:

... a risk is acceptable if and only if the total benefits that the exposure gives rise to outweigh the total risks, measured as the probability-weighted disutility of outcomes.

A third approach is to base risk acceptance on the consent of people who suffer the risks after they have been informed about these risks (informed consent). A problem of this approach is that technological risks usually affect a large number of people at once. Informed consent may therefore lead to a "society of stalemates" (Hansson 2003: 300).

Several authors have proposed alternatives to the traditional approaches of risk evaluation on the basis of philosophical and ethical arguments. Shrader-Frechette (1991) has proposed a number of reforms in risk assessment and evaluation procedures on the basis of a philosophical critique of current practices. Roeser (2012) argues for a role of emotions in judging the acceptability of risks. Hansson has proposed the following alternative principle for risk evaluation:

Exposure of a person to a risk is acceptable if and only if this exposure is part of an equitable social system of risk-taking that works to her advantage. (Hansson 2003: 305).

Hansson's proposal introduces a number of moral considerations in risk evaluation that are traditionally not addressed or only marginally addressed. These are the consideration whether individuals profit from a risky activity and the consideration whether the distribution of risks and benefits is fair.

Some authors have criticized the focus on risks in the ethics of technology. One strand of criticism argues that we often lack the knowledge to reliably assess the risks of a new technology before it has come into use. We often do not know the probability that something might go wrong, and sometimes we even do not know, or at least not fully, what might go wrong and what possible negative consequences may be. To deal with this, some authors have proposed to conceive of the introduction of new technology in society as a social experiment and have urged to think about the conditions under which such experiments are morally acceptable (Martin & Schinzingler 2005; van de Poel 2016). Another strand of criticism states that the focus on risks has led to a reduction of the impacts of technology that are considered (Swierstra & te Molder 2012). Only impacts related to safety and health, which can be calculated as risks, are considered, whereas 'soft' impacts, for

example of a social or psychological nature, are neglected, thereby impoverishing the moral evaluation of new technologies.

## **Computer and Information Ethics**

This section surveys the field of computer and information ethics. The first section will define the field and will consider its aims and scope, its history, and major approaches and orientations. In the section thereafter, major topics in computer ethics will be surveyed, including privacy, security, free expression and content control, equity issues, intellectual property, and issues of moral responsibility. The final section will focus on the approaches of values in design and valuesensitive design, which aim to analyze embedded values in computer software and systems, and to devise methodologies for incorporating values into the design process.

**Approaches in Computer and Information ethics** Computer ethics is a field of applied ethics that addresses ethical issues in the use, design and management of information technology and in the formulation of ethical policies for its regulation in society. Computer ethics, which has also been called cyberethics, took off as a field in the 1980s, together with the rise of the personal computer. Early work in the field had already started in the 1940s, soon after the invention of the computer. MIT Professor Norbert Wiener was a precursor of the field, already identifying many issues of computer ethics in his book *The Human Use of Human Beings* [Wiener, 1950]. The term “computer ethics” was first introduced in the mid-1970s by Walter Maner, who also promoted the idea of teaching computer ethics in computer science curricula [Maner, 1980]. The watershed year of 1985 saw the appearance of seminal publications by Jim Moor [1985] and Deborah Johnson [1985] that helped define the field. Since then, it has become a recognized field of applied ethics, with its own journals and conference series. In recent years, the field is sometimes also related to a more general field of information ethics, which includes computer ethics, media ethics, library ethics, and bioinformation ethics.

Why would there be a need for computer ethics, while there is no need for a separate field of ethics for many other technologies, like automobiles and appliances? Jim Moor [1985] has argued that the computer has had an impact like no other recent technology. The computer seems to impact every sector of society, and seems to require us to rethink many of our policies, laws and behaviors. According to Moor, this great impact is due to the fact that computers have logical malleability, meaning that their structure allows them to perform any activity that can be specified as a logical relation between inputs and outputs. Many activities can be specified in this way, and the computer therefore turns out to be an extremely powerful and versatile machine that can perform an incredible amount of functions, from word processor to communication device to gaming platform to financial manager.

The versatility of computers is an important reason for the occurrence of a computer revolution, or information revolution, which is now transforming many human activities and social institutions. Many important things that humans do, including many that raise moral questions like stealing from someone, defaming someone, or invading someone’s privacy now also exist in electronic form. In addition, the computer also makes substantially new types of activities possible that are morally controversial, such as the creation of virtual child pornography for which no real children were abused. Because many of the actions made possible by computers are different and new, we often lack policies and laws to guide them. They generate what Moor has called policy vacuums, being the lack of clear policies or rules of conduct. The task of computer ethics, then, is to propose and develop new ethical policies, ranging from explicit laws to informal guidelines, to guide new types of actions that involve computers. Computer ethics has taken off since its birth in the mid-

80s, and has established itself as a mature field with its own scientific journals, conferences and organizations.

The field initially attracted most of its interests from computer scientists and philosophers, with many computer science curricula nowadays requiring a course or module on computer ethics. However, given the wide implications for human action sketched by Moor, computer ethics is also of interest to other fields that focus on human behavior and social institutions, such as law, communication studies, education, political science and management. Moreover, computer ethics is also an important topic of debate in the public arena, and computer ethicists regularly contribute to public discussions regarding the use and regulating of computer technology. Computer ethics is sometimes defined as a branch of professional ethics similar to other branches like engineering ethics and journalism ethics. On this view, the aim of computer ethics is to define and analyze the moral and professional responsibilities of computer professionals. Computer professionals are individuals employed in the information technology branch, for example as hardware or software engineer, web designer, network or database administrator, computer science instructor or computer-repair technician.

Computer ethics, on this view, should focus on the various moral issues that computer professionals encounter in their work, for instance in the design, development and maintenance of computer hardware and software. Within this approach to computer ethics, most attention goes to the discussion of ethical dilemmas that various sorts of computer professionals may face in their work and possible ways of approaching them. Such dilemmas may include, for example, the question how one should act as a web designer when one's employer asks one to install spyware into a site built for a client, or the question to what extent software engineers should be held accountable for harm incurred by software malfunction. Next to the discussion of specific ethical dilemmas, there is also general discussion of the responsibilities of computer professionals towards various other parties, such as clients, employers, colleagues, and the general public, and of the nature and importance of ethical codes in the profession.

A recent topic of interest has been the development of methods for value-sensitive design, which is the design of software and systems in such a way that they conform to a desired set of (moral) values [Friedman, Kahn and Borning, 2006]. While the professional ethics view of computer ethics is important, many in the field employ a broader conception that places the focus on general ethical issues in the use and regulation of information technology. This approach may be called the philosophical ethics approach to computer ethics. This conception holds, following Moor [1985], that computer ethics studies moral issues that are of broad societal importance, and develops ethical policies to address them. Such policies may regulate the conduct of organizations, groups and individuals and the workings of institutions.

The philosophical approach focuses on larger social issues like information privacy and security, computer crime, issues of access and equity, and the regulation of commerce and speech on the Internet. It asks what ethical principles should guide our thinking about these issues, and what specific policies (laws, social and corporate policies, social norms) should regulate conduct with respect to them. Within this approach, some researchers focus on the development of ethical guidelines for users of computer technology. Others place more emphasis on policy issues, and try to formulate ethical policies for organizations, government agencies or lawmakers. Still others focus on computer technologies themselves, and try to identify and evaluate morally relevant features in their design. Some also focus on theoretical and metaethical issues.

## **Topics in Computer and Information Ethics**

Introductions to computer ethics show considerable agreement on what the central issues for computer ethics are. They include ethical issues of privacy, security, computer crime, intellectual property, free expression, and equity and access, and issues of responsibility and professional ethics.

### **Privacy**

Privacy is a topic that has received much attention in computer ethics from early on. Information technology is often used to record, store and transmit personal information, and it may happen that this information is accessed or used by third parties without the consent of the corresponding persons, thus violating their privacy. Privacy is the right of persons to control access to their personal affairs, such as their body, thoughts, private places, private conduct, and personal information about themselves. The most attention in computer ethics has gone to information privacy, which is the right to control the disclosure of personal data. Information technology can easily be used to violate this right.

Privacy issues come into play on the Internet, where cookies, spyware, browser tracking and access to the records of internet providers may be used to study the Internet behavior of individuals or to get access to their PCs. They also come into play in the construction of databases with personal information by corporations and government organizations, and the merging of such databases to create complex records about persons or to find matches across databases. Other topics of major concern include the privacy implications of video surveillance and biometric technologies, and the ethics of medical privacy and privacy in the workplace. It has also been studied whether people have a legitimate expectation to privacy in public areas, whether they can be freely recorded, screened and tracked whenever they appear in public and how the notion of "public" itself has changed in light of information technology.

### **Security and crime**

Security has become a major issue in computer ethics, because of rampant computer crime and fraud, the spread of computer viruses, malware and spam, and national security concerns about the status of computer networks as breeding grounds for terrorist activity and as vulnerable targets for terrorist attacks. Computer security is the protection of computer systems against the unauthorized disclosure, manipulation, or deletion of information and against denial of service attacks. Breaches of computer security may cause harms and rights violations, including economic losses, personal injury and death, which may occur in so-called safety-critical systems, and violations of privacy and intellectual property rights.

Much attention goes to the moral and social evaluation of computer crime and other forms of disruptive behavior, including hacking (non-malicious break-ins into systems and networks), cracking (malicious break-ins), cybervandalism (disrupting the operations of computer networks or corrupting data), software piracy (the illegal reproduction or dissemination of proprietary software), and computer fraud (the deception for personal gain in online business transactions by assuming a false online identity or by altering or misrepresenting data). Another recently important security-related issue is how state interests in monitoring and controlling information infrastructures to better protect against terrorist attacks should be balanced against the right to privacy and other civil rights [Nissenbaum, 2005].

## **Free expression and content control**

The Internet has become a very important medium for the expression of information and ideas. This has raised questions about whether there should be content control or censorship of Internet information, for example by governments or service providers. Censorship could thwart the right to free expression, which is held to be a basic right in many nations. Free expression includes both freedom of speech (the freedom to express oneself through publication and dissemination) and freedom of access to information.

Several types of speech have been proposed as candidates for censorship. These include pornography and other obscene forms of speech, hate speech such as websites of fascist and racist organizations, speech that can cause harm or undermine the state, such as information as to how to build bombs, speech that violates privacy or confidentiality, and libelous and defamatory speech. Studies in computer ethics focus on the permissibility of these types of speech, and on the ethical aspects of different censorship methods, such as legal prohibitions and software filters.

**Equity and access** The information revolution has been claimed to exacerbate inequalities in society, such as racial, class and gender inequalities, and to create a new, digital divide, in which those that have the skills and opportunities to use information technology effectively reap the benefits while others are left behind. In computer ethics, it is studied how both the design of information technologies and their embedding in society could increase inequalities, and how ethical policies may be developed that result in a fairer and more just distribution of their benefits and disadvantages. This research includes ethical analyses of the accessibility of computer systems and services for various social groups, studies of social biases in software and systems design, normative studies of education in the use of computers, and ethical studies of the digital gap between industrialized and developing countries.

**Intellectual property** Intellectual property is the name for information, ideas, works of art and other creations of the mind for which the creator has an established proprietary right of use. Intellectual property laws exist to protect creative works by ensuring that only the creators benefit from marketing them or making them available, be they individuals or corporations. Intellectual property rights for software and digital information have generated much controversy. There are those who want to ensure strict control of creators over their digital products, whereas others emphasize the importance of maintaining a strong public domain in cyberspace, and argue for unrestricted access to electronic information and for the permissibility of copying proprietary software. In computer ethics, the ethical and philosophical aspects of these disputes are analyzed, and policy proposals are made for the regulation of digital intellectual property in its different forms. Patentability of software is also a topic of major concern, which is problematic due to the non-tangible nature of software as well as the difficulty in specifying what counts as the identity of a piece of software (cf. Turner and Eden, forthcoming b).

## **Moral Responsibility**

Society strongly relies on computers. It relies on them for correct information, for collaboration and social interaction, for aid in decision-making, and for the monitoring and execution of tasks. When computer systems malfunction or make mistakes, harm can be done, in terms of loss of time, money, property, opportunities, or even life and limb. Who is responsible for such harms? Computer professionals, end-users, employers, policy makers and others could all be held responsible for particular harms.

It has even been argued that intelligent computer systems can bear moral responsibility themselves [Dodig-Crnkovic and Persson, 2008]. In computer ethics, it is studied how the moral responsibility of different actors can be defined, and what kinds of decisions should be delegated to computers to begin with. It is studied how a proper assignment of responsibility can minimize harm and allows for attributions of accountability and liability.

## **Foundational Issues in Computer Ethics**

Foundational, metaethical and methodological issues have received considerable attention in computer ethics. Many of these issues have been discussed in the context of the so-called foundationalist debate in computer ethics [Floridi and Sanders, 2002; Himma, 2007a]. This is an ongoing metatheoretical debate on the nature and justification of computer ethics and its relation to metaethical theories. Three questions central to the foundationalist debate are: "Is computer ethics a legitimate field of applied ethics?", "Does computer ethics raise any ethical issues that are new or unique?" and "Does computer ethics require substantially new ethical theories, concepts or methodologies different from those used elsewhere in applied ethics?"

The first question, whether computer ethics is a legitimate field of applied ethics, has often been discussed in the context of the other two questions, with discussants arguing that the legitimacy of computer ethics depends on the existence of unique ethical issues or questions in relation to computer technology. The debate on whether such issues exist has been called the uniqueness debate [Tavani, 2002].

In defense of uniqueness, Maner [1996] has argued that unique features of computer systems, like logical malleability, superhuman complexity and the ability to make exact copies, raise unique ethical issues to which no non-computer analogues exist. Others remain unconvinced that any computer ethics issue is genuinely unique. Johnson [2003] has proposed that issues in computer ethics are new species of traditional moral issues. They are familiar in that they involve traditional ethical concepts and principles like privacy, responsibility, harm and ownership, but the application of these concepts and principles is not straightforward because of special properties of computer technology, which require a rethinking and retooling of ethical notions and new ways of applying them. Floridi and Sanders [2002; Floridi, 2003] do not propose the existence of unique ethical issues but rather argue for the need of new ethical theory. They argue that computer ethics needs a metaethical and macrotheoretical foundation, which they argue be different from the standard macroethical theories like utilitarianism and Kantianism. Instead, they propose a macroethical theory they call Information Ethics, which assigns intrinsic value to information. The theory covers not just digital or analogue information, but in fact analyzes all of reality as having an informational ontology, being built out of informational objects.

Since informational objects are postulated to have intrinsic value, moral consideration should be given to them, including the informational objects produced by computers. In contrast to these various authors, Himma [2007a] has argued that computer technology does not need to raise new ethical issues or require new ethical theories to be a legitimate field of applied ethics. He argues that issues in computer ethics may not be unique and may be approached with traditional ethical theories, and that it nevertheless is a legitimate field because computer technology has given rise to an identifiable cluster of moral issues in much the same way like medical ethics and other fields of applied ethics.

Largely separately from the foundationalist debate, several authors have discussed the issue of proper methodology in computer ethics, discussing standard methods of applied ethics and their limitations for computer ethics [Van den Hoven, 2008; Brey, 2000]. An important recent development that has methodological and perhaps also metaethical ramifications is the increased focus on cultural issues. In intercultural information ethics [Ess and Hongladarom, 2007; Brey, 2007], ethicists attempt to compare and come to grips with the vastly different moral attitudes and behaviors that exist towards information and information technology in different cultures. In line with this development, Gorniak-Kocycowska [1995] and others have argued that the global character of cyberspace requires a global ethics which transcends cultural differences in value systems.

## **Other Topics**

There are many other social and ethical issues that are studied in computer ethics next to these central ones. Some of these include the implications of IT for community, identity, the quality of work, and the quality of life, the relation between information technology and democracy, the ethics of Internet governance and electronic commerce, and the ethics of trust online. Many new ethical issues come up together with the development of new technologies or applications. Recently, much attention has been devoted to ethical aspects of social networking sites like Facebook, MySpace and Youtube, to ubiquitous computing and ambient intelligence, and to robotics and artificial agents. The constant addition of new products and services in information technology and the emergence of new uses and correlated social and cultural consequences ensures that the field keeps meeting new challenges.

## **Values and Computer Systems Design**

Although most ethical commentary in the philosophical approach is directed at the use of computers by individuals and organizations, attention has also started to be paid to systems and software themselves. It has come to be recognized that the systems themselves are not morally neutral but contain values and biases in their design that must also be analyzed. Approaches of this sort have been called values in design approaches [Nissenbaum, 1998; Flanagan, Howe and Nissenbaum, 2007]. Values in design approaches hold that computer software and systems can be morally evaluated partially or wholly independently of actual uses of them. They can be said to embody values in the sense that they have a tendency to promote or sustain particular values when used. This may sound like technological determinism, but proponents usually do not subscribe to the strong determinist thesis that embodied values necessitate certain effects in whatever way the system is used.

Yet, they do hold a weak determinism according to which systems may embody values that systematically engender certain effects across a wide range of uses, at least including typical or "normal" ways of using the system. For a system to embody a value, then, means that there is a tendency for that value to be promoted or realized when the system is used. This observation has led proponents to argue that more attention should be paid to ethical aspects in the design of computer systems rather than just their use.

Friedman and Nissenbaum [1996] have studied how values may enter into computer systems, with a focus on justice and bias. They argue that bias can enter into computer systems in three ways. Preexisting bias emerges from the practices and attitudes of designers and the social institutions in which they function. Technical bias arises from technical constraints. Emergent bias arises after the design of the system, when a context of use emerges that is different from the one anticipated. These three origins of bias may be generalized to apply to other values as well. Brey [2000] has

proposed a particular values in design approach termed disclosive computer ethics. He claims that a significant part of the effort of computer ethics should be directed at deciphering and subsequently evaluating embedded moral values in computer software and systems. The focus should be on widely held public and moral values, such as privacy, autonomy, justice, and democracy. Research, Brey argues, should take place at three levels: the disclosure level, at which morally charged features of computer systems are detected and disclosed, the theoretical level, at which relevant moral theory is developed, and the application level, at which ethical theory is used in the evaluation of the disclosed morally charged features. He claims that such research should be interdisciplinary, involving ethicists, computer scientists and social scientists.

The approach of value-sensitive design [Friedman, Kahn and Borning, 2006; Friedman & Kahn, 2003] is not so much concerned with the identification and evaluation of values in computer systems, but rather with the development of methods for incorporating values into the design process. It is an approach to software engineering and systems development that builds on values in design approaches and studies how accepted moral values can be operationalized and incorporated into software and systems. Its proposed methodology integrates conceptual investigations into values, empirical investigations into the practices, beliefs and intentions of users and designers, and technical investigations into the way in which technological properties and mechanisms support or hinder the realization of values. It also seeks procedures to incorporate and balance the values of different stakeholders in the design process.

## **Biotechnology**

The term “techno science” is increasingly being used to refer to such contemporary disciplines as information and communication technology, nanotechnology, artificial intelligence and to biotechnology. The popularity of the term is illustrated by the fact that even a group of social scientists reporting on the changing attitudes of European public towards biotechnology invokes the term to mark the departure of this particular field from the norms and values once held to be essential to the ethos of science. The evident commercialization and industrialization of biotechnology, with the pursuit of private knowledge, patents and profits, hardly meets Merton's criteria of universalism, communism, disinterestedness and skepticism, or the public's expectations about the values, accountability and social responsibility of science. Biotechnology has become a techno science, a commercial enterprise accountable to financial markets and to shareholders. It is interesting to note that the public, according to these social scientists, have not yet fully accommodated to the new commercial realities of “techno science” and still entertain expectations about science that modern biotechnology is unlikely going to meet.

In the seventeenth century the philosophers Francis Bacon (1561–1626) and René Descartes (1596–1650) advocated a new way of doing science that would have the power to conquer nature for human benefit. (The old science had seemed to be more concerned with contemplating nature than controlling it.) In the contemporary world biotechnology is providing the technology for controlling and changing living nature, including human nature. However, because biotechnological power over the living world offers not only the promise for doing good but also an opportunity for doing evil, this has provoked an ethical debate over the modern scientific project for the mastery of nature through technology.

Biotechnology can be defined as the technical manipulation of living organisms or parts of those organisms to provide products and services to satisfy human desires. If it is defined in this broad way, one can see that biotechnology has been employed throughout human history.

## **Biotechnology in History**

Biotechnology can be defined as the technical manipulation of living organisms or parts of those organisms to provide products and services to satisfy human desires. If it is defined in this broad way, one can see that biotechnology has been employed throughout human history.

The history of biotechnology can be divided into three periods: ancient, modern, and contemporary. Ancient biotechnology began more than 10,000 years ago with the emergence of agriculture in ancient Mesopotamia. Modern biotechnology began in the nineteenth century with the development of industrial microbiology. Contemporary biotechnology began in the 1970s with new techniques for genetic engineering. In each period one can see the power humans have acquired to manipulate nature. But one also can see the natural limits of this power, which is constrained by the natural potentialities available in wild plants and animals and the natural complexities of behavioral traits in the living world.

Ancient biotechnology began when human beings started to domesticate plants and animals for human use. Throughout most of the history of the human species, spanning approximately six million years, human beings fed themselves by gathering wild plants and hunting wild animals. Then some people in a few parts of the world began to produce food by cultivating domesticated plants and herding domesticated animals. As a consequence those farmers and herders bred for and selected genetic modifications in domesticated organisms that were more suitable to human desires. Even in the early twenty-first century all of human civilization depends on this project in agricultural biotechnology.

The human power of domestication is limited, however, by the natural potentiality of wild plants and animals. Most plant and animal species in the wild are not suitable for domestication. For example, most wild plants are not good as a source of food because they are woody or do not produce fruit, leaves, or roots that are edible. Most wild animals are not susceptible to successful domestication because they cannot be bred and herded in a manner that makes them useful for human beings. Although advances in biological knowledge have increased human biotechnological power over living nature, that power will always be limited by the potentialities found in nature.

Modern biotechnology arose in the nineteenth century as growing knowledge in the biological sciences was applied to the technological manipulation of the living world for human purposes. For example, the chemist Louis Pasteur's (1822–1895) microbiological explanation of fermentation as resulting from the activity of microscopic organisms allowed improvements in the brewing of beer and other industries that depend on using fermentation by yeast to produce food and beverages. Pasteur also showed that infectious diseases are caused by disease-producing microorganisms and perfected techniques for vaccination that would create immunity to some of those diseases. Later, in the twentieth century, the discovery of the ways in which some fungi produce antibiotics such as penicillin revolutionized the medical treatment of bacterial infections. In the early 2000s there are hundreds of pharmaceutical agents derived from fungal fermentation.

However, even modern biotechnology shows the technical limits set by nature. Bacteria vulnerable to fungal toxins can evolve to become resistant to those toxins. Indeed, bacteria have been so successful in evolving tolerance to antibiotics that there is a growing fear in the medical profession that the age of antibiotic protection against infectious diseases is reaching its end. The power of this aspect of biotechnology for controlling living nature is great but limited.

The contemporary biotechnology that began in the last half of the twentieth century arose from a deeper knowledge of genetics and molecular biology and has provided humans with greater power over the living world. Even so, contemporary biotechnology is limited in its technical means by the physical and chemical limits of nature. Contemporary biotechnology began in 1973 when Herbert Boyer and Stanley Cohen developed the technology for recombinant DNA, which allows scientists to alter DNA molecules and thus artificially create new forms of life. They did this by combining a number of discoveries. Bacteria protect themselves against certain viruses through the use of restriction enzymes that cut up viral DNA at specific sequences of nucleotide bases; this allows a scientist with the right restriction enzyme to cut out a specific genetic sequence. Bacteria contain plasmids, which are small loops of DNA that can pass from one bacterium to another. This allows bacteria to develop antibiotic resistance quickly if the genes for resistance are passed by plasmids. Boyer and Cohen showed how one could use a restriction enzyme to cut out a specific genetic sequence and then glue that sequence into a bacterial plasmid. That plasmid, with its new combination of genetic sequences, could be introduced into a bacterial cell. As the bacterial cell divided, it would produce copies of the recombinant plasmid, which then could be extracted from the bacteria.

An illustration of the value of this recombinant DNA technique is provided by the production of human insulin. People with diabetes do not have enough of the protein insulin to regulate blood-sugar levels. After the 1920s diabetic patients were treated with injections of insulin extracted from pigs and cattle. This is an example of modern biotechnology. Although pig and cow insulin is very similar to human insulin, there are enough differences that some people with diabetes have had allergic reactions. Contemporary biotechnology provided a solution to the problem by using recombinant DNA techniques. The human gene for insulin was identified and then could be inserted into a bacterial cell through a plasmid so that the bacterium would produce human insulin that could be harvested for use by human patients. In 1982 human insulin produced in genetically modified bacteria became the first drug of contemporary biotechnology to be approved by the U.S. Food and Drug Administration.

Contemporary biotechnology has developed hundreds of products with agricultural, environmental, and medical benefits. Agricultural biotechnology uses reliable techniques for genetic manipulation to produce new kinds of plants and animals to provide food that is cheaper and more nutritious. Environmental biotechnology is used to design genetically modified organisms that can clean up environmental pollution by consuming toxic materials. Medical biotechnology is used to devise new drugs and vaccines and therapeutic techniques that relieve or prevent suffering, cure disease, and enhance physical and mental well-being.

## **Ethical Issues**

Despite its many benefits, biotechnology has provoked ethical controversy in six areas of moral concern: safety, liberty, justice, environmental nature, humannature, and religious beliefs. SAFETY. Safety is a moral concern for opponents of biotechnology who worry that its power disrupts the complex balance in living nature in ways that are likely to be harmful. Individuals such as Jeremy Rifkin (1977) and groups such as Greenpeace have warned that genetically modified crops and foods could endanger human health as well as the health of the environment. Critics of medical biotechnology fear that biotechnology medicine alters the human body and mind in radical ways that could produce harmful consequences—perhaps far into the future—in ways that are hard to foresee.

Proponents of biotechnology such as James Watson (2003) and Michael Fumento (2003) argue that its techniques are so precise and controlled that it tends to be far safer than older forms of technology. Breeders of plants and animals have genetically modified organisms for thousands of years without understanding exactly what they were doing. But biotechnology in the early 2000s provides a better understanding of and greater power over genetic mechanisms so that it is possible to minimize the risks. In fact, there is no clear evidence that any human being among the hundreds of millions who have been exposed has become sick from eating genetically modified foods. Similarly, the risks to human health from medical biotechnology can be reduced by means of careful testing and new techniques for designing drugs and therapies that are designed specifically for individual patients with unique genetic traits. Nevertheless, the history of unforeseen harm from all technologies justifies a cautious approach.

**LIBERTY.** Liberty is a moral concern for those who fear that biotechnology will give some people tyrannical power over others. The history of eugenics, in which governments used coercion to eliminate those judged to be biologically "unfit," illustrates the danger of encroachments on liberty. Libertarian proponents of biotechnology such as Fumento and Virginia Postrel (1998) insist that there should be no threat to liberty as long as biotechnology is chosen freely by individuals in a free market economy. But conservatives such as Leon Kass (2002) worry that people could be coerced informally by social pressure, employers, and insurance companies so that they will feel compelled to adopt biotechnology products and procedures. Moreover, Kass and others suggest that biotech can give parents the power to control the nature and behavior of their children in ways that threaten the liberty of the children.

**JUSTICE.** Justice is a moral concern for people who anticipate that biotechnology will be so expensive that only the richest individuals will benefit from it so that the rich will have an unjust advantage over the poor. Even proponents of biotechnology such as Lee Silver (1998) worry that reproductive biotechnology eventually could divide humanity into two separate species based on the wealth or poverty of their ancestors: the "genrich" who would be genetically designed to be superior and the "genpoor" who would be left behind as biologically inferior beings. Of course in some ways this problem is not unique to biotechnology because rich people always have unfair advantages over the poor, but the libertarian defenders of biotechnology foresee that in a free-market society prices for biotechnology products and services eventually will decline as a result of competition, and this will lessen the advantages of the rich over the poor. Similarly, critics of biotechnology argue that the rich nations of the world will benefit more from this new technology than will the poor nations, yet libertarians predict that international free trade will spread the advantages of biotechnology around the world.

**ENVIRONMENTAL NATURE.** Environmental nature is a moral concern for environmentalists such as Rifkin and Bill McKibben (2003). Those environmentalists predict that biotechnology will promote the replacement of the natural environment with a purely artificial world and that this will deprive human beings of healthy contact with wild nature. They also fear that introducing genetically modified organisms into the environment will produce monstrous forms of life that will threaten human beings and the natural world.

Proponents of biotechnology respond by noting that beginning with agriculture, human beings have been creating genetically modified organisms that transform the environment for thousands of years. All organisms modify their environments, sometimes with global effects. For example, the

oxygen in the earth's atmosphere has been produced over billions of years by photosynthetic organisms. Biologists such as F. John Odling-Smee (2003) have called this "niche construction." So human beings are not unique in their capacity for changing their environments. Although this sometimes has produced disasters such as the extinction of plants and animals and the emergence of new disease-causing agents, people have learned to adjust to these dangers, and contemporary biotechnology provides more precise knowledge and techniques to recognize and avoid such dangers. Moreover, environmental biotechnology is developing new organisms, such as bacteria genetically engineered to metabolize toxic wastes, to restore dangerous natural environments to a condition that is safe for human beings.

## **HUMAN NATURE.**

Human nature is a moral concern for anyone who fears that biotechnology could change or even abolish human nature. Both environmentalists such as Rifkin and McKibben and conservatives such as Kass and Francis Fukuyama (2002) worry that the biotechnological transformation of human nature will produce a "posthuman" world with no place for human dignity rooted in human nature. On the other side of this debate Nick Bolstrom (2003) and others in the World Transhumanist Association welcome the prospect of using biotechnology to move toward a "transhuman" condition. More moderate proponents of biotechnology dismiss both positions for being based on exaggerated views of the power of biotechnology.

In a report by the President's Council on Bioethics (2003) Kass and other members of the council contend that biotechnology expresses a willful lack of humility in pursuing a scientific mastery of nature that carries out the modern scientific project first described by Francis Bacon. When a physician uses medical therapy to restore the health of a patient, the physician cultivates the body's natural capacity for healing to serve the natural goal of health. Such medical treatment is guided in both its means and its ends by nature. But when biotechnologists use genetic engineering or psychotropic drugs to extend human bodily or mental powers beyond their normal range, they act not as nature's servant but as nature's master because they are forcing nature to serve their own willful desires.

As an example Kass and other members of the council point to the use of psychotropic drugs such as Prozac that alter the biochemistry of the brain to elevate mood. Using such drugs to cure severely depressed patients can be justified as therapy directed toward restoring normal mental health, but their use to change human personality radically—perhaps by inducing feelings of contentment that never yield to sadness—would violate the normal range of human mental experience set by nature. The ultimate aim of such a psychopharmacological science would be a drug-dependent fantasy of happiness that would be dehumanizing. Furthermore, scientists such as David Healy (2004) have warned that any drug powerful enough to change human personality is likely to have severely harmful side effects.

The President's Council (2003) warns against the excessive pride inherent in Bacon's project for mastering nature, which assumes that nature is mere material for humans to shape to their desires. Rather, it urges people to adopt an attitude of humility and respect and treat the natural world as a "gift." To respect the "giftedness" of the natural world is to recognize that the world is given to humans as something not fully under their control and that even human powers for changing the world belong to human nature as the unchanging ground of all change (Kass 2003).

Proponents of biotechnology could respond by defending Bacon's project as combining respect

for nature with power over nature. At the beginning of the *Novum Organon* Bacon observed that "nature to be commanded must be obeyed" because "all that man can do is to put together or put asunder natural bodies," and then "the rest is done by nature working within" (Bacon 1955, p. 462). Kass has used the same words in explaining how the power of biotechnology is limited by the potentialities inherent in nature (Kass 1985).

Throughout the history of biotechnology—from the ancient Mesopotamian breeders of plants and animals, to Pasteur's use of microorganisms for fermentation and vaccination, to Boyer and Cohen's techniques for gene splicing—people have employed nature's properties for the satisfaction of human desires. Boyer and Cohen did not create restriction enzymes and bacterial plasmids but discovered them as parts of living nature. They then used those natural processes to bring about outcomes, such as the production of human insulin for persons with diabetes, that would benefit human beings. Biotechnology has the ability to change nature only insofar as it conforms to the laws of nature. To command nature people must obey it.

Baconian biotechnology is thus naturally limited in its technical means because it is constrained by the potentialities of nature. It is also naturally limited in its moral ends because it is directed toward the goals set by natural human desires. Kass and the President's Council (2003) acknowledge this by showing how biotechnology is employed to satisfy natural desires such as the desire of parents for happy children and the desire of all human beings for life and health. As they indicate, it is not enough to respect the "giftedness" of nature because some of the "gifts" of nature, such as diabetes and cancer, are undesirable. People accept some of nature's gifts and reject others on the basis of the desires inherent in human nature.

**RELIGIOUS BELIEFS.** To appreciate life as a gift that should elicit a feeling of humility rather than mastery is a religious emotion. Some of the moral concerns about biotechnology express the religious attitude that life is sacred and therefore the biotechnological manipulation of life shows a lack of reverence for the divinely ordained cosmic order. The biblical story of the Tower of Babel (Genesis 11:1–9) suggests that the human lust for technical power over the world provokes divine punishment.

In 1977 the environmentalist Jeremy Rifkin wrote a book attacking biotechnology with the title *Who Should Play God?: The Artificial Creation of Life and What It Means for the Future of the Human Race*. The title conveys the direction of his argument. The "creation of life" is proper only for God. For human beings to create life "artificially" is a blasphemous transgression of God's law that will bring punishment upon the human race. Rifkin often uses the imagery of the Frankenstein story. Like Doctor Frankenstein, biotech scientists are trying to take God's place in creating life, and the result can only be the creation of monsters. When people such as Rifkin use the phrase "playing God," they evoke a religious sense that nature is a sacred expression of God's will and therefore should not be changed by human intervention. Rifkin has said that "the resacralization of nature stands before us as the great mission of the coming age" (Rifkin 1983, p. 252).

In contrast to Rifkin, Bacon thought that regarding nature as sacred was a pagan idea contrary to biblical religion. In pagan antiquity the natural world was the sacred image of God, but the Bible teaches that God is the transcendent Creator of nature; therefore, God's mysterious will is beyond nature. Although nature declares God's power and wisdom, it does not declare the will and true worship of God. Bacon believed that true religion as based on faith in biblical revelation must be separated from true philosophy based on the rational study of nature's laws (Bacon 1955).

Some biblical theologians, such as Philip Hefner (2003) and Ted Peters (2003), have restated this Baconian claim that the biblical conception of God as the supernatural creator of nature separates the sacred and the natural and thus denies pagan pantheism. They argue that because human beings have been created in God's image and God is the Creator, human beings must share somehow in God's creativity. The Bible declares that when God made humanity in his image, this was to include "dominion" or "mastery" over all the earth, including all the animals (Genesis 1:26–28). Hefner reads the Bible as teaching that human beings are "created cocreators." As "created," humans are creatures and cannot create in the same way as God, who can create *ex nihilo*, "from nothing." However, as "cocreators" people can contribute to changes in creation. Of course, Hefner warns, people must do this as cautious and respectful stewards of God's creation, but it is not appropriate to worship nature as sacred and thus inviolable.

The theological idea of human beings as cocreators was affirmed by Pope John Paul II in his 1981 encyclical *Laborem Exercens* and criticized as a "remarkably bad idea" by the Protestant theologian Stanley Hauerwas (Houck and Williams 1983). In his 1991 encyclical *Centesimus Annus* the Pope stressed the importance of human technological knowledge in improving the conditions of life (Novak 1993).

That God transcends nature, that nature is thus not sacred, that human beings as created in God's image share in God's creative activity, that human beings have the power and the duty to master nature by artful manipulation, and that they have the moral duty to do this as an activity of charity for the improvement of human life—all the precepts Bacon drew from the Bible to support his view of the new science—have been accepted by some biblical believers. But many of those believers worry that modern science promotes an atheistic materialism that denies the dignity of human beings and of the natural world generally as God's Creation. In particular they worry about whether biotechnology expresses an unduly willful attitude toward the world as merely raw material for human manipulation and survival.

## **Environmental ethics Introduction**

Environmental ethics is a sub-discipline of philosophy that deals with the ethical problems surrounding environmental protection. It aims to provide ethical justification and moral motivation for the cause of global environmental protection.

Body

- Environmental ethics focuses on questions concerning how we ought to inhabit the world; what constitutes a good life or a good society; and who, where, or what merits moral standing. The field emerged most significantly in the 1960s from an increasing awareness of the global environmental condition.
- It is concerned with the issue of responsible personal conduct with respect to natural landscapes, resources, species, and non-human organisms. It is a cluster of beliefs, values and norms regarding how humans should interact with the environment.

## **Issues involved in environmental ethics**

- a) **Consumption of natural resources:** Since humans are part of nature, sustainable use of resources can be achieved through cooperation with nature.
- b) **Destruction of forests:** Big industries and multinational companies form the major section which exploits forests unsustainably. However, the brunt of the destruction is faced by the poor

and tribals who are the inhabitants of the forests. It leads to the loss of biodiversity, habitats and extinction of plants and animals.

- c) **Environmental pollution:** Consequences of environmental pollution do not respect national boundaries. Moreover, the poor and weaker sections of society are disproportionately affected by negative effects of climate change.
- d) **Anthropocentrism:** It refers to an ethical framework that grants “moral standing” solely to human beings. Thus, an anthropocentric ethic claims that only human beings are morally considerable in their own right, meaning that all the direct moral obligations we possess, including those we have with regard to the environment, are owed to our fellow human beings.
- e) **Equity:** People living in the economically-advanced sections/ parts use greater amount of resources and energy per individual and also waste more resources. This is at the cost of poor people who are resource-deprived.
- f) **Animal rights:** The plants and animals that share the Earth with us too have a right to live and share the Earth’s resources and living space. Animal welfare is relevant to environmental ethics because animals exist within the natural environment and thus form part of environmentalists’ concerns.

## Measures to maintain environmental ethics

- The “**land ethic**” of Aldo Leopold: It demands that we stop treating the land as a mere object or resource. Land is not merely soil, instead, it is a fountain of energy, flowing through a circuit of soils, plants and animals.
- In order to preserve the relations within the land, Leopold claims that we must move towards a “land ethic”, thereby granting moral standing to the land community itself, not just its individual members.

## Deep ecology: There are eight principles or statements that are basic to deep ecology:

- The well-being and flourishing of human and non-human life on Earth have value in themselves. These values are independent of the usefulness of the non-human world for human purposes.
- Richness and diversity of life forms contribute to the realization of these values and are also values in themselves.
- Humans have no right to reduce this richness and diversity except to satisfy vital needs.
- The flourishing of human life and cultures is compatible with a substantial decrease of the human population. The flourishing of non-human life requires such a decrease.
- Present human interference with the non-human world is excessive, and the situation is rapidly worsening.
- Policies must therefore be changed. These policies affect basic economic, technological and ideological structures. The resulting state of affairs will be deeply different from the present.
- The ideological change is mainly that of appreciating life quality rather than adhering to an increasingly higher standard of living.
- Those who subscribe to the foregoing points have an obligation directly or indirectly to try to implement the necessary changes.

**The conservation ethics and traditional value systems:** Since olden days, people have always valued mountains, rivers, forests, trees and several animals. Thus, much of nature was venerated and

protected. Traditions held plants and animals as an important aspect of nature and were considered the basis of life-support systems and integral to bring about a harmonious life.

**Virtue ethics:** Virtue ethics is a way of thinking about how to behave well, which focuses on the character of moral agents and the nature of the good life. Virtue ethics is based on a positive view of human nature, one that takes into account that humans are strongly predisposed to recognize excellence in others (including non-human) whom they can take as role models and gain fulfillment from a life lived virtuously.

## Conclusion

To cope with the issues of environmental ethics, human beings must reach some value consensus and cooperate with each other at the personal, national, regional, multinational and global levels. Global environmental protection depends on global governance. An environmental ethic is, therefore, typically a global ethic with a global perspective.

## Nature as means or end

From the Latin *natura* (Gr. φύσις), a term with many related meanings in philosophy and with extensive applications in theology. Among philosophers it is commonly taken to mean the essence of a thing as this is the source of its properties or operations; more strictly, however, it is a primary and per se principle of motion and rest that is found in natural things as opposed to artifacts. It is sometimes used in the more restricted sense of human nature, for which meaning see man. Theologians use the term in opposition to grace or to supernature, particularly when discussing human nature, and in opposition to person, particularly in Trinitarian theology and Christology.

Since nature is the proper subject of the philosophy of nature, the major emphasis in this article is on nature as studied in natural philosophy. Topics treated include the primary meanings of the concept, its development among the Greeks, modifications in it occasioned by the rise of modern science, an Aristotelian analysis of its meaning in natural philosophy, and various secondary meanings.

**Primary Meanings.** On Nature (Περὶ φύσεως) is the title under which the writings of the pre-Socratics have been handed down to posterity. Some doubt exists as to what precisely was the first meaning, but it is generally admitted that at least an early and important use of the term φύσις was to designate the primordial stuff or underlying substratum persisting through all change. It is likely that the early Ionian philosophers imagined the world as developing in an orderly fashion from within, somewhat as a living being, and hence the primary substance would have been viewed, though indistinctly, as a source of activity. Thus φύσις was an intrinsic principle that accounted for the ceaseless change or becoming of things. Moreover, the very process of becoming, it seems, was itself called φύσις, a term that is etymologically related to φύω, to grow (cf. Lat. *natura* and *nascor*). Finally, at some later date the term was applied to the changing things themselves taken in their totality. This is possibly the most common sense of nature in modern usage and was probably the meaning of φύσις intended in the title Περὶ φύσεως.

**Greek Development.** The attempt of the Ionians of the 6th century b.c. to explain all becoming in terms of one material principle (e.g., water or air or fire) reached its logical conclusion in Parmenides with the very denial of nature as process. For Parmenides all being must be one and exclude all nonbeing; as such it is perfectly immutable, and only as such is it knowable; all change is but sensory illusion. After Parmenides, there was an attempt to reconcile being, stable object of intel-

lect, with the becoming of sensory experience. Fundamental reality remained immutable; it was, however, multiple: the four elements of Empedocles; the "seeds," infinite in number, of Anaxagoras; the atoms of Leucippus and Democritus. These particles, in motion, combined and separated, and as such were principles of change and of a multiplicity of changing compounds. The atomists, with their homogeneous particles differing only in size and shape, interpreted all change in terms of movement in space ("void") and all sensible qualities, such as color, in terms of quantitative differences. They have been considered as forerunners to modern science. So too have the Pythagoreans, who, from the 6th century B.C., had been seeking to explain the world in the light of numbers. The claim to find the ultimate explanation of reality in the random motions of corporeal elements, i.e., in nature and chance, was strongly opposed by Plato. If nature means the primary source of becoming, what is truly nature, for him, could only be what is really first, and that is intelligence and art. Thus, with Plato, nature in the commonly accepted sense gave way to divine soul, and chance to divine direction (Laws 888E–899D). Finality, introduced as conscious design, was lodged in a principle (soul) distinct from the purely corporeal. Likewise, the intelligibility of sensible bodies was to be sought beyond them, in the changeless, purely intelligible Ideas, of which they are imperfect imitations. The order of the sensible world could be seen, too, in terms of the a priori principles of pure number. As for the changing imitations considered in themselves, of these there could be no science, but only a likely account.

Nature was reinstated as a true principle and a real source of explanation within the material universe by Aristotle, who thus restored the philosophy of nature to the rank of a science (*scientia*). Aristotle continued the naturalist tradition of the pre-Socratics, his science being qualitative rather than mathematical, empirical rather than rationalist. It was far from being a mere return, however. After Plato there was form to be reckoned with. In Aristotle the natural world becomes intelligible in itself only because nature is identified with form in matter—with form now seen as the actuality of matter—even more properly than with matter itself. This form becomes the origin of activity, and matter, considered in itself, is reduced to a principle of mere passivity and receptivity. The realization of form in matter is the goal of natural activity, and although there are various combinations and separations of elements, it is always for the sake of a form; hence, the teleological view, as opposed to the mechanistic, remains dominant. But purpose is now found in the unconscious workings of form as well as in the conscious activities of rational soul. Although Aristotle conceived the natural universe as impregnated with and illuminated by form, for the ultimate explanation he too reached beyond nature. It is the desire to imitate the fully actual reality of Pure Form that, in the final analysis, explains all the ceaseless processes of nature.

**Later Modifications.** Both the Platonist and the Aristotelian view of nature extended into the Middle Ages. The early period was largely Neoplatonist, but in the 13th century the commentaries of St. Albert the Great and especially of St. Thomas Aquinas brought the Aristotelian doctrine of nature into the foreground.

In the 16th and 17th centuries, the rapid development of the new empirico-mathematical science was accompanied by an emphatic rejection of teleology: the conception of nature tending to ends. At first, change was Platonistically explained by an inherent, creative principle (*natura naturans*) animating and directing the world of nature (*natura naturata*)—terms that go back to the Latin translation of Averroës. Before long, however, under the influence of F. Bacon, J. Kepler, G. Galilei, R. Descartes, I. Newton, and others, the account became thoroughly mechanistic. With the rejection of the geocentric astronomy and the adoption of the universal law of gravitation, the qualitatively differentiated world of Aristotle gave place to a totally homogeneous universe. Purely qual-

itative differences, such as color, were considered to be functions of quantitative structure, and were soon dismissed as mere appearances to a sentient mind. Matter as potency was replaced by matter as mass and extension. All change was reduced to the motion of smallest parts in space; all causality, to prior events, i.e., to prior motions, identical causes being followed by identical effects. The spontaneous activity of bodies gave way to the idea of force (impact, attraction) and the impulse toward ends was displaced by inertia, the disposition to remain always the same. Nature thus became, for the scientist and the philosopher of nature alike, a mechanical system of inert, homogeneous mass-bodies, situated in space and time, moved by external forces, and utterly devoid of all but quantitative properties.

In the 20th century, the adequacy of purely mechanistic principles of explanation has been seriously questioned for the biological and psychological sciences. Further, the scientific theories of evolution along with the physicist's conception of matter as energy have made more generally acceptable a view that was already to some degree in evidence in the philosophies of G. W. Leibniz and G. W. F. Hegel, viz, the idea of nature as internally active and engaged in process. This conception, to which in some instances has been added the idea of aim, has found philosophical expression in the works of such thinkers as H. Bergson, S. Alexander, and A.N. Whitehead.

**Aristotelian Analysis.** A fuller presentation of the Aristotelian concept of nature, which has been generally adopted by scholastic thinkers, entails considering his definition of nature, nature as passive, nature as active, end as nature, and related concepts.

**Definition of Nature.** Aristotle (Phys. 192b 8–32) reached his definition of nature by way of a comparison of the things that exist by nature (viz, animals and their parts, plants and simple bodies) with those that exist by other causes, in particular by art. The former are seen to have within them a tendency to move, i.e., to change. The artifact as such has no such tendency. It has an inclination to change only accidentally insofar as it is made of a natural substance. Nature, then, concluded Aristotle, is the principle or cause of being moved and being at rest in that in which it is primarily, by reason of itself and not accidentally.

"Being moved" implies passivity. Strictly speaking, the principle that constitutes a thing as a mover is a nature only when the mover by its activity is itself moved. Also, motion here includes any kind of corporeal change, accidental or substantial; it excludes, however, spiritual operations, such as intellection. "Rest" implies the attainment of the end to which the movement was directed. The phrase "by reason of itself and not accidentally" excludes such cases as the doctor who cures himself. The art of medicine is, in this case, intrinsic but accidental to the one who is being cured, considered as such.

**Nature as Passive.** Nature, thus defined, was identified by Aristotle first (Phys. 193a 10–30) with matter taken as the substratum of change, i.e., as the passive, potential principle of being moved. In opposition to the pre-Socratics, Aristotle conceived of the ultimate material principle (primary matter) as being of itself bereft of all form, purely passive, pure potentiality. The matter, however, from which becoming proceeds, taken in its concrete existence, is always determined matter. The substantial form currently possessed, determining the matter in a particular way, always limits and defines matter's immediate potentialities. This is true both for the potency of primary matter for new substantial forms and more obviously for the accidental receptivities characteristic of any given being. Furthermore, since the form already possessed by the matter can be the source of certain activities as well, the matter on which a natural agent operates, just as it is

never pure potency, need not be entirely passive. Its activity, in fact, may run contrary to the aim of the agent.

Nature as Active. It is especially with form, however, that Aristotle is concerned to identify nature (Phys. 193a 30-b 19). The ancients, not distinguishing the two principles of matter and form, had conceived of their primordial stuff as already determined and capable of activity. Once substantial form is disassociated from matter and recognized as principle of essential determination, source of activity, and end of generation, it becomes obvious that form more than matter deserves to be called nature. Nature, then, as active principle of movement, is substantial form. (Note that, although one says "Nature acts," strictly speaking it is the composite substance that acts in virtue of its nature.)

Form is the source of two different types of activity in nature. First and more obviously, form is the intrinsic source of the vital activities of the living body. As such, it is known as soul. And as such it is a nature, since, by these activities, the living being is itself moved. The soul, in fact, is the primary source of activity whereby one part of the heterogeneous composite moves another part. Moreover, all the vital activities are either movements themselves (e.g., growth) or essentially connected with movements (e.g., sensation) or they pre-suppose movements (e.g., intellection). The soul, however, is also the principle of generation, an activity that is essentially directed to another substance. But even as such, it is a nature, insofar as the movement takes place within the same species, if not within the same individual.

Second, form is the intrinsic source of the spontaneous activities characteristic of a given body, e.g., a chemical element. Inanimate bodies, not having differentiated parts, do not move themselves. Their activities, on the contrary, are directed to other bodies that in turn may affect them. The forms, in this case, satisfy the requirement of interiority in the definition of nature insofar as they are parts within a system of interrelated active and passive potencies.

In Aristotle's cosmology, however, there are certain movements of bodies that do arise from an intrinsic source (Phys. 254b 33–255b 31), as in his example of a body falling to the ground—a movement that does not appear to require an external agent. In this case, however, nature functions as a principle of activity without constituting the thing as a mover. The body, in fact, does not move itself, part moving part, as does the living thing. For Aristotle, rather, the movement arises spontaneously from the impulse of the form toward what is appropriate to it, which, in this instance, is a suitable environment.

### **End as Nature.**

Whether a movement is natural or not cannot always be determined by sole reference to the active and passive principles. The determining factor is ultimately the end of becoming, and this too is nature.

Nature, in one sense, has been identified with the receptive and determinable principle. There are, however, in the world of nature, potencies that are not natural: the capacity of a natural body to take on an artificial form, or the capacity to be altered by some violent action. The natural potency differs from these in that it is a positive inclination to an act that perfects or fulfills the being so inclined, or else contributes to the good of the species or even to the good of the universe as a whole. The passive principle in nature, moreover, is normally related to a natural agent, through the activity of which it is brought to act. The activity of natural agents is accounted for by the tendency of the form in nature to actualize and bring to completion what is potential either within the same

individual or beyond. The natural agent, then, actively tends to that good or perfection to which the potential principle is passively inclined. Furthermore, the natural agent, fixed in its species by its form, is also determined by this same principle with respect to specific goals, which it attains for the most part. Thus the acts to which it naturally directs matter by its activity are determinate acts. It is in this sense that a nature is said to act for an end. (Obviously, the end as a good is more easily recognized in the activity of living beings than it is in the workings of the inanimate world.) Consequently, it is the act or form, considered as the end to which a natural being tends either actively or passively, that determines whether a process is or is not in accordance with nature. And in those cases where the good of the whole is in opposition to the good of the individual (as in the case of corruption), it is the former that takes precedence as a determining principle.

The form considered as end, furthermore, is itself properly called nature. It is a principle of becoming, and one that, in the essential order of things, is prior even to the passive and active principles as such. It is also intrinsic, insofar as natural movements are for the sake of the form (*finis cui*) from which they spring. In fact, the natural form seeks its own preservation and development within the individual; it tends by generation to its own continuance, as a specific form, in other individuals; and ultimately, by realizing its specific ends, it contributes to the order and preservation of the universe, i.e., to the good of the whole of which it is a part.

Related Concepts. Art, violence, and chance are all active principles that presuppose nature but operate outside the order of natural finality.

**Secondary Meanings.** From nature meaning the form or essence that is the end of generation, the word has been extended to signify any essence whatsoever without reference at all to becoming. This sense, as applicable to any being, material or immaterial, is frequently conveyed by the terms definition and quiddity. A meaning somewhat closer to the original is that of essence as the source of any activity, whether of physical movement or of spiritual operation (*De ente* 1). This sense, too, is sometimes conveyed by the term substance.

### **Aldo-Leopold; land-ethics**

When god-like Odysseus returned from the wars in Troy, he hanged all on one rope a dozen slave-girls of his household whom he suspected of misbehavior during his absence. This hanging involved no question of propriety. The girls were property. The disposal of property was then, as now, a matter of expediency, not of right and wrong. Concepts of right and wrong were not lacking from Odysseus'. Greece: witness the fidelity of his wife through the long years before at last his black galleys clove the wine-dark seas for home. The ethical structure of that day covered wives, but had not yet been extended to human chattels. During the three thousand years which have since elapsed, ethical criteria have been extended to many fields of conduct, with corresponding shrinkages - in those judged by expediency only.

### **The Ethical Sequence**

This extension of ethics, so far studied only by philosophers, is actually a process in ecological evolution. Its sequences may be described in ecological as well as in philosophical terms. An ethic, ecologically, is a limitation on freedom of action in the struggle for existence. An ethic, philosophically, is a differentiation of social from anti-social conduct. These are two definitions of one thing. The thing has its origin in the tendency of interdependent individuals or groups to evolve modes of co-operation. The ecologist calls these symbioses. Politics and economics are advanced symbioses in which the original free-for-all competition has been replaced, in part, by co-operative mech-

organisms with an ethical content. The complexity of co-operative mechanisms has increased with population density, and with the efficiency of tools. It was simpler, for example, to define the anti-social uses of sticks and stones in the days of the mastodons than of bullets and billboards in the age of motors. The first ethics dealt with the relation between individuals; the Mosaic Decalogue is an example. Later accretions dealt with the relation between the individual and society. The Golden Rule tries to integrate the individual to society; democracy to integrate social organization to the individual. There is as yet no ethic dealing with man's relation to land and to the animals and plants which grow upon it. Land, like Odysseus' slave-girls, is still property. The land-relation is still strictly economic, entailing privileges but not obligations.

The extension of ethics to this third element in human environment is, if I read the evidence correctly, an evolutionary possibility and an ecological necessity. It is the third step in a sequence. The first two have already been taken. Individual thinkers since the days of Ezekiel and Isaiah have asserted that the despoliation of land is not only inexpedient but wrong. Society, however, has not yet affirmed their belief. I regard the present conservation movement as the embryo of such an affirmation. An ethic may be regarded as a mode of guidance for meeting ecological situations so new or intricate, or involving such deferred reactions, that the path of social expediency is not discernible to the average individual. Animal instincts are modes of guidance for the individual in meeting such situations. Ethics are possibly a kind of community instinct in-the-making.

### **The Community Concept**

All ethics so far evolved rest upon a single premise: that the individual is a member of a community of interdependent parts. His instincts prompt him to compete for his place in the community, but his ethics prompt him also to co-operate (perhaps in order that there may be a place to compete for). The land ethic simply enlarges the boundaries of the community to include soils, waters, plants, and animals, or collectively: the land.

This sounds simple: do we not already sing our love for and obligation to the land of the free and the home of the brave? Yes, but just what and whom do we love? Certainly not the soil, which we are sending helter-skelter downriver. Certainly not the waters, which we assume have no function except to turn turbines, float barges, and carry off sewage. Certainly not the plants, of which we exterminate whole communities without batting an eye. Certainly not the animals, of which we have already extirpated many of the largest and most beautiful species. A land ethic of course cannot prevent the alteration, - management, and use of these 'resources,' but it does affirm their right to continued existence, and, at least in spots, their continued existence in a natural state.

In short, a land ethic changes the role of Homo sapiens from conqueror of the land-community to plain member and citizen of it. It implies respect for his fellow-members, and also respect for the community as such. In human history, we have learned (I hope) that the conqueror role is eventually self-defeating. Why? Because it is implicit in such a role that the conqueror knows, ex cathedra, just what makes the community clock tick; and just what and who is valuable, and what and who is worthless, in community life. It always turns out that he knows neither, and this is why his conquests eventually defeat themselves.

In the biotic community, a parallel situation exists. Abraham knew exactly what the land was for: it was to drip milk and honey into Abraham's mouth. At the present moment, the assurance with which we regard this assumption is inverse to the degree of our education: The ordinary citizen today assumes that science knows what makes the community clock tick; the scientist is equally

sure that he does not. He knows that the biotic mechanism is so complex that its workings may never be fully understood: That man is, in fact, only a member 'of a biotic team is shown by an ecological interpretation of history. Many historical events, hitherto explained solely in terms of human enterprise, were actually biotic interactions between people and land. The characteristics of the land determined the facts quite as potently as the characteristics of the men who lived on it.

Consider, for example, the settlement of the Mississippi valley. In the years following the Revolution, three groups were contending for its control: the native Indian, the French and English traders, and the American settlers. Historians wonder what would have happened if the English at Detroit had thrown a little more weight into the Indian side of those tipsy scales which decided the outcome of the colonial migration into the cane-lands of Kentucky. It is time now to ponder the fact that the cane-lands, when subjected to the particular mixture of forces represented by the cow, plow, fire, and axe of the pioneer, became bluegrass.

What if the plant succession inherent in this dark and bloody ground had, under the impact of these forces, given us some worthless sedge, shrub, or weed? Would Boone and Kenton have held out? Would there have been any overflow into Ohio, Indiana, Illinois, and Missouri? Any Louisiana Purchase? Any transcontinental union of new states? Any Civil War?

Kentucky was one sentence in the drama of history. We are commonly told what the human actors in this drama tried to do, but we are seldom told that their success, or the lack of it, hung in large degree on the reaction of particular soils to the impact of the particular forces exerted by their occupancy. In the case of Kentucky, we do not even know where the bluegrass came from whether it is a native species, or a stowaway from Europe.

Contrast the cane-lands with what hindsight tells us about the Southwest, where the pioneers were equally brave, resourceful, and persevering. The impact of occupancy here brought no bluegrass, or other plant fitted to withstand the bumps and buffetings of hard use. This region, when grazed by livestock, reverted through a series of more and more worthless grasses, shrubs, and weeds to a condition of unstable equilibrium. Each recession of plant types bred erosion; each increment to erosion bred a further recession of plants. The result today is a progressive and mutual deterioration, not only of plants and soils, but of the animal community subsisting thereon. The early settlers did not expect this: on the cienegas of New Mexico some even cut ditches to hasten it. So subtle has been its progress that few residents of the region are aware of it. It is quite invisible to the tourist who finds this wrecked landscape colorful and charming (as indeed it is, but it bears scant resemblance to what it was in 1848).

This same landscape was 'developed' once before, but with quite different results. The Pueblo Indians settled the Southwest in pre-Colombian times, but they happened not to be equipped with range live stock. Their civilization expired, but not because their land expired. In India, regions devoid of any sod-forming grass have been settled, apparently without wrecking the land, by the simple expedient of carrying the grass to the cow, rather than vice versa. (Was this the result of some deep wisdom, or was it just good luck? I do not know.) In short, the plant succession staved the course of history; the pioneer simply demonstrated, for good or ill, what successions inhered in the land. Is history taught in this spirit? It will be, once the concept of land as a community really penetrates our intellectual life.

## The Ecological Conscience

Conservation is a state of harmony between men and land. Despite nearly a century of propaganda, conservation still proceeds at a snail's pace; progress still consists largely of letterhead pieties and convention oratory. On the back forty we still slip two steps backward for each forward stride. The usual answer to this dilemma is 'more conservation education.' No one will debate this, but is it certain that only the volume of education needs stepping up? Is something lacking in the content as well? It is difficult to give a fair summary of its content in brief form, but, as I understand it, the content is substantially this: obey the law, vote right, join some organizations, and practice what conservation is profitable on your own land; the government will do the rest. Is not this formula too easy to accomplish anything worth while? It defines no right-or-wrong, assigns no obligation, calls for no sacrifice, implies no change in the current philosophy of values. In respect of land use, it urges only enlightened self-interest. Just how far will such education take us? An example will perhaps yield a partial answer.

By 1930 it had become clear to all except the ecologically blind that southwestern Wisconsin's topsoil was slipping seaward. In 1933 the farmers were told that if they would adopt certain remedial practices for five years, the public would donate CCC labor to install them, plus the necessary machinery and materials. The offer was widely accepted, but the practices were widely forgotten when the five-year contract period was up. The farmers continued only those practices that yielded an immediate and visible economic gain, for themselves.

This led to the idea that maybe farmers would learn more quickly if they themselves wrote the rules. Accordingly the Wisconsin Legislature in 1937 passed the Soil Conservation District Law. This said to farmers, in effect: We, the public, will furnish you free technical service and loan you specialized machinery, if you will unite your own rules for land-use. Each county may write its own rules, and these will have the force of law. Nearly all the counties promptly organized to accept the proffered help, but after a decade of operation, no county has yet written a single rule. There has been visible progress in such practices as strip-cropping, pasture renovation, and soil liming, but none in fencing woodlots against grazing, and none in excluding plow and cow from steep slopes. The farmers, in short, have selected those remedial practices which were profitable anyhow, and ignored those which were profitable to the community, but not clearly profitable to themselves.

When one asks why no rules have been written, one is told that the community is not yet ready to support them; education must precede rules. But the education actually in progress makes no mention of obligations to land over and above those dictated by self-interest. The net result is that we have more education but less soil, fewer healthy woods, and as many floods as in 1937.

The puzzling aspect of such situations is that the existence of obligations over and above self-interest is taken for granted in such total community enterprises as the betterment of roads, schools, churches, and baseball teams. Their existence is not taken for granted, nor as yet seriously discussed, in bettering the behavior of the water that falls on the land, or in the preserving of the beauty or diversity of the farm landscape. Land use ethics are still governed wholly by economic self-interest, just as social ethics were a century ago.

To sum up: we asked the farmer to do what he conveniently could to save his soil, and he has done just that, and only that. The farmer who clears the woods off a 75 percent slope, turns his cows

into the clearing, and dumps its rainfall, rocks, and soil into the community creek, is still (if otherwise decent) a respected member of society. If he puts lime on his fields and plants his crops on contour, he is still entitled to all the privileges and emoluments of his Soil Conservation District. The District is a beautiful piece of social machinery, but it is coughing along on two cylinders because we have been too timid, and too anxious for quick success, to tell the farmer the true magnitude of his obligations. Obligations have no meaning without conscience, and -the problem we face is the extension of the social conscience from people to land.

No important change in ethics was ever accomplished without an internal change in our intellectual emphasis loyalties, affections, and convictions. The proof that- conservation has not yet touched these foundations of conduct lies in the fact that philosophy and religion have not yet heard of it. In our attempt to make conservation easy, we have made it trivial.

### **Substitutes for a Land Ethic**

When the logic of history hungers for bread and we hand out a stone, we are at pains to explain how much the stone resembles bread. I now describe some of the stones which serve in lieu of a land ethic. One basic weakness in a conservation system based wholly on economic motives is that most members of the land community, have no economic value. Wildflowers and songbirds are examples. Of the 22,000 higher plants and animals native to Wisconsin, it is doubtful whether more than 5 per cent can be sold, fed, eaten, or otherwise put to economic use. Yet members of the biotic community; and if (as I believe) its stability depends on its integrity, they are entitled to continuance. When one of these non-economic categories is threatened; and if we happen to love it, we invent subterfuges to give it economic importance. At the beginning of the century songbirds were supposed to be disappearing. Ornithologists jumped to the rescue with some distinctly shaky evidence to the effect that insects would eat us up if birds failed to control them. The evidence had to be economic in order to be valid. It is painful to read these -circumlocutions today. We have no land ethic yet, but we have at least drawn nearer the point of admitting that birds should continue as a matter of biotic right, regardless of the presence or absence of economic advantage to us.

A parallel situation exists in respect of predatory mammals, raptorial birds, and fish-eating birds. Time was when biologists somewhat overworked the evidence that these creatures preserve the health of game by killing weaklings, or that they control rodents for the farmer, or that they prey only on 'worthless' species. Here again, the evidence had to be economic in order to be valid. It is only in recent years that we hear the more honest argument that predators are members of the community, and that no special interest has the right to exterminate them for the sake of a benefit, real or fancied, to itself. Unfortunately this enlightened view is still in the talk stage. In the field the extermination of predators goes merrily on: witness the impending erasure of the timber wolf by fiat of Congress, the Conservation Bureaus, and many state legislatures.

Some species of trees have been 'read out of the party' by economics-minded foresters because they grow too slowly, or have too low a sale value to pay as - timber crops: white cedar, tamarack, cypress, beech, and hemlock are examples. In Europe, where forestry is ecologically - more advanced, the non-commercial tree species are recognized as members of the native forest community, to be preserved as such, within reason. Moreover some (like beech) have been found to have a valuable function in building up soil fertility. The interdependence of the forest and its constituent tree species, ground flora, and fauna is taken for granted.

Lack of economic value is sometimes a character not only of species or groups, but of entire biotic communities: marshes, bogs, dunes, and 'deserts' are examples. Our formula in such cases is to relegate their conservation to government as refuges, monuments, or parks. The difficulty is that these communities are usually interspersed with more valuable private lands; the government cannot possibly own or control such scattered parcels. The net effect is that we have relegated some of them to ultimate extinction over large areas. If the private owner were ecologically minded, he would be proud to be the custodian of a reasonable proportion of such areas, which add diversity and beauty to his farm and to his community. In some instances, the assumed lack of profit in these 'waste' areas has proved to be wrong, but only after most of them had been done away with. The present scramble to reflood muskrat marshes is a case in point.

There is a clear tendency in American conservation to relegate to government all necessary jobs that private landowners fail to perform. Government ownership, operation, -subsidy, or regulation is now widely prevalent in forestry, range management, soil and watershed management, park and wilderness conservation, fisheries management, and migratory bird management, with more to come. Most of this growth in governmental conservation is proper and logical, some of it is inevitable. That I imply no disapproval of it is implicit in the fact that I have spent most of my life working for it. Nevertheless the question arises: What is the ultimate magnitude of the enterprise? Will the tax base carry its eventual ramifications? At what point will governmental conservation, like the mastodon, become handicapped by its own dimensions? The answer, if there is any, seems to be in a land ethic, or some other force which assigns more obligation to the private landowner.

Industrial landowners and users, especially lumbermen and stockmen, are inclined to wail long and loudly about the extension of government ownership and regulation to land, but (with notable exceptions) they show little disposition to develop the only visible alternative: the voluntary practice of conservation on their own lands. When the private landowner is asked to perform some unprofitable act for the good of the community, he today assents only without stretched palm. If the act costs him cash this is fair and proper, but when it costs only fore-thought, open-mindedness, or time, the issue is at least debatable. The overwhelming growth of land-use subsidies in recent years must be ascribed, in large part, to the government's own agencies for conservation education: the land bureaus, the agricultural colleges, - and the extension services. As far as I can detect, no ethical obligation toward land is taught in these institutions.

To sum up: a system of conservation based solely on economic self-interest is hopelessly lopsided. It tends to ignore, and thus eventually to eliminate, many elements in the land community that lack commercial value, but that are (as far as we know) essential to its healthy functioning. It assumes, falsely, I think, that the economic parts of the biotic cluck will function without the uneconomic parts. It tends to relegate to government many functions eventually too large, too complex, or too widely dispersed to be performed by government. An ethical obligation on the part of the private owner is the only visible remedy for these situations.

## **The Land Pyramid**

An ethic to supplement and guide the economic relation to land presupposes the existence of some mental image of land as a biotic mechanism. We can be ethical only in relation to something we can see, feel, understand, love, or otherwise have faith in. The image commonly employed in conservation education is 'the balance of nature.' For reasons too lengthy to detail here, this figure of speech \* fails to describe accurately what little we know about the land mechanism.- A much

truer image is the one employed in ecology: the biotic pyramid. I shall first sketch the pyramid as a symbol of develop some of its implications in terms of land-use.

Plants absorb energy from the sun. This energy flows through a circuit called the biota, which may be represented by a pyramid consisting of layers. The bottom layer is the soil. A plant layer rests on the soil, an insect layer on the plants, a bird and rodent layer on the insects, and so on up through various animal groups to the apex layer, which consists of the larger carnivores. The species of a layer are alike not in where they came from, or in what they look like, but rather in what they eat. Each successive layer depends on those below it for food and often for other services, and each in turn furnishes food and services to those above. Proceeding upward, each successive layer decreases in numerical abundance. Thus, for every carnivore there are hundreds of his prey, thousands of their prey, millions of insects, uncountable plants. The pyramidal form of the system reflects this numerical progression from apex to base. Man shares an intermediate layer with the bears, raccoons, and squirrels which eat both meat and vegetables.

The lines of dependency for food and other services are called food chains. Thus soil-oak-deer-Indian is a chain that has now been largely converted to soil-corn-cow-farmer. Each species, including ourselves, is a link in many chains. The deer eats a hundred plants other than oak, and the cow a hundred plants other than corn. Both; then, are links in a hundred chains. The pyramid is a tangle of chains so complex as to seem disorderly, yet the stability of the system proves it to be a highly organized structure. Its functioning depends on the cooperation and competition of its diverse parts.

In the beginning; the pyramid of life was low and squat; the food chains short and simple. Evolution has added layer after layer, link after link. Man is one of thousands of accretions to the height and complexity of the pyramid. Science has given us many doubts, .but it has given us at least one certainty: the trend ; of evolution .is to elaborate and diversify the biota. Land, then, is not merely soil; it is a fountain of energy flowing through a circuit of soils, plants, and animals. Food chains are the living channels which conduct energy upward; death and decay return it to the soil. The circuit is not closed; some energy is dissipated in decay, some is added by absorption from the air, some is stored in soils, peats and longlived forests; but it is a sustained circuit, like a slowly augmented revolving fund of life. There is always a net loss by downhill wash, but this is normally small and offset by the decay of rocks. It is deposited in the ocean and, in the course of geological time, raised to form new lands and new pyramids.

The velocity and character of the upward flow of energy depend on the complex structure of the plant and animal community, much as the upward flow of sap in a tree depends on its complex cellular organization. Without this complexity, normal circulation would presumably not occur. Structure means the characteristic numbers, as well as the characteristic kinds and functions, of the component species. This interdependence between the .complex structure of the land and its smooth functioning as -an, energy unit is one of its basic attributes.

When a change occurs in one part: of the circuit, may other parts must adjust themselves to it. Change does not . necessarily obstruct or divert the flow of energy; evolution is a long series of self-induced changes, the net result of which has been to elaborate the flow, mechanism, and to lengthen. the circuit. Evolutionary changes; however, are usually slow and local. Man's invention of tools has enabled him to make changes of unprecedented violence, rapidity, and scope.

One change is in the composition of floras and faunas. The larger predators are lopped off the apex of the pyramid; food chains, for the first time in history, become shorter rather than longer. Domesticated species from other lands are substituted for wild ones, and wild ones are moved to new habitats. In this world-wide pooling of faunas and floras, some species get out of bounds as pests and diseases, others are, extinguished. Such effects are seldom intended or foreseen; they represent unperfected and often untraceable readjustments in the structure. Agricultural science is largely a race between the emergence of new pests and the emergence of new techniques for their control.

Another change touches the flow of energy through plants and animals and its return to the soil. Fertility is the ability of soil to receive, store, and release energy. Agriculture, by overdrafts on the soil, or by too radical a substitution of domestic for native species in the superstructure; may derange the channels of flow or deplete storage. Soils depleted of their storage, or of the organic matter which anchors it, wash away faster than they form. This is erosion. Waters, like soil; are part of the energy circuit. Industry, by polluting waters or obstructing them with dams, may exclude the plants and animals necessary to keep energy incirculation.

Transportation brings about another basic change: the plants or animals grown in one region are now consumed and returned to the soil in another. Transportation taps the energy stored in rocks, and in the air, and uses it elsewhere; thus we fertilize the garden with nitrogen gleaned by the guano birds from the fishes of seas on the other side of the Equator. Thus the formerly localized and self-contained circuits are pooled on a world-wide scale.

The process of altering the pyramid for human occupation releases stored energy, and this often gives rise, during the pioneering period; to a deceptive exuberance of plant and animal life, both wild and tame. These releases of biotic capital tend to becloud or postpone the penalties of violence.

This thumbnail sketch of land as an energy circuit conveys three basic ideas:

1. That land is not merely soil.
2. That the native plants and animals kept the energy circuit open; others may or may not.
3. That man-made changes are of a different order than evolutionary changes, and have effects more comprehensive than is intended or foreseen.

These ideas, collectively; raise two basic issues: Can the land adjust itself to the new order? Can the desired alterations be accomplished with less violence? Biotas seem to differ in their capacity to sustain violent conversion. Western Europe, for example, carries a far different pyramid than Caesar found there. Some large animals are lost; swampy forests have become meadows or plowland; many new plants and animals are introduced, some of which escape as pests; the remaining natives are greatly changed in distribution and abundance. Yet the soil is still there and, with the help of imported nutrients, still fertile; the waters flow normally; the new structure seems to function and to persist. There is no visible stoppage or derangement of the circuit.

Western Europe, then, has a resistant biota. Its inner processes are tough, elastic, resistant to strain. No matter how violent the alterations, the pyramid, so far, has developed some new *modus vivendi* which preserves its habitability for man, and for most of the other natives. Japan seems to

present another instance of radical conversion without disorganization. Most other civilized regions, and some as yet barely touched by civilization, display various stages of disorganization, varying from initial symptoms to advanced wastage: In Asia Minor and North Africa diagnosis is confused by climatic changes, which may have been either the cause or the effect of advanced wastage. In the United States the degree of disorganization varies locally; it is worst in the Southwest, the Ozarks, and parts of the South, and least in New England and the Northwest. Better land-uses may still arrest it in the less advanced regions. In parts of Mexico, South America, South Africa, and Australia a violent and accelerating wastage is in progress, but I cannot assess the prospects.

This almost world-wide display of disorganization in the land seems to be similar to disease in an animal, except that it never culminates in complete disorganization or death. The land recovers, but at some reduced level of complexity, and with a reduced carrying capacity for people, plants, and animals: Many biotas currently regarded as lands of opportunity' are in fact already subsisting on exploitative agriculture, i.e. they have already exceeded their sustained carrying capacity. Most of South America is overpopulated in this sense.

In arid regions we attempt to offset the process of wastage by reclamation, but it is only too evident that the prospective longevity of reclamation projects is often short. In our own West, the best of them may not last a century.

The combined evidence of history and ecology seems to support one general deduction: the less violent the man-made changes, the greater the probability of successful readjustment in the pyramid. Violence, in turn, varies with human population density; a dense population requires a more violent conversion. In this respect, North America has a better chance for permanence than Europe, if she can contrive to limit her density.

This deduction runs counter to our current philosophy, which assumes that because a small increase in density enriched human life, that an indefinite increase will enrich it indefinitely. Ecology knows of no density relationship that holds for indefinitely wide limits. All gains from density are subject to a law of diminishing returns.

Whatever may be the equation for men and land, it is improbable that we as yet know all its terms. Recent discoveries in mineral and vitamin nutrition reveal unsuspected dependencies in the up-circuit: incredibly minute quantities of certain substances determine the value of soils to plants, of plants to animals. What of the down-circuit? What of the vanishing species, the preservation of which we now regard as an esthetic luxury? They helped build the soil; in what unsuspected ways may they be essential to its maintenance? Professor Weaver proposes that we use prairie flowers to reflocculate the wasting soils of the dust bowl; who knows for what purpose cranes and condors, otters and grizzlies may some day be used?

### **Land Health and the A-B Cleavage**

A land, ethic, then, reflects the existence of an ecological conscience, and this in turn reflects a conviction of individual responsibility for the health of the land. Health is the capacity of the land for self-renewal. Conservation is our effort to understand and preserve this capacity. Conservationists are notorious for their dissensions. Superficially these seem to add up to mere confusion, but a more careful scrutiny reveals a single plane of cleavage common to many specialized fields. In each field one group (A) regards the land as soil, and its function as commodity-production; another

er group (B) regards the land as a biota, and its function as something broader. How much broader is admittedly in a state of doubt and confusion. In my own field, forestry, group A is quite content to grow trees like cabbages, with cellulose as the sic forest commodity. It feels no inhibition against violence; its ideology is agronomic. Group B, on the other hand, sees forestry as fundamentally different from agronomy because it, employs natural species, and manages a natural environment rather than creating an artificial one. Group B prefers natural reproduction on principle. It worries on biotic as well as economic grounds about the loss of species like chestnut, and the threatened lugs of the white pines. It worries about a whole series of secondary forest Functions: wildlife, recreation, watersheds, wilderness areas. To my mind, Group B feels the stirrings of an ecological conscience.

In the wildlife field, a parallel cleavage exists. For Group A the basic commodities are sport and meat; the yardsticks of production are ciphers of take in pheasants and trout. Artificial propagation is acceptable as a permanent as well as a temporary recourse if its unit costs permit. Group B, on the other hand, worries about a whole series of biotic side-issues. What is the cast in predators of producing a game crop? Should we have further recourse to exotics? How can management restore the shrinking species, like prairie grouse, already hopeless as shootable game? How can management restore the threatened ratites, like trumpeter-swan and whooping crane? Can management principles be extended to wildflowers? Here again it is dear to me that we have the same A-B cleavage as in forestry.

In the larger field of agriculture I am less competent to speak, but there seem to be somewhat parallel cleavages. Scientific agriculture was actively developing before ecology was born, hence a slower penetration of ecological concepts might be expected. Moreover the farmer, by the very nature of his techniques, must modify the biota more radically than the forester or the wildlife manager. Nevertheless, there are many discontents in agriculture which seem to add up to a new vision of biotic farming.'

Perhaps the most important of these is the new evidence that poundage or tonnage is no measure of the food-value of farm crops; the products of fertile soil may be qualitatively as well as quantitatively superior. We can bolster poundage from depleted soils by pouring on imported fertility, but we are riot necessarily bolstering food-value. The possible ultimate ramifications of this idea are so immense that I must leave their exposition to abler pens.

The discontent that labels itself 'organic farming,' while bearing some of the earmarks of a cult, is nevertheless biotic in its direction, particularly in its insistence on the importance of soil flora and fauna.

The ecological fundamentals of agriculture are just as poorly known to the public as in other fields of land-use. For example, few educated people realize that the marvelous advances in technique made during recent decades are improvements in the pump, rather than the well. Acre for acre, they have barely sufficed to offset the sinking level of fertility.

In all of these cleavages, we see repeated the same basic paradoxes: man the conqueror versus man the biotic citizen; science the sharpener of his sword versus science the searchlight on his universe; land the slave and servant versus land the collective organism. Robinson's injunction to Tristram may well be applied, at this juncture, to Homo Sapiens as a species in geological time. Whether you will or not You are a King, Tristram, for you are one Of the time- tested few that leave

the world, When they are gone, not the same place it was. Mark what you leave.

## The Outlook

It is inconceivable to me that an ethical relation to land can exist without love, respect, and admiration for land, and a high regard for its value. By value, I of course mean something far broader than mere economic value; I mean value in the philosophical sense. Perhaps the most serious obstacle impeding the evolution of a land ethic is the fact that our education headed away from, rather than toward, an intense consciousness of land. Your true modern is separated from the land by many middlemen, and by innumerable physical gadgets. He has no vital relation to it; to him it is the space between cities on which crops grow. Turn him loose for a day on the land, and if the spot does not happen to be a golf links or a 'scenic' area, he is bored stiff. If crops could be raised by hydroponics instead of farming, it would suit him very well. Synthetic substitutes for wood, leather, wool, and other natural land products suit him better than the originals. In short, land is something he has 'outgrown.'

Almost equally serious as an obstacle to a land ethic is the attitude of the farmer for whom the land is still an adversary, or a taskmaster that keeps him in slavery. Theoretically, the mechanization of farming ought to cut the farmer's chains, but whether it really does is debatable. One of the requisites for an ecological comprehension of land is an understanding of ecology, and this is by no means co-extensive with 'education'; in fact, much higher education seems deliberately to avoid ecological concepts. An understanding of ecology does not necessarily originate in courses bearing ecological labels; it is quite as likely to be labeled geography, botany, agronomy, history, or economics. This is as it should be, but whatever the label, ecological training is scarce.

The case for a land ethic would appear hopeless but for the minority which is in obvious revolt against these 'modern' trends.

The 'key-log' which must be moved to release the evolutionary process for an ethic is simply this: quit thinking about decent land-use as solely an economic problem. Examine each question in terms of what is ethically and esthetically right, as well as what is economically expedient. A thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community. It is wrong when it tends otherwise.

It of course goes without saying that economic feasibility limits the tether of what can or cannot be done for land. It always has and it always will. The fallacy the economic determinists have tied around our collective neck, and which we now need to cast off, is the belief that economics determines all land use. This is simply not true. An innumerable host of actions and attitudes, comprising perhaps the bulk of all land relations, is determined by the land-users' tastes and predilections, rather than by his purse. The bulk of all land relations hinges on investments of time, forethought, skill, and faith rather than on investments of cash. As a land-user thinketh, so is he.

I have purposely presented the land ethic as a product of social evolution because nothing so important as an ethic is ever 'written.' Only the most superficial student of history supposes that Moses 'wrote' the Decalogue; it evolved in the minds of a thinking community, and Moses wrote a tentative summary of it for a 'seminar.' We say tentative because evolution never stops.

The evolution of a land ethic is an intellectual as well as emotional process. Conservation is paved with good intentions which prove to be futile, or even dangerous, because they are devoid of criti-

cal understanding either of the land, or of economic land-use. We think it is a truism that as the ethical frontier advances from the individual to the community, its intellectual content increases. The mechanism of operation is the same for any ethic: social approbation for right actions: social disapproval for wrong actions. By and large, our present problem is one of attitudes and implements. We are remodeling the AI with a steam-shovel, and we are proud of our yardage. We shall hardly relinquish the shovel, which after-all has many good points, but we are in need of gentler and more objective criteria for its successful use.

## **Deep Ecology**

“Deep ecology” was born in Scandinavia, the result of discussions between Næss and his colleagues Sigmund Kvaløy and Nils Faarlund; for a historical survey and commentary on the development of deep ecology). All three shared a passion for the great mountains. On a visit to the Himalayas, they became impressed with aspects of “Sherpa culture” particularly when they found that their Sherpa guides regarded certain mountains as sacred and accordingly would not venture onto them. Subsequently, Næss formulated a position which extended the reverence the three Norwegians and the Sherpas felt for mountains to other natural things in general.

The “shallow ecology movement”, as Næss (1973) calls it, is the “fight against pollution and resource depletion”, the central objective of which is “the health and affluence of people in the developed countries.” The “deep ecology movement”, in contrast, endorses “biospheric egalitarianism”, the view that all living things are alike in having value in their own right, independent of their usefulness to others. The deep ecologist respects this intrinsic value, taking care, for example, when walking on the mountainside not to cause unnecessary damage to the plants.

Inspired by Spinoza’s metaphysics, another key feature of Næss’s deep ecology is the rejection of atomistic individualism. The idea that a human being is such an individual possessing a separate essence, Næss argues, radically separates the human self from the rest of the world. To make such a separation not only leads to selfishness towards other people, but also induces human selfishness towards nature. As a counter to egoism at both the individual and species level, Næss proposes the adoption of an alternative relational “total-field image” of the world. According to this relationalism, organisms (human or otherwise) are best understood as “knots” in the biospherical net. The identity of a living thing is essentially constituted by its relations to other things in the world, especially its ecological relations to other living things. If people conceptualise themselves and the world in relational terms, the deep ecologists argue, then people will take better care of nature and the world in general.

As developed by Næss and others, the position also came to focus on the possibility of the identification of the human ego with nature. The idea is, briefly, that by identifying with nature we can enlarge the boundaries of the self beyond my skin. My larger—ecological—Self (the capital “S” emphasizes that we are something larger than our body and consciousness), deserves respect as well. To respect and to care for my Self is also to respect and to care for the natural environment, which is actually part of me and with which I should identify. “Self-realization”, in other words, is the reconnection of the shriveled human individual with the wider natural environment. Næss maintains that the deep satisfaction that we receive from identification with nature and close partnership with other forms of life in nature contributes significantly to our life quality. (One clear historical antecedent to this kind of nature spiritualism is the romanticism of Jean-Jacques Rousseau as expressed in his last work, the *Reveries of the Solitary Walker*).

When Næss's view crossed the Atlantic, it was sometimes merged with ideas emerging from Leopold's land ethic. But Næss—wary of the apparent totalitarian political implications of Leopold's position that individual interests and well-being should be subordinated to the holistic good of the earth's biotic community—has always taken care to distance himself from advocating any sort of "land ethic". Some critics have argued that Næss's deep ecology is no more than an extended social-democratic version of utilitarianism, which counts human interests in the same calculation alongside the interests of all natural things (e.g., trees, wolves, bears, rivers, forests and mountains) in the natural environment. However, Næss failed to explain in any detail how to make sense of the idea that oysters or barnacles, termites or bacteria could have interests of any morally relevant sort at all. Without an account of this, Næss's early "biospheric egalitarianism"—that all living things whatsoever had a similar right to live and flourish—was an indeterminate principle in practical terms. It also remains unclear in what sense rivers, mountains and forests can be regarded as possessors of any kind of interests. This is an issue on which Næss always remained elusive.

Biospheric egalitarianism was modified in the 1980s to the weaker claim that the flourishing of both human and non-human life have value in themselves. At the same time, Næss declared that his own favoured ecological philosophy— "Ecosophy T", as he called it after his Tvergastein mountain cabin—was only one of several possible foundations for an environmental ethic. Deep ecology ceased to be a specific doctrine, but instead became a "platform", of eight simple points, on which Næss hoped all deep green thinkers could agree. The platform was conceived as establishing a middle ground, between underlying philosophical orientations, whether Christian, Buddhist, Daoist, process philosophy, or whatever, and the practical principles for action in specific situations, principles generated from the underlying philosophies. Thus the deep ecological movement became explicitly pluralist.

While Næss's Ecosophy T sees human Self-realization as a solution to the environmental crises resulting from human selfishness and exploitation of nature, some of the followers of the deep ecology platform in the United States and Australia further argue that the expansion of the human self to include non-human nature is supported by the Copenhagen interpretation of quantum theory, which is said to have dissolved the boundaries between the observer and the observed. These "relationalist" developments of deep ecology are, however, criticized by some feminist theorists. The idea of nature as part of oneself, one might argue, could justify the continued exploitation of nature instead. For one is presumably more entitled to treat oneself in whatever ways one likes than to treat another independent agent in whatever ways one likes. According to some feminist critics, the deep ecological theory of the "expanded self" is in effect a disguised form of human colonialism, unable to give nature its due as a genuine "other" independent of human interest and purposes.

Meanwhile, some third-world critics accused deep ecology of being elitist in its attempts to preserve wilderness experiences for only a select group of economically and socio-politically well-off people. The Indian writer Ramachandra.

Guha (1989, 1999) for instance, depicts the activities of many western-based conservation groups as a new form of cultural imperialism, aimed at securing converts to conservationism (cf. Bookchin 1987 and Brennan 1998a). "Green missionaries", as Guha calls them, represent a movement aimed at further dispossessing the world's poor and indigenous people. "Putting deep ecology in its place," he writes, "is to recognize that the trends it derides as "shallow" ecology might in fact be varieties of environmentalism that are more apposite, more representative and more popular in the

countries of the South.” Although Næss himself repudiates suggestions that deep ecology is committed to any imperialism. Guha’s criticism raises important questions about the application of deep ecological principles in different social, economic and cultural contexts. Finally, in other critiques, deep ecology is portrayed as having an inconsistent utopian vision.

## **Peter Singer; Animal Rights**

Moral philosopher and Princeton professor Peter Singer described what he called a “momentous revolution in thinking” regarding animal welfare during a talk in the Ames Courtroom at the Harvard Law School on Friday.

During the event, entitled “Ethics and Animals: Where are We Now,” Singer described the economically-driven processes of factory farming and mass-fishing and the laws that the European Union and United Kingdom have implemented in the past decade to strictly regulate the treatment of animals during those practices.

But, Singer cautioned, while the world has come a long way, outlooks surrounding the ethics and the treatment of animals have not been pushed as far as he thinks they could.

“Animals have interests,” Singer said. “When these are similar to ours, or their pain is on a similar level, why give them less consideration?”

Singer cited the Bible, in which God grants the humans dominion over the animals, as the first documentation of humanity’s obligation to animals. He said that he thinks “dominion” has come to be interpreted as the right “to do as we will,” rather than as responsible stewardship.

“The question is not ‘Can they reason?’ nor ‘Can they talk?’ but ‘Can they suffer?’” said Singer, quoting the logic used by nineteenth-century philosopher Jeremy Bentham, Bentham’s ideology has also been applied to discussions about slaves, infants, and those with cognitive disabilities.

The case for animal consciousness and the need to acknowledge their interests, Singer said, is evidenced by the similarities between animals and humans— anatomically, physiologically, and behaviorally. He also pointed to the shared evolutionary history between the two. “We are animals,” Singer said, citing Darwin’s theory of evolution.

Singer, a professor of bioethics at Princeton and the University of Melbourne, is the author of the controversial book *Animal Liberation*, which asserts that animals’ interests should be given equal weight to those of humans. The book drew criticism upon its release in 1975.

Friday’s talk was part of a series sponsored by the Petrie-Flom Center for Health Law Policy, Biotechnology, and Bioethics at the Law School. Singer also spoke later in the day in the Science Center about effective altruism—a utilitarian stance on how best to affect change in the world.

“If God were a utilitarian, Singer would be his patron saint,” Law School professor and Petrie-Flom Center co-director Glenn Cohen said in his introduction.

## **Medical-Ethics: Surrogacy**

“Surrogacy is often thought to be a ‘treatment’ option for the infertile or an alternative to adoption, and so to be celebrated in fulfilling people’s desires to be parents. However, surrogacy also brings a wealth of more complex ethical issues around gender, labour, payment, exploitation and inequali-

ty.”

## **Payment**

Take the issue of payment: surrogacy involves literal labour (physical and often emotional effort in both gestating and birthing). However, many see it as distinct from labour (working in a factory or teaching a class). This raises an ethical question around whether surrogacy is different from other kinds of paid work and, if it isn't, shouldn't we remunerate surrogates?

Some philosophers argue that surrogacy is unique when compared to other work. For instance, they claim that women are intimately connected to their reproductive capacities and bodies (so pregnancy and birth are special and shouldn't be bought), or that being pregnant requires an unusual time commitment (unlike other kinds of work, the woman works for 24 hours a day, seven days a week, for nine months).

Others argue that there is equivalence to traditional work. Various occupations demand control over the body (ballerinas and astronauts are heavily controlled in what they can eat and how much they exercise, just as surrogates are) and longevity of work (writing a book can take longer than gestating and delivering a baby). All this work should be paid, so the argument goes.

## **Gender**

Ethics also come into play when thinking about the gendered nature of surrogacy and intended parenting. Biologically, the surrogate has to be someone with the capacity to gestate and give birth – usually a woman. As gendered labour, surrogacy triggers important feminist concerns, such as about bodily autonomy, vulnerability, inequality and rights.

For example, whether women who are surrogates maintain autonomy over their body when they are carrying a foetus for another individual or couple, or when decisions are being made about what happens to that foetus when there is disagreement. I think about the complexity of these sorts of questions and defend the importance of protecting and promoting women's autonomy in my broader work on feminist conceptions of autonomy.

Intended parenthood raises feminist concerns too, such as on gendered roles and expectations. This includes whether women in particular feel that being mothers is critical to being 'proper' women (and hence why they might pursue surrogacy if they cannot carry their own children). Likewise, women might feel breastfeeding is what 'real' mothers (and women) do (and why intended mothers – ie, women who are not pregnant – might want to induce lactation).

Interestingly, at SUK's annual conference in September, it was noted that lactation can be induced in men using a similar process as for non-pregnant women. (It has been used for a transgender woman who wanted to breastfeed recently too). For feminists worried about unequal gender roles in parenting in general, this could be further ammunition for dispelling myths about women as 'natural' carers because of their biological capacities.

## **Exploitation**

A final ethical issue to mention is exploitation. The UK, Ukraine, US, Australia and India have different regulations about surrogacy. Some countries see the surrogate, while others the intended mother, as the legitimate mother. Some favour altruistic forms of surrogacy, while others allow commercial forms. Some countries give parental rights to intended parents before or at the birth of

the child, while others only after six weeks.

There are good reasons to worry about a country-specific approach to surrogacy, as outlined in the recent. In particular, the country-specific approach opens up the potential to exploit legal loopholes, intended parents, and, ultimately those doing the majority of the labour – surrogates.

Despite the inevitable difficulties of securing global agreement, concerns about exploitation – of all parties, but especially the most vulnerable – provides a significant reason to push for a global approach to surrogacy arrangements.

These are just three ethical puzzles of surrogacy. All of the themes, and more beyond, require careful consideration since what we think about each is not just philosophically intriguing but is likely to have implications for how we believe our practice, laws and policy should be shaped. As the UK is currently reviewing its legislation on surrogacy, giving attentive thought to these issues is a particularly timely demand on all of us.

## **Social, ethical, medical & legal aspects of surrogacy:**

### **An Indian Scenario**

On examining the thousands of years old records of Indian Vedic literature and based on the discoveries of today's science dealing with molecules, genes and DNA it appears that the motherhood is an instinct driven physiological phenomena. Instinct of motherhood is the most powerful desire that exists in all the living creatures that include all animals and humans. According to ancient Indian philosophy the biological purpose of life is to propagate once own traits (genes) and all living creatures are here on a transition phase to pass their own traits (genes) to the next generation. Propagation is the ultimate purpose of any species, therefore, birth of an offspring is always dependent on the factors that lead to high chances of survival of the offspring. For example, birds migrate thousands of kilometers to find out suitable place where environment can support the high chances of survival of their offsprings. In the Canadian Inuit Community which is 300 miles north of Arctic Circle, the seasonality was reported till 1970. But due to modernization and decline of traditional life-style the seasonality in this community has not been reported in the later years.

Infertility is generally known as a social stigma in India. It is hypothesized that the agony and trauma of infertility is best felt and described by the infertile couples themselves. Though, infertility does not claim the life of an individual but it inflicts devastating influence on life of an individual for not fulfilling the biological role of parenthood for no fault of his or her own. It is also known that in general, Indian society has got a very stable family structure, strong desire for children and particularly for son to carry forth the lineage or Vansh. With the enormous advances in the field of medicine, the infertility can now be treated using the new medical technologies collectively called as Assisted Reproductive Technology (ART) such as in vitro fertilization (IVF) or intracytoplasmic sperm injection.

(ICSI), etc. The birth of the world's first child, Louise Brown on July 25, 1978, through the technique of in vitro fertilization was a path-breaking step in control of infertility; and is considered as one of the most important medical advances of the last century. In October 1978, Dr Subhash Mukherjee, Kolkata (India) announced the birth of country's first test tube baby. Dr Mukherjee and his team used the cryopreserved embryo.

There are different types of infertility and in some cases it would be physically or medically impos-

sible/ undesirable to carry a baby to term and hence, to fulfill the desire of such infertile couple to have a child, the surrogacy comes as an important option.

## **Surrogacy**

In Latin "Surrogatus" means a substitute i.e. a person appointed to act in the place of another. As per the Black's Law Dictionary surrogacy means the process of carrying and delivering a child for another person. The New Encyclopedia Britannica defines surrogacy as a practice in which a woman bears a child for a couple unable to produce children in the usual way. According to Warnock Report (1984) HF&E, surrogacy is the practice whereby one woman carries a child for another with the intention that the child should be handed over after birth.

There are two types of surrogacy practices prevailing in India: (i) Traditional/Natural/Partial surrogacy; and (ii) Gestational surrogacy.

Like in other countries, in India also, the following two types of surrogacy arrangements are being practiced:

**Altruistic surrogacy:** Where the surrogate mother receives no financial rewards for her pregnancy or the relinquishment of the child to the genetic parents except necessary medical expenses.

**Commercial surrogacy:** Where the surrogate mother is paid over and above the necessary medical expenses.

Surrogacy is the union of science, society, services and person that make it a reality. Surrogacy leads to a win-win situation for both the infertile couple and the surrogate mother. The infertile couple is able to fulfill their most important desire and the surrogate mother receives the suitable reward.

To give a womb for rent means to nurture the fertilized egg of another couple in your womb and give birth to the child with a specific intention, the intention here being either money, or service, or because of altruistic reasons.

Bhadaraka has described the following misconceptions regarding a surrogate mother:

1. She is not the genetic mother of the child whom she nurtures and gives birth to.
2. She is not the wife of the father of the child to whom she gives birth.
3. This is a scientific idea, a scientific process. There is no need for any physical contact.
4. She is not an asocial woman.
5. This is not an illegal practice.
6. She is not forced into this. She herself decides whether she wants to become a surrogate mother or not.
7. She has no claim or rights over the child that is born.
8. "This is my child", "this child is my inheritance" - she cannot articulate such thoughts, because of social, scientific and legal restrictions.
9. She is not a woman who sells children.
10. She is not responsible for the child (once the child is born).
11. Surrogacy is a mutually beneficial concept of providing services.

It is necessary to mention here that the couple's insistence does not agree with what science be-

lieves. It does not matter as to which religion the surrogate belongs, as the child is genetically of the couple. Religion is interpreted according to the conditions, education, time and the circumstances.

Surrogacy is a social act of highest level of service which is scientific and brims with goodwill. A person's opinion based on a lack of information should not harm others. Like medicine is prescribed for treatment of a disorder, in the same way surrogacy is also a method of treatment.

Bhadaraka reported that the majority of the Indian society considered surrogate mother as an amalgam of religion, culture and science with following noble services: (i) She shows a strong inclination to society by doing something novel, (ii) She abolishes the stigma of infertility from the society, (iii) She fulfils her duty by doing something worthwhile for the society, and (iv) She is an example of a model woman in society.

As per the proposed draft Assisted Reproductive Technology (Regulation) Bill the surrogacy and related terms are defined in the following ways: (i) Surrogacy means an arrangement in which a woman agrees to a pregnancy, achieved through assisted reproductive technology, in which neither of the gametes belong to her or her husband, with the intention to carry it to term and hand over the child to the person or persons for whom she is acting as a surrogate; (ii) Surrogate mother means a woman who agrees to have an embryo generated from the sperm of a man who is not her husband and the oocyte of another woman, implanted in her to carry the pregnancy to full term and deliver the child to its biological parents; and (iii) Surrogacy agreement means a contract between the persons availing of assisted reproductive technology and the surrogate mother.

### **Issues related with surrogacy**

Surrogacy, by ART, should be considered only for those infertile women for whom it would be physically or medically impossible/ undesirable to carry a baby to the term. Surrogate mother should sign an agreement with the commissioning couple which shall have legal bindings on both the parties. Before signing the agreement, the written consent of her spouse shall be required. A woman seeking or agreeing to act as a surrogate shall be medically tested for diseases such as sexually transmitted diseases or otherwise, as may be necessary, and all other communicable diseases which may endanger the health of the child or children, and must declare in writing that she has not received a blood transfusion or a blood product in the last six months. The commissioning parent(s) shall ensure that the surrogate and the child or children she delivers are appropriately insured until the time the child is handed over to the commissioning parent(s) or any other person as per the agreement and till the surrogate is free of all health complications arising out of surrogacy. Surrogate mother must register as a patient in her own name in the hospital after signing the appropriate agreement. While registering, the surrogate mother must mention that she is a surrogate mother and should provide all the necessary information about the commissioning parents. Surrogate mother should not use or register in the name of the commissioning couple for whom she is acting as surrogate as this would pose legal issues, particularly in the untoward event of maternal death.

The birth certificate shall be in the name of the commissioning parents. The ART clinic should also provide a certificate to the commissioning parents giving the name and address of the surrogate mother. All the expenses of surrogate mother during the period of pregnancy and postnatal care relating to pregnancy should be borne by the commissioning couple. The surrogate mother would also be entitled a monetary compensation from the commissioning couple for agreeing to act as a surrogate. The exact value of the compensation should be decided by discussion between the commissioning couple. and the prospective surrogate mother or an appropriate formula may be

developed by the Government to calculate the minimum compensation to be paid to the surrogate mother. A surrogate mother should never donate her own oocyte to the commissioning couple. Surrogate mother as well as the donor shall relinquish all parental rights related with the offsprings in writing.

### **Background of proposed draft ART (Regulation) Bill**

After the birth of the first scientifically well documented test tube baby in 1986 in India, there was mushrooming of IVF clinics in the country. The services offered by some of these IVF clinics were questionable. The reason for this was a lack of ART guidelines as well as legislation on ART in the country, no accreditation, supervisory and regulatory body and no control of Government. Therefore, the Indian Council of Medical Research (ICMR) developed draft National Guidelines for Accreditation, Supervision & Regulation of ART Clinics in India in 2002. The draft document was then subjected to extensive public debate throughout the country (in seven cities; New Delhi, Jodhpur, Mumbai, Bangalore, Chennai, Hyderabad & Kolkata) where more than four thousand people participated. To obtain the opinion of the people on the various issues where the consensus of all the members of the Committee could not be established, a prescribed proforma was designed and given to the participants (85% general public, 13% Indian doctors and 2% international doctors).

Based on the opinion of this survey (Table), comments and suggestions received from the various stakeholders including National Commission for Women and National Human Right Commission, the National Guidelines were finalized and after the approval of the Drafting Committee the revised document was submitted to the Ministry of Health & Family Welfare, Government of India. The Ministry of Health & Family Welfare examined these guidelines and after slight modifications published the National Guidelines for Accreditation, Supervision & Regulation of ART Clinics in India as National Guidelines of Government of India in 2005.

Table

Opinion of the people on various issues obtained during the public debates

Sl. no.	Issues	Opinion of the people (%)					
		Doctor			General public		
		Yes	No	No opinion	Yes	No	No opinion
1	Whether surrogacy should be allowed in the Country?	96	2	2	92	3	5
2	Whether commercial surrogacy should be allowed in the Country?	80	15	5	72	24	4
3	Whether relatives/friends should be allowed to act as a surrogate mother?	45	52	3	14	83	3
4	Whether the identity of the donor should be known to the infertile couple?	37	58	5	7	89	4
5	Whether relatives/friends should be allowed for gamete donation?	44	54	2	8	91	1
6	Whether you are satisfied or agreed with the points mentioned under the heading "How may sperm and oocytes donors be sourced?"	54	42	4	81	15	4

On obtaining the feedback from different States of the country it was noticed that these National Guidelines were not being followed properly in the country. Therefore, the Indian Council of Medical Research developed draft Assisted Reproductive Technology (Regulation) Bill in 2008 with the help of a Drafting Committee of ICMR. The draft Assisted Reproductive Technology (Regulation) Bill-2008 was again subjected to extensive public debate not only throughout the country but globally by placing the draft Bill on the websites of the Ministry of Health & Family Welfare, Government of India and of the ICMR. Based on the comments received from various stakeholders including the comments from other countries and as per the recommendations of the Drafting Committee, the draft Assisted Reproductive Technology (Regulation) Bill was revised and finalized. The finalized version of draft Assisted Reproductive Technology (Regulation) Bill- 2010 was sent to the Ministry of Health & Family Welfare, and has now been revised by the Ministry of Law & Justice as Assisted Reproductive Technology (Regulation) Bill - 2013. The Assisted Reproductive Technology (Regulation) Bill- 2014 has now become a part of the Cabinet Note.

## Conclusion

The draft Assisted Reproductive Technology (Regulation) Bill proposes to establish National Board, State Boards and National Registry of Assisted Reproductive Technology (ART) in India for accreditation and supervision of ART clinics and ART Banks, ensuring that services provided by these are ethical and that the medical, social and legal rights of all those concerned including surrogate mother are protected with maximum benefit to all the stakeholders within a recognized framework of ethics and good medical practices.

## The doctor-patient relationship Introduction

The doctor-patient relationship plays an essential role in ordering the health care system and medical ethics, and since it is a form of communication, it necessitates ethical, philosophical, psychological, and sociological considerations. The present paper aims to evaluate the essence of the doctor-patient relationship in order to re-examine its conceptual framework. In the first part, the

philosophical, psychological and sociological significance of this relationship is explored, and in the final section, the theoretical implications will be discussed. It seems that despite the imbalance in the relationship between doctors and patients resulting from the greater significance of the physicians' ethics, organization of this relationship is not possible without enhancing patient ethics.

Simultaneous consideration of sociological, psychological and philosophical dimensions of the doctor-patient relationship can contribute to developing theoretical foundations and multidisciplinary bases for establishing practical ethical codes. The result will eventually be a more effective interaction between the two.

## **A) The Philosophical Essence of the Doctor-Patient Relationship**

In investigating the philosophical essence of the doctor-patient relationship, three points should be taken into consideration. First, ethical demands in doctor-patient interactions must have distinct definitions and terms; second, the phenomenological ethical debates on this issue need to be explored; and third, modern topics in the philosophy of the relationship should be considered, and relationships with the others should be analyzed from different perspectives.

### **Ethical Demands**

Various organizations and professions differ in their attitudes towards ethical demands, recommendations, norms, values and judgments. The three components of inclusion, priority and severity are presented below as the criteria for judgment in ethical issues.

- 1. Inclusion:** The main questions to answer in regard to this component are: "What are the ethical limits?" and "Should all of our actions be judged ethically or only some of them are included in the scope of ethical judgment?" In other words, is it enough to avoid doing the wrong thing, or is doing right among our moral duties too? It seems that the doctors' moral duties include doing the right thing as well. This important matter is embedded within the principles of beneficence and non-maleficence.
- 2. Priority:** The component of priority relies on the answers to the following questions: "If what morality is demanding is in conflict with our personal interests (for example it concerns our self, family, friends and so on), which side should we take? Should we always take the ethical side and forget about our personal interests? Or personal interests could have priority over moral obligations?" Nigel and Stalker explain that autonomy and our personal integrity have priority over what morality is demanding from us, or as Kagan and Singer say, demandingness of morality can even affect autonomy and our personal integrity. It seems that on the one hand the altruism of a practitioner as a professional should be based on the priority of patients' interests, and on the other hand it should safeguard the practitioner's own autonomy.
- 3. Severity:** The main questions here are: Can ethics press extreme and costly demands from us? Or are the obligations of morality lighter and easier in the way that most people could overcome? Apparently if ethics are founded on costly demands, we will be more likely to fail to fulfill our ethical duties.

Based on the above-mentioned considerations and classifications, three macro-positions emerge in the ethical relationship, including: maximal ethics, ordinary ethics, and minimal ethics.

**Maximal Ethics:** Maximal ethics include all the three components discussed above. In this type of

ethics, ethical inclusion does not have any limits and covers all human actions. Extremist moralities consider ethical inclusion to be an absolute matter that covers all life styles and signify that no human action should be outside of this infinite circle.

**Ordinary Ethics:** This is the sort of ethics that most people believe in, and because of its affinity to the contemporary human life, it is also referred to as “common ethics”. Here what ethics demands from us are boundaries. In other words, moderate ethics often state that after performing our obligations and moral duties, in a relatively wide range of personal interests we can start selecting. Thus, our actions are not always subject to moral judgment.

**Minimal Ethics :** This type of ethics is contradicted with maximal ethics. According to minimalists, the only forbidden action is intentional harassment. Followers of minimal ethics believe in a wide range of choices and selection areas; they recognize only a limited range of constraints and are in favor of acting upon personal interests.

It is a growing concern in medical ethics that the doctor-patient relationship is not approached in a sufficiently broad way and that this overly narrow medical perspective leaves doctors, nurses and other health care professionals badly equipped to deal with ethical dilemmas. Phenomenology could broaden this perspective and serve as a strong basis to understand moral sensitivity. Two notions in phenomenology have a central role in understanding the concept of the doctor-patient relationship: intentionality and first-person point of view.

### **Intentionality and first-person point of view**

One of the basic concepts of phenomenology is attainment of phenomenal intentionality, which occurs when a person recognizes earlier assumptions and adopts a perspective. Some thinkers like Franz Brentano believe that intentionality and the phenomenological approach can be applied to the first-person point of view. For instance the first sighting of a beautiful landscape elevates us in a way that may not happen in later encounters. The reason is that later encounters are accompanied by presuppositions of the observer, who will be more used to the landscape. It seems that the phenomenological approach can be applied to the doctor-patient relationship. Doctors must reexamine and restrict assumptions toward patients, and at the same time value intentionality in order not to fall into habits.

### **Moral Sensitivity**

Moral sensitivity may be enhanced in two ways. First, through reinforcing the phenomenological approach by renewing the first sight experience, that is, in each re-identification (of the patient for instance), priorities should be observed. Second, since any situation could come to a fork and ethical conflicts may rise, the adverse impacts should be considered and every situation must be regarded from an ethical perspective. Although at commencement moral sensitivity appears to overlap with maximal ethics, it is of particular importance especially in heterogeneous communications such as the doctor-patient relationship. It may be added that enhancing moral sensitivity even seems to be the target of the phenomenology of ethics in the doctor-patient relationship.

### **Communication with Others**

The term “communication” can be defined through the philosophical approaches of great thinkers such as Levinas, Marcel and Buber who set their philosophical arguments in the relationship between “me” and “the other”. Levinas insists on the maximum responsibility of any other; Marcel insists on turning the me-that relationship to the me-you relationship and replacing absence with

presence; Buber finds God in "Thou".

## **B) The Psychological Essence of The Doctor-Patient Relationship**

In terms of psychology, the doctor-patient relationship is imbalanced as the doctor has superiority over the patient. Such imbalanced relationships may give rise to various patterns of communication behavior. Psychologists have distinguished the following four communication behavior patterns based on components such as honesty, perspicuity, respect and inhibition:

### **1) Submissiveness**

Submissive persons are shy, and although they speak honestly, they are usually taciturn and cannot express themselves perspicuously. They are also afraid of being judged or offending others, so they are incapable of making eye contact while speaking. Their voices are weak and unsteady, and they speak hesitantly. Submissive people avoid conflict rather than try to resolve it. They speak indirectly and in general terms because they cannot express themselves openly and may quickly feel depressed and vulnerable. People with this behavioral pattern admittedly let others abuse them and treat them disrespectfully. These patterns work both for doctors and patients. Patients who evade their responsibilities and encourage physicians to patriarchy in the process of therapy, or doctors who are not able to say "no" to patients easily consent to inappropriate and ineffective treatments.

### **2) Dominance**

Domineering people feel insecure and believe that they do not possess good qualities. Accordingly, they try to deceive others and take advantage. Domineering persons do not have the perspicuity and honesty necessary for earning their wishes. They express themselves in general terms and sometimes their voices shake. These people use others to achieve their goals and make light of this inhibition and deception, so they take away another person's autonomy and freedom. This behavioral pattern is often seen in doctors and sometimes among patients as well. Doctors who prefer patient satisfaction to authority thus create a false autonomy for the patients and will eventually be dominated by them, and patients with this behavioral pattern impair the healing process by inhibition and deception.

### **3) Aggressiveness**

The target of aggressive and domineering people is very similar and that is exploitation and domination of others. Their difference is that a domineering person achieves this aim by secrecy and cheating, while an aggressive person follows it frankly and openly. Unlike the domineering type, aggressive people are honest and straightforward; they are horrible listeners, always accuse others, get angry soon, get confused by criticism, and are usually grim in appearance. They have loud voices and look hostile, and in conflicts, they tend to destroy their opponents. This pattern is seen among both physicians and patients. Impatient physicians that do not listen, shout all the time and sometimes make irreparable mistakes during the healing process, or patients with lower anger thresholds who create tension in medical environments belong in the category of aggressive people.

### **4) Assertiveness**

Assertiveness is the most creative behavioral pattern of communication. Assertive people respect themselves and others, and observe the authority of all sides. They are both honest and frank, and do not accuse themselves or others. Their approach to matters is problem-oriented, that is, when dealing with a problem, instead of accusing themselves and others, they think of a solution. They listen effectively and speak appropriately and understandably. During conflict they emphasize con-

versation. Their arguments are clear, specified, objective, fair and respectful, and eventually they are the most successful communicators. Issues such as breaking bad news, wasted treatments and medical mistakes are easy and solvable with this type of behavioral pattern. While submissiveness, dominance and aggression lead to lose-lose situations in long term, assertiveness, is a helpful behavioral pattern and finally results in win-win solutions.

Based on the above-mentioned notions, the following practical hints should be outlined:

- 1. Psychic Distance:** An important topic in aesthetics and artistic criticism that is also related to ethics is psychic distance. In aesthetics, this refers to the distance that should exist between a work of art and the viewer, so that aesthetic entente is created and art is not confused with reality. Omitting the psychic distance and forming deep sympathy and psychological identification with the work of art obstructs artistic judgment and aesthetic approach. In medical ethics, the concept seems to be important while encountering patients. Reduction of psychic distance and excessive sympathy with patients prevent an effective doctor-patient relationship as a fundamental element of treatment.
- 2. Body Language:** Nonverbal communication skills are referred to as body language. This type of communication is very important in the doctor-patient relationship due to factors such as the limited visiting time, and linguistic and discourse differences.
- 3. Truth-Telling versus Pain Relief:** One of the oldest ethical challenges is the pain and suffering that can be caused by telling the truth. On the other hand, we can bring comfort and relief to patients by lying to them. Physicians can employ various methods at their discretion, but it seems that health care systems are more inclined toward telling the truth, and doctors must try to maintain a balance between the two.
- 4. Emotional Quotient (EQ):** Unlike intelligence quotient that does not improve after the second decade of life, emotional quotient can continue to improve till the end. Emotional quotient refers to the ability to control emotions, sentiments and unwanted desires. People with high intelligence quotient dealing with people with lower intelligence quotient are susceptible to reckless, impulsive behavior and may gradually lose their EQ. In order to improve the doctor-patient relationship, health providers must be instructed in techniques to promote their emotional quotient.

### **C) The Sociological Essence of the Doctor-Patient Relationship**

Unlike the psychological approach, the sociological approach to the doctor-patient relationship examines the essence of this (individualistic) relationship in a social context. In other words, the sociological approach regards the doctor-patient relationship beyond a merely mutual connection and therefore external elements are considered particularly important.

In order to investigate this relationship from the sociological perspective, communicative actions serve as a valid basis. They have been included among the most important sociological criteria in the last few decades as a set of social actions oriented towards reaching entente. The target of communication action theory is to subvert a single prophetic and patriarchal individualism in human interactions. Jürgen Habermas has developed this notion in his famous book *The Theory of Communicative Action*, and his ideas are quite often presented in ethical manuscripts and medical ethics books. In this book Habermas distinguishes and characterizes his theory by drawing a distinction between instrumental action and communicative action.

## **Instrumental Action**

Jürgen Habermas states, "We call an action oriented to success instrumental when we consider it in the light of following the rules of rational choice and assess the efficiency of influencing the decisions of a rational opponent. By contrast, I shall speak of communicative action whenever the actions of the agents involved are coordinated not through egocentric calculations of success but through acts aiming at reaching an understanding. In communicative action the participants are not primarily oriented to their own individual successes; they pursue their individual goals under the condition that they can harmonize their plans of action on the basis of common situation definitions. In this respect, negotiating the definitions of the situation is an essential element of the interpretive accomplishments required for communicative action".

Reducing an individual to only one of the functions of his or her integrity is called instrumentalism. The function of a ticket seller in a bus station is just like that of a machine and therefore his human dimension could easily be overlooked. In the doctor-patient relationship both sides (especially the doctor) are susceptible to perceive others as mere instruments. The power that is practiced over patients by "medical gazing" makes them abject by reducing them to bodies that are examined simply to locate illness. Three fundamental concepts in sociology and philosophy have been purposed to deal with instrumentalism:

### **1) Teleological view of others by emphasizing the task:**

In his works on the Golden Rule, Kant argues that instrumental action is inconsistent with socialization and human dignity, and proposes to regard others as an end, not an instrument. The universal version of this rule is that you should like for others whatever you like for yourself and vice versa. One concrete technique for applying this rule is that human beings constantly put themselves in other people's positions and see the world from their perspectives.

### **2) The distinction between mysterious looks and issue makers:**

Martin Buber and Gabriel Marcel emphasize the difference between the I-Thou and I-It relationship. In the former, a human is a mystery that unfolds and in the latter, an issue that resolves.

### **3) Maximum responsibility toward others:**

Emmanuel Levinas states, "We are responsible for each other, and me more so...". This approach considers responsibility toward others as an unconditional matter, but does not require others to be equally responsible in return.

## **Communicative Action**

Communicative action is allegedly an action focused on entente. Whoever wants to be successful in reaching entente should be prepared to bring up claims. Habermas states that the communication between a speaker and a listener is constituted by the existence of three universally valid claims: the claims for truth, rightness and truthfulness. The terms of these claims in the doctor-patient relationship accurately reveal the sociological essence of this relationship. Doctors should speak understandably and beware of ambiguity and opacity in their speech. On the other hand, they should make true statements and propositions, scientific and other. They should be honest and have faith in what they say, and ultimately they can use their discretion to determine the content of their relationship with patients.

## **Analysis**

To clarify the concept of relationship and connectedness, we used a hybrid concept analysis including: identifying essential attributes, critiquing the existing definitions, examining boundaries

and identifying antecedents. On the basis of the comparative concept analysis, the doctor-patient relationship is an interdisciplinary notion and a mono-disciplinary approach will reduce this relationship to communicative skills.

## **Discussion and Conclusion**

The doctor-patient relationship has greater impact on the health system than it may seem at first. In this paper, three novel dimensions of the doctor-patient relationship were deeply explored. The philosophical approach emphasizes the importance of promoting moral sensitivity. Communicating with others entails considerations rooted in the human soul that provoke great philosophical concerns. The psychological approach emphasizes learning about behavioral patterns, enhancing the intelligence quotient, and creating a balance between truth-telling and pain relief. Finally, the sociological approach demonstrates that the doctor-patient relationship is part of a macro social relationship in a community and discovers various aspects beyond the two-person relationship.

## **Abortion**

An overview of the moral and legal aspects of abortion and evaluates the most important arguments. The central moral aspect concerns whether there is any morally relevant point during the biological process of the development of the fetus from its beginning as a unicellular zygote to birth itself that may justify not having an abortion after that point. Leading candidates for the morally relevant point are: the onset of movement, consciousness, the ability to feel pain, and viability. The central legal aspect of the abortion conflict is whether fetuses have a basic legal right to live, or, at least, a claim to live. The most important argument with regard to this conflict is the potentiality argument, which turns on whether the fetus is potentially a human person and thus should be protected. The question of personhood depends on both empirical findings and moral claims.

## **Preliminary Distinctions**

One of the most important issues in biomedical ethics is the controversy surrounding abortion. This controversy has a long history and is still heavily discussed among researchers and the public—both in terms of morality and in terms of legality. The following basic questions may characterize the subject in more detail: Is abortion morally justifiable? Does the fetus (embryo, conceptus, and zygote) have any moral and/or legal rights? Is the fetus a human person and, thus, should be protected? What are the criteria for being a person? Is there any morally relevant break along the biological process of development from the unicellular zygote to birth? This list of questions is not meant to be exhaustive, but it describes the issues of the following analysis.

### **1) Three Views on Abortion**

There are three main views: first, the extreme conservative view (held by the Catholic Church); second, the extreme liberal view (held by Singer); and third, moderate views which lie between both extremes. Some opponents (anti-abortionists, pro-life activists) holding the extreme view, argue that human personhood begins from the unicellular zygote and thus – according to the religious stance – one should not have an abortion by virtue of the imago dei of the human being (for example, Schwarz 1990). To have an abortion would be, by definition, homicide. The extreme liberal view is held by proponents (abortionists). They claim that human personhood begins immediately after birth or a bit later (Singer). Thus, they consider the relevant date is at birth or a short time later (say, one month). The proponents of the moderate views argue that there is a morally relevant break in the biological process of development – from the unicellular zygote to birth – which determines the justifiability and non-justifiability of having an abortion. According to them, there is a gradual process from being a fetus to being an infant where the fetus is not a human being but a

human offspring with a different moral status.

The advantage of the extreme conservative view is the fact that it defines human personhood from the beginning of life (the unicellular zygote); there is no slippery slope. However, it seems implausible to say that the zygote is a human person. The advantage of the extreme liberal view is that its main claim is supported by a common philosophical usage of the notion "personhood" and thus seems more sound than the extreme conservative view because the offspring is far more developed; as the unicellular zygote. This view also faces severe problems; for example, it is not at all clear where the morally relevant difference is between the fetus five minutes before birth and a just born offspring. Some moderate views have commonsense plausibility especially when it is argued that there are significant differences between the developmental stages. The fact that they also claim for a break in the biological process, which is morally relevant, seems to be a relapse into old and unjustified habits. As Gillespie stresses in his article "Abortion and Human Rights" (1984, 94-102) there is no morally relevant break in the biological process of development. But, in fact, there are differences, which make a comparative basis possible without having to solve the problem of drawing a line. How should one decide?

## **2) The Standard Argument**

The standard argument is the following practical syllogism:

- The killing of human beings is prohibited.
- A fetus is a human being.
- The killing of fetuses is prohibited.

Hence, abortion is not allowed since homicide is prohibited. It seems obvious to question the result of the practical syllogism since one is able to argue against both premises. First, there are possible situations where the first premise could be questioned by noting, for example that killing in self-defense is not prohibited. Second, the second premise could also be questioned since it is not at all clear whether fetuses are human beings in the sense of being persons, although they

are of course human beings in the sense of being members of the species of homo sapiens. Consecutively, one would deny that fetuses are persons but admit that a young two year old child may be a person. Although, in the end, it may be difficult to claim that every human being is a person. For example, people with severe mental handicaps or disorder seem not to have personhood. That is, if personhood is defined with regard to specific criteria like the capacity to reason, or to have consciousness, self-consciousness, or rationality, some people might be excluded. But, in fact, this does not mean that people with severe mental handicaps who lack personhood can be killed. Even when rights are tied to the notion of personhood, it is clearly prohibited to kill disabled people. Norbert Hoerster, a well-known German philosopher, claims that fetuses with severe handicaps can be – like all other fetuses – aborted, as born human beings with severe handicaps they have to be protected and respected like all other human beings, too (1995, 159).

## **3) The Modified Standard Argument**

However, it seems appropriate to modify the standard argument and to use a more sophisticated version. Replace the notion "human being" with "human life form." The new practical syllogism is:

- The killing of human life forms is prohibited.
- A fetus is a human life form.

- The killing of fetuses is prohibited.

The objection against the first premise of the standard argument still holds for the new more sophisticated version. But, the second modified premise is much stronger than the previous one because one has to determine what a human life form really is. Is a fetus a human life form? But, even if the fetus is a human life form, it does not necessarily follow that it should be protected by that fact, simpliciter. The fetus may be a human life form but it hardly seems to be a person (in the ordinary sense of the notion) and thus has no corresponding basic right to live. However, as already stated, this kind of talk seems to go astray because the criteria for personhood may be suitable for just-borns but not appropriate for fetuses, embryos, or unicellular zygotes, like some biological (human being), psychological (self-consciousness), rational (ability to reasoning), social (sympathy/love), or legal (being a human life form with rights) criteria may indicate (for example, Jane English 1984). Jane English persuasively argues in "Abortion and the Concept of a Person" that even if the fetus is a person, abortion may be justifiable in many cases, and if the fetus is no person, the killing of fetuses may be wrong in many cases.

## Personhood

What does it mean to claim that a human life form is a person? This is an important issue since the ascription of rights is at stake. I previously stated that it is unsound to say that a fetus is a person or has personhood since it lacks, at least, rationality and self-consciousness. It follows that not every human being is also a person according to the legal sense, and, thus, also lacks moral rights (extreme case). The fetus is by virtue of his genetic code a human life form but this does not mean that this would be sufficient to grant it legal and moral rights. Nothing follows from being a human life form by virtue of one's genes, especially not that one is able to derive legal or moral rights from this very fact (for example, speciesism). Is a human person exclusively defined by her membership of the species *Homo sapiens sapiens* and thus should be protected? To accept this line of argumentation would entail the commitment of the existence of normative empirical features. It seems premature to derive the prohibition to kill a life form from the bare fact of its genetic feature – including the human life form – unless one argues that human beings do have the basic interest of protecting their offspring. Is a human life form a moral entity? This seems to be a good approach. The argument runs as follows: It seems plausible to claim that human beings create values and, if they have the basic interest of protecting their offspring, human beings may establish a certain morality by which they can argue, for example, for the prohibition of abortions. The moral judgment can be enforced through legal norms.

To be more precise about the assumption of the existence or non-existence of normative, empirical features: Critics of the view to tie the right to live and the biological category of being a human being claim that the protagonists effect the is-ought fallacy. Why is it unsound to take the bare fact of being a member of the biological species *Homo sapiens* as a solid basis for granting the right to live? The linkage seems only justified when there are sound factual reasons. If there are none, the whole line of reasoning would "hang in the air" so that one could also easily argue for the right to live for cats and dogs. Only factual relevant features may be important for the linkage. What could these relevant features look like?

Jane English presents in her article "Abortion and the Concept of a Person" several features of personhood which characterize the human person. Her notion of personhood can be grouped into five sectors (English 1984, pp. 152):

- (i) the biological sector (being a human being, having extremities, eating and sleeping);

- (ii) the psychological sector (perception, emotions, wishes and interests, ability to communicate, ability to make use of tools, self-consciousness);
- (iii) the rational sector (reasoning, ability to make generalizations, to make plans, learning from experience);
- (iv) the social sector (to belong to different groups, other people, sympathy and love); and
- (v) the legal sector (to be a legal addressee, ability to make contracts, to be a citizen). According to English, it is not necessary for a human life form to comply with all five sectors and different aspects to count as a person. A fetus lies right in the penumbra where the concept of personhood is hard to apply. There is no core of necessary and sufficient features that could be ascribed to a human life form in order to be sure that these features constitute a person (English 1984, 153).

Mary Anne Warren claims that a human life form should qualify as a person when, at least, some of the following aspects (especially i-iii) are at stake: (i) consciousness and the ability to feel pain; (ii) reasoning; (iii) a self-motivated activity; (iv) ability to communicate; and (v) the existence of a self-concept (for example, individual, racial) and self-consciousness (Warren 1984, 110-113). Warren argues that the fetus is no person since it lacks the criteria of personhood and, thus, an abortion is justified.

The aim is not to give an airtight definition of the concept of personhood. The main question is whether a fetus could qualify as a person. The following can be stated: The fetus is a human offspring but is not a legal, social, and rational person in the ordinary sense of the notions. Some aspects of the psychological sector for example, the ability to feel and perceive can be ascribed to the fetus but not to the embryo, conceptus, or the (unicellular) zygote. It seems implausible to say that a fetus (or embryo, conceptus, zygote) is a person, unless one additionally claims that the genetic code of the fetus is a sufficient condition. However, this does not mean, in the end, that one could always justify an abortion. It only shows that the fetus could hardly be seen as a human person.

It is hard to keep the legal and moral aspects of the conflict of abortion apart. There are overlaps which are due to the nature of things since legal considerations are based on the ethical realm. This can also be seen according to the notion person. What a person is is not a legal question but a question which is to be decided within a specific ethics. If one characterizes the notion of a person along some criteria, then the question of which criteria are suitable or not will be discussed with regard to a specific moral approach (for example, Kantianism, utilitarianism, virtue ethics). The relevant criteria, in turn, may come from different areas like the psychological, rational, or social sphere. If the criteria are settled, this influences the legal sector because the ascription of legal rights – especially the right to live in the abortion debate – is tied to persons and respectively to the concept of personhood.

### **Moral Aspects of the Abortion Conflict**

The main question with regard to the moral sphere concerns identification of the right developmental point of the fetus (or the embryo, conceptus, zygote) to decide which break may morally justify an abortion or not (proponents of the moderate view and the extreme liberal view claim that there is such a break). The main arguments in the debate will be evaluated in the following. Before we analyze the arguments, it is necessary to say something about moral rights.

## **a) Moral Rights**

Some authors claim that the talk of moral rights and moral obligations is an old never-ending tale. There are no “moral rights” or “moral obligations” per se; at least, in the sense that there are also moral rights and moral obligations apart from legal rights and legal obligations. There is no higher ethical authority which may enforce a specific moral demand. Rights and obligations rest on law. According to ethics, one should better say “moral agreements” (for example, Gauthier). The proponents claim that moral agreements do have a similar status to legal rights and legal obligations but stress that no person has an enforceable demand to have her moral rights prevail over others. The suitability is the essential aspect of the metaphysics of rights and obligations. Only the formal constraint establishes rights and obligations within a given society (for example, Hobbes); the informal constraint within a given society – though it may be stronger – is not able to do so. Without a court of first instance there are no rights and obligations. Only by using the legal system is one able to establish specific moral rights and specific moral obligations. Those authors claim that there are no absolute moral rights and moral obligations which are universally valid; moral agreements are always subjective and relative. Hence, there are also no (absolute) moral rights which the fetus (embryo, conceptus, or zygote) may call for. The only solution may be that the survival of the fetus rests on the will of the human beings in a given moral society. According to their view, it is only plausible to argue that an abortion is morally reprehensible if the people in a given society do have a common interest not to abort and make a moral agreement which is enforced by law.

## **b) At Birth**

Proponents of the liberal view contend that the morally significant break in the biological development of the fetus is at birth. This means that it is morally permitted to have an abortion before birth and morally prohibited to kill the offspring after birth. The objection against this view is simple because there seems to be no morally relevant difference between a short time (say five minutes) before birth and after it. Factually, the only biological difference is the physical separation of the fetus from the mother. However it seems unsound to interpret this as the morally significant difference; the bare evidence with regard to the visibility of the offspring and the physical separation (that is, the offspring is no longer dependent on the woman’s body) seems insufficient.

## **c) Viability**

Proponents of the moderate view often claim that the viability criterion is a hot candidate for a morally significant break because the dependence of the nonviable fetus on the pregnant woman gives her the right to make a decision about having an abortion. The aspect of dependence is insufficient in order to determine the viability as a possible break. Take the following counter-example: A son and his aged mother who is nonviable without the intensive care of her son; the son has no right to let his mother die by virtue of her given dependence. However, one may object that there is a difference between “needing someone to care for you” and “needing to live off a particular person’s body.” Furthermore, one may stress that the nonviable and the viable fetus both are potential human adults. But as below the argument of potentiality is flawed since it is unclear how actual rights could be derived from the bare potentiality of having such rights at a later time. Hence, both types of fetuses cannot make claim for a right. There is also another objection that cannot be rebutted: the viability of the fetus regarding the particular level of medical technology. On the one hand, there is a temporal relativity according to medical technology. The understanding of what constitutes the viability of the fetus has developed over time according to the technical level of embryology in the last centuries and decades. Today, artificial viability allows physicians to rescue many premature infants who would have previously died. On the other hand, there exists a local relativity according to the availability of medical supplies in and within countries which de-

termines whether the life of a premature infant will be saved. The medical supply may vary greatly. Consequently, it seems inappropriate to claim that viability as such should be regarded as a significant break by being a general moral justification against abortions.

#### **d) First Movement**

The first movement of the fetus is sometimes regarded as a significant break because proponents stress its deeper meaning which usually rests on religious or non-religious considerations. Formerly the Catholic Church maintained that the first movement of the fetus shows that it is the breathing of life into the human body (animation) which separates the human fetus from animals. This line of thinking is out-of-date and the Catholic Church no longer uses it. Another point is that the first movement of the fetus that women experience is irrelevant since the real first movement of the fetus is much earlier. Ultrasonic testing shows that the real first movement of the fetus is somewhere between the 6th and 9th week. But even if one considers the real first movement problems may arise. The physical ability to move is morally irrelevant. One counter-example: What about an adult human being who is quadriplegic and is unable to move? It seems out of the question to kill such people and to justify the killing by claiming that people who are disabled and simply lack the ability to move are, therewith, at other people's disposal.

#### **e) Consciousness and the Ability to Feel Pain**

In general, proponents of moderate views believe that consciousness and the ability to feel pain will develop after about six months. However the first brain activities are discernable after the seventh week so that it is possible to conclude that the fetus may feel pain after this date. In this respect, the ability to suffer is decisive for acknowledging a morally significant break. One may object to this claim, that the proponents of this view redefine the empirical feature of "the ability to suffer" as a normative feature (is-ought fallacy). It is logically unsound to conclude from the bare fact that the fetus feels pain that it is morally reprehensible or morally prohibited per se to abort the fetus.

#### **f) Unicellular Zygote**

Proponents of the extreme conservative view claim that the morally significant break in the biological development of the fetus is given with the unicellular human zygote. They argue that the unicellular zygote is a human person, and thus, it is prohibited to have an abortion because one kills a human being (for example, Schwarz).

The extreme conservative proponents argue that biological development from the fetus to a human being is an incremental process which leaves no room for a morally significant break (liberals deny this line of thinking). If there is no morally significant break, then the fetus has the same high status of a newborn, or the newborn has the same low status of the fetus.

To many opponents of the "extreme" conservative position, it seems questionable to claim that a unicellular zygote is a person. At best, one may maintain that the zygote will potentially develop into a human being. Except the potentiality argument is flawed since it is impossible to derive current rights from the potential ability of having rights at a later time. Opponents (for example, Gert) also object to any attempt to base conclusions on religious considerations that they believe cannot stand up to rational criticism. For these reasons, they argue that the conservative view should be rejected.

#### **g) Thomson and the Argument of The Sickly Violinist**

Judith Jarvis Thomson presents an interesting case in her landmark article "A Defense of Abor-

tion" (1971) in order to show that, even if the fetus has a right to live, one is still able to justify an abortion for reasons of a woman's right to live/integrity/privacy. Thomson's famous example is that of the sickly violinist: You awake one morning to find that you have been kidnapped by a society of music lovers in order to help a violinist who is unable to live on his own by virtue of his ill-health. He has been attached to your kidneys because you alone have the only blood type to keep him alive. You are faced with a moral dilemma because the violinist has a right to live by being a member of the human race; there seems to be no possibility to unplug him without violating this right and thus killing him. However, if you leave him attached to you, you are unable to move for months, although you did not give him the right to use your body in such a way (Thomson 1984, 174-175).

First, Thomson claims that the right to live does not include the right to be given the means necessary for survival. If the right to live entails the right to those means, one is not justified in preventing the violinist from the on-going use of one's kidneys. The right to the on-going use of the kidneys necessarily implies that the violinist's right to his means for survival always trumps the right to another person's body. Thomson refuses this and claims that "the fact that for continued life that violinist needs the continued use of your kidneys does not establish that he has a right to be given the continued use of your kidneys" (Thomson 1984, 179). She argues that everybody has a right of how his own body is used. That is, the violinist has no right to use another person's body without her permission. Therefore, one is morally justified in not giving the violinist the use of one's own kidneys.

Second, Thomson contends that the right to live does not include the right not to be killed. If the violinist has the right not to be killed, then another person is not justified in removing the plug from her kidneys although the violinist has no right to their use. According to Thomson, the violinist has no right to another person's body and hence one cannot be unjust in unplugging him: "You surely are not being unjust to him, for you gave him no right to use your kidneys, and no one else can have given him any such right" (Thomson 1984, 180). If one is not unjust in unplugging oneself from him, and he has no right to the use of another person's body, then it cannot be wrong, although the result of the action is that the violinist will be killed.

### **Legal Aspects of the Abortion Conflict**

What is the legal status of the fetus (embryo, conceptus, and zygote)? Before the question is answered, one should pay some attention to the issue of the genesis of a legal system. Which ontological status do legal rights have? Where do they come from? Usually we accept the idea that legal rights do not "fall from the blue sky" but are made by human beings. Other conceptions which had been provided in the history of human kind are:

1. rights rest on God's will;
2. rights rest on the strongest person; or
3. rights rest on a specific human feature like a person's wisdom or age.

However, let us take the following description for granted: There is a legal community in which the members are legal entities with (legal) claims and legal addressees with (legal) obligations. If someone refuses the addressee's legal obligation within such a system, the legal entity has the right to call the legal instance in order to let his right be enforced. The main question is whether the fetus (or the embryo, conceptus, zygote) is a legal person with a basic right to live or not and, furthermore, whether there will be a conflict of legal norms, that is a conflict between the fetus' right

to live and the right of self-determination of the pregnant woman (principle of autonomy). Is the fetus a legal entity or not?

### **The Account of Quasi-Rights**

It was previously stated that the fetus as such is no person and that it seems unsound to claim that fetuses are persons in the ordinary sense of the notion. If rights are tied to the notion of personhood, then it seems appropriate to say that fetuses do not have any legal rights. One can object that animals of higher consciousness have some “rights” or quasi-rights because it is prohibited to kill them without good reason (killing great apes and dolphins for fun is prohibited in most countries). Their “right” not to be killed is based on the people’s will and their basic interest not to kill higher developed animals for fun. But, it would be wrong to assume that those animals are legal entities with “full” rights, or that they have only “half” rights. Thus, it seems reasonable to say that animals have “quasi-rights.” There is a parallel between the so-called right of the fetus and the quasi-rights of some animals: both are not persons in the normal sense of the notion but it would cause us great discomfort to offer them no protection and to deliver them to the vagaries of the people. According to this line of argument, it seems sound to claim that fetuses also have quasi-rights. It does not follow that the quasi-rights of the fetuses and the quasi-rights of the animals are identical; people would normally stress that the quasi-rights of fetuses are of more importance than that of animals.

However, there are some basic rights of the pregnant woman, for example, the right of self-determination, the right of privacy, the right of physical integrity, and the right to live. On the other hand, there is the existential quasi-right of the fetus, that is, the quasi-right to live. If the presumption is right that legal rights are tied to the notion of personhood and that there is a difference between rights and quasi-rights, then it seems right that the fetus has no legal right but “just” a quasi-right to live. If this is the case, what about the relation between the existential quasi-right of the fetus and the basic legal rights of the pregnant woman? The answer seems obvious: quasi-rights cannot trump full legal rights. The fetus has a different legal status that is based on a different moral status (see above). On this view there is no legal conflict of rights.

### **The Argument of Potentiality**

Another important point in the debate about the ascription of legal rights to the fetus is the topic of potential rights. Joel Feinberg discusses this point in his famous article “Potentiality, Development, and Rights” (1984, 145-151) and claims that the thesis that actual rights can be derived from the potential ability of having such rights is logically flawed because one is only able to derive potential rights from a potential ability of having rights. Feinberg maintains that there may be cases where it is illegal or wrong to have an abortion even when the fetus does not have any rights or is not yet a moral person. To illustrate his main argument – that rights do not rest on the potential ability of having them – Feinberg considers Stanley Benn’s argument which I slightly modified:

If person X is President of the USA and thus is Commander in Chief of the army, then person X had the potential ability to become the President of the USA and Commander in Chief of the army in the years before his rule.

### **But, it does not follow that:**

The person X has the authority to command the army as potential President of the USA.

Thus, it seems incorrect to derive actual rights from the bare potential ability to have legal rights at a later time. It should be added that Benn – despite his criticism on the argument of potential

rights – also claims that there are valid considerations which do not refer to the talk of rights and may provide plausible reasons against infanticide and late abortions even when fetuses and newborns are lawless beings with no personhood.

## **A Pragmatic Account**

There is always a chance that women get pregnant when they have sex with their (heterosexual) partners. There is not a 100% certainty of not getting pregnant under “normal circumstances”; there is always a very small chance even by using contraception to get pregnant. However, what does the sphere of decisions look like? A pregnancy is either deliberate or not. If the woman gets deliberately pregnant, then both partners (respectively the pregnant woman) may decide to have a baby or to have an abortion. In the case of having an abortion there may be good reasons for having an abortion with regard to serious health problems, for example, a (seriously) disabled fetus or the endangerment of the woman’s life. Less good reasons seem to be: vacation, career prospects, or financial and social grievances. If the pregnancy is not deliberate, it is either self-caused in the sense that the partners knew about the consequences of sexual intercourse and the contraception malfunctioned or it is not self-caused in the sense of being forced to have sex (rape). In both cases the fetus may be aborted or not. The interesting question concerns the reasons given for the justification of having an abortion.

There are at least two different kinds of reasons or justifications: The first group will be called “first order reasons”; the second “second order reasons.” First order reasons are reasons of justifications which may plausibly justify an abortion, for example, (i) rape, (ii) endangerment of the woman’s life, and (iii) a serious mentally or physically disabled fetus. Second order reasons are reasons of justifications which are, in comparison to first order reasons, less suitable in providing a strong justification for abortion, for example, (i) a journey, (ii) career prospects, (iii) by virtue of financial or social grievances.

### **a) First Order Reasons**

#### **i. Rape**

It would be cruel and callous to force the pregnant woman who had been raped to give birth to a child. Judith Jarvis Thomson maintains in her article “A Defense of Abortion” that the right to live does not include the right to make use of a foreign body even if this means having the fetus aborted (Thomson 1984, pp. 174 and pp. 177). Both the fetus and the raped woman are “innocent,” but this does not change “the fact” that the fetus has any rights. It seems obvious in this case that the raped woman has a right to abort. Forcing her not to abort is to remind her of the rape day-by-day which would be a serious mental strain and should not be enforced by law or morally condemned.

However, this assumption would be premature from John Noonan’s viewpoint according to his article “An Almost Absolute Value in History” (Noonan 1970, 51- 59). He claims that

the fetus as human [is] a neighbor; his life [has] parity with one’s own [...] [which] could be put in humanistic as well as theological terms: do not injure your fellow man without reasons. In these terms, once the humanity of the fetus is perceived, abortion is never right except in self-defense. When life must be taken to save life, reason alone cannot say that a mother must prefer a child’s

life to her own. With this exception, now of great rarity, abortion violates the rational humanist tenet of the equality of human lives.

Hence, the woman has no right to abort the fetus even if she had been raped and got pregnant against her will. This is the consequence of Noonan's claim since he only permits having an abortion in self-defense while Thomson argues that women, in general, have a right to abort the fetus when the fetus is conceived as an intruder (for example, due to rape). But, it remains unclear what Noonan means by "self-defense." At the end of his article he states that "self-sacrifice carried to the point of death seemed in extreme situations not without meaning. In the less extreme cases, preference for one's own interests to the life of another seemed to express cruelty or selfishness irreconcilable with the demands of love"

(Noonan 1970). On this view, even in the standard case of self-defense – for example, either the woman's life or the life of the fetus – the pregnant woman's death would not be inappropriate and in less extreme cases the raped woman would express cruelty or selfishness when she aborts the fetus – a judgment not all people would agree with.

## **ii. Endangerment of the Woman's Life**

Furthermore, there is no good reason to proceed with a pregnancy when the woman's life is in serious danger. Potential life should not be more valued than actual life. Of course, it is desirable to do everything possible to rescue both but it should be clear that the woman's life "counts more" in this situation. To force her at the risk of her life means to force her to give up her right of self-defense and her right to live. There seems to be no good reason to suspend her basic right of self-defense.

## **iii. Serious Mentally or Physically Disabled Fetuses**

It is hard to say when exactly a fetus is seriously mentally or physically disabled because this hot issue raises the vital question of whether the future life of the disabled fetus is regarded as worth living (problem of relativity). Hence, there are simple cases and, of course, borderline cases which lie in the penumbra and are hard to evaluate. Among the simple cases take the following example: Imagine a human torso lacking arms and legs that will never develop mental abilities like self-consciousness, the ability to communicate, or the ability to reason. It seems quite obvious to some people that such a life is not worth living. But what about the high number of borderline cases? Either parents are not entitled to have a healthy and strong offspring, nor are the offspring entitled to become healthy and strong. Society should not force people to give birth to seriously disabled fetuses or morally worse to force mothers who are willing to give birth to a disabled fetus to have an abortion (for example, Nazi Germany). It seems clear that a rather small handicap of the fetus is not a good reason to abort it.

Often radical groups of disabled persons claim that, if other people hold the view that it is all right to abort fetuses with (serious) genetic handicaps, the same people therewith deny the basic right to live of disabled adults with serious handicaps. This objection is unreasonable since fetuses in contrast to adult human beings have no basic interest in continuing to live their lives. Disabled fetuses maybe aborted like other fetuses, disabled (adult) human persons have to be respected like other people.

## **b) Second Order Reasons**

### **i. A Journey to Europe**

With regard to the reasons of justification according to the second group, there is a specific view

which is based on the argument that it is the decision of the woman to have an abortion or not.

There is a related view that rests on the assumption of the pregnant woman who claims that the fetus is a part of her body like a limb so that she has the right to do what ever she wants to do with the fetus. The argument is wrong. The fetus is certainly not a simple part of the pregnant woman but, rather, a dependent organism that relies on the woman.

The following example, the journey to Europe from North America, is based on the feminist argument but it is somewhat different in stressing another point in the line of argumentation: A young woman is pregnant in the seventh month and decides to make a journey to Europe for a sight-seeing tour. Her pregnancy is an obstacle to this and she decides to have an abortion. She justifies her decision by claiming that it will be possible for her to get pregnant whenever she wants but she is only able to make the journey now by virtue of her present career prospects. What can be said of her decision? Most authors may feel a deep discomfort not to morally condemn the action of the woman or not to reproach her for her decision for different reasons. But, there seems only two possible answers which may count as a valid basis for morally blaming the woman for her decision: First, if the young woman lives in a moral community where all members hold the view that it is immoral to have an abortion with regard to the reason given, then her action may be morally reprehensible. Furthermore, if the (moral) agreement is enforced by law, the woman also violated the particular law for which she has to take charge of. Second, one could also blame her for not showing compassion for her potential child. People may think that she is a callous person since she prefers to make the journey to Europe instead of giving birth to her almost born child (seventh month). If the appeal to her mercy fails, one will certainly be touched by her "strange" and "inappropriate" action. However, the community would likely put some informal pressure on the pregnant woman to influence her decision not to have an abortion. But some people may still contend that this social pressure will not change anything about the fact that the fetus has no basic right to live while claiming that the woman's decision is elusive.

## **ii. Financial and Social Reasons**

A woman got pregnant (not deliberately) and wants to have an abortion by virtue of her bad financial and social background because she fears that she will be unable to offer the child an appropriate life perspective. In this case, the community should do everything possible to assist the woman if she wants to givebirth to her child. Or, some may argue, that society should offer to take care of her child in special homes with other children or to look for other families who are willing to house another child. According to this line of thinking, people may claim that the financial or social background should not be decisive for having an abortion if there is a true chance for help.

## **c) First Order Reasons vs. Second Order Reasons**

There is a difference between the first order reasons and the second order reasons. We already saw that the first order reasons are able to justify an abortion while the second order reasons are less able to do so. That is because people think that the second order reasons are weaker than the reasons of the first group. It seems that the human ability to show compassion for the fetus is responsible for our willingness to limit the woman's basic right of autonomy where her reasons are too elusive. However, one may state that there are no strong compulsive reasons which could morally condemn the whole practice of abortion. Some people may not unconvincingly argue that moral agreements and legal rights are due to human beings so that reasons for or against abortion are always subjective and relative. According to this view, one is only able to contend the "trueness" or "wrongness" of a particular action in a limited way. Of course, there are other people who argue for the opposite (for example, Kantians, Catholic Church). One reason why people have

strong feelings about the conflict of abortion is that human beings do have strong intuitive feelings, for example, to feel compassion for fetuses as helpless and most vulnerable human entities. But moral intuitionism falls short by being a valid and objective basis for moral rights.

In the end, it is a question of a particular moral approach whether one regards an abortion as morally justifiable or not. But not every approach is justified. There is no anything goes.

## **Public Policy and Abortion**

One of the most difficult issues is how to make a sound policy that meets the needs of most people in a given society without focusing on the extreme conservative view, or the extreme liberal view, or the many moderate views on the conflict of abortion. The point is simple, one cannot wait until the philosophical debate is settled, for maybe there is no one solution available. But, in fact, people in a society must know what the policy is; that is, they have to know when and under what circumstances abortion is permitted or altogether prohibited. What are the reasons for a given policy? Do they rest on religious beliefs or do they depend on cultural claims? Whose religious beliefs and whose cultural claims? Those beliefs and claims of most people or of the dominant group in a given society? What about the problem of minority rights? Should they be respected or be refused? These are hard questions; no one is able to yet give a definite response.

But, of course, the problem of abortion has to be “solved,” at least, with regard to practical matters. This means that a good policy does not rest on extreme views but tries to cover as many points of views, although being aware of the fact that one is not able to please every person in society. This would be an impossible task. It seems that one should adopt a moderate view rather than the proposed extreme views. This is not because the moderate view is “correct” but because one needs a broad consensus for a sound policy. The hardliners in the public debate on the conflict of abortion, be they proponents or opponents, may not be aware of the fact that neither view is sustainable for most people.

A sound way for governments with regard to a reasonable policy could be the acceptance of a more or less neutral stance that may function as a proper guide for law. But, in fact, the decisive claim of a “neutral stance” is, in turn, questionable. All ethical theories try to present a proper account of a so-called neutral stance but there is hardly any theory that could claim to be sustainable with regard to other approaches. However, the key seems to be, again, to accept a middle way to cover most points of views. In the end, a formation of a policy seeks a sound compromise people could live with. But this is not the end of the story. One should always try to find better ways to cope with hard ethical problems. The conflict of abortion is of that kind and there is no evidence to assume otherwise.

## **Clinical Ethics Consultation and Abortion**

The vital issue of how one chooses whether or not to have an abortion is of utmost importance since people, in particular women, want to have a proper “guideline” that can support them in their process of ethical decision-making. According to pregnant women, the most crucial point seems not to be whether abortion is morally legitimate or not but, rather, how one should deliberate in the particular case. In fact, observations regularly show that women will nearly have the same number of abortions in contexts in which it is legal or not.

Gert is right in claiming that “the law can allow behavior that some people regard as morally unacceptable, such as early abortion, and it can prohibit behavior that some people regard as morally acceptable, such as late abortion. No one thinks that what the law decides about abortion settles the moral issue” (Gert 2004, 138). But what follows from that? What aspects should one consider

and how should one decide in a particular case?

It would be best to consult a neutral person who has special knowledge and experiences in medicine and medical ethics (for example, clinical ethics consultation). Most people are usually not faced with hard conflicts of abortion in their daily lives and get simply swamped by it; they are unable to determine and evaluate all moral aspects of the given case and to foresee the relevant consequences of the possible actions (for example, especially with regard to very young women who get pregnant by mistake). They need professional help without being dominated by the person in order to clarify their own (ethical) stance.

However, the conflict of abortion as such may not be solvable, in the end, but the experienced professional is able to provide persons with feasible solutions for the particular case.

## **Euthanasia**

Euthanasia, also called 'Mercy Killing' and 'Physician Assisted Suicide'; is a term in medical ethics for the practice of interfering or intervening in a natural process towards death. In other words it is accelerating the natural course of death in terminally ill patients, when all treatments become ineffective or much too painful for the patient to bear. In short Euthanasia is ending a human life with the intention of relieving the person from an unbearable pain. Haris (2001) precisely defines Euthanasia as 'a deliberate intervention undertaken with the express intention of ending a life to relieve intractable suffering'.

The issue of Euthanasia has always remained controversial and still has failed to carry legal and constitutional support in most parts of the world. Suicide in any form and by any means is either punished or at least disapproved in human history. There is no permissibility of such a killing/suicide in Islam so Euthanasia can never be the part of Muslim law in Islamic world. Therefore the origin and development of this concept can be historically located in the non Muslim countries especially of the west.

Back in 400 BC when the father of medicine Hippocrates formulated the oath still taken by the fresh medical graduates dictates 'I will give no deadly medicine to any one if asked, nor suggest any such counsel'., speaks against physician assisted suicide. Even in the 19th century, the US legislation proclaimed that if a suicide is committed on the advice of another person, the adviser would be guilty of a murder. In the early 20th century, the Supreme Court reevaluated its judgments concerning 'living will' and focusing how best to ensure the dignity and the independence for the 'end of life' with considerable changes in the health laws. In 1920 the book "Permitting the Destruction of Life not Worthy of Life" was published, in which the author Hoche advocated the death assistance be given under very controlled conditions. In 1935 Euthanasia society was formed in England to support mercy killing. 1939's Nazi's Euthanasia became very popular when Hitler ordered mercy killing of the sick and disabled. From 1995 to 2008, Euthanasia has been legalized in countries like parts of Australia, Netherland, Belgium and few states of the United States of America. [2]

There are several forms or kinds of Euthanasia; each form has its own ethical issues. Active Euthanasia: is the one which causes immediate death of the patient, by the direct and deliberate action of the physician. For example when a lethal injection is given to the patient or an overdose of a pain killer when the physician knows the after effects of such a dose.

Passive Euthanasia involves an indirect action by the physician for the death of the patient. This may include withdrawing or withholding the required treatment. For example switching off the life supporting machine like ventilator or not doing the required surgical procedures that can keep the

person alive though for a shorttime. Voluntary Euthanasia:- takes place with the will of the patient, usually on his request to the physician.

Non-Voluntary Euthanasia occurs when the patient is unconscious or in comma for a long time, or unable to make decision for example a very young child, or a mentally retarded person. Therefore someone else related to the patient makes the decision of ending the patient's life.

Involuntary Euthanasia:- is oftentimes equated to murder because in this case the patient does not opt for death but he is killed as the doctor thinks it to be in his benefit.

Indirect Euthanasia: – does not involve the intentional killing by the physician, but the side effects of the treatment, usually given to reduce the pain accelerate the death of the patient.

Assisted Suicide:- includes cases when the patient seeks help from his physician to die. This can include making the lethal drugs available for the patients.

The most common argument given by the proponents of Euthanasia is its effective way of relieving excruciating pain. To this one argument there can be two counter arguments. Firstly the advancements made today in the field of medicine, especially in pain management weakens the justification for Euthanasia. Secondly research shows that terminally ill patients choose suicide not because of the physical pain but because of depression. A study of terminally ill patients published in The American Journal of Psychiatry in 1986 concluded:

'The striking feature of [our] results is that all of the patients who had either desired premature death or contemplated suicide were judged to be suffering from clinical depressive illness; that is, none of those patients who did not have clinical depression had thoughts of suicide or wished that death would come early'.

Researchers believe that a person diagnosed with terminal illness should be given time and support to pass through the five stages of the process – denial, anger, bargaining, depression and acceptance, and killing them before they come to terms with the situation is nothing less than a murder.

## **View our services**

Boston Globe survey of 1991 shows that patients with incurable illnesses who see suicide as an option are mostly those who are neither tired of pain or of restricted life style, nor the fear of machine dependency but rather the feeling of being a burden on their family. Sometimes it's the family who advocate Euthanasia for the terminally ill patient, considering his life unworthy, and therefore a burden; which in turn throws the patient in the abbeys of depression. One should be afraid of the day when legalization of the right to die will become duty to die, pressurizing the already tormented patients to select Euthanasia as an only option. [3]

If we look at Euthanasia from another angle it is not a right to die but gives someone a right to kill. A right given to doctors and the relatives of a person to intentionally end his life. There is a need to differentiate between suicide and killing. Suicide is an individual act, whereas Euthanasia is not a private act. It involves the will of the person or the relatives and action of the physician, and known

by everyone around. It is therefore more close to public killing than suicide. Such a power to kill can be abused for the most vulnerable people in the population.

There should be a public realization that if all forms of treatments fail or become ineffective or continuation of any medical or surgical procedure would increase the pain rather than alleviating it, the suffering soul should be given support in all possible ways and all efforts should be directed toward minimizing his agony and making whatever little time he has, comfortable.

As followers of Islam such an option as Euthanasia can never cross our minds for ourselves or for our dear ones. I have a personal experience of accompanying a close kin of mine to the dialysis sessions, where patients were not only dependent on machines for their lives but were not even allowed to drink water during the warmest summers, but never did I once heard a patient or any of his relative praying for a quick demise. They would seek Allah's blessings during the hardest of times and a kind of hope would get them going. I saw doctors trying to look for options to improve the quality of life of such patients but any thought of eliminating the patient's pain through killing them was out of question and option.

As Muslims it is our firm belief that every life is sacred and Allah never creates and sustains anyone without purpose. In the holy Quran He says 'And if anyone saved a life, it would be as if he has saved the life of whole people'. (Quran 5:32). Allah further commands 'take not the life which Allah made sacred otherwise in the course of justice'.

If we equate voluntary Euthanasia with suicide, then again none of us has a right to take his own life. How can we have this right when we have not created ourselves, in fact how can we destroy something of which we are not the owners. Our bodies and souls belong to the Almighty and have been entrusted to us to be taken care of in the best ways possible. Suicide is a crime which is not only punishable in this world but also unforgivable sin in the hereafter. Prophet Mohammad warned the people against suicide by saying "Whoever kills himself with an iron instrument will be carrying it forever in hell. Whoever takes poison and kills himself will forever keep sipping that poison in hell. Whoever jumps off a mountain and kills himself will forever keep falling down in the depths of hell". [4]

Our religion Islam not only emphasize on seeking all possible medical help during illness but further consoles the patients in pain by giving him the happy tidings for reward if he endures the pain with patience. In one of the hadith it is mentioned that when a true believer is afflicted with pain, even a prick of a thorn and he bears it with patience, then his sins will be forgiven and his wrongdoings will be discarded as the tree sheds off its leaves. Such words by the Holy Prophet can be a huge support for a sufferer of a terminal illness or of incurable and painful disease. Euthanasia cannot therefore be a part of the dictionary of a true believer.

The weak value system of the west has come up with the idea of deserting the old, weak and the sick by leaving them in the old houses and hospitals. These so called facilities also sometimes cost them huge amounts, which make them claim that people who become unproductive for the society and a burden on the productive fellows should die for the good of the people around and for their own ease. But the east has still kept its value system strong. Our religious and social values dictate us to take care with respect and dignity of the old, weak, sick and the helpless. Allah has specially stressed upon respecting and serving the parents specially when they become old. "and that you be kind to your parents. Whether one or both of them attain old age in your life, say not to them a word of contempt but address them in terms of honor. And lower to them

the wing of humility out of compassion, and say: my Lord, bestow on them your mercy even as they cherished me in childhood" (Qur'an 17:25- 25). As far as the issue of heavy cost is concerned to keep a terminally ill patient alive, Islam makes it a responsibility of the state and the society as a whole to cover the health care needed.

Euthanasia might be categorized into several kinds but Islam emphasizes the intentions involved in the act. If for example physician intends to alleviate the pain of the patients but the dose somehow kill him, the doctor cannot be accused of murder, or cannot be said to have practiced Euthanasia. The doctor is expected to help the patient in the process of life and not in process of death.

Important enough is to consider the relative nature of the terms like pain, suffering and agony. It really depends on the patience and tolerance level of each individual, which of course varies. What is suffering for one person might not be the same for the other, similarly excruciating pain for one can be bearable for someone else.

Conclusion: – Humans might be the wisest form of God's creation but still not wise enough to be given a right to decide for their own death or for the death of another of their own kind. All lives are precious and sacred and only such value system can be the basis of a human society, where the sanctity of life is maintained. Euthanasia in any of its forms, involves the intention of killing or finishing a still living human weakens the fabric of the society and gives an altogether a different lens to the members to see death as the only solution for all pains and torments, which blurs the vision to see other possibilities to fight the situation. Euthanasia should therefore be discouraged in all its forms and in all parts of the world.

Euthanasia, also called 'Mercy Killing' and 'Physician Assisted Suicide; is a term in medical ethics for the practice of interfering or intervening in a natural process towards death. In other words it is accelerating the natural course of death in terminally ill patients, when all treatments become ineffective or much too painful for the patient to bear. Euthanasia should therefore be discouraged in all its forms and in all parts of the world.

### **Female-infanticide What is infanticide?**

Infanticide is the unlawful killing of very young children. It is found in both indigenous and sophisticated cultures around the world.

### **Female infanticide**

Female infanticide is the deliberate killing of girl babies. It is also described as gender-selective killing or "gendercide". (Similar words like 'gynocide' and 'femicide' are used to describe the killing of females of any age.) Female infanticide is more common than male infanticide, and in some countries, particularly India and China, is likely to have serious consequences on the balance of the sexes in the population. The reasons behind it are almost always cultural, rather than directly religious. The causes:

### **Anti-female bias**

Societies that practise female infanticide always show many other signs of bias against females. Women are perceived as subservient because of their role as carers and homemakers, whilst men predominantly ensure the family's social and economic stability.

## Family economics

Girl babies are often killed for financial reasons.

- **Earning power:** Men are usually the main income-earners, either because they are more employable or earn higher wages for the same work, or because they are able to do more agricultural work in subsistence economies. Since male babies have a greater income potential, they are less likely to be killed.
- **Potential pensions:** In many societies, parents depend on their children to look after them in old age. But in many of these cultures a girl leaves her parental family and joins her husband's family when she marries. The result is that parents with sons gain extra resources for their old age, when their sons marry, while parents with daughters lose their 'potential pensions' when they marry and move away. This gives parents a strong reason to prefer male children. Some parents (particularly poor ones) who can't afford to support a large family, will kill female babies. Girls are considered a drain on family resources during their childhood without bringing economic benefits later on.
- **Dowry:** Some girl babies are killed so that the family doesn't have to pay a dowry when they get married. In Indian society it is tradition for the parents of the bride to give a dowry to the groom and his family. The dowry consists of large amounts of money and valuable goods. For families with several daughters this can be a serious financial burden.

## Government policy

Governmental policies have also increased female infanticide as an unpredicted side-effect. For example, when the Chinese Government introduced a One Child per Family Policy there was a surge in female infanticide. Families needed to have a son because of their higher earning potential, so a girl baby was an economic disaster for them, and there was a strong motive to ensure that girl babies did not survive.

## Caste

Some female infants are killed because they are regarded as being lower in the **caste** hierarchy than males.

## Where does female infanticide occur?

Female infanticide is a significant problem in parts of Asia - infanticide does occur in the West, but usually as isolated family tragedies with no underlying pattern or gender bias.

## India

Female infanticide and **female foeticide** (the selective abortion of girls in the womb) are significant issues in India.

Female infanticide has been a problem for centuries, partly as a result of the patriarchal nature of Indian society.

## Tackling the issue

Modern India has tried several ways to tackle the issue. One initiative in the state of Tamil Nadu was taken to attack the underlying economic problems.

Where parents had one or two daughters but no son, and either of the parents was willing to be sterilised, the government offered the parents money to help look after the children. This money

was to be paid annually throughout the daughter's education, followed by a lump sum on her twentieth birthday, either for use as a dowry or to fund further education.

## **China**

Female infanticide has existed in China for a long time, and although the One Child per Family policy has added to the problem, it didn't cause it.

The One Child Policy was introduced by the Chinese Government in 1979 with the intention of keeping the population within sustainable limits even in the face of natural disasters and poor harvests, and improving the quality of life for the Chinese population as a whole.

Under the policy, parents who have more than one child may have their wages reduced and be denied some social services.

Despite the egalitarian nature of Chinese society, many parents believe that having a son is a vital element of providing for their old age. Therefore in extreme cases, a baby is killed if it is not of the preferred sex, because of the pressure not to have more than one child.

## **Tackling the issue**

The Chinese Government have acknowledged the problem and introduced laws to deal with it:

- Marriage law prohibits female infanticide.
- Women's Protection Law prohibits infanticide and bans discrimination against women who choose to keep female babies.
- Maternal Health Care Law forbids the use of technological advances, such as ultra-sound machines, to establish the sex of foetuses, so as not to pre-determine the fate of female infants or encourage selective abortion.

## **Origins of infanticide**

Infanticide occurs in most cases as a way of restricting poverty and population. Throughout history infanticide has been regarded as a productive and efficient way to control starvation and poor standards of living caused by over population.

## **Confucianism**

The male bias in China is deeply rooted in Chinese traditions which leads parents to want their first child to be a boy. Confucianism regards male children as more desirable since they provide security for the elderly, work and are important for the performance of ancestral rites.

## **Hinduism**

Hindu authorities condemn infanticide. Son-preference in Hindu cultures is largely based on the fact that men are better providers, and that sons are required for the proper performance of funeral rites. Some writers argue that Hindu culture has long had a patriarchal bias against women.

## **Sikhism**

Sikh authorities condemn infanticide. The Sikh religion is one of the most gender-neutral, and explicitly proclaims the equality of men and women. This makes it more surprising that censuses in India show there are far more male children than female children in the Sikh community.

In practice there does appear to be a strong preference for boys in the Sikh heartland. The community appears to give greater respect to the parents of boys, and boys themselves.

In response the Sikh religious organisation Akal Takht has re-emphasised that women are equal to men. It has banned neo-natal sex identification, selective abortion and the killing of female babies.

## **Islam**

Islam has always condemned infanticide. Female infanticide was common in pre-Islamic Arabia. However, by the time of Muhammad, and the revelation of the Qur'an female infanticide was strictly forbidden, and regarded as seriously as adult murder.

### **The Qur'an on female infanticide:**

When the infant girl, is buried alive, is questioned, for what crime she was killed.

#### **Surah 81 v 8 - 9**

You shall not kill your children for fear of want. We will provide for them and for you. To kill them is a grievous sin.

#### **Surah 17 v 31**

## **Christianity**

Christianity has always condemned infanticide.

## **Judaism**

Judaism has always condemned infanticide. **Professional Ethics: Corporate Governance The ends and means of corporate governance**

There is significant debate about the ends and means of corporate governance, i.e., about who firms should be managed for, and who should (ultimately) manage them. Much of this debate is carried on with the large publicly-traded corporation in view.

### **Ends: shareholder primacy or stakeholder balance?**

There are two main views about the proper ends of corporate governance. According to one view, firms should be managed in the best interests of shareholders. It is typically assumed that managing firms in shareholders' best interests requires maximizing their wealth. This view is often called "shareholder primacy" (Stout 2002) or—in order to contrast it more directly with its main rival (to be discussed below) "shareholder theory". (Confusingly, the label 'shareholder primacy' is sometimes used—e.g., by Bainbridge [2008]—to refer to the view that shareholders should have ultimate control over the firm.) Shareholder primacy is the dominant view about the ends of corporate governance among financial professionals and in business schools.

A few writers argue for shareholder primacy on deontological grounds. On this argument, shareholders own the firm, and hire managers to run it for them on the condition that the firm is managed in their interests. Shareholder primacy is thus based on a promise that managers make to shareholders (Friedman 1970; Hasnas 1998). In response, some argue that shareholders do not own the firm. They own stock, a type of corporate security (Bainbridge 2008; Stout 2002); the firm itself may be unowned (Strudler 2017). Others argue that managers do not make, explicitly or implicitly, any promises to shareholders to manage the firm in a certain way (Boatright 1994). More writers argue for shareholder primacy on consequentialist grounds. On this argument, managing firms in the interests of shareholders is more efficient than managing them in any other way (Hansmann & Kraakman 2001; Jensen 2002). In support of this, some argue that, if managers are not given a single objective that is clear and measurable—viz., maximizing shareholder value—then they will have an enhanced opportunity for self-dealing (Stout 2002). Consequentialist arguments

for shareholder primacy run into problems that afflict many versions of consequentialism: in requiring all firms to be managed in a certain way, it does not allow sufficient scope for personal choice (Hussain 2012). Most think that people should be able to pursue projects, including economic projects, that matter to them, even if those projects do not maximize welfare.

The second main view about the proper ends of corporate governance is given by stakeholder theory. This theory was first put forward by Freeman in the 1980s (Freeman 1984; Freeman & Reed 1983), and then refined by Freeman and various collaborators over the next 30 years (see, e.g., Freeman et al. 2010; Jones, Wicks, & Freeman 2002). According to stakeholder theory—or at least, early formulations of the theory—instead of managing the firm in the best interests of shareholders only, managers should seek to “balance” the interests of all stakeholders, where a stakeholder is anyone who has a “stake”, or interest (including a financial interest), in the firm.

To its critics, stakeholder theory has seemed both insufficiently articulated and weakly defended. With respect to articulation, one question that has been pressed is: Who are the stakeholders (Orts & Strudler 2002, 2009)? The groups most commonly identified are shareholders, employees, the community, suppliers, and customers. But other groups have stakes in the firm, including creditors, the government, and competitors. It makes a great deal of difference where the line is drawn, but stakeholder theorists have not provided a clear rationale for drawing a line in one place rather than another. Another question is: What does it mean to “balance” the interests of all stakeholders—other than not always giving precedence to shareholders’ interests (Orts & Strudler 2009)? With respect to defense, critics have wondered what the rationale for managing firms in the interests of all stakeholders is. In one place, Freeman (1984) offers an instrumental argument for his view, claiming that balancing stakeholders’ interests is better for the firm strategically than maximizing shareholder wealth. (This is precisely what defenders of shareholder primacy say about that view.) In another, he gives an argument that appeals to Rawls’s justice as fairness.

In recent years, questions have been raised about whether stakeholder theory is appropriately seen as a genuine competitor to shareholder primacy, or is even appropriately called a “theory”. In one article, Freeman and collaborators say that stakeholder theory is simply “the body of research ... in which the idea of ‘stakeholders’ plays a crucial role” (Jones et al. 2002). In another, Freeman describes stakeholder theory as “a genre of stories about how we could live”

(1994: 413). It may be, as Norman (2013) says, that stakeholder is now best regarded as “mind-set”, i.e., a way of looking at the firm that emphasizes its embeddedness in a network of relationships.

It is important to realize that a resolution of the debate between shareholder and stakeholder theorists (however we conceive of the latter) will not resolve all or even most of the ethical questions in business. This is because this is a debate about the ends of corporate governance; it cannot answer all of the questions about the moral constraints that must be observed in pursuit of those ends (Goodpaster 1991; Norman 2013). Neither shareholder primacy nor stakeholder theory is plausibly interpreted as the view that corporate managers should do whatever is possible to maximize shareholder wealth and balance all stakeholders’ interests, respectively. Rather, these views should be interpreted as views that managers should do whatever is morally permissible to achieve these ends. A large part of business ethics is trying to determine what morality permits in this domain.

## **Means: control by shareholders or others too?**

Answers to questions about the means of corporate governance often mirror answers to question about the ends of corporate governance. Often the best way to ensure that a firm is managed in the interests of a certain party P is to give P control over it. Conversely, justifications for why the firm should be managed in the interests of P sometimes appeal P's rights to control it.

Thus Friedman (1970) thinks that shareholders' ownership of the firm gives them a right to control the firm (which they can use to ensure that the firm is run in their interests). We might see control rights for shareholders as following analytically from the concept of ownership. To own a thing is to have a bundle of rights with respect to that thing. One of the standard "incidents" of ownership is control.

As noted, in recent years the idea that the firm is something that can be owned has been challenged (Bainbridge 2008; Strudler 2017). But contractarian arguments for shareholder control of firms have been constructed which do not rely on the assumption of firm ownership. All that is assumed in these arguments is that some people own capital, and others own labor. Capital can "hire" labor (and other inputs of production), on terms that it draws up, or labor can "hire" capital, on terms that it draws up, with society setting limits on what the terms may be. It just so happens that, in most cases, capital hires labor. These points are emphasized especially by those who regard the firm as a "nexus of contracts" among various parties.

Many writers find this result troubling. Even if the governance structure in most firms is in some sense agreed to, they say that it is unjust in other ways. Anderson (2015) characterizes standard corporate governance regimes as oppressive and unaccountable private dictatorships. To address this injustice, these writers call for various forms of worker participation in managerial decision-making, including the ability by workers to reject arbitrary directives by managers (Hsieh 2005), worker co-determination of firms' policies and practices, and exclusive control of productive enterprises by workers.

Arguments for these governance structures take various forms. One type of argument appeals to the value of protecting workers' interests (Brenkert 1992a; Hsieh 2005). A second type of argument appeals to the value of autonomy, or a right to freely determine one's actions, including one's actions at work (McCall 2001). A third type of argument for worker participation in managerial decision-making is the "parallel case" argument. According to it, if states should be governed democratically, then so should firms, because firms are like states in the relevant respects (Dahl 1985; Walzer 1983). A fourth argument for worker participation in firm decision-making sees it as valuable or even necessary training for participation in political processes in the broader society (Cohen 1989).

Space considerations prevent a detailed examination of these arguments. But criticisms generally fall into two categories. The first insists on the normative priority of agreements, of the sort described above. There are few legal restrictions on the types of governance structures that firms can have. And some firms are in fact controlled by workers (Dow 2003; Hansmann 1996). To insist that other firms should be governed this way is to say, according to this argument, that people should not be allowed to arrange their economic lives as they see fit. Another criticism of worker participation appeals to efficiency. Allowing workers to participate in managerial decision-making may decrease the pace of decision-making, since it requires giving many workers a chance to make their voices heard (Hansmann 1996). It may also raise the cost of capital for firms, as investors may demand more favorable terms if they are not given control of the enterprise in return

(McMahon 1994). Both sources of inefficiency may put the firm at a significant disadvantage in a competitive market. And it may not be just a matter of competitive disadvantage. If it were, the problem could be solved by making all firms worker-controlled. The problem may be one of diminished productivity more generally.

### **Corporate social responsibility**

Corporate social responsibility is based on the premise that a business can only thrive if it operates within a thriving society. In that way, the business depends on the community it operates within, and as such, has an ethical and moral responsibility towards that community. A business is perceived as legitimate when its activities are congruent with the goals and values of the society in which the business operates.

Consumers and other companies are likely to shun firms that develop unethical reputations. And arguably, companies that don't pay attention to their social and ethical responsibilities are more likely to stumble into legal troubles, such as mass corruption or accounting fraud scandals – threatening the sustainability of the business itself.

By promoting respect for the company in the marketplace, CSR can result in higher sales, enhance employee loyalty and attract better personnel to the firm. It is also a way to connect to the personal well-being of customers. In this way, the CSR can contribute towards higher profits for the company.

Therefore, by ensuring brand loyalty and consumer patronage, CSR can ensure that the business remains sustainable in the long-term and it stays profitable.

### **Ethical Responsibility**

Responsibility is an ethical concept that refers to the fact that individuals and groups have morally based obligations and duties to others and to larger ethical and moral codes, standards and traditions.

### **Ethical Principles of Responsibility and Accountability**

Responsibility in a business context refers to “a sphere of duty or obligation assigned to a person by the nature of that person's position, function or work.”

The roles taken on by decision-makers imply a responsibility to perform certain functions associated with those roles. To be more specific, responsibility refers to more than just the primary function of a role; it refers to the multiple facets of that function, which includes both processes and outcomes, and the consequences of the acts performed as part of that set of obligations. A responsible actor may be seen as one whose job involves a predetermined set of obligations that need to be met in order for the job to be accomplished.

According to Aristotle, moral responsibility was viewed as originating with the moral agent as decision-maker, and grew out of an ability to reason, an awareness of action and consequences, and a willingness to act free from external compulsion.

Accountability is the readiness or preparedness to give an explanation or justification to stakeholders for one's judgments, intentions and actions.

“It is a readiness to have one's actions judged by others and, where appropriate, accept responsibility for errors, misjudgments and negligence and recognition for competence, conscientiousness,

excellence and wisdom.” While responsibility is defined as a bundle of obligations associated with a role, accountability could be defined as “blaming or crediting someone for an action”—normally associated with a recognized responsibility. The accountable actor is “held to external oversight, regulation, and mechanisms of punishment aimed to externally motivate responsive adjustment in order to maintain adherence with appropriate moral standards of action.”

In the professional context, accountability is about answering to clients, colleagues and other relevant professionals. The demand to give an account of one’s judgments, acts and omissions arises from the nature of the professional-client and the professional-professional relationships. For communication professionals, accountability has more specific implications. Recent years have seen more practical and concrete interpretation of the concept of accountability by communication specialists. It is associated with responsiveness to the views of all stakeholders, which includes a willingness to explain, defend, and justify actions.

While tracing the lines of responsibility and accountability can be difficult, in the end, if one is responsible in any way for an action, then one must accept some degree of accountability. On the other hand, if responsibility and accountability are not equitably shared and if the process by which they are assigned is not transparent, then problems will arise. In the corporate world, not every actor is blame-worthy, especially if the actor’s autonomy is limited by structure, process, or circumstance. However, lack of autonomy is not an excuse for avoiding accountability entirely.

### **Media Ethics: ethical issues in Privacy Introduction**

The use of social media is growing at a rapid pace and the twenty-first century could be described as the “boom” period for social networking. According to reports provided by Smart Insights, as at February 2019 there were over 3.484 billion social media users. The Smart Insight report indicates that the number of social media users is growing by 9% annually and this trend is estimated to continue. Presently the number of social media users represents 45% of the global population. The heaviest users of social media are “digital natives”; the group of persons who were born or who have grown up in the digital era and are intimate with the various technologies and systems, and the “Millennial Generation”; those who became adults at the turn of the twenty-first century. These groups of users utilize social media platforms for just about anything ranging from marketing, news acquisition, teaching, health care, civic engagement, and politicking to social engagement.

The unethical use of social media has resulted in the breach of individual privacy and impacts both physical and information security. Reports in 2019, reveal that persons between the ages 8 and 11 years spend an average 13.5 hours weekly online and 18% of this age group are actively engaged on social media. Those between ages 12 and 15 spend on average 20.5 hours online and 69% of this group are active social media users. While children and teenagers represent the largest Internet user groups, for the most part they do not know how to protect their personal information on the Web and are the most vulnerable to cyber-crimes related to breaches of information privacy.

In today’s IT-configured society data is one of, if not the most, valuable asset for most businesses/organizations. Organizations and governments collect information via several means including invisible data gathering, marketing platforms and search engines such as Google. Information can be attained from several sources, which can be fused using technology to develop complete profiles of individuals. The information on social media is very accessible and can be of great value to individuals and organizations for reasons such as marketing, etc.; hence, data is retained by most companies for future use.

## Privacy

Privacy or the right to enjoy freedom from unauthorized intrusion is the negative right of all human beings. Privacy is defined as the right to be left alone, to be free from secret surveillance, or unwanted disclosure of personal data or information by government, corporation, or individual (dictionary.com). In this chapter we will define privacy loosely, as the right to control access to personal information. Supporters of privacy posit that it is a necessity for human dignity and individuality and a key element in the quest for happiness. According to Baase [5] in the book titled “A Gift of Fire: Social, Legal and Ethical Issues for Computing and the Internet,” privacy is the ability to control information about one’s self as well as the freedom from surveillance from being followed, tracked, watched, and being eavesdropped on. In this regard, ignoring privacy rights often leads to encroachment on natural rights.

Privacy, or even the thought that one has this right, leads to peace of mind and can provide an environment of solitude. This solitude can allow people to breathe freely in a space that is free from interference and intrusion. According to Richards and Solove, Legal scholar William Prosser argued that privacy cases can be classified into four related “torts,” namely:

1. Intrusion—this can be viewed as encroachment (physical or otherwise) on one’s liberties/solitude in a highly offensive way.
2. Privacy facts—making public, private information about someone that is of no “legitimate concern” to anyone.
3. False light—making public false and “highly offensive” information about others.
4. Appropriation—stealing someone’s identity (name, likeness) to gain advantage without the permission of the individual.

Technology, the digital age, the Internet and social media have redefined privacy however as surveillance is no longer limited to a certain pre-defined space and location. An understanding of the problems and dangers of privacy in the digital space is therefore the first step to privacy control. While there can be clear distinctions between informational privacy and physical privacy, as pointed out earlier, intrusion can be both physical and otherwise.

This chapter will focus on informational privacy which is the ability to control access to personal information. We examine privacy issues in the social media context focusing primarily on personal information and the ability to control external influences. We suggest that breach of informational privacy can impact: solitude (the right to be left alone), intimacy (the right not to be monitored), and anonymity (the right to have no public personal identity and by extension physical

privacy impacted). The right to control access to facts or personal information in our view is a natural, inalienable right and everyone should have control over who see their personal information and how it is disseminated.

In May 2019 the General Data Protection Regulation (GDPR) clearly outlined that it is unlawful to process personal data without the consent of the individual (subject). It is a legal requirement under the GDPR that privacy notices be given to individuals that outline how their personal data will be processed and the conditions that must be met that make the consent valid. These are:

- “Freely given—an individual must be given a genuine choice when providing consent and it

should generally be unbundled from other terms and conditions (e.g., access to a service should not be conditional upon consent being given).”

- “Specific and informed—this means that data subjects should be provided with information as to the identity of the controller(s), the specific purposes, types of processing, as well as being informed of their right to withdraw consent at any time.”
- “Explicit and unambiguous—the data subject must clearly express their consent (e.g., by actively ticking a box which confirms they are giving consent—pre-ticked boxes are insufficient).”
- “Under 13s—children under the age of 13 cannot provide consent and it is therefore necessary to obtain consent from their parents.”

Arguments can be made that privacy is a cultural, universal necessity for harmonious relationships among human beings and creates the boundaries for engagement and disengagement. Privacy can also be viewed as instrumental good because it is a requirement for the development of certain kinds of human relationships, intimacy and trust. However, achieving privacy is much more difficult in light of constant surveillance and the inability to determine the levels of interaction with various publics. Some critics argue that privacy provides protection against anti-social behaviors such as trickery, disinformation and fraud, and is thought to be a universal right. However, privacy can also be viewed as relative as privacy rules may differ based on several factors such as “climate, religion, technological advancement and political arrangements”. The need for privacy is an objective reality though it can be viewed as “culturally rational” where the need for personal privacy is viewed as relative based on culture. One example is the push by the government, businesses and Singaporeans to make Singapore a smart nation. According to GovTech 2018 reports there is a push by the government in Singapore to harness the data “new gold” to develop systems that can make life easier for its people. The report points out that Singapore is using sensors robots Smart Water Assessment Network (SWAN) to monitor water quality in its reservoirs, seeking to build smart health system and to build a smart transportation system to name a few. In this example privacy can be describe as “culturally rational” and the rules in general could differ based on technological advancement and political arrangements.

In today’s networked society it is naïve and ill-conceived to think that privacy is over-rated and there is no need to be concerned about privacy if you have done nothing wrong. The effects of information flow can be complex and may not be simply about protection for people who have something to hide. Inaccurate information flow can have adverse long-term implications for individuals and companies. Consider a scenario where someone’s computer or tablet is stolen. The perpetrator uses identification information stored on the device to access their social media page which could lead to access to their contacts, friends and friends of their “friends” then participate in illegal activities and engage in anti- social activities such as hacking, spreading viruses, fraud and identity theft. The victim is now in danger of being accused of criminal intentions, or worse. These kinds of situations are possible because of technology and networked systems. Users of social media need to be aware of the risks that are associated with participation.

## **Social media**

The concept of social networking pre-dates the Internet and mass communication as people are said to be social creatures who when working in groups can achieve results in a value greater than the sum of its parts. The explosive growth in the use of social media over the past decade has made it one of the most popular Internet services in the world, providing new avenues to “see and be seen”. The use of social media has changed the communication landscape resulting in changes in ethical norms and behavior. The unprecedented level of growth in usage has resulted in the reduction in the use of other media and changes in areas including civic and political engagement, pri-

vacy and safety. Alexa, a company that keeps track of traffic on the Web, indicates that as of August, 2019 YouTube, Facebook and Twitter are among the top four (4) most visited sites with only Google, being the most popular search engine, surpassing these social media sites.

Social media sites can be described as online services that allow users to create profiles which are “public, semi-public” or both. Users may create individual profiles and/or become a part of a group of people with whom they may be acquainted offline. They also provide avenues to create virtual friendships. Through these virtual friendships, people may access details about their contacts ranging from personal background information and interests to location. Social networking sites provide various tools to facilitate communication. These include chat rooms, blogs, private messages, public comments, ways of uploading content external to the site and sharing videos and photographs. Social media is therefore drastically changing the way people communicate and form relationships.

Today social media has proven to be one of the most, if not the most effective medium for the dissemination of information to various audiences. The power of this medium is phenomenal and ranges from its ability to overturn governments (e.g., Moldova), to mobilize protests, assist with getting support for humanitarian aid, organize political campaigns, organize groups to delay the passing of legislation (as in the case with the copyright bill in Canada) to making social media billionaires and millionaires. The enabling nature and the structure of the media that social networking offers provide a wide range of opportunities that were nonexistent before technology. Facebook and YouTube marketers and trainers provide two examples. Today people can interact with and learn from people millions of miles away. The global reach of this medium has removed all former pre-defined boundaries including geographical, social and any other that existed previously. Technological advancements such as Web 2.0 and Web 4.0 which provide the framework for collaboration, have given new meaning to life from various perspectives: political, institutional and social.

### **Privacy and social media**

Social media and the information/digital era have “redefined” privacy. In today’s Information Technology—configured societies, where there is continuous monitoring, privacy has taken on a new meaning. Technologies such as closed-circuit cameras (CCTV) are prevalent in public spaces or in some private spaces including our work and home. Personal computers and devices such as our smart phones enabled with Global Positioning System (GPS), Geo locations and Geo maps connected to these devices make privacy as we know it, a thing of the past. Recent reports indicate that some of the largest companies such as Amazon, Microsoft and Facebook as well as various government agencies are collecting information without consent and storing it in databases for future use. It is almost impossible to say privacy exists in this digital world (@nowthisnews).

The open nature of the social networking sites and the avenues they provide for sharing information in a “public or semi-public” space create privacy concerns by their very construct. Information that is inappropriate for some audiences are many times inadvertently made visible to groups other than those intended and can sometimes result in future negative outcomes. One such example is a well-known case recorded in an article entitled “The Web Means the End of Forgetting” that involved a young woman who was denied her college license because of backlash from photographs posted on social media in her private engagement.

Technology has reduced the gap between professional and personal spaces and often results in information exposure to the wrong audience. The reduction in the separation of professional and

personal spaces can affect image management especially in a professional setting resulting in the erosion of traditional professional image and impression management. Determining the secondary use of personal information and those who have access to this information should be the prerogative of the individual or group to whom the information belongs. However, engaging in social media activities has removed this control.

Privacy on social networking sites (SNSs) is heavily dependent on the users of these networks because sharing information is the primary way of participating in social communities. Privacy in SNSs is "multifaceted." Users of these platforms are responsible for protecting their information from third-party data collection and managing their personal profiles. However, participants are usually more willing to give personal and more private information in SNSs than anywhere else on the Internet. This can be attributed to the feeling of community, comfort and family that these media provide for the most part. Privacy controls are not the priority of social networking site designers and only a small number of the young adolescent users change the default privacy settings of their accounts. This opens the door for breaches especially among the most vulnerable user groups, namely young children, teenagers and the elderly. The nature of social networking sites such as Facebook and Twitter and other social media platforms cause users to re-evaluate and often change their personal privacy standards in order to participate in these social networked communities.

While there are tremendous benefits that can be derived from the effective use of social media there are some unavoidable risks that are involved in its use. Much attention should therefore be given to what is shared in these forums. Social platforms such as Facebook, Twitter and YouTube are said to be the most effective media to communicate to Generation Y's (Gen Y's), as teens and young adults are the largest user groups on these platforms. However, according to Bolton et al. Gen Y's use of social media, if left unabated and unmonitored will have long-term implications for privacy and engagement in civic activities as this continuous use is resulting in changes in behavior and social norms as well as increased levels of cyber-crime.

Today social networks are becoming the platform of choice for hackers and other perpetrators of antisocial behavior. These media offer large volumes of data/information ranging from an individual's date of birth, place of residence, place of work/business, to information about family and other personal activities.

In many cases users unintentionally disclose information that can be both dangerous and inappropriate. Information regarding activities on social media can have far reaching negative implications for one's future. A few examples of situations which can, and have been affected are employment, visa acquisition, and college acceptance. Indiscriminate participation has also resulted in situations such as identity theft and bank fraud just to list a few. Protecting privacy in today's networked society can be a great challenge. The digital revolution has indeed distorted our views of privacy, however, there should be clear distinctions between what should be seen by the general public and what should be limited to a selected group. One school of thought is that the only way to have privacy today is not to share information in these networked communities. However, achieving privacy and control over information flows and disclosure in networked communities is an ongoing process in an environment where contexts change quickly and are sometimes blurred. This requires intentional construction of systems that are designed to mitigate privacy issues.

## **Ethics and social media**

Ethics can be loosely defined as "the right thing to do" or it can be described as the moral philoso-

phy of an individual or group and usually reflects what the individual or group views as good or bad. It is how they classify particular situations by categorizing them as right or wrong. Ethics can also be used to refer to any classification or philosophy of moral values or principles that guides the actions of an individual or group. Ethical values are intended to be guiding principles that if followed, could yield harmonious results and relationships. They seek to give answers to questions such as “How should I be living? How do I achieve the things that are deemed important such as knowledge and happiness or the acquisition of attractive things?” If one chooses happiness, the next question that needs to be answered is “Whose happiness should it be; my own happiness or the happiness of others?” In the domain of social media, some of the ethical questions that must be contemplated and ultimately answered are:

- Can this post be regarded as oversharing?
- Has the information in this post been distorted in anyway?
- What impact will this post have on others?

As previously mentioned, users within the ages 8–15 represent one of the largest social media user groups. These young persons within the 8–15 age range are still learning how to interact with the people around them and are deciding on the moral values that they will embrace. These moral values will help to dictate how they will interact with the world around them. The ethical values that guide our interactions are usually formulated from some moral principle taught to us by someone or a group of individuals including parents, guardians, religious groups, and teachers just to name a few. Many of the Gen Y’s/“Digital Babies” are “newbies” yet are required to determine for themselves the level of responsibility they will display when using the varying social media platforms. This includes considering the impact a post will have on their lives and/or the lives of other persons. They must also understand that when they join a social media network, they are joining a community in which certain behavior must be exhibited. Such responsibility requires a much greater level of maturity than can be expected from them at that age.

It is not uncommon for individuals to post even the smallest details of their lives from the moment they wake up to when they go to bed. They will openly share their location, what they eat at every meal or details about activities typically considered private and personal. They will also share likes and dislikes, thoughts and emotional states and for the most part this has become an accepted norm. Often times however, these shares do not only contain information about the person sharing but information about others as well. Many times, these details are shared on several social media platforms as individuals attempt to ensure that all persons within their social circle are kept updated on their activities. With this openness of sharing risks and challenges arise that are often not considered but can have serious impacts. The speed and scale with which social media creates information and makes it available—almost instantaneously—on a global scale, added to the fact that once something is posted there is really no way of truly removing it, should prompt individuals to think of the possible impact a post can have. Unfortunately, more often than not, posts are made without any thought of the far-reaching impact they can have on the lives of the person posting or others that may be implicated by the post.

### **Why do people share?**

According to Berger and Milkman there are five (5) main reasons why users are compelled to share content online, whether it is every detail or what they deem as highlights of their lives. These are:

- cause related

- personal connection to content
- to feel more involved in the world
- to define who they are
- to inform and entertain

People generally share because they believe that what they are sharing is important. It is hoped that the shared content will be deemed important to others which will ultimately result in more shares, likes and followers.

Figure below sums up the findings of Berger and Milkman which shows that the main reason people feel the need to share content on the varying social media platform is that the content relates to what is deemed as worthy cause. 84% of respondents highlighted this as the primary motivation for sharing. Seventy-eight percent said that they share because they feel a personal connection to the content while 69 and 68%, respectively said the content either made them feel more involved with the world or helped them to define who they were. Forty-nine percent share because of the entertainment or information value of the content. A more in depth look at each reason for sharing follows.

**Figure**

Why people share source: Global Social Media Research.

**Content related to a cause**

Social media has provided a platform for people to share their thoughts and express concerns with others for what they regard as a worthy cause. Cause related posts are dependent on the interest of the individual. Some persons might share posts related to causes and issues happening in society. In one example, the parents of a baby with an aggressive form of leukemia, who having been told that their child had only 3 months to live unless a suitable donor for a blood stem cell transplant could be found, made an appeal on social media. The appeal was quickly shared and a suitable donor was soon found. While that was for a good cause, many view social media merely as platforms for freedom of speech because anyone can post any content one creates. People think the expression of their thoughts on social media regarding any topic is permissible. The problem with this is that the content may not be accepted by law or it could violate the rights of someone thus giving rise to ethical questions.

## **Content with a personal connection**

When social media users feel a personal connection to their content, they are more inclined to share the content within their social circles. This is true of information regarding family and personal activities. Content created by users also invokes a deep feeling of connection as it allows the users to tell their stories and it is natural to want the world or at least friends to know of the achievement. This natural need to share content is not new as humans have been doing this in some form or the other, starting with oral history to the media of the day; social media. Sharing the self-created content gives the user the opportunity of satisfying some fundamental needs of humans to be heard, to matter, to be understood and emancipated. The problem with this however is that in an effort to gratify the fundamental needs, borders are crossed because the content may not be sharable (can this content be shared within the share network?), it may not be share-worthy (who is the audience that would appreciate this content?) or it may be out of context (does the content fit the situation?).

## **Content that makes them feel more involved in the world**

One of the driving factors that pushes users to share content is the need to feel more in tune with the world around them. This desire is many times fueled by jealousy. Many social media users are jealous when their friends' content gets more attention than their own and so there is a lot of pressure to maintain one's persona in social circles, even when the information is unrealistic, as long as it gets as much attention as possible. Everything has to be perfect. In the case of a photo, for example, there is lighting, camera angle and background to consider. This need for perfection puts a tremendous amount of pressure on individuals to ensure that posted content is "liked" by friends. They often give very little thought to the amount of their friend's work that may have gone on behind the scenes to achieve that perfect social post.

Social media platforms have provided everyone with a forum to express views, but, as a whole, conversations are more polarized, tribal and hostile. With Facebook for instance, there has been a huge uptick in fake news, altered images, dangerous health claims and cures, and the proliferation of anti-science information. This is very distressing and disturbing because people are too willing to share and to believe without doing their due diligence and fact-checking first.

## **Content that defines who they are**

Establishing one's individuality in society can be challenging for some persons because not everyone wants to fit in. Some individuals will do all they can to stand out and be noticed. Social media provides the avenue for exposure and many individuals will seek to leverage the media to stand out of the crowd and not just be a fish in the school. Today many young people are currently being brought up in a culture that defines people by their presence on social media where in previous generations, persons were taught to define themselves by their career choices. These lessons would start from childhood by asking children what they wanted to be when they grew up and then rewarding them based on the answers they give. In today's digital era, however, social media postings and the number of "likes" or "dislikes" they attract, signal what is appealing to others. Therefore, posts that are similar to those that receive a large number of likes but which are largely unrealistic are usually made for self-gratification.

## **Content that informs and entertains**

The acquisition of knowledge and skills is a vital part of human survival and social media has made this process much easier. It is not uncommon to hear persons realizing that they need a particular knowledge set that they do not possess say "I need to learn to do this. I'll just YouTube it." Learning and adapting to change in as short as possible time is vital in today's society and social

media coupled with the Internet put it all at the finger tips. Entertainment has the ability to bring people together and is a good way for people to bond. It provides a diversion from the demands of life and fills leisure time with amusement. Social media is an outlet for fun, pleasurable and enjoyable activities that are so vital to human survival. It is now common place to see persons watching a video, viewing images and reading text that is amusing on any of the available social media platforms. Quite often these videos, images and texts can be both informative and entertaining, but there can be problems however as at times they can cross ethical lines that can lead to conflict.

## **Ethical challenges with social media use**

The use of modern-day technology has brought several benefits. Social media is no different and chief amongst its benefit is the ability to stay connected easily and quickly as well as build relationships with people with similar interests. As with all technology, there are several challenges that can make the use of social media off putting and unpleasant. Some of these challenges appear to be minor but they can have far reaching effects into the lives of the users of social media and it is therefore advised that care be taken to minimize the challenges associated with the use of social media.

A major challenge with the use of social media is oversharing because when persons share on social media, they tend to share as much as is possible which is often times too much. When persons are out and about doing exciting things, it is natural to want to share this with the world as many users will post a few times a day when they head to lunch, visit a museum, go out to dinner or other places of interest. While this all seems relatively harmless, by using location-based services which pinpoint users with surprising accuracy and in real time, users place themselves in danger of laying out a pattern of movement that can be easily traced. While this seems more like a security or privacy issue it stems from an ethical dilemma—"Am I sharing too much?" Oversharing can also lead to damage of user's reputation especially if the intent is to leverage the platform for business. Photos of drunken behavior, drug use, partying or other inappropriate content can change how you are viewed by others.

Another ethical challenge users of social media often encounter is that they have no way of authenticating content before sharing, which becomes problematic when the content paints people or establishments negatively. Often times content is shared with them by friends, family and colleagues. The unauthenticated content is then reshared without any thought but sometimes this content may have been maliciously altered so the user unknowingly participates in maligning others. Even if the content is not altered the fact that the content paints someone or something in a bad light should send off warning bells as to whether or not it is right to share the content which is the underlying principle of ethical behavior.

## **Conflicting views**

Some of the challenges experienced by social media posts are a result of a lack of understanding and sometimes a lack of respect for the varying ethical and moral standpoints of the people involved. We have established that it is typical for persons to post to social media sites without any thought as to how it can affect other persons, but many times these posts are a cause of conflict because of a difference of opinion that may exist and the effect the post may have. Each individual will have his or her own ethical values and if they differ then this can result in conflict. When an executive of a British company made an Instagram post with some racial connotations before boarding a plane to South Africa it started a frenzy that resulted in the executive's immediate dismissal. Although the executive said it was a joke and there was no prejudice intended, this difference in views as to the implications of the post, resulted in an out of work executive and a company

scrambling to maintain its public image.

### **Impact on personal development**

In this age of sharing, many young persons spend a vast amount of time on social media checking the activities of their “friends” as well as posting on their own activities so their “friends” are aware of what they are up to. Apart from interfering with their academic progress, time spent on these posts at can have long term repercussions. An example is provided by a student of a prominent university who posted pictures of herself having a good time at parties while in school. She was denied employment because of some of her social media posts. While the ethical challenge here is the question of the employee’s right to privacy and whether the individual’s social media profile should affect their ability to fulfill their responsibilities as an employee, the impact on the individual’s long term personal growth is clear.

### **Conclusion**

In today’s information age, one’s digital footprint can make or break someone; it can be the deciding factor on whether or not one achieves one’s life-long ambitions. Unethical behavior and interactions on social media can have far reaching implications both professionally and socially. Posting on the Internet means the “end of forgetting,” therefore, responsible use of this medium is critical. The unethical use of social media has implications for privacy and can result in security breaches both physically and virtually. The use of social media can also result in the loss of privacy as many users are required to provide information that they would not divulge otherwise. Social media use can reveal information that can result in privacy breaches if not managed properly by users. Therefore, educating users of the risks and dangers of the exposure of sensitive information in this space, and encouraging vigilance in the protection of individual privacy on these platforms is paramount. This could result in the reduction of unethical and irresponsible use of these media and facilitate a more secure social environment. The use of social media should be governed by moral and ethical principles that can be applied universally and result in harmonious relationships regardless of race, culture, religious persuasion and social status.

Analysis of the literature and the findings of this research suggest achieving acceptable levels of privacy is very difficult in a networked system and will require much effort on the part of individuals. The largest user groups of social media are unaware of the processes that are required to reduce the level of vulnerability of their personal data. Therefore, educating users of the risk of participating in social media is the social responsibility of these social network platforms. Adapting universally ethical behaviors can mitigate the rise in the number of privacy breaches in the social networking space. This recommendation coincides with philosopher Immanuel Kant’s assertion that, the Biblical principle which states “Do unto others as you have them do unto you” can be applied universally and should guide human interactions. This principle, if adhered to by users of social media and owners of these platforms could raise the awareness of unsuspecting users, reduce unethical interactions and undesirable incidents that could negatively affect privacy, and by extension security in this domain.

### **Cyberspace**

**Cyberspace** is a global domain within the information environment consisting of the interdependent network of information technology infrastructures (ITI) including the Internet, telecommunication networks, computer systems, and embedded processors and controllers. The term originates in science fiction, where it also includes various kinds of virtual reality (which is the experience of "being" in the alternate reality, or the simulated "being" in such a reality").

Cyberspace raises unique issues, especially regarding intellectual property and copyright infringement, and may call for new models of commerce. Furthermore, cyberspace has also become a unique area for developing human relationships and communities. While some argue that this universal ground for communication helps bring the world together, others point out that people will continue to associate narrowly with those of similar interests and economic and social status. Nevertheless, largely through the Internet, cyberspace has become a common ground for the rapid communication of ideas and values.

While cyberspace itself is a neutral space that allows for the rapid communication of ideas, the use of this space will determine its value and benefit for humankind. While the free use of this space is indeed valuable, especially as this cyberspace binds all humankind together in inseparable, interdependent relationships, the free use of this space also calls for its responsible use in order to ensure its value for humanity's overall pursuit of freedom and happiness. Thus, cyberspace mandates the responsible use of technology and reveals the need for a value-based perspective of the use of such technology.

### **Origins of the term**

The word "cyberspace" (from cybernetics and space) was coined by science fiction author William Gibson in his 1982 story, "Burning Chrome," and popularized by his 1984 novel *Neuromancer*. The portion of *Neuromancer* cited in this respect is usually the following:

**Cyberspace.** A consensual hallucination experienced daily by billions of legitimate operators, in every nation, by children being taught mathematical concepts... A graphic representation of data abstracted from banks of every computer in the human system. Unthinkable complexity. Lines of light ranged in the nonspace of the mind, clusters and constellations of data. Like city lights, receding (69).

Gibson later commented on the origin of the term in the 2000 documentary *No Maps for These Territories*:

**Note:** The term "cyberspace" was coined by science fiction writer William Gibson. All I knew about the word "cyberspace" when I coined it, was that it seemed like an effective buzzword. It seemed evocative and essentially meaningless. It was suggestive of something, but had no real semantic meaning, even for me, as I saw it emerge on the page.

### **Metaphorical**

The term Cyberspace started to become a de facto synonym for the Internet, and later the World Wide Web, during the 1990s. Author Bruce Sterling, who popularized this meaning, credits John Perry Barlow as the first to use it to refer to "the present-day nexus of computer and telecommunications networks."

### **Cyberspace as an internet metaphor**

While cyberspace should not be confused with the real internet, the term is often used to refer to objects and identities that exist largely within the communication network itself, so that a web site, for example, might be metaphorically said to "exist in cyberspace." According to this interpretation, events taking place on the Internet are not, therefore, happening in the countries where the participants or the servers are physically located, but "in cyberspace."

The "space" in cyberspace has more in common with the abstract, mathematical meanings of the term than physical space. It does not have the duality of positive and negative volume (while in physical space for example a room has the negative volume of usable space delineated by positive volume of walls, Internet users cannot enter the screen and explore the unknown part of the Net as an extension of the space they are in), but spatial meaning can be attributed to the relationship between different pages (of books as well as web servers), considering the unturned pages to be somewhere "out there." The concept of cyberspace therefore refers not to the content being presented to the surfer, but rather to the possibility of surfing among different sites, with feedback loops between the user and the rest of the system creating the potential to always encounter something unknown or unexpected.

Videogames differ from text-based communication in that on-screen images are meant to be figures that actually occupy a space and the animation shows the movement of those figures. Images are supposed to form the positive volume that delineates the empty space. A game adopts the cyberspace metaphor by engaging more players in the game, and then figuratively representing them on the screen as avatars. Games do not have to stop at the avatar-player level, but current implementations aiming for more immersive playing space (such as in Laser tag) take the form of augmented reality rather than cyberspace, fully immersive virtual realities remaining impractical.

Although the more radical consequences of the global communication network predicted by some cyberspace proponents (that is, the diminishing of state influence envisioned by John Perry Barlow) failed to materialize and the word lost some of its novelty appeal, the term continues to be used.

Some virtual communities explicitly refer to the concept of cyberspace, for example, Linden Lab calling their customers "Residents" of Second Life, while all such communities can be positioned "in cyberspace" for explanatory and comparative purposes (as Sterling did in *The Hacker Crackdown* and many journalists afterwards), integrating the metaphor into a wider cyber-culture.

The metaphor has been useful in helping a new generation of thought leaders to reason through new military strategies around the world, led largely by the U.S. Department of Defense (DoD). The use of cyberspace as a metaphor has had its limits, however, especially in areas where the metaphor becomes confused with physical infrastructure.

### **Alternate realities in philosophy and art**

**Predating computers**  
Before cyberspace became a technological possibility, many philosophers suggested the possibility of a reality, or suggested that the reality in which we live in now is a reflection of some reality perhaps more pure than what we are aware of. In *The Republic*, Plato sets out his allegory of the cave, widely cited as one of the first conceptual realities. He suggests that we are already in a form of virtual reality which we are deceived into thinking is true. True reality for Plato is accessible only through mental training and is the reality of the forms. These ideas are central to Platonism and neoplatonism. Depending on how one views cyberspace in relation to physical reality, either people are living in a cyberspace-like reality in relation to a higher realm of ideas or cyberspace contains the abstract ideas that take form in the current, tangible reality. Another forerunner of the modern idea of cyberspace is Descartes' hypothetical that people might be deceived by an evil demon which feeds them a false reality, and so the only thing one can be certain of is that one thinks; in other words, one is a thinking thing. This argument is the direct predecessor of the modern ideas of brain in a vat and many popular conceptions of cyberspace take Descartes' ideas as their starting point.

Visual arts have a tradition, stretching back to antiquity, of artifacts meant to fool the eye and be mistaken for reality. This questioning of reality occasionally led some philosophers and especially theologians to distrust art as deceiving people into entering a world which was not real. The artistic challenge was resurrected with increasing ambition as art became more and more realistic with the invention of photography, film and finally, immersive computer simulations.

### **Influenced by computersPhilosophy**

American counterculture exponents like William S. Burroughs (whose literary influence on Gibson and cyberpunk in general is widely acknowledged) were among the first to extol the potential of computers and computer networks for individual empowerment. Some contemporary philosophers and scientists (such as David Deutsch in *The Fabric of Reality*) use virtual reality in various thought experiments. Philip Zhai connects cyberspace to the platonic tradition:

Let us imagine a nation in which everyone is hooked up to a network of VR infrastructure. They have been so hooked up since they left their mother's wombs. Immersed in cyberspace and maintaining their life by teleoperation, they have never imagined that life could be any different from that. The first person that thinks of the possibility of an alternative world like ours would be ridiculed by the majority of these citizens, just like the few enlightened ones in Plato's allegory of the cave.

### **Cyberspace and virtual reality**

Although cyberspace and virtual reality are often used interchangeably, these two concepts have a different orientation. While virtual reality refers to the simulated experience of reality, cyberspace refers to the plane of reality, or environment, within which this experience is made possible. Thus, experiences in cyberspace can entail aspects of virtual reality when a user is fully immersed in this alternate reality.

The difference between the two can be further described using an analogy of physical (space itself is not physical though) space and concepts of reality. On one hand, human beings presuppose a frame of reference called "space." Whether the space people live in is an empty container like a repository (Newtonian concept) or people exist in space according to the relationship between things (Leibnizian concept) is debatable; likewise, human beings relate to reality through perception (Kantian concept of space as a form of intuition) or through a nexus of meanings (concept of "lived space" in Phenomenology). Either way, human beings presuppose a plane of experience called "space." Within this space, humans physically experience reality through their five senses.

By extension, this sense of reality can be applied to imagined objects. Cyberspace is a frame of reference within which people can have quasi-real experiences with such objects; virtual reality refers to the simulated experiences with these objects.

Human experience of reality is also extended to non-physical events or phenomena such as death and associated emotional feelings about it. Fear, anxiety, joy, and other emotional feelings are real without association with the physical senses. At the same time, virtual reality may suggest a false reality that can be virtually experienced. Thus, the whole question of reality poses a series of questions beyond current epistemological models in modern philosophy, which presuppose the primacy of sense perception.

### **Pornographic Ethics**

"I can't define pornography," one judge once famously said, "but I know it when I see it." (Justice

Stewart in *Jacobellis v. Ohio* 378 US 184 (1964).) Can we do better?

The word “pornography” comes from the Greek for writing about prostitutes. However, the etymology of the term is not much of a guide to its current usage, since many of the things commonly called “pornography” nowadays are neither literally written nor literally about prostitutes.

Here is a first, simple definition. Pornography is any material (either pictures or words) that is sexually explicit. This definition of pornography may pick out different types of material in different contexts, since what is viewed as sexually explicit can vary from culture to culture and over time. “Sexually explicit” functions as a kind of indexical term, picking out different features depending on what has certain effects or breaks certain taboos in different contexts and cultures. Displays of women’s uncovered ankles count as sexually explicit in some cultures, but not in most western cultures nowadays (although they once did: the display of a female ankle in Victorian times was regarded as most risqué). There may be borderline cases too: do displays of bared breasts still count as sexually explicit in various contemporary western cultures? However, some material seems clearly to count as sexually explicit in many contexts today: in particular, audio, written or visual representations of sexual acts (e.g., sexual intercourse, oral sex) and exposed body parts (e.g., the vagina, anus and penis—especially the erect penis).

Within the general class of sexually explicit material, there is great variety in content. For example, some sexually explicit material depicts women, and sometimes men, in postures of sexual display (e.g., Playboy centrefolds). Some depicts non-violent sexual acts (both homosexual and heterosexual) between adults who are portrayed as equal and consenting participants. Other sexually explicit representations depict acts of violent coercion: people being whipped, beaten, bound, tortured, mutilated, raped and even killed. Some sexually explicit material may be degrading, without necessarily being overtly violent. This material depicts people (most often women) in positions of servility and subordination in their sexual relations with others, or engaged in sexual acts that many people would regard as humiliating. Some sexually explicit material involves or depicts children. Some portrays bestiality and necrophilia; and so on.

On the first definition of pornography as sexually explicit material, all such material would count as pornography, insofar as it is sexually explicit. But this simple definition is not quite right. Anatomy textbooks for medical students are sexually explicit—they depict exposed genitalia, for example—but are rarely, if ever, viewed as pornography. Sexual explicitness may be a necessary condition for material to count as pornographic, but it does not seem to be sufficient. So something needs to be added to the simple definition. What else might be required?

Here is a second definition. Pornography is sexually explicit material (verbal or pictorial) that is primarily designed to produce sexual arousal in viewers. This definition is better: it deals with the problem of anatomy textbooks and the like. Indeed, this definition is one that is frequently employed (or presupposed) in discussions of pornography and censorship. Of course, it is important to distinguish here between sexually explicit material that is wholly or primarily designed to produce sexual arousal (i.e., whose only or overriding aim is to produce sexual arousal) and material whose aim is to do this in order to make some other artistic or political point. The film, *Last Tango in Paris* arguably aims to arouse audiences, but this is not its primary aim. It does so in order to make a broader political point.

It is sometimes assumed that pornography, in this second sense, is published and consumed by a small and marginalized minority. But, while exact estimates of the size and profitability of the international trade in pornography vary somewhat, it is generally agreed that the pornography indus-

try is a massive international enterprise, with a multi-billion dollar annual turnover. In 2003, the pornography industry (taken to include adult videos, magazines, Cable/Pay per view, Internet and CD-Rom) is estimated to have grossed US\$34 billion world-wide; and in excess of \$8 billion in the U.S. alone, greater than the combined revenue of ABC, CBS, and NBC (\$6.2. billion). Pornography is much more widely consumed than is sometimes supposed, and is a large and extremely profitable international industry.

However, the term “pornography” is often used with an additional normative force that the first and second definitions leave out. When many people describe something (e.g., a book such as *Tropic of Capricorn* or a film such as *Baise Moi*) as “pornographic”, they seem to be doing more than simply dispassionately describing its sexually explicit content or the intentions of its producers—indeed, in these debates, the intentions of producers are sometimes treated as irrelevant to the work's status as pornography. They seem to be saying, in addition, that it is bad—and perhaps also that its badness is not redeemed by other artistic, literary, or political merit the work may possess. (Consider, for example, how people use the term “visual pornography” to condemn certain sorts of art or television, often when the material is not even sexually explicit).

This suggests a third definition: pornography is sexually explicit material designed to produce sexual arousal in consumers that is bad in a certain way. This definition of pornography makes it analytically true that pornography is bad: by definition, material that is not bad in the relevant way is not pornography. It might be that all and only sexually explicit material is bad in a certain way (e.g., obscene): in which case, “pornography” will refer to all and only the class of sexually explicit materials. But it might be that only some sexually explicit material is objectionable (e.g., degrading to women), in which case only the bad subset of sexually explicit material will count as pornography. And, of course, it is possible that no sexually explicit material is bad in the relevant way (e.g., harmful to women), in which case we would have an error theory about pornography: there would be no pornography, so defined, merely harmless, sexually explicit “erotica”.

A number of approaches define pornography as sexually explicit material that is bad—although they disagree as to the relevant source of its badness, and consequently about what material is pornographic. A particularly dominant approach has been to define pornography in terms of obscenity. (For critical discussions of this approach see Schauer 1982, Feinberg 1987, MacKinnon 1987.) The obscenity might be taken to be intrinsic to the content of the material itself (for example, that it depicts deviant sexual acts that are immoral in themselves) or it may lie in contingent effects that the material has (for example, that it tends to offend “reasonable” people, or to deprave and corrupt viewers, or to erode traditional family and religious values). If all sexually explicit material is obscene by whichever of these standards is chosen, then all sexually explicit material will be pornography on this definition. This is the definition of pornography that moral conservatives typically favour.

But the badness of pornography need not reside in obscenity. Pornography might be defined, not as sexually explicit material that is obscene, but as that sexually explicit material that harms women. Thus many contemporary feminist definitions define “pornography” as sexually explicit material that depicts women's subordination in such a way as to endorse that subordination. (See Longino 1980, MacKinnon 1987.) This definition of pornography leaves it open in principle that there might be sexually explicit material that is not pornography: sexually explicit material that does not subordinate women will count as harmless “erotica”.

Of course, women may not be the only people harmed by the production or consumption of certain sorts of sexually explicit material. The consumption of sexually explicit material has often been

thought to be harmful to its (mostly male) consumers: for example, by corrupting their morals or by making them less likely to have loving, long-term sexual relationships. Many people strongly object to “child pornography”: that subset of sexually explicit material that involves depictions of actual children engaged in sexual activity. This class of sexually explicit material is widely regarded as objectionable because it involves the actual sexual exploitation of children, together with a permanent record of that abuse which may further harm their interests.

I have discussed how, on this third approach to defining “pornography” as sexually explicit material that is bad or harmful in a certain way, there are three possibilities: “pornography” might name all, some or even no sexually explicit material, depending on what (if any) class of sexually explicit material is in fact bad in the relevant way. But it is worth noting that there is an interesting fourth possibility. It is possible that some non-sexually explicit material might also turn out to be bad in the relevant way. It might be that some non-sexually explicit material is obscene in the relevant sense (e.g., Andres Serrano’s famously controversial artwork entitled “Piss Christ”, which displays a plastic crucifix in urine with cow’s blood). Or it might turn out that non-sexually explicit advertising that depicts women in positions of sexual servility in such a way as to endorse that subordination is also bad in the relevant way. (As many philosophers might be inclined to put the point, the sexually explicit materials that subordinate women via their depiction of women as subordinate may turn out not to form a natural kind.) In this case, there are two options. “Pornography” might be taken to name only the sexually explicit subset of material that is bad in the relevant sense (e.g., that depicts women as men’s sexual subordinates in such a way as to endorse their subordination); or “pornography” might be taken to refer to all the material that is bad in that way, whether that material is sexually explicit or not. The former option would clearly stick more closely to the everyday conception of pornography as involving the sexually explicit. But it might be that this ordinary conception, on reflection, turns out not to capture what is of moral and political interest and importance. There may thus be a theoretical reason to conceive of pornography more broadly than simply sexually explicit material that is bad in a certain way, or perhaps simply to invent a new term that captures the theoretically interesting kind. Some feminists seem inclined to this broader approach, suggesting that material that explicitly depicts women in postures of sexual submission, servility or display in such a way as to endorse it counts as pornography. This may include some non-sexually explicit material that would not ordinarily be thought of as pornography: for example, photographs in artwork, advertising or fashion spreads that depict women bound, chained or bruised in such a way as to glamorise these things.

The term “pornography” is used in all of these different ways in everyday discourse and debate, as well as in philosophical discussions: sometimes it is used to mean merely material which is sexually explicit; sometimes it is used to mean material which is sexually explicit and objectionable in some particular way; and so on. It seems to me that we do not need to choose between these different definitions, for all of them capture something of the term’s everyday use. What matters crucially is that we know which definition is being used in a particular case. For the fact that “pornography” has different senses can have two very unfortunate consequences if these differences are not clearly noted and kept in mind: it can make it seem that there is disagreement when there is not; and it can obscure the real nature of the disagreement when there is. Here is one topical example of how this might happen. Some feminists object to pornography on the grounds that it harms women. Other feminists claim that pornography may not always be harmful to women, and may even sometimes be beneficial. It seems that there is genuine disagreement here. But is there? Not necessarily. For the two sides might mean different things by “pornography”. Suppose that feminists who object to pornography are defining “pornography” as sexually explicit material that subordinates women. So pornography, for them, is that subset of sexually explicit material that in

fact harms women. This definition makes it an analytic truth that pornography, wherever it exists, is bad from a feminist point of view. Feminists who defend pornography, however, may be using “pornography” to mean simply sexually explicit material (regardless of whether it is harmful to women). There may thus be no genuine disagreement here. For both sides might agree that sexually explicit material that harms women is objectionable. They might also agree that there is nothing objectionable about sexually explicit material that does not harm women (or anyone else). If protagonists in the debate are using “pornography” in different senses in this way, they may simply be talking past each other.

Two really substantive issues at stake in the feminist debate over pornography are 1) whether any sexually explicit material is in fact harmful to women; and, if so, what should be done about it?; and 2) whether all sexually explicit material is in fact harmful to women; and, if so, what should be done about it? (We can thus phrase two of the important issues, if we like, without mentioning “pornography” at all.) If we define “pornography” simply as sexually explicit material (regardless of whether it is harmful to women), then the first substantive issue must be posed in this way: “is there any pornography that is harmful to women; and, if so, what should be done about it?” However, if “pornography” is defined as that sexually explicit material that subordinates women then, while we can ask this question, we must pose it differently: we must ask “which pieces of sexually explicit material, if any, are pornographic; and what should be done about any pornography that exists?” A second substantive issue at stake in the debate is whether all sexually explicit material, either in principle or under current social conditions, is or would be harmful to women. Again, it should be noted that this question can be asked using either conception of “pornography”, but it must be posed differently. If we define “pornography” simply as sexually explicit material (regardless of whether it is harmful), the question must be posed like this: “is all pornography as a matter of fact harmful?” On the other hand, if we define “pornography” as sexually explicit material that harms women, we must ask: “is all sexually explicit material as a matter of fact pornographic?” These are just terminological variants of the same substantive question: but when different terminology is used by different participants in the debate, the exact questions at issue, which are actually very simple to state, can be obscured.

## **The shape of the traditional pornography debate**

- **Conservative arguments for censorship**

Until comparatively recently, the main opposition to pornography came from moral and religious conservatives, who argue that pornography should be banned because its sexually explicit content is obscene and morally corrupting. By “pornography”, conservatives usually mean simply sexually explicit material (either pictures or words), since conservatives typically view all such material as obscene.

According to conservatives, the sexually explicit content of pornography is an affront to decent family and religious values and deeply offensive to a significant portion of citizens who hold these values. The consumption of pornography is bad for society. It undermines and destabilizes the moral fabric of a decent and stable society, by encouraging sexual promiscuity, deviant sexual practices and other attitudes and behaviour that threaten traditional family and religious institutions, and which conservatives regard as intrinsically morally wrong. Furthermore, pornography is bad for those who consume it, corrupting their character and preventing them from leading a good and worthwhile life in accordance with family and religious values.

According to conservatives, the state is justified in using its coercive power to uphold and enforce a community's moral convictions and to prevent citizens from engaging in activities that offend prevailing community standards of morality and decency. (See e.g., Devlin 1968, Sandel 1984.) This position is sometimes called 'legal moralism'. Governments also have a responsibility to prevent citizens from harming themselves. This is true, even where the citizen is not a child (who may not yet be competent to make responsible judgements for themselves about what is in their own best interests), but a mature adult who is voluntarily engaged in an activity which they judge to be desirable and which causes no harm to others. The view that the state is entitled to interfere with the freedom of mentally competent adults against their will for their own good is often called 'legal paternalism'.

Conservatives therefore think that it is entirely legitimate for the state to prohibit consenting adults from publishing and viewing pornography, even in private, in order to protect the moral health of would-be consumers and of society as a whole.

### **The traditional liberal defence of a right to pornography**

Traditional liberal defenders of pornography famously disagree, rejecting both the principle of legal moralism and the principle of legal paternalism, at least where consenting adults are concerned. This is not to say that liberal defenders of pornography necessarily approve of it. Indeed, they frequently personally find pornography-especially violent and degrading pornography-mindless and offensive. Many concede that pornography-by which they usually mean sexually explicit material whose primary function is to produce sexual arousal in viewers-is "low value" speech: speech that contributes little, if anything, of intellectual, artistic, literary or political merit to the moral and social environment. But this does not mean that it should not be protected-quite the opposite. A vital principle is at stake for liberals in the debate over pornography and censorship. The principle is that mentally competent adults must not be prevented from expressing their own convictions, or from indulging their own private tastes, simply on the grounds that, in the opinion of others, those convictions or tastes are mistaken, offensive or unworthy. Moral majorities must not be allowed to use the law to suppress dissenting minority opinions or to force their own moral convictions on others. The underlying liberal sentiment here is nicely captured in the famous adage (often attributed to the French philosopher, Voltaire): "I disapprove of what you say, but I will defend to the death your right to say it."

For liberals, there is a very strong presumption in favour of individual freedom, and against state regulation that interferes with that freedom. The only grounds that liberals typically regard as providing a legitimate reason for state restrictions on individual freedom is in order to prevent harm to others. Hence, in debates over censorship and other forms of state regulation that restrict the liberty of individuals against their will, the burden of proof is always firmly on those who argue for censorship to demonstrate that the speech or conduct in question causes significant harm to others. It must either be shown to directly cause actual physical violence to others (e.g., murder, rape, assault, battery), on a narrower understanding of "harm"; or to deliberately or negligently violate sufficiently important interests or rights of others, on a broader, interest-based conception of "harm".

Liberals have traditionally defended a right to pornography on three main grounds. (By the "right to pornography" here, and in what follows, I mean the negative right of consenting adults not to be prevented from making, publishing, exhibiting, distributing and consuming pornography in private). Firstly, on the grounds of freedom of speech or expression, which protects the freedom of individuals (in this case, pornographers) to express their opinions and to communicate those opinions to

others, however mistaken, disagreeable or offensive others may find them. Liberals have tended to conceive of freedom, including freedom of expression, as negative freedom-as non-interference by others-rather than as positive freedom, which involves having the positive goods and facilities required to exercise the freedom. Freedom is thus something that individuals have just so long as there are no coercive external obstacles-notably, physical or legal restrictions-in their way.

Few liberals nowadays think that the (negative) right to freedom of speech is an absolute right: a freedom that can never legitimately be restricted by the state. If the speech causes sufficiently great harm to others then the state may have a legitimate interest in regulating or preventing it. There is no simple general formula or algorithm for determining when the harm caused to others is "sufficiently great" to justify legal restrictions in the case of speech and more generally. This will depend on the outcome of a complex process of carefully weighing and balancing the strength and nature of the harm and the competing interests at stake, and an analysis of the costs and benefits of alternative policies, that needs to be undertaken on a case by case basis.

However, when it comes to legislation that interferes with free speech, the liberal presumption against legislation is especially high. For liberals take freedom of expression to be an especially important right that takes precedence over most other rights and interests (including equality) should they ever conflict. Levels of harm that would normally be sufficient to justify regulating the conduct which causes them may be not be sufficiently great to justify restrictions in cases where the harm is caused by speech or expression. Hence, for liberals, justifying censorship of pornography requires that there is extremely reliable evidence to show that the publication or voluntary private consumption of pornography by consenting adults causes especially great and serious harm to others. The harm caused by expression must be very certain and very great before it is legitimate for a state to prohibit it. We would be justified in banning a certain type of pornography (e.g., bondage pictures) only when we are very sure that, on average, tokens of that type (i.e., most particular bondage pictures) cause very great harm.

Secondly, liberals have defended a right to pornography on the grounds of a right to privacy (or "moral independence", as one prominent liberal defender of pornography calls it), which protects a sphere of private activity within which individuals can explore and indulge their own personal tastes and convictions, free from the threat of coercive pressure or interference by the state and other individuals. The spectre of state intrusion into the private lives of individuals underpins much of the liberal discomfort about censorship of pornography.

Like the right to freedom of speech, the liberal commitment to privacy is not absolute. It can be overridden if the private activities of individuals are such as to cause significant harm to others. Thus, if there is reliable evidence to suggest that the voluntary private consumption of pornography causes sufficiently great harm to others then- providing this harm is sufficiently great and that state prohibitions are the only effective way of preventing it-the state would have a legitimate interest in prohibiting it.

But-and this is the third prong of the traditional liberal defence-pornography is comparatively harmless. Neither the expression of pornographic opinions, nor the indulging of a private taste for pornography, causes significant harm to others, in the relevant sense of 'harm' (i.e., crimes of physical violence or other significant wrongful rights-violations). Hence, the publication and voluntary private consumption of pornography is none of the state's business.

### **The 'harm principle': when is the state justified in restricting individual liberty?**

These three central ingredients in the liberal defence of pornography find their classic expression

in a famous and influential passage from John Stuart Mill's *On Liberty* (1859). In this passage, Mill sets out the principle that underpins the prevailing liberal view about when it is justified for the state to coercively interfere with the liberty of its citizens. It is a principle that continues to provide the dominant liberal framework for the debate over pornography and censorship. Mill writes:

The only principle for which power can be rightfully exercised over any member of a civilized community, against his will, is to prevent harm to others. His own good, either physical or moral, is not a sufficient warrant. He cannot rightfully be compelled to do or forbear because it will be better for him to do so, because it will make him happier, because, in the opinion of others, to do so would be wise or even right. These are good reasons for remonstrating with him, or reasoning with him, or persuading him, or entreating him, but not for compelling him, or visiting him with any evil in case he do otherwise. To justify that, the conduct from which it is desired to deter him, must be calculated to produce evil to someone else. The only part of the conduct of any one for which he is amenable to society, is that which concerns others. In the part which merely concerns himself, his independence is, of right, absolute. (Mill 1975: 15)

Mill's central claim is that society is justified in interfering with the freedom of mentally competent adults to say and do what they wish only when their conduct will cause harm to others. This has come to be known as the 'liberty principle' or 'harm principle'; and it forms the cornerstone of the traditional liberal defence of individual liberty. It protects the freedom of all mentally competent individuals to live and shape their own lives in accordance with their own preferences and beliefs, so long as they do not harm others in the process.

Mill goes on to stress that the harm principle is meant to apply "only to human beings in the maturity of their faculties" (Mill 1975:15). So the principle permits paternalistic intervention in the case of those who are not competent to make an informed decision about what is in their best interests for themselves, and so who "must be protected against their own actions as well as external injury": for example, young children or those adults whose decision-making abilities are temporarily or permanently impaired.

It is generally thought to follow that child pornography, which is taken to involve the actual sexual abuse or exploitation of children (with or without their apparent consent), can legitimately be banned in order to protect the interests of children, who are not yet competent to fully understand the nature of the choice they are making or to grasp the impact of their decisions on their present and future interests. (This is not entirely uncontroversial, however: for it might be denied that children are harmed by participating in pornography. The North American Man Boy Love Association (NAMBLA), for example, denies that having sex with adults is harmful for children.) For the same reason, liberals think that children can quite rightly be prevented by parents or by the state from purchasing or viewing pornography, if this is thought likely to harm them. That child pornography should be banned is common ground between liberals and conservatives. However, pornography that involves the simulated abuse of children (for example, consenting adult actors dressed up as schoolgirls) cannot legitimately be prohibited under the harm principle, unless there is good evidence to suggest that consumption of this material causes significant harm to people other than those who consume it: by, for example, causing those who consume it to abuse children.

We are now in a better position both to see what it would take for liberals to think that censorship of pornography is justified and why liberals have been so unsympathetic to the sort of argument against pornography that conservatives make. Conservatives wish to prevent mentally competent adults from publishing and consuming pornography on the grounds that the choice to consume pornography is deeply morally misguided. But, as Mill insists, this is "not a sufficient warrant" for

coercive interference with individual liberty. Neither the state nor moral majorities are entitled to restrict the private choices and activities of individuals against their will simply because, in the opinion of state officials or the social majority, that way of life is unworthy or unrewarding. Mill thinks that this sort of legal moralism will lead inevitably to a terrible “tyranny of the majority”, crushing individual diversity and blocking human progress and flourishing.

However, following Mill, liberals are generally happy to allow that considerations of the individual or common good may entitle the state to use other, so-called non-coercive means to persuade citizens to make wise or better choices. Thus public education campaigns designed to inform citizens of the dangers of smoking or excessive alcohol consumption, or to persuade them to make “wise” choices (for example, to eat more fruit and vegetables) may be justified. While others cannot force an individual to do something (or to forbear from doing it) when they are not harming others, it is entirely legitimate to seek to advise, instruct or persuade them. So, if there are reasons to think that pornography is not good for the individual who consumes it (say, because it makes them less likely to be able to have successful loving or long-term relationships), public education campaigns to warn consumers of these dangers may be justified. Indeed this education and debate is precisely the solution that liberals typically recommend to counter any harm that pornography may cause. (See e.g., Feinberg 1985, Donnerstein et al. 1987, Dworkin 1985) This solution respects the freedom of rational agents to exercise their own rational capacities in deciding what to think and how to live.

However, liberals insist that if attempts at persuasion should fail, and where an individual's conduct poses no significant threat to the physical security or interests of others, the state may not use coercive legal mechanisms to enforce these “wise” choices. “The only freedom which deserves the name is that of pursuing our own good in our own way, so long as we do not attempt to deprive others of theirs, or impede their efforts to obtain it” (Mill 1975: 18). For Mill, the individual person is in the best position to judge what is in his or her own best interests; and, even if individuals may sometimes make bad choices, it is better in general that they be left free to make these mistakes. For no one's opinion about the good life is infallible; and, in any case, a life lived ‘from the inside’, in accordance with values that the individual endorses, is more likely to be a fulfilling one than a life where the individual is forced against their will to live as others as believe best.

In an influential liberal defence of pornography, Ronald Dworkin expresses this commitment in terms of a right to “moral independence”. People, he says, “have the right not to suffer disadvantage in the distribution of social goods and opportunities, including disadvantages in the liberties permitted to them by the criminal law, just on the ground that their officials or fellow-citizens think that their opinions about the right way for them to lead their own lives are ignoble or wrong.” (Dworkin 1985: 353.) The fact, if it is one, that the majority of people in a society prefer that pornography be banned because they regard it as immoral or offensive is not a legitimate reason for interfering with (pornographers') freedom of speech or for preventing consenting adults from consuming it in private. For allowing such illegitimate “external” preferences of a majority to dictate government policy would violate the right to moral independence of the producers and consumers of pornography. It would give moral majorities the power to dictate how members of minority or non-mainstream groups can live on the basis of the majority's opinions about what sort of people are most worthy and what sorts of lives are worth living, and this violates the basic right of all individuals to be treated with equal concern and respect.

## **Pornography and Offense: Justifying restrictions on the public display of pornography**

However, Dworkin thinks, considerations of offence may provide some justification for preventing or restricting the public display of pornography so as to avoid its causing offense to non-consenting adults who might otherwise involuntarily or unwittingly be exposed to it. Joel Feinberg, another well-known liberal defender of pornography, agrees. But Feinberg thinks that such restrictions must be justified by a separate principle to the harm principle, for he thinks that certain sorts of unpleasant psychological states are not in themselves harms. Feinberg calls this additional principle the offense principle. The offense principle says that "It is always a good reason in support of a proposed criminal prohibition that it would probably be an effective way of preventing serious offense (as opposed to injury or harm) to persons other than the actor, and that it is probably a necessary means to that end (i.e., there is probably no other means that is equally effective at no greater cost to the other values)."

Like Dworkin, Feinberg thinks that the voluntary private consumption of pornography does not cause harm to others. Hence, wholesale criminal prohibitions on the publication and private voluntary consumption of pornography cannot be justified. But the public display of pornography may nonetheless constitute an "offensive nuisance" to non-consenting adults who are involuntarily exposed to it (just as neighbours who play bad music loudly into the wee hours of the morning may be an "offensive nuisance"). Since the harm-or rather, pseudo-harm-of pornography is the offense it may cause unwitting viewers involuntarily exposed to it, the solution is to restrict its exhibition to domains where such involuntary exposure will not occur, such as inside well sign-posted adult bookshops and cinemas where those who will be offended will know not to venture. Although this may prevent pornographers from distributing their opinions as widely as they might like, and may also cause some minor inconvenience to consumers (who may have to go further out of their way to find and view pornography, or suffer the embarrassment of having to sneak into known adult bookstores), these costs may be relatively small compared with the level of offense that involuntary exposure is likely to cause. Such restrictions on the public display of pornography would not amount to censorship, for pornographers are still free to publish and distribute their opinions. Nor would they violate consumers' right to privacy, for pornography would be freely available for willing consumers to view in private. The Williams Committee Report into Obscenity and Film Censorship in England made a similar recommendation, pointing to general considerations of public decency that prevent "offensive" public displays of conduct (e.g., nudity or sexual intercourse) that is appropriately seen or done only in private. Susan Wendell also agrees that the public display of certain sorts of pornography-visual, audio and written material that depicts and condones the unjustified physical coercion of women or other human beings- should be prohibited, although her particular concern is to remove the anxiety that involuntary exposure to such coercive material is likely to cause women and the harm it is likely to do to their self-esteem (Wendell 1983).

Liberal defenders of the right to pornography may thus allow that restrictions on its public display may be justified. But only if pornography can reliably be shown to cause significant harm to people other than those who voluntarily consume it will there be a legitimate case for prohibiting its voluntary private consumption. When an individual's private activities cause harm to others then they become no longer merely a private matter, but of legitimate public interest; and the state may be justified in regulating them. Thus, Dworkin says, were excessive consumption of pornography shown to cause absenteeism from work, then the public and the state might have some legitimate interest in preventing it. But, Dworkin thinks, there is as yet no reliable evidence that firmly establishes that the voluntary private production or consumption of pornography by consenting

adults causes this or any other sufficiently significant harm to others, in the relevant sense of 'harm'. Hence, pornography satisfies only harmless personal preferences for sexual gratification; and is therefore none of the state's business.

### **The dangers of censorship**

Liberals also have technical concerns about how censorship laws might work in practice. Many liberal (and feminist) objections to censorship of pornography point to the practical costs and dangers of censorship, arguing that even if pornography does cause some harm to others, the risks involved in censoring it are too great. They point to the difficulties involved in formulating a legal definition of 'pornography' that will be sufficiently precise to minimize the danger that censorship laws targeting pornography will be used (intentionally or unintentionally) to censor other unpopular material, including valuable literary, artistic and political works. Censoring pornography may thus place us on a dangerous "slippery slope" to further censorship of other material; and may have a general "chilling effect" on expression, making people reluctant to say or publish things that might be construed as pornography and for which they could be prosecuted.

These are serious dangers; and they need to be carefully taken into account in weighing the costs and benefits of censorship as a solution to any harm that pornography might cause. But it is worth noting that they are inherent in many existing forms of legislation, and are not always taken to be insoluble or to constitute a decisive reason against censorship in themselves.

### **Recent liberal dissent**

Although traditional defenders of a right to pornography have been liberals, it is important to note that not all contemporary liberals defend such a right. Indeed, the question of whether there might be good liberal grounds for prohibiting or otherwise regulating the voluntary private consumption of (some) pornography has become the subject of increasing and lively debate. Inspired by more recent feminist arguments against pornography, some scholars argue that the liberal commitment to protecting individual autonomy, equality, freedom of expression and other important liberal values may in fact support a policy that prohibits certain kinds of pornography, rather than the permissive stance that liberals have traditionally favoured. (See e.g., Dyzenhaus 1992, Easton 1994: 42–51, Langton 1990, Okin 1987, West 2003.) These theorists do not normally reject the harm principle, broadly understood: They generally agree that the crucial question in determining whether censorship of pornography is justified is whether there is reliable evidence to show that the publication or viewing of pornography by consenting adults causes sufficiently great harm to significant interests of others. Rather, they are open to the legitimacy of censorship because they think that the production and consumption of certain sorts of sexually explicit material—in particular, violent pornography and non-violent but degrading pornography—may in fact cause sufficiently significant harm to others, particularly women.

These theorists often follow social science researchers in drawing more fine-grained distinctions within the general category of pornography (i.e., the sexually explicit material whose primary function is to produce sexual arousal in those who view or read them). They often distinguish between

1. violent pornography;
2. non-violent but degrading pornography; and
- 3) non-violent and non-degrading pornography, since there is some evidence to suggest that some of these materials (e.g., in categories 1 and 2) may be harmful in ways that other material (e.g., category 3) is not. I will summarize some of this important evidence shortly.

One important dimension of the disagreement between those liberals who defend a right to pornography and those who think that liberals should be open to the legitimacy of censorship is empirical: they disagree about the crucial empirical issue of whether there is reliable evidence to show that the production and consumption of pornography by consenting adults in fact causes harm to others, particularly women. But frequently they also disagree about some important conceptual matters as well. In particular, they may disagree (albeit sometimes implicitly) about how three central elements of the harm principle should be understood: (i) exactly what counts as “harm” to others, in the relevant sense; (ii) when can we say that something is a “cause”, or a sufficiently “direct cause”, of a harm; and (iii) how much harm to others is “sufficiently great” to justify coercive sanctions against the speech or conduct that produces it. In other words, they disagree about how the harm principle should be interpreted and applied.

Many argue that more traditional liberal conceptions of the interests or rights that individuals have, and so of what activities can cause harm to them, is too narrow. It ignores the way in which threats to individuals' interests can come not just from the state, but also from other social practices and circumstances (e.g., substantive socio-economic disadvantage) that can prevent the meaningful exercise of freedom just as effectively. The state may thus have a legitimate role to play in promoting the social conditions that enable individuals to exercise their rights in meaningful ways, and in regulating such activities of non-governmental agents or groups as may serve significantly to infringe them.

### **Pornographic Ethics**

A 2008 study on university campuses found that a whopping 87 percent of “emerging” adult men (aged 18-26), and 31 percent of emerging adult women report using porn at some level. Twenty percent of young men report using pornography daily or every other day, and almost half use it at least weekly. But the shock factor of pornography consumption statistics do not stop there: The sky is blue and men view porn—we’ve lost the shock value in our passive acceptance. Perhaps the more telling pornography statistic is that slightly over two thirds of young men, and nearly half of young women believe that porn consumption is morally acceptable.

This statistic of acceptance is particularly interesting because it is pulled from our generation, which often defines right and wrong in terms of consequences. Consequence-based morality maintains that if something doesn’t hurt yourself or others, it’s not wrong. The principle of “Thou shalt not hurt” thus becomes the backbone of discursive moral reasoning, as observed by the National Study of Youth and Religion. Removing an external moral standard from moral reasoning makes it difficult to condemn sex trafficking, exploitation, and violence, much less explicit sexual content and nudity. But even in terms of a “Thou shalt not hurt” moral code, passively accepting pornography overlooks the very real consequences of porn consumption.

Healthy sexuality combines emotional, social, intellectual, and physical elements, but pornography separates the mechanized components of intercourse from real sexuality itself. It leads to decreased sensitivity toward women and increased aggression. It also leads to a decreased ability to build healthy relationships or experience sexual satisfaction; users are increasingly unable to properly link emotional involvement with sex. Indeed, porn fosters incredibly unhealthy views about sexuality and human beings. Most porn portrays women as sex-obsessed, mindless objects, promiscuous and subordinate. As feminist scholar Catharine MacKinnon might propose, the prevalence of pornography begs the question: Are women human? Though that question seems extreme, ask yourself if a good society can intentionally engage in a medium that portrays half of its members in such a derogatory manner.

There is much discussion on how the government should regulate the big business of pornography, seesawing between freewheeling libertarianism and heavy-handed censorship.

Indeed, we are increasingly desensitized to discussion about porn use and regulation, even as research proves the effects of pornography are life altering, and stories of sex exploitation, psychological problems, and abuse dominate inspections into the porn industry. Many Americans embrace fair-trade coffee, concerned about the industries that produce their goods, but few consumers express concern about porn industry operations, and its employees and victims.

Even by the often-cited moral standards of individual choice and "Thou shalt not hurt," the porn discussion demands our moral attention. Recent work by neurologists illustrates the very real addictive properties of pornography. Porn addictions restrict real individual choice. University of Texas-San Antonio's Dr. Donald L. Hilton, Jr.'s research on porn addiction explains that pleasure chemicals in the brain are gradually overused when a person views pornography; the brain then limits dopamine production, causing the viewer to become starved for dopamine.

Despite the personal and social costs of pornography, health services are absurdly silent on the issue of such an exploitative and harmful industry. Harvard's University Health Services and Office of Sexual Prevention and Response dance around the issue without offering services or information to students about porn consumption and addiction. OSAPR refused the requests of True Love Revolution officers to assist with the White Ribbon Against Pornography Week without citing any reasons. OSAPR should make a concerted effort to reach out to students who are struggling with porn and educate students on the harmful effects of pornography. University offices shy away from addressing the porn issue as a tangible part of students' personal lives; they instead turn it into a vague, elusive matter.

Perhaps the University avoids the porn issue in order to avoid moral or social controversy, but fear of stirring up debate does few favors for students who struggle with porn consumption. University of Chicago professor Jean Bethke Elshtain argues in *The Social Costs of Pornography* that we should not dismiss the "moral" in our avoidance of the "moralistic." Elshtain maintains that in order to be responsible citizens, we must ask ourselves, "What sort of community is this?"

Is it reasonably decent and kind? Is it a fit place for human habitation, especially for the young? What happens to the most vulnerable among us? How do we ill- dignify the human body, and how do we forestall such affronts?" Such questions demand long-winded, nuanced answers, yet it is worth seeking these answers. They are pertinent to those who are involved in the porn industry, and they are pertinent to our own lives. We should all be asking ourselves whether pornography is compatible with a respectful and good society.

## **Representation**

Representation is simply the act of imitation or the act of identification, people identify themselves by means of their mimetic ability, when they see themselves in others and perceive a state of mutual equality. Representation of reality may refer to simile, similarity and symbolization of the world when we take it as a transformation of myth. The idea of representation at its simple level involves our understanding for the action of representation and how we define that act. This essay details media representation of reality as outlined by key theorists and their theories in the classical age and it further explains representation as a substitute and also as ideology.

Classical age refers to the antique period before the birth of Jesus Christ (Auerbach, E, 1974). Key

philosophers during this period included people such as Plato who is the ancient Greek philosopher; Aristotle who is also a Greek philosopher and he was Plato's student; Saint Thomas Aquinas who is a theologian from Italy; Galileo Galilei an Italian physician, astronomy and philosopher and last but not least Francis Bacon who is an English philosopher and leader of scientific revolution. I will critically do an in-depth analysis/discuss representation as outlined by these philosophers and I will also distinguish representation as a substitute and ideology.

First of all let's consider Plato who takes 'representation' with several meanings and connotations in the dialogue and alters the term according to the context in which he uses it. Plato can perhaps be identified as the culprit behind the idea that representation are lacking in truth or 'real' quality. Plato view representation as imitation or 'mimesis.' (Annas, 1982).

For Plato, more than two thousand years ago, an image was the representation of something and was not, could not, be an original. It was always an imitation and always lacking in value when compared to the original since it was not an original it had to be a simulacrum, a false claim to being. (Annas, 1982).

Plato simulacrum calls into question, the entire relationship between the real objects and its copy, and also prioritises the two entities in terms of value. Plato discuss 'representation' as likening oneself to another in speech and bodily behaviour and as addressing the lower part of man's soul; he also refers to the epistemology and metaphysics of the concept. (Spring, 1985)

In contradicting this, Aristotle who is known to be Plato's student 'representation' does not refer to the imitation of idea and appearance, like that of Plato. Aristotle view representation as a sign and argues that each area of knowledge is imitated in the sense that as a human being we all learn through imitation (Annas, 1982)

According to Angelo (1985) Aristotle is the first to deal with 'representation' as a theory of art. He dwell on the concept of representation as an aesthetic theory of art and considers imitation in terms of the form it is embodied. Aristotle states that all human action are mimetic and that men learn through imitation e.g. in the social learning theory of Albert Bandura it is said that we learn by imitating from an early age. In particular to him 'representation' is a distinguishing quality of an art.

For Plato, the artist was nothing but an imitator. This imitator while pretending to represent the real, did nothing more than give representation to an opinion about the real. Plato's student Aristotle, perhaps more diplomatically than Plato, described the image of painted figure not as the likeness of a character but rather as a sign of the character. Aristotle view representation of reality as referent to someone or something but does not try to pose as that someone or something (Summers, 1996:6).

However, he carefully makes a distinction between different kinds of knowledge e.g. he claims that art and philosophy deal with different kinds of truth; philosophy deals with concrete and absolute truth, whereas art deals with aesthetic and universal truth. Aristotle take's representation as an active aesthetic process. (Crane, R, S & Keats, W, R et al, 1996).

Plato and Aristotle attributed different meanings to the term representation. Plato considers representation as in ethical and political context whereas Aristotle uses representation as an aesthetic phenomenon and as an activity of the artist as I have explained in the above paragraph; they both agree that poetry is mimetic but they have different idea about poetry and representation. (Summers, 1996). Plato and Aristotle argue that artist (Demiurge) and poet imitate nature, thus, a work

of art is a reflection of nature. However, they have different views on the functions of imitation in art and literature. Plato believes in the existence of the ideal world, where exists a real form of every object found in nature. A work of art which reflects nature and is twice far from the reality it represents. Aristotle, on the other hand, does not deal with the ideal world, instead he analyses nature. He argues that a work of art does not imitate nature as it is, but as it should be. In this sense, an artist does not violate the truth but reflects the reality.

Plato's main concern is with the public recitation of dramatic and epic poetry and in Plato there is emulation between philosophy and poetry. The poet influences the character of the young in every way and has corruptive impact upon the education of the young mind. In addition, poets don't have a true knowledge of the things. Plato suggests that the emotional appeal is a threat to reason, that mimetic art is remote from reality, that the poet is not serious and knows nothing about poetry and cannot give satisfactory information about his art.

It is obvious that he resists the concept of imitation in the case of poetic composition. Tragedy, in particular, and poetry, in general, is concerned with pleasure rather than instruction and since it is not possible to imitate a wise and quiet person in the play, since such a person does not fit the content of tragedy, 'representation' is ethically distracting. Therefore, the function of various discussions of representational art in the Republic is ethical; wherever he mentions art he discusses it in relation to education and ethics (Annas, 1982).

Although Aristotle agrees with Plato that poetry has the power to stimulate emotions, he does not pay much attention to the ethical and epistemological aspects of 'representation'. Yet he dwells on the pleasure that men take in learning and argues that tragedy discharges the feelings and spectators leave the play in a state of calm, free of passions.

Plato worries about the moral effect of poetry, while Aristotle strikes to psychology and returns repeatedly to shuddering terror and pity that the tragedy is creating in the spectator, who therefore repeats or imitates what has already taken place on stage. And that, in its turn, spectator repeats or imitates what has already taken place. (Phillip, 1996).

Plato argues that there is a duality between art (representation and narrative art) and ethics. This manner of representation (impersonation), according to Plato, leads to the loss-of-self or transformation of identity and becomes a matter of moral destruction. Aristotle also takes the same activity of impersonation, but in a different way. (Gerathy, 1996:275).

After few years a medieval catholic theologian Thomas Aquinas acknowledged the vertical nature that symbolic representation had now taken on; a lower verse which indicates points to represent the higher God. Although denying that the higher and the lower are equivalents, Aquinas admitted that the higher can be addressed through the lower. Aquinas view representation as a divine instrument.

According to Aquinas representation have, in the midst of the mysteries of the faith, become almost supernatural mediums between mankind and God. In fact Aquinas encouraged this practice; since we cannot directly be exposed to divine truth, the faith must be translated into something which is represented to be consumed by us through our lower or human sense.

## **Representation and differences-Marginalization**

Media represent one of the most dynamically changing systems in society. The evolution of media has been determined by the progress in the area of information and communication technologies,

their spread and mass usage, whereas it includes numerous and diverse political, economic, cultural, ethical, and social implications. The editor of the publication, Rachna Sharma, stated following in the Introduction: "Today, while observing 'movements' on social issues at an increased frequency, with increased participation of the public, the claimed media interventions and the changing role of governments in this triangular relationship, one is compelled to locate the issue of marginalised sections in society."

The present is, above all, the time of social media characterised by a high degree of civic activism and individual freedom in the creation and presentation of the content: on the other hand, the power and economic strength of international media conglomerates has been growing on a regional and global scale. It is often discussed the undeniable contribution of the media to building a democratic society, a healthy public environment and their ability to help to radical social transformations, however we may also see that media provide a diametrically different space for the presentations of certain groups. If they highlight specific social participants, others are out of focus of the mainstream media. This bipolarity in displaying marginalised groups in society is one of the paradoxes of the postmodern society and a significant feature of the contemporary mainstream mass media.

Relevant responding to numerous questions related to the establishment and clarification of relations between media, the state and marginalized groups has become the subject of an academic debate, the results of which have the potential to reach the broader social awareness and media practice. In March 2016, the National seminar on the topic Media, the State and the Marginalized: Tackling Challenges took place at the Department of Journalism, Kalindi College, University of Delhi in India. The reviewed publication consists of selected papers presented at the seminar, edited by Rachna Sharma, Assistant Professor in the Department of Journalism of Lady Shri Ram College for Women at Delhi University, India. The publication includes 21 chapters summarised in five major thematic areas, as follows: Part I: Media and Political Communication, Part II: Representation of the Marginalised and Media Ethics, Part III: New Media, Social Media and Digital Activism, Part IV: Alternative and Community Media: The Media of the Marginalised? and Part V: Critical Theory, Media Criticism and Media Reforms. A part of the proceedings is a brief dictionary, in which the reader can find definitions of key terms related to the solved issues and an index of concepts and names that will help them in orientation in the content. It consists of 331 pages.

As indicated by the structure of the publication, its ambition is to provide a variety of views on the dynamically changing relation between media, the state and marginalized groups in an effort to comprehensively understand current social-political and social-cultural processes, which the contributors managed to accomplish. Individual authors address selected areas in a comparative and interdisciplinary perspective. This is mainly due to the composition of the authors' team, which includes leading Indian experts from different areas, such as media studies, cultural studies, journalism, sociology, Public Relations, as well as long-standing experts from media practice. It is an interdisciplinary approach to exploring how media are in the digital age, who marginalised groups are in current social-political-economic structures and how they are reported by mainstream media that can be considered as a significant contribution of the publication to the wider debate on the subject. Despite the fact that the issue is dealt with by the authors from the domestic, Indian perspective, its overlap lies in a qualitative and quantitative solution. This approach expands the possibilities of publication's use. It can serve not only to academics and researchers, but also to the students of media studies, journalism, political science, and sociology. However, also workers in the media, especially in the news-service and others who are interested in the issue of marginalized groups in Indian society and its various stances can find a lot of inspirational information.

Thus, notions presented in individual contributions may serve as the basis for the theoretical and empirical comparative research of the allocated groups in other countries, as well. We should particularly appreciate the fact that the findings published in the book *Media, the State and Marginalisation: Tackling Challenges* may serve as the foundation for institutional debate aimed at addressing the problematic position of the marginalized groups in the Indian society heading towards formulating reforms. Thus, I consider the reviewed publication as an extraordinarily impressive contribution to the discussion on tackling the position of marginalized groups in modern society, with a significant overlap to the theory and the endeavour to practically apply the findings not only in media practice, but also in formulating measures at society-wide level.

## **Martin Slivka**

'The Master of nine crafts', Professor Karol Plicka, was Martin Slivka's role model and inspiration. A few of his films and scholarly analyses published in several books were devoted to Plicka and his extraordinary artistic accomplishments. He was not only Slivka's inspiration but also the object of his profound research inquiries. Slivka's own creative path unfolded from his Master's work he admired so much. This creative path was extraordinarily rich and diverse – he was an excellent documentary filmmaker, screenwriter, playwright, director, as well as a prominent ethnologist, a scientist and, ultimately, a lecturer who inspired and provoked his students by creating a space for free search of connections through his lectures.

He considered education, creativity and ethics to be the basic values any artist should have possessed. He is one of the key personalities of our culture that need to be re-discovered, reflected on by returning to their messages, confronted with the world. Martin Slivka was the co-founder of modern Slovak documentary film; he made more than 140 remarkable film documents. His independent debut, *Water and Work* (1963), highlighted the fact that a gifted filmmaker possessing a precious artistic opinion has just entered the area. The motion picture, which focuses on technical landmarks such as mills, uses artworks of prominent Slovak artists, e.g. music of Ilja Zeljenka and images of Jozef Grussmann, yet without any explicit spoken comments.

In addition to many other Slivka's films worthy of our attention, the documentary from Bulgaria *Man Is Leaving* (1968) is truly exceptional. "He reconsidered the traditionally descriptive ethnographic film works, (...) talking about the place of death in human life, about things that are common in all cultures," *The History of Slovak Cinematography* (2016) claims. The same publication also states that "During the period of 1963 – 1969, the authors of various generations, e.g. Karol Skřípský (1908), Vlado Kubenko (1924), Martin Slivka (1929), Dušan Hanák (1938) and Dušan Trančík (1946) created their masterpieces, their opuses". However, it was no coincidence; the political situation of the 1960s in our country but also anywhere else in the world seemed to universally inspire the best creators of different generations active in different areas of artistic life. Martin Slivka used similar artistic approaches to creating films about art and film portraits of prominent Slovak artists.

Moreover, he remained faithful to ethnographic film, exploring folk culture in its essence (but through a modern film language), customs and folk theatre that he also reflected on in his academic publications. The publication *The Slovak Folk Theatre* (2002) is the result of his researching and seeking. His precise work preparations necessarily involved searching for co-creators who, in his opinion, would provide their future collective work with the best possible quality. That is why Milan Rúfus, one of the most outstanding personalities of Slovak literature, wrote comments on some of his films. Moreover, world-famous music artists such as Krzysztof Penderecki and Ilja Zeljenka were willing to link their music with Slivka's films. Martin Slivka's filmmaking skills were con-

nected to his ethnological erudition, based on multidisciplinary approaches to the presented themes, as his unique studies on this topic clearly reflected.

He was a rebellious, stubborn debater; his former students, and there are many, are grateful not only for his professional supervision but also for the intellectual search they were lucky to experience while standing beside him. "It is difficult, if I may use his own words, to 'establish Martin Slivka in any structure'. He is a patriarchal tradition of the East and a Renaissance legacy of the West, all in one.

His whole being completely smells of humanity," writes one of his most successful students, the film director Mário Homolka.

While appreciating his work, it is impossible to omit the 13-part television series *The Children of the Wind* (1990) about the lives of Gypsies in many European countries. His son Ľubomír worked with him and despite many difficulties they experienced in many countries while making the series, they created a unique piece of art that is still unmatched in this area of creative expression and, as I daresay, it will remain unmatched for a long time. The film's value will definitely increase, since it offers a set of thorough, yet subtle expressions of the quickly vanishing Romani traditions. Martin Slivka is the winner of many prizes and awards, one of the most discussed Slovak filmmakers. Above all, he will be remembered as an inventive, wise and loving man, as a true renaissance person who knew how to understand human weaknesses and always tried to overcome these weaknesses through considerable doses of irony that was so typical for all his works.

## **Milan Stano**

Painter, graphic designer, cartoonist. Publisher, editor, writer and connoisseur of everything connected with travelling around the world. His inspirations are tangible not only in images and writings he has created but also in endless considerations, comparisons and evaluations reflecting on his works. He is original, capable in each of the mentioned creative fields, unrepeatable. He is tough and hardworking. Most of his paintings are landscapes, images of rural environments and urban visions. Following his paintings, he travels across the country with his rack, sketchbook, colours and brushes. "In his paintings, a calm landscape emerges, radiating harmony, balance; through urban motives and folk architecture, he creates poetic compositions," wrote a critic. The humorous images of Slovak folklore and folk traditions also define the cartoons he has been publishing since 1966: "I love Slovak humour; the soul of the nation, the unbound joy of life, the sense of justice and the mockery of stupidity are all enchanted within it," wrote Milan Stano. That is why he also became the publisher, editor and later editor-in-chief of the independent satirical monthly magazine

*Kocúrkovo*, published by Štúdio humoru a satiry since 1990. That is where he started to publish books as well. His cartoons are kind, ironic and provocative at the same time, always able to reflect the problems Slovakia has to face – after all, the reader should become acquainted with various cultural or historical contexts –; however, they also point out the more general questions of being, joy and 'borderless' stupidity. They represent timelessness and a peculiar dialogue with the universe. His heroes are mostly sketched with a closed line, and that is the hallmark of his work: "I understand the caricature as a system of fine arts philosophy through which I can contribute to creating a certain atmosphere. For example, a humorous drawing allows me to create a sense of good mood, optimism, while a cartoon satire helps me create an atmosphere of criticism. The caricature is a good companion," wrote the author.

## **Legal Ethics: law and morality**

Ethics is a branch of philosophy that aims to answer the basic question, "What should I do?" It's a process of reflection in which people's decisions are shaped by their values, principles, and purpose rather than unthinking habits, social conventions, or self-interest. Our values, principles, and purpose are what give us a sense of what's good, right, and meaningful in our lives. They serve as a reference point for all the possible courses of action we could choose. On this definition, an ethical decision is one made based on reflection about the things we think are important and that is consistent with those beliefs.

While each person is able to reflect and discover their own sense of what's good, right, and meaningful, the course of human history has seen different groups unify around different sets of values, purposes and principles. Christians, consequentialists, Buddhists, Stoics and the rest all provide different answers to that question, "What should I do?" Each of these answers is a 'morality'.

### **Morality**

Many people find morality extremely useful. Not everyone has the time and training to reflect on the kind of life they want to live, considering all the different combinations of values, principles, and purposes. It's helpful for them to have a coherent, consistent account that has been refined through history and can be applied in their day to day lives.

Many people also inherit their morality from their family, community or culture – it's rare for somebody to 'shop around' for the morality that most closely fits their personal beliefs. Usually the process is unconscious. There's a challenge here: if we inherit a ready-made answer to the question of how we should live, it's possible to apply it to our lives without ever assessing whether the answer is satisfactory or not.

We might live our whole lives under a moral system which, if we'd had the chance to think about, we would have rejected in part or in full.

### **Law**

The law is different. It's not a morality in the strict sense of the word because, at least in democratic nations, it tries to create a private space where individuals can live according to their own ethical beliefs or morality. Instead, the law tries to create a basic, enforceable standard of behaviour necessary in order for a community to succeed and in which all people are treated equally.

Because of this, the law is narrower in focus than ethics or morality. There are some matters the law will be agnostic on but which ethics and morality have a lot to say. For example, the law will be useless to you if you're trying to decide whether to tell your competitor their new client has a reputation for not paying their invoices, but our ideas about what's good and right will still guide our judgement here.

There is a temptation to see the law and ethics as the same – so long as we're fulfilling our legal obligations we can consider ourselves 'ethical'. This is mistaken on two fronts. First, the law outlines a basic standard of behaviour necessary for our social institutions to keep functioning. For example, it protects basic consumer rights. However, in certain situations the right thing to do in solving a dispute with a customer might require us to go beyond our legal obligations.

Secondly, there may be times when obeying the law would require us to act against our ethics or morality. A doctor might be obligated to perform a procedure they believe is unethical or a public servant might believe it's their duty to leak classified information to the press. Some philosophers

have argued that a person's conscience is more binding on them than any law, which suggests to the letter of the law won't be an adequate substitute for ethical reflection.

## **Law and Morality**

Law and morality are too vague to understand. It must be added here that the notions of law and justice can't be captured and presented before us within a few sentences. These notions are too vast that even words are not sufficient to define them.

In general view morality is the quality of being in accord with standards of right or wrong conduct. Morality, speaks of a system of behavior in regards to standards of right or wrong. The word carries the concepts of: (1) moral standards, with regard to behavior; (2) moral responsibility, referring to our conscience; and (3) a moral identity, or one who is capable of right or wrong action. Morality has become a complicated issue in the multi-cultural world we live in today. Timeless wisdom explains that there cannot be a complete law unless there lays the effect and inclusion of morality. My Project explores what is Moore's concept of morality and how he explains its affects on our behavior, our conscience, our society, and our ultimate destiny.

Law and morality are too vague to understand. It must be added here that the notions of law and justice can't be captured and presented before us within a few sentences. These notions are too vast that even words are not sufficient to define them. Many jurists from the ancient Greek period to the modern and even the post-modern era have attempted numerously to define these concepts, but have failed. One of the reasons may be that the roots of these concepts lie somewhere within the human psyche, which is extremely random and versatile. Well it is required to describe the tenets of the two main schools of law.

## **Theory of Relationship between Law and Morality**

Ever since the revival of the scientific study of jurisprudence the connection of law and morality has much discussed, but the question is not yet, and perhaps never will be settled. Every variety of opinion has been entertained, from the extreme doctrine held by Austin that for the purpose of the jurist, law is absolutely independent of morality, almost to the opposite positions, held by every Oriental cad, that morality and law are one. The question is an important one, and upon the answer which is given to it depends upon the answer which is consequences. The problem is an intensely practical one.

The popular conception of the connection between law and morality is that in some way the law exists to promote morality, to preserve those conditions which make the moral life possible, and than to enable men to lead sober and industrious lives. The average man regards law as justice systematized, and justice itself as a somewhat chaotic mass of moral principles. On this view, the positive law is conceived of as a code of rules, corresponding to the code of moral laws, deriving its authority from the obligatory character of those moral laws, and being just or unjust according as it agrees with, or differs from them. This, like all other popular conceptions, is inadequate for scientific purposes, and the jurist, so far at least as he is also a scientist, is compelled to abandon it. For it is contradicted by the fact's. positive laws do not rest upon moral laws and common notions of justice furnish no court of appeal from the decrees of the State. The average man confounds law and morality, and identifies the rules of law with the principles of abstract justice.

## **No Distinction in Ancient Times**

In the earlier stages of the society there was no distinction between law and morals. In Hindu law, the prime source of which are the Vedas and the Smritis, we do not find such distinction in the

beginning. However, later on, Mimansa laid down certain principles to distinguish obligatory from recommendatory injunctions. In the West also the position was similar. The Greeks in the name of the doctrine of 'natural right' formulated a theoretical moral foundation of law. The Roman jurist in the name of 'natural law' recognized certain moral principles as the basis of law. In the Middle Ages, the Church became dominant in Europe. The 'natural law' was given a theological basis and Christian morals were considered as the basis of law.

### **Moral as a part of law**

There are some who assert that even if law and morals are distinguishable it remains true that morality is in some way an integral part of law or of legal development, that morality is "secreted in the interstices" of the legal system, and to that extent is inseparable from it.

Thus it has been said that law in action is not a mere system of rules, but involves the use of certain principles, such as that of the equitable and the good (*aequum et bonum*). By the skilled application of these principles to legal rules the judicial process distills a moral content out of the legal order, though it is admitted that this does not permit the rules themselves to be rejected on the general ground of their immorality.

Another approach would go much further and confer upon the legal process an inherent power to reject immoral rules as essentially non-legal; this seems to resemble the classical natural law mode of thought, but it is urged, the difference is that according to the present doctrine it is a matter of the internal structure of the legal system, which treats immoral rules as inadmissible rather than as being annulled by an external law of nature.

If value judgments such as moral factors, form an inevitable feature of the climate of legal development, as is generally admitted, it is difficult to see the justification for this exclusive attitude. Value judgments which enter into law will require consideration of what would be a just rule or decision, even though not objective in the sense of being based on absolute truth, may, nevertheless, be relatively true, in the sense of corresponding to the existing moral standards of the community.

Whether it is convenient or not to define law without reference to subjective factors, when we come to observe the phenomena with which law is concerned and to analyze the meaning and use of legal rules in relation to such phenomena, it will be found impossible to disregard the role of value judgments in legal activity, and we cannot exercise this functional role by stigmatizing such judgments as merely subjective or unscientific.

### **The Problem about the Nature of Law J.Raz (1982)**

The theory of knowledge attempts to clarify the nature of knowledge, the philosophy of logic examines the definition of logic, moral philosophy reflects on the nature and boundaries of morality and so on.

One finds philosophers who took the enquiry concerning the nature of law to be an attempt to define the meaning of the word "law". Traditionally those who adopted the linguistic approach concentrated on the word "law". However, it encountered the overwhelming problem that that word is used in a multiplicity of non-legal contexts. We have laws of nature and scientific laws, laws of God and thought, of logic and of language, etc. Clearly the explanation of "law" has to account for its use in all these contexts and equally clearly any explanation which is so wide and general can be of very little use to legal philosophers.

Only one assumption can the explanation of "law" hope to provide the answer to the legal philosopher's inquiry into the nature of law. That assumption is that the use of "law" in all its contexts but one is analogical or metaphorical or in some other way parasitical on its core meaning as displayed in its use in one type of context and that that core meaning is the one the legal philosopher has at the centre of his enquiry. Unfortunately, the assumption is mistaken. Its implausibility is best seen by examining the most thorough and systemic attempt to provide an analysis of "law" based on this assumption, that proposed by John Austin in *The Province of Jurisprudence Determined*.

## **The Lawyers' Perspective**

Many legal philosophers start from an unstated basic intuition:

"The law has to do with those considerations which it is appropriate for the courts to rely upon in justifying their decisions."

Most theorists tend to be by education and profession lawyers and their audience often consists primarily of law students. Quite naturally and imperceptibly they adopted the lawyers' perspective on the law. Lawyers' activities are dominated by litigation in court, actual or potential. They not only conduct litigation in the courts. They draft documents, conclude legal transactions, advise clients, etc., always with an eye to the likely outcome of possible litigation in which the validity of the document or transaction or the legality of the client's action may be called into question. From the lawyer's point of view the law does indeed consist of nothing but considerations appropriate for courts to rely upon.

Hans Kelsen says he follows a combination of the linguistic approach and the institutional approach: "Any attempt to define a concept in question. In defining the concept of law we must begin by examining the following questions:

Do the social phenomena generally called law present a common characteristic distinguishing them from other social phenomena of a similar kind?

The clue to the methodological approach Kelsen was in fact pursuing is in his insistence that legal theory must be a pure theory. Kelsen regarded it as doubly pure. It is pure of all moral argument and it is pure of all sociological facts. Kelsen indicates his belief that the analysis of legal concepts and the determination of the content of any legal system depends in no way at all on the effects the law has on the society or the economy, nor does it involve examination of people's motivation in obeying the law or in breaking it.

For Kelsen, it is self-evident that legal theory is free of all moral considerations. The task of legal theory is clearly to study law. If law is such that it cannot be studied scientifically then surely the conclusion that if the law does involve moral considerations and therefore cannot be studied scientifically, then legal theory will study only those aspects of the law which can be studied scientifically. Since Kelsen has no good reason to insist that legal theory should be free from moral consideration, he has no good reason to delimit the law in the way he does.

## **The international Approach**

It is the lawyer's perspective which delivers the verdict. Yet there is something inherently implausible in adopting the lawyer's perspective as one fundamental methodological stance. There is no

doubting the importance of the legal profession and of the judicial system in society. It is however, unreasonable to study such institutions exclusively from the lawyer's perspective. Institutional approach seems much superior to its rivals. The institutional approach strives to present an analysis of a central political institution should be accepted as the analysis of law. From the institutional point of view, the basic intuition is the starting point for further critical reflection. It is entirely plausible to regard the notion of law as bound up with that of a judicial system but what are the essential characteristics of a court and why are they important to the political organization of society? Three features characterize courts of law:

1. They deal with disputes with the aim of resolving them.
2. They issue authoritative rulings which decides these disputes.
3. In their activities they are bound to be guided, at least partly, by positivist authoritative consideration.

At the highest level of philosophical abstraction the doctrine of the nature of law can and should be concerned with explaining law within the wider context of social and political institutions. It shows how the inclination to identify the theory of law with a theory of adjudication and legal considerations with all those appropriate for courts is based on a short sighted doctrine overlooking the connection of law with the distinction between executive and deliberative conclusion. Clearly, a theory of adjudication is a moral theory. It concerns all the considerations affecting reasoning in the courts, both legal and non-legal.

When the doctrine of the nature of law is identified with a theory of adjudication it becomes itself a moral theory. The doctrine of the nature of law yields a test for identifying law the use of which requires no resort to moral or any other evaluative argument. But it does not follow that one can defend the doctrine of the nature of law itself without using evaluative arguments. Its justification is tied to an evaluative judgment about the relative importance of various features of social organizations and these reflect our moral and intellectual interest and concerns.

## **Law and Morality**

In the modern world, morality and law are almost universally held to be unrelated fields and, where the term "legal ethics" is used, it is taken to refer to the professional honesty of lawyers or judges, but has nothing to do with the possible "rightness" or "wrongness" of particular laws themselves.

This is a consequence of the loss of the sense of any "truth" about man, and of the banishment of the idea of the natural law. It undermines any sense of true human rights, leaves the individual defenseless against unjust laws, and opens the way to different forms of totalitarianism. This should be easy enough to see for a person open to the truth; but many people's minds have set into superficial ways of thinking, and they will not react unless they have been led on, step by step, to deeper reflection and awareness.

## **Relationship between Law and Morality or Ethics**

Law is an enactment made by the state. It is backed by physical coercion. Its breach is punishable by the courts. It represents the will of the state and realizes its purpose.

Laws reflect the political, social and economic relationships in the society. It determines rights and duties of the citizens towards one another and towards the state.

It is through law that the government fulfils its promises to the people. It reflects the sociological need of society.

Law and morality are intimately related to each other. Laws are generally based on the moral principles of society. Both regulate the conduct of the individual in society.

They influence each other to a great extent. Laws, to be effective, must represent the moral ideas of the people. But good laws sometimes serve to rouse the moral conscience of the people and create and maintain such conditions as may encourage the growth of morality.

Laws regarding prohibition and spread of primary education are examples of this nature. Morality cannot, as a matter of fact, be divorced from politics. The ultimate end of a state is the promotion of general welfare and moral perfection of man.

It is the duty of the state to formulate such laws as will elevate the moral standard of the people. The laws of a state thus conform to the prevailing standard of morality. Earlier writers on Political Science never made any distinction between law and morality.

Plato's Republic is as good a treatise on politics as on ethics. In ancient India, the term Dharma connoted both law and morality. Law, it is pointed out, is not merely the command of the sovereign, it represents the idea of right or wrong based on the prevalent morality of the people.

Moreover, obedience to law depends upon the active support of the moral sentiments of the people. Laws which are not supported by the moral conscience of the people are liable to become dead letters.

For example laws regarding Prohibition in India have not succeeded on account of the fact that full moral conscience of the people has not been aroused in favor of such laws.

As Green put it, "In attempting to enforce an unpopular law, a government may be doing more harm than good by creating and spreading the habit of disobedience to law. The total cost of such an attempt may well be greater than the social gain."

Although law and morality are interdependent yet they differ from each other in their content, definiteness and sanction.

### **Some points of distinction between law and morality may be brought out as follows:**

Law: The Oxford English Dictionary defines the law as: 'the body of rules, whether proceeding from formal enactment or from custom, which a particular state or community recognizes as binding on its members or subjects.'

That this should be regarded as the definition of law for the English language is evidence of the influence legal positivism has upon the philosophy of law in our culture. The central themes of positivism are the contentions: firstly, that the existence of law rests upon identifiable social facts and, secondly, that it is necessary to maintain a conceptual distinction between law and morality. In this essay I will examine the positivist assertion that law is identifiable independently of morality, with

a particular focus on the theory of H.L.A.Hart.

1. Law regulates and controls the external human conduct. It is not concerned with inner motives. A person may be having an evil intention in his or her mind but law does not care for it.
2. Law will move into action only when this evil intention is translated into action and some harm is actually done to another person.
3. Law is universal in a particular society. All the individuals are equally subjected to it. It does not change from man to man.
4. Political laws are precise and definite as there is a regular organ in every state for the formulation of laws.
5. Law is framed and enforced by a determinate political authority. It enjoys the sanction of the state. Disobedience of law is generally followed by physical punishment.
6. The fear of punishment acts as a deterrent to the breach of political law.
7. Law falls within the purview of a subject known as Jurisprudence.

### **Morality:**

1. Morality regulates and controls both the inner motives and the external actions. It is concerned with the whole life of man.

The province of law is thus limited as compared with that of morality because law is simply concerned with external actions and does not take into its fold the inner motives.

Morality condemns a person if he or she has some evil intentions but laws are not applicable unless these intentions are manifested externally.

2. Morality is variable. It changes from man to man and from age to age. Every man has his own moral principles.
3. Moral laws lack precision and definiteness as there is no authority to make and enforce them.
4. Morality is neither framed nor enforced by any political authority. It does not enjoy the support of the state. Breach of moral principles is not accompanied by any physical punishment.

The only check against the breach of morality is social condemnation or individual conscience. 'Moral actions are a matter of choice of inner conscience of the individual, laws are a matter of compulsion'.

5. Morality is studied under a separate branch of knowledge known as Ethics.  
We may conclude the discussion in the words of Gilchrist, "The individual moral life manifests itself in manifold ways. The state is the supreme condition of the individual moral life, for without the state no moral life is possible.

The state, therefore, regulates other organizations in the common interest. The state, however, has a direct function in relation to morality."

### **Points to Remember**

Laws may be defined as external rules of human conduct backed by the sovereign political authority. Law and morality are intimately related to each other.

## **Laws are generally based on the moral principles of a particular society. Some points of distinction may be brought out as follows:**

- (a) Laws regulate external human conduct whereas morality mainly regulates internal conduct.
- (b) Laws are universal; morality is variable.
- (c) Laws are definite and precise while morality is variable.
- (d) Laws are upheld by the coercive power of the state; morality simply enjoys the support of public opinion or individual conscience.
- (e) Laws are studied under Jurisprudence but morality is studied under Ethics.

### **Law and freedom**

Both law and morality imply human freedom. Clearly, without freedom one cannot speak of morality. But the same holds for law, for if it were automatically and not freely obeyed, men would be mere robots. Law is not a simple indication of what happens, such as the law of physics; it is an admonition to free persons about what they are required to do if they wish to live freely and responsibly in society; and it normally carries with it a sanction or punishment to be imposed on whoever is shown to have acted against given norms of conduct. Just law, properly understood, appeals to freedom.

Nevertheless one of the most generalized liberal ideas is that law is by nature the enemy of freedom. Servais Pinckaers holds that Catholic moralists have gone through many centuries under the influence of this mentality which has led, by reaction, to the anti-law approach of much of contemporary moral theology. In this view, law and freedom were seen as "two opposed poles, law having the effect of limitation and imposing itself on freedom with the force of obligation. Freedom and law faced each other as two proprietors in dispute over the field of human actions. The moralists commonly said, "Law governs this act, freedom governs that one..." The moralists were traditionally the representatives of the moral law, and their mission was to show to conscience how to apply it in a particular situation, in a "case of conscience". Today we witness a strong tendency to invert the roles; the moralists now regard themselves as defenders of freedom and of personal conscience" [as against the law].

### **Law and justice**

Law cannot attempt to regulate the purely interior sphere of personal conduct; morality can. Human or civil law is connected with external actions, precisely insofar and because they impinge on the rights or lawful actions of others. Hence the necessary connection of law with justice. For the regulation of interpersonal relations must work from the basic principle of justice: "to each his due". Hence arises the fundamental question of what is due to each one, and from this the further question of human rights.

To each his due. Something is due to each. This is the sense of equality before the law. "The possibility of giving his or her due not only to a relative, friend, citizen or fellow believer, but also to every human being simply because he is a person, simply because justice requires it, is the honor of law and of jurists. If there is an expression of the unity of the human race and of equality between all human beings, this expression is rightly given by the law, which can exclude no one from its horizon under pain of altering its specific identity".

Even for those who see law and freedom in mutual opposition, the whole concept of law is essentially connected with that of justice. The ancient principle *lex iniusta non est lex* (an unjust law is

not a law), is at the basis of so many modern protests in the name of freedom. "This law is discriminatory, therefore it is not just". But justice is a moral concept; so these protests bear out the intrinsic connection between law and morality, "There is another crucial link between the virtues and law, for knowing how to apply the law is itself possible only for someone who possesses the virtue of justice".

'The law must respond to "living situations"...' Very good, but not in the sense that it must take the situation as its norm. Justice must remain the norm, and sometimes the law must regain ground for justice.

### **Influence of Morals on Law**

Law and Morals act and react upon and mould each other. In the name of 'justice', 'equity', 'good faith', and 'conscience' morals have in-filtered into the fabrics of law. In judicial law making, in the interpretation of legal precepts, in exercising judicial discretion (as in awarding punishment) moral considerations play a very important role. Morals work as a restraint upon the power of the legislature because the legislature cannot venture to make a law which is completely against the morals of the society. Secondly, all human conduct and social relations cannot be regulated and governed by law alone. A considerable number of them are regulated by morals. A number of action and relations in the life of the community go on very smoothly without any intervention by law. Their observance is secured by morals. So far as the legal rules are concerned, it is not the legal sanction alone that ensure their obedience but morals also help in it. Thus, morals perfect the law. 'In marriage, so long as love persists, there is little need of law to rule the relations of the husband and wife – but the solicitor comes in through the door, as love flies out of the window.'

### **Growing Importance of Morals**

Now, sociological approach has got its impact upon the modern age. This approach is more concerned with the ends that law has to pursue. Thus, recognized values, or, in other words, morals (of course the morals of the modern age) have become a very important subject of study for good law making. On international law also morals are exercising a great influence. The brutalities and inhuman acts in World Wars made the people to turn back to morals and efforts are being made to establish standards and values which the nations must follow. Perhaps there is no other so forceful ground to justify the Nuremberg Trials as morals. If the law is to remain closer to the life of the people and effective, it must not ignore morals.

### **Legal Obligation and Authority**

Whatever else they do, all legal systems recognize, create, vary and enforce obligations. This is no accident: obligations are central to the social role of law and explaining them is necessary to an understanding of law's authority and, therefore, its nature. Not only are there obligations in the law, there are also obligations to the law. Historically, most philosophers agreed that these include a moral obligation to obey, or what is usually called "political obligation." Voluntarists maintained that this requires something like a voluntary subjection to law's rule, for example, through consent. Non-voluntarists denied this, insisting that the value of a just and effective legal system is itself sufficient to validate law's claims. Both lines of argument have recently come under intense scrutiny, and some philosophers now deny that law is entitled to all the authority it claims for itself, even when the legal system is legitimate and reasonably just. On this view there are legal obligations that some of law's subjects have no moral obligation to perform.

## Obligations In the Law

Every legal system contains obligation-imposing laws, but there is no decisive linguistic marker determining which these are. The term "obligation" need not be used, nor its near-synonym, "duty." One rarely finds the imperative mood. The Canadian Criminal Code imposes an obligation not to advocate genocide thus: "Every one who advocates or promotes genocide is guilty of an indictable offence and liable to imprisonment for a term not exceeding five years." The English Sale of Goods Act says that, "Where the seller sells goods in the course of a business, there is an implied condition that the goods supplied under the contract are of merchantable quality." That these laws create obligations follows from the way "offence" and "implied condition" function in their respective areas of law, not from the language in which they are expressed.

On the face of it, some laws have other functions. A requirement that "a will must be signed" generally imposes no duty—not a duty to make a will, and not even a duty to have it signed if you do—it sets conditions in the absence of which the document simply does not count as a valid will. Nonetheless, some philosophers, including Jeremy Bentham and Hans Kelsen, argue that the content of every legal system can and should be represented solely in terms of duty-imposing and duty-excepting laws. Bentham asks, "What is it that every article of law has in common with the rest? It commands and by doing so creates duties or, what is another word for the same thing, obligations". They think that analyzing laws this way reveals what legislators or subjects most need to know: under what conditions the coercive power of law will ultimately be met. Others argue that even if such a reduction were possible, it would be unwieldy, uninformative and unmotivated, concealing as it does the different social functions that laws fulfil (Hart 1994: 26– 49) and the different kinds of reasons for action that they create (Raz 1990). Others still, despairing of any principled way of knowing what a law is, have abandoned the problem entirely and tried to develop a theory of law that bypasses it. At a minimum, it does seem clear that whether or not all laws impose obligations, they can only be fully understood through their relations to those that do. Thus, a legal right is an interest that warrants holding others under an obligation to protect it, a legal power is the ability to create or modify obligations, and so forth.

What then are legal obligations? They are legal requirements with which law's subjects are bound to conform. An obligatory act or omission is something the law renders non-optional. Since people plainly can violate their legal obligations, "non-optional" does not mean that they are physically compelled to perform, nor even that law leaves them without any eligible alternative. On the contrary, people often calculate whether or not to perform their legal duties. Could it be then that obligations are simply weighty reasons to perform, even if sometimes neglected or outweighed? This cannot be a sufficient condition: high courts have important reasons not to reverse themselves too frequently, but no legal obligation to refrain. Nor is it necessary: one has an obligation, but only a trivial reason, not to tread on someone's lawn without his consent.

If their content does not account for the stringency of obligations, what does? An historically important, though now largely defunct, theory explained it in terms of penalty. Following Hobbes and Bentham, the English jurist John Austin says that to have a legal obligation is to be subject to a sovereign command to do or forbear, where a command requires an expression of will together with an attached risk, however small, of suffering an evil for non-compliance. "When I am talking directly of the chance of incurring the evil, or (changing the expression) of the liability or obnoxiousness to the evil, I employ the term duty, or the term obligation..." (Austin 1832, 18). Others conceived an indirect connection between duty and sanction. Hans Kelsen holds that what is normally counted as the content of a legal duty is in reality only part of a triggering condition for the mandatory norm which commands or authorizes officials to impose a sanction: "[A] norm: 'You

shall not murder' is superfluous, if a norm is valid: 'He who murders ought to be punished'"(Kelsen 1967, 55). And thus, "Legal obligation is not, or not immediately, the behavior that ought to be. Only the coercive act, functioning as a sanction, ought to be" (Kelsen 1967, 119).

None of these versions of the sanction theory survived H.L.A. Hart's criticisms (Hart 1994, 27–42; cf. Hacker 1973). First, they misleadingly represent a range of disparate legal consequences—including compensation and even invalidation—as if they all function as penalties. Second, they render unintelligible many familiar references to duties in the absence of sanctions, for example, the duty of the highest courts to apply the law. Third, they offer an inadequate explanation of non-optionalness. "You have an obligation not to murder" cannot merely mean "If you murder you will be punished," for the law is not indifferent between people, on the one hand, murdering and being jailed, and on the other hand not murdering at all. "The right to disobey the law is not obtainable by the payment of a penalty or a licence fee". Such dicta are commonplace and reflect familiar judicial attitudes. Most important, the normal function of sanctions in the law is to reinforce duties, not to constitute them. It is true that one reason people are interested in knowing their legal duties is to avoid sanctions, but this is not the only reason nor is it, contrary to what Oliver Wendell Holmes supposed, a theoretically primary one. Subjects also want to be guided by their duties—whether in order to fulfil them or deliberately to infringe them—and officials invoke them as reasons for, and not merely consequences of, their decisions.

Sensitivity to such matters led Hart to defend a rule-based theory. He says that while sanctions might mark circumstances in which people are obliged to conform, they have an obligation only when subject to a practiced social rule requiring an act or omission. The fact that subjects use it as a rule marks it as normative. Three further features distinguish obligation-imposing rules: they must be reinforced by serious or insistent pressure to conform; they must be believed important to social life or to some valued aspect of it; and their requirements may conflict with the interests and goals of the subject (Hart 1994, 85–88). This account of the nature of obligations is not an account of their validity. Hart does not say that a legal duty is binding whenever there is a willingness to deploy serious pressure in its support, etc. He holds that a duty is legally valid if it is part of the legal system (i.e., if it is certified as such by the tests for law in that system), and a legal duty is morally valid only if there are sound moral reasons to comply with it. But, at least in his early work, he offers the practice theory as an explanation of duties generally—legal duties are the creatures of legal rules, moral duties of moral rules and so on.

The constitutive role of social pressure is sometimes considered an Austinian blemish on Hart's theory, but there are in any case more serious problems with it as a general account of obligations. People readily speak of obligations when they are well aware that there are no relevant social practices, as might a lone vegetarian in a meat eating society. And Hart's practice conditions may be satisfied in cases where there is no obligation but only generally applicable reasons, as when victims are regularly urged to yield their wallets to a mugger. At best, Hart's theory will apply only to a special class of obligations in which the existence of a conventional practice is an essential part of the reasons for conformity, though even here, the theory is open to doubt.

A third account is reason-based. On this view, what constitutes obligations is neither the social resources with which they are enforced, nor the practices in which they may be expressed, but the kind of reasons for action that they offer. Legal obligations are content-independent reasons that are both categorical and pre-emptive in force. The mark of their content-independence is that their force does not depend on the nature or merits of the action they require: in most cases, law can impose an obligation to do X or to refrain from doing X. That they are pre-emptive means that

they require the subject to set aside his own view of the merits and comply nonetheless. That they are categorical means that they do not condition their claims on the subject's own goals or interests.

This view is foreshadowed in both Hobbes and Locke, but its most influential contemporary version is due to Joseph Raz. He argues that obligations are categorical reasons for action that are also protected by exclusionary reasons not to act on some of the competing reasons to the contrary. Obligations exclude some contrary reasons—typically at least reasons of convenience and ordinary preference—but they do not normally exclude all: an exclusionary reason is not necessarily a conclusive reason. The stringency of an obligation is thus a consequence not of its weight or practice features, but of the fact that it supports the required action by special normative means, insulating it from the general competition of reasons. Or at any rate this is what obligations do when they have the force the claim, i.e., when they are binding. The theory does not assume that all legal obligations actually are binding from the moral point of view, but it does suppose that the legal system puts them forth as if they were—a consequence that some have doubted. (Hart 1982, 263–67; Himma 2001, 284–97) And while this account is invulnerable to the objections to sanction-based and practice-based theories, it does need to make good the general idea of an 'exclusionary reason', and some philosophers have expressed doubts on that score also (Perry 1989, Regan 1987): is it ever reasonable to exclude entirely from consideration an otherwise valid reason? The account has, nonetheless, been adopted by legal philosophers with otherwise starkly contrasting views of the nature of law.

### **Authority, Obligation, and Legitimacy**

A competitive market is not a legal system, even though people adjust their behaviour in response to relative prices and the whole constitutes a form of social order. Neither was the system of mutual nuclear deterrence, though it guided behaviour and generated norms that regulated the Cold War. Many philosophers and social scientists agree that a social order is a legal system only if it has effective authority. An effective (or *de facto*) authority may not be justified, but it does stand in a special relation to justified (*de jure*) authority. Justified authority is what effective authorities claim, or what they are generally recognized to have.

What is legal authority, and how is it related to obligations? It is a kind of practical authority, i.e. authority over action. On one influential view, "To claim authority is to claim the right to be obeyed" (Wolff 1970, 5). There are, of course, authorities that make no such claim. Theoretical authorities, i.e., experts, are not characterized by claims to obedience—they need not even claim a right to be believed. And there are weaker forms of practical authority. To give someone authority to use your car is merely to permit him. But political authority, of which legal authority is one species, is normally seen as a right to rule, with a correlative duty to obey. On this account law claims the right to obedience wherever it sets out obligations. And to obey is not merely to comply with the law; it is to be guided by it. Max Weber says it is "as if the ruled had made the content of the command the maxim of their conduct for its very own sake" (Weber 1963, 946). Or, as Robert Paul Wolff somewhat more perspicuously puts it: "Obedience is not a matter of doing what someone tells you to do. It is a matter of doing what he tells you to do because he tells you to do it" (Wolff 1970, 9). This is not to say that one obeys only in treating the authority's say-so as an indefeasible reason for action; but one must treat as a binding content-independent reason. The question whether there is an obligation of obedience to law is a matter of whether we should act from the legal point of view and obey the law as it claims to be obeyed.

It is an interesting feature of this account that it supposes that one can tell what the authority re-

quires independent of whether the requirement is justified on its merits. Richard Friedman argues: “[I]f there is no way of telling whether an utterance is authoritative, except by evaluating its contents to see whether it deserves to be accepted in its own right, then the distinction between an authoritative utterance and advice or rational persuasion will have collapsed” (Friedman 1973, 132). An idea of this sort is developed by Raz into one of the leading arguments for the “sources thesis”, the idea that an adequate test for the existence and content of law must be based only on social facts, and not on moral arguments. Authority’s subjects “can benefit by its decisions only if they can establish their existence and content in ways which do not depend on raising the very same issues which the authority is there to settle” (Raz 1994, 219). If law aims to settle disputes about moral issues, then law must be identifiable without resolving these same disputes. The law is therefore exhausted by its sources (such as legislative enactments, judicial decisions, and customs, together with local conventions of interpretation). This kind of argument has been generalized (see Shapiro 1998), but also subjected to criticism. It is uncertain what sort of constraint is posed by the idea that it should not involve “the very same issues”—perhaps if morality is a necessary condition only there could be moral tests for authority that leave the relevant dependent reasons untouched (Coleman 2001, 126–7). And while law does indeed serve as a scheme for guiding and appraising behaviour, it may also have other functions, such as educating its subjects about right and wrong, and this may be ill-served the attitude that the rules are to be obeyed in part because they are the rules (Waluchow 1994).

The obligation-correlative view of authority is not universally accepted. Some argue that legal authority involves no claim right, but only a set of liberties: to decide certain questions for a society and to enforce their decisions. The liberty conception must answer two questions. First, is it not a feature of a right to decide that it requires subjects to refrain from acting on competing decisions? If the law says that abortion is permissible and the Church says that it is not, what does the denial of the Church’s right to decide amount to if not that public policy should be structured by the former decision and not the latter, even if the latter is correct? Second, does the right to enforce include a duty of subjects to pay the penalty when required? If it does, then this is only a truncated version of the obligation-correlative theory—one that holds that punitive and remedial obligations, but not primary obligations, are binding. If not, it is starkly at variance with the actual views of legal officials, who do not think that subjects are at liberty to evade penalties if they can.

This reaches a methodological issue in the philosophy of law. Some consider that the character of law’s authority is a matter for descriptive analysis fixed by semantic and logical constraints of official language and traditions of argument. Others maintain that such analysis is impossible or indeterminate, and that we are therefore driven to normative arguments about what legal authority should be. Crudely put, they think that we should understand law to claim only the sort of authority it would be justifiable for law to have. Such is the motivation for Friedrich Hayek’s suggestion that ‘The ideal type of law ... provides merely additional information to be taken into account in the decision of the actor’ (Hayek 1960, 150). Hayek favours the free market, and concludes that the nature of legal authority should be understood analogically. The most radical position of this sort is Ronald Dworkin’s. He prefers what he calls a “more relaxed” understanding of legal authority (Dworkin 1986: 429). Others have argued that the pre-emptive notion of authority is unsatisfactory because it is too rigid (e.g., Perry 1989). Dworkin’s objection runs much deeper. His position is not that law communicates only a weaker form of guidance; it is that law is not to be understood as trying to communicate anything at all. A subject considering his legal duties is not listening to the law; he is engaged in “a conversation with oneself,” and is “trying to discover his own intention in maintaining and participating in that practice” (Dworkin 1986, 58). On this view there is no fact of

the matter about what law claims that is independent of what each does well to regard it as claiming.

However we resolve the methodological question, there are two parallel normative questions:

- The problem of obligation: What if anything justifies the duty to obey the law, and how far does that obedience properly extend?
- The problem of legitimacy: What if anything justifies the coercive power of law, and how far may that power properly extend?

What is the relationship between these? Some maintain that obligation comes first: “[T]hough obligation is not a sufficient condition for coercion, it is close to a necessary one. A state may have good grounds in some special circumstances for coercing those who have no duty to obey. But no general policy of upholding the law with steel could be justified if the law were not, in general, a source of genuine obligations” (Dworkin 1986, 191). The idea is that merely having justice on one's side is an inadequate ground for coercing others; one also needs a special title flowing from the moral status of the law. (Contrast, for example, Locke's view that everyone has an “executive power of the law of nature,” at least outside political society (§ 13).)

Others contend that this gets the relationship backwards. First, it is doubtful whether one could have an obligation to obey an illegitimate regime. As Rawls says, “[A]cquiescence in, or even consent to, clearly unjust institutions does not give rise to obligations”. If so, at least some conditions of legitimacy precede an obligation of obedience. Second, there are substantive reasons for thinking we would not have obligations to obey if the law were not already justified in upholding its requirements “with steel.” A legal system that could not justifiably coerce could not assure the law-abiding that the recalcitrant will not take them for suckers. Without being able to solve this assurance problem it would be unjust to impose obligations on them, and unjust to demand their obedience. Underlying this suggestion is that idea that effectiveness is a necessary—but certainly not sufficient—condition for justified authority.

### **3. Obligations to the Law**

It may affirm our confidence in the obligation-correlative view to know that from earliest times philosophical reflection on political authority has focussed on the obligation to obey. The passive obligation of obedience is certainly not all we owe the law (Parekh 1993, 243; Green 2003, 543–47) but many have taken it to be law's minimum demand. This gives rise to a puzzle. As Wolff puts it: “If the individual retains his autonomy by reserving to himself in each instance the final decision whether to co-operate, he thereby denies the authority of the state; if, on the other hand, he submits to the state and accepts its claim to authority then... he loses his autonomy”. Wolff resolves the dilemma in favour of autonomy, and on that basis defends anarchism.

Some of Wolff's worries flow from the “surrender of judgement” itself—how can it ever be rational to act against reason as one sees it? Others flow from the fact that it is a surrender to the law. On the first point, it is relevant to notice that promises and contracts also involve surrender of judgement and a kind of deference to others, yet a rational anarchist needs such voluntary commitments to substitute for authoritative ordering. A principled objection to every surrender of judgement is thus self-defeating. Moreover, there seem to be cases in which by surrendering judgement on some matters one can secure more time and resources for reflection and decision on things

that are more important, or with respect to which one has greater capacity for self-direction. A partial surrender of judgment may therefore enhance the agent's autonomy overall.

This suggests that Wolff's concern is better understood as scepticism about whether it is justifiable to surrender one's judgment wholesale to the law. Some philosophers have queried the intelligibility of this doubt; they say that it is of the nature of law that there is an obligation to obey it, at least in its central case. Some go so far as to conclude that it is therefore absurd to ask for any ground of the duty to obey the law: law is that which is to be obeyed (McPherson 1967, 64). We need a way into this circle, and the best entrance is in specifying the nature of law in a way compatible with various theories of its nature. Three features are especially important (drawing on Hart 1994, 193–200; Raz 1990, 149–54; and Lyons 1984, 66–68.) First, law is institutionalized: nothing is law that is not connected with the activities of institutions such as legislatures, courts, administrators, police, etc. Second, legal systems have a wide scope. Law not limited to the affairs of small face-to-face groups such as families or clans, nor does it only attend to a restricted domain of life such as baseball. Law governs open-ended domains of large, loosely structured groups of strangers and it regulates their most urgent interests: life, liberty, property, kinship, etc. But although law necessarily deals with moral matters, it does not necessarily do so well, and this is its third central feature: law is morally fallible. This is acknowledged by both positivists and natural lawyers, whose slogan “an unjust law is not a law” was never intended to assert the infallibility of law.

The question of political obligation, then, turns on whether there are moral reasons to obey the mandatory requirements of a wide-ranging, morally fallible, institutionalized authority. This obligation purports to be comprehensive in that it covers all legal obligations and everyone whose compliance the law requires. It is not assumed to bind come what may, though it is to be one genuine obligation among others. Some philosophers also consider that it should bind people particularly to their own states, i.e., the states of which they are residents or citizens, and that an argument that could not show that one had more stringent duties to obey one's own country than a similarly just foreign one would be in that measure deficient (Simmons 1979, 31–35; Green 1988, 227–28). Finally, it is common ground the obligation exists only when a threshold condition of justice is met.

## **Legal Validity**

Legal validity governs the enforceability of law, and the standard of legal validity enhances or restricts the ability of the political ruler to enforce his will through legal coercion. Western law adopts three competing standards of legal validity. Each standard emphasizes a different dimension of law (Berman 1988, p. 779), and each has its own school of jurisprudence.

Legal positivism emphasizes law's political dimension. Legal positivism recognizes political rulers as the only source of valid law and adopts the will of the political ruler as its validity standard. Leading legal positivists include Jeremy Bentham, John Austin, and H.L.A. Hart.

Natural law theory emphasizes law's moral dimension. Natural law theory recognizes universal moral principles as the primary source of valid law. These moral principles provide a standard of legal validity that imposes moral limits on the ruler's coercive powers. Leading natural law theorists include Aristotle, Cicero, Justinian, and Thomas Aquinas.

The historicist school emphasizes law's historical dimension. The historicist school recognizes legal custom as the primary source of valid law. Legal custom provides a standard of legal validity that imposes customary limits on the political ruler's coercive powers. Leading historicists in-

clude Sir Edward Coke, John Selden, Sir Matthew Hale, and Sir William Blackstone.

Legal positivism recognizes positive law as the only real law and rejects law's moral and historical dimensions as sources of valid laws. Natural law theory and the historicist school, on the other hand, often integrate law's three dimensions. They recognize each dimension as a potential source of valid law but emphasize a particular dimension through their validity standard. Blackstone's unique jurisprudence adopts two validity standards, one from law's historical dimension, and one from law's moral dimension.

Standards of legal validity are historically cyclical. A society typically adopts a standard of legal validity based on moral principles, custom, or both. This validity standard restricts the ruler's ability to enforce his will through legal coercion. Then, intellectual challenges to moral principles and legal custom minimize their esteem. A new validity standard is adopted based on the will of the political ruler. Abuses of coercive powers by political rulers eventually stimulate renewed restrictions on those powers. The society adopts a revived standard of legal validity based on moral principles, custom, or both. The revived validity standard will typically endure until the memory of abuse fades, when the cycle begins again.

This cycle began with Hesiod in 700 B. C. E. and continued into the 21st Century. In common law jurisprudence, judicial acceptance of Hart's legal positivism eroded Blackstone's validity standards based on moral principles and custom. In civil law jurisprudence, Soviet and Nazi abuses of positivist legal systems revived validity standards based on moral principles.

## **The Sophists**

The first standard of legal validity in the Western legal tradition appears in Hesiod's religious poem *Works and Days*, circa 700 B. C. E. Hesiod presents an archetypal jurisprudence that integrates law's three dimensions. Dikê, the goddess of human justice, personifies law's moral dimension. Dikê's father Zeus personifies law's political dimension. Dikê's mother Thetis, the Titan embodiment of custom and social order, personifies law's historical dimension.

Justice "sets the laws straight with righteousness" and distinguishes men from beasts. Divinely decreed moral principles establish the validity standard for human law and customs, and conforming laws and customs establish the *nomoi* (law). Just men obey the *nomoi*, and obedience brings peace and prosperity. Disobedience brings punishment to the individual and his city through famine, plague, infertility, and military disaster.

The Sophists, wandering teachers of the fifth century B. C. E., challenged Greek conventions in religion, morality, and political conduct. They rejected Hesiod's moral dimension by rejecting the existence of divine lawgivers and universal moral principles. They rejected Hesiod's historical dimension by denying any normative authority to custom. Might was right, and law functioned only in the political dimension as the will of the strongest.

The Sophist Protagoras of Abdera (b. circa 481 B. C. E.), rejected law's moral dimension. As an agnostic, Protagoras rejected the divine lawgiver. As a moral relativist, Protagoras rejected the existence of universal moral principles. Unlike later Sophists, however, Protagoras accepted the validity of custom in law's historical dimension.

Protagoras based his moral relativism on the argument that a shared factual knowledge of the world is impossible. The foundation of Protagoras' relativism is the "man-measure" of the *Aletheia* (Truth). "Man is the measure of all things, of those that are that they are, of those that are not that

they are not.”

Sense perception forms the basis of all knowledge, Protagoras believed, and every sense impression that a person receives is securely true. The data of sense perception, however, are private, subjective states. The wind is truly warm to the man who perceives it as warm, but the same wind is truly cold to the man who perceives it as cold. Perceived objects therefore have contradictory properties and there are no public facts.

Protagoras maintained that all knowledge claims are thus equally true. Furthermore, their truth endures regardless of conflicting claims. Protagoras therefore claimed “it is equally possible to affirm and deny anything of anything.”

Protagoras extended his doctrine that all knowledge claims are equally true to claim that all virtue claims are equally true. Virtue claims are relative to the claimant because virtue is only another form of knowledge. (Plato, *Protagoras*, 323a-328d). There are no universal moral principles, and law’s moral dimension does not exist.

Although Protagoras rejected law’s moral dimension, he embraced law’s historical dimension. Although all knowledge and virtue claims are equally true, Protagoras argued they are not all equally sound. Only the ignorant equated truth with soundness. One set of thoughts can therefore be “better than another, but not in any way truer.” The same is true of laws. All laws are equally true, but not all laws are equally sound.

Protagoras accepted a duty to obey the law. Since no moral or legal code is truer than any other, no individual should assert his moral or legal judgments over those advanced by the state. Society is required to preserve humanity. The perpetuation of society, in turn, requires respect for law and custom. Men should obey the state’s laws and customs so long as they function soundly.

The Sophist Callicles (b. circa 484 B. C. E.), rejected law’s historical dimension and denied any duty to obey the law. Using “nature” to mean the antithesis of mind, Callicles argued that nature’s normative authority (*physis*) supersedes the normative authority of man’s laws and customs (*nomoi*). Man’s laws and customs violate “nature’s own law” and “natural justice.” Nature’s law, not man’s, should govern our actions.

Callicles said that what men call “right” merely expresses what men believe to be to their advantage. Legal conventions in democracies wrongfully elevate the weak over the strong. The majority of weaker folk frame the laws for their advantage to prevent the stronger from gaining advantage over them. The true nature of right is established by nature, not men, and nature’s law establishes right in the strong.

Natural justice provides that the better and wiser man should rule over and have more than the inferior. Might, therefore, makes right. All animals and races of man recognize right as the sovereignty and advantage of the stronger over the weaker.

The Sophist Thrasymachus (b. circa 459 B. C. E.) argued for disobeying laws and customs. Defining justice as obedience to the laws, Thrasymachus argues that justice is nothing but the advantage of the stronger. Obedience furthers the advantage of others and reduces the obedient to a form of slavery. Only disobedience to law profits a man and leads to his advantage. Injustice is therefore “a stronger, freer, and more masterful thing than justice.”

Solon's constitution created an archetypal positivist legal system in Athens in 594 B. C. E. Solon reposed political and judicial authority in the heliastic courts. The courts enforced undefined laws with no standard of legal validity other than the unrestrained will of the jurors. Pericles' introduction of payments for jurors in 451 B. C. E. enthroned Athens' poorest and least educated class as dikasts in the heliastic courts. The Athenian courts became infamous for injustice and gullibility. Xenophon writes that Athenian courts often acted on emotion to put innocent men to death and acquit wrongdoers. Eighty dikasts who found Socrates innocent voted for his death.

Athenian ostracism (ostrakismos) permitted the conviction, exile, and execution of any Athenian without charges, hearing, or defense. Originally intended for removing tyrants, Plutarch records that ostracism quickly became a way of pacifying jealousy of the eminent. Ostracism breathed out malice in exile and death. Everyone was liable to it whose reputation, birth, or eloquence rose above the common level.

Athens ostracized its greatest heroes from envy of their honors. Athens ostracized Aristides, the hero of the Battle of Marathon, in 483 B. C. E. Athens ostracized Themistocles, savior of Athens at the Battle of Salamis, in 471 B. C. E. Both men were exiled for ten years without charges or a hearing.

Lack of procedural safeguards encouraged frivolous public prosecutions (graphai) and impeachments (eisangeliai), giving free reign to Athens' gullible and imprudent dikasts. Frivolous political prosecutions destroyed Athens' leadership, spawning bloody regime changes and military disasters. The frivolous prosecution of Pericles in 443 B. C. E. precipitated the Peloponnesian War with Sparta. The frivolous prosecution of Alcibiades in 415 B. C. E. caused Athens' ablest general to switch sides and lead Sparta against Athens.

The greatest ignominy involves the Arginusae generals in 404 B. C. E. Six Athenian naval commanders won a great naval victory against Sparta at Arginusae. A violent storm prevented their recovering the dead and shipwrecked. The generals were nevertheless impeached and executed for failing to do so. Deprived of her best generals, Athens lost the war the next year in a devastating naval defeat at Aegospotami.

Political prosecutions wreaked political havoc as well. Five regime changes rocked Athens between 411 B. C. E. and 403 B. C. E. These regimes included the reign of terror by the Thirty Tyrants in 404 B. C. E.

Athenian positivism criminalized thought and expression in frivolous prosecutions against philosophers. Anaxagoras circa 430 B. C. E., Protagoras circa 415 B. C. E., and Socrates in 399 B. C. E. were all convicted on manufactured charges of impiety (asebeia). Impiety was undefined by Athenian law. Every juror defined it anew in every case as he pleased.

Athens often regretted its decisions. Socrates' lead accuser Anytus was stoned for his role in Socrates' death. Athens honored Socrates with a bronze statue by Lysippus. Athens thus gained "the indelible reproach of decreeing to the same citizens the hemlock on one day and statues on the next."

## **Plato**

Plato described Socrates as the bravest, wisest, and most upright man of his time. Plato planned a

career in politics but “withdrew in disgust” after observing how Athenian courts “corrupted the written laws and customs.” (Plato, Letter VII, 325a-c). Plato reacted to Socrates’ death by repudiating the Sophists, reviving law’s moral and historical dimensions, and formulating a natural law standard of legal validity based on principles of universal justice.

Plato begins his revival of law’s historical dimension by emphasizing the autonomy of law, which he considered the most important aspect of government. Autonomous laws wield supremacy over political rulers. Political rulers are subject to the same laws as other citizens, and they may not alter the laws to suit their will. Plato wrote that the preservation or ruin of a community depends on the autonomy of laws more than anything else. Respecting law’s autonomy preserves the entire community. Disregarding it brings destruction. Autonomy is so important that “the man who is most perfect in obedience to established law” should receive the highest post in government. The second most obedient man should receive the second highest post, and so on for all the posts.

Plato begins his revival of law’s moral dimension by persuasively refuting Protagoras’ moral relativism in the *Theaetetus*. Protagoras claimed that all sense perceptions are equally true. Since knowledge is perception, all knowledge claims are equally true. Since moral claims are a species of knowledge claims, all moral claims are equally true. Therefore, no one set of moral principles has authority to guide the laws.

Plato offers eleven objections to Protagoras’ arguments in the *Theaetetus*. Three are recounted here. First, Plato denies that knowledge is perception. If knowledge were perception, we would understand anyone speaking to us in a foreign tongue. This is clearly not the case. Second, remembered knowledge refutes Protagoras’ claim that knowledge is perception. Remembered knowledge involves no perception, but it is knowledge nonetheless.

Third, moral relativism is self-refuting. Assume, as Protagoras claims, that “all beliefs are true.” Assume also that another man exists who believes that “not all beliefs are true.” If Protagoras is correct, then the second man’s belief must be true. Protagoras’ belief that “all beliefs are true” is thus refuted.

Plato continues his revival of law’s moral and historical dimensions in the *Crito*. The *Crito* considers whether a duty exists to obey the law. Socrates’ friend Crito argues for Socrates to escape and avoid his unjust execution.

Socrates replies that the soul is more precious than the body. Good actions benefit our souls, but wrong actions mutilate them. The important thing is not living, but living well. This means living honorably. Socrates utilizes three principles in determining whether to escape. First, circumstances never justify wrong action. Second, one should not injure others, even when they injure you. Third, one “ought to honor one’s agreements, provided they are right.”

Plato defines law’s moral dimension through these principles. Justinian’s *Corpus Juris Civilis* defines its moral dimension by these same principles in the sixth century. (Justinian, *Digest*, 1.1.10). Blackstone’s *Commentaries* does the same in the eighteenth century.

Plato next refutes Thrasymachus’ claim in the *Republic* that disobeying the law “is a stronger, freer, and more masterful thing” than obeying the law. In the *Crito*’s “Speech of the Laws,” the Laws present two arguments for obedience. The first is the “argument from agreement.” Socrates has undertaken to live his life in obedience to Athens’ laws. Athens did not force Socrates to live in its precincts. Socrates was free to leave at any time. By choosing to stay in Athens with full

knowledge of how the laws functioned, Socrates promised obedience to the laws.

The Laws' orders are "in the form of proposals, not savage commands." Socrates can either obey the Laws or persuade (the personification of) the Law that they are at fault. If Socrates escapes without persuading the personification of the Laws that they were at fault, he would dishonor his agreement to obey the laws. Dishonoring a just agreement violates the ethic of "living well" and damages the soul.

The Laws' second argument is the "argument from injury." Disobedience destroys both the Laws and the city, which cannot exist if legal judgments are ignored. Socrates concludes that "both in war and in the law courts and everywhere else you must do whatever your city and your country command, or else persuade them in accordance with universal justice" that they are at fault.

The Laws' second argument implies a natural law standard of validity based on principles of universal justice. The Laws insist they operate as "proposals, not savage commands." Socrates' duty to obey the Laws is contingent on the Laws' compliance with principles of universal justice. By implication, there is no duty to obey the Laws if they violate principles of universal justice.

## **Aristotle**

Aristotle designs his legal philosophy to avoid the catastrophes described in his Athenian Constitution. Aristotle accepts the necessity of law's political dimension because laws cannot enforce themselves. Nevertheless, the Athenian legal history proves the political dimension is not sufficient to preserve a society or achieve its happiness.

Human nature demands more than political power from law. Law must accomplish justice and foster virtue. Justice is required to prevent revolution, and virtue is required for human happiness. Man separated from justice is "the worst of animals," and man without virtue "is the most unholy and the most savage of animals."

Aristotle writes in the Politics that securing justice is the state's most important function. Justice is more essential to the state than providing the necessities of life. Governments must be founded on justice to endure. Governments that rule unjustly and give unequal treatment to similarly placed subjects provoke revolutions. Justice maintained, however, forms a bond between the members of society that preserves the state. (Aristotle, Politics 1328b, 1332b, 1253a). Aristotle's Nicomachean Ethics defines justice as lawfulness concerned with the common advantage and happiness of the political community. Aristotle distinguishes between legal justice (to nomikon dikaion) and natural justice (physikon dikaion). Legal justice involves positive laws and custom enacted by man, such as conventional measures for grain and wine. These "are just not by nature but by human enactment" and "are not everywhere the same." Aristotle secures legal justice by granting autonomy to law and by utilizing custom to encourage obedience.

Natural justice, on the other hand, involves principles of natural law that originate in nature. Such principles do not arise in the minds of men "by people's thinking this or that." Natural law principles apply with equal force everywhere, just as fire burns both in Greece and in Persia. Aristotle secures natural justice by adopting natural law precepts as the standard of legal validity. Positive laws that violate natural law precepts are nullified.

Aristotle secures legal justice by restricting the will of the political ruler through autonomous laws. The Politics teaches that unrestrained power produces tyranny, even in democracies. Aristotle considers whether societies function best under the "rule of men" or the "rule of law." He con-

cludes that laws, when good, should be supreme. Political rulers should merely complement the law by acting as its guardians and ministers. They should only regulate those matters on which the laws are unable to speak with precision owing to the difficulty of any general principle embracing all particulars. Aristotle gives four reasons for emphasizing law's autonomy over the will of the political ruler. First, law frees the state from the desires and passions that afflict political rulers. "The law is reason unaffected by desire. Desire ... is a wild beast, and passion perverts the minds of rulers, even when they are the best of men." (Aristotle, *Politics*, 1287a). Second, tyranny results when political rulers exercise autonomy over law, even in democracies. Third, the orderly rotation of political offices requires autonomous laws. Equality, liberty, justice, and expediency mandate that every mature citizen participates in governing the state. Fourth, the orderly rotation of political offices preserves the state by assuring evenhanded administration by magistrates.

Aristotle utilizes law's historical dimension to secure legal justice through custom. Aristotle uses the term *nomos* for law, and *nomos* includes custom and convention as components of the social norm. Aristotle writes in the *Politics* that legal custom is itself a form of justice. Custom and convention maintain social stability by encouraging obedience to the law. The law has no power to command obedience except that of habit, which can only be given by time. Aristotle urges caution in changing the law because changes enfeeble the power of the law. If the advantage of a change is small, it is wiser to leave errors in the law. The citizens usually lose more by the habit of disobedience than they gain by changing the law.

Aristotle utilizes law's moral dimension to secure natural justice in two ways. The first is by nullifying positive laws that subvert natural law precepts. Aristotle formulates a natural law standard of legal validity. Aristotle's *Rhetoric* describes natural law as an unwritten law, based on nature, and common to all people. "There is in nature a common principle of the just and unjust that all people in some way divine."

Natural law provides immutable and universal standards of justice. Natural law constitutes a separate body of binding law that exceeds positive law in authority. Human actions should complete nature rather than subvert it, and natural law nullifies positive laws that subvert natural law precepts.

Like Plato, Aristotle argues that the universal standards of natural law justify disobeying positive laws. Aristotle's *Rhetoric* provides two examples invalidating positive law for violating natural law precepts. The first is the case of Sophocles' *Antigone*, where Antigone disobeys Creon's order and provides funeral rites to her brother Polyneices. The second is Aristotle's guide to jury nullification of written law by appealing to higher principles of natural law.

Aristotle never explains why natural law wields supremacy over positive law. The supremacy of natural law is consistent, however, with Aristotle's view in the *Physics* that the ultimate causes of nature are divine.

The second way that Aristotle secures natural justice is by fostering virtue. Aristotle believed that human happiness depended on virtue more than liberty. The government is thus responsible for producing a virtuous state, and this is best accomplished through law. Although virtue encompasses more than mere conformity to law, virtue will only develop and flourish in a state that supports the legal enforcement of virtue. The state must provide moral education through its laws to make its citizens just and good. Failing to do so undermines the state's political system and harms its citizens.

## Cicero

Marcus Tullius Cicero (106-43 B. C. E.) was a politician, philosopher, orator, and attorney. Cicero's *De Legibus* (The Laws), *De Officiis* (On Duties), and *De Re Publica* (The Republic) greatly influence the natural law tradition. Cicero esteemed Plato and Aristotle. Although not a Stoic, Cicero adopted Stoicism's divine Nature as the source of natural law precepts that dictate legal validity. The histories of Herodotus, Thucydides, Xenophon, and Polybius persuaded Cicero that natural law imposes justice on human events.

Cicero's signature contribution to jurisprudence is his explication of Nature as divine lawgiver. Law and justice originate in Nature as a divinely ordained set of universal moral principles. Cicero describes Nature as the omnipotent ruler of the universe, the omnipresent observer of every individual's intentions and actions, and the common master of all people. Belief in divine Nature stabilizes society, encourages obedience to law, and leads to individual virtue.

Law's moral dimension dominates Cicero's jurisprudence. Cicero defines natural law as perfect reason in commanding and prohibiting. These principles are the sole source of justice and provide the sole standard of legal validity. "True law is right reason in agreement with Nature."

The precepts of natural law are eternal and immutable. They apply universally at all places, at all times, and to all people. Natural law summons to duty by its commands, and averts from wrongdoing by its prohibitions. Nature serves as the enforcing judge of natural law precepts, and Nature's punishment for violating natural law precepts is inescapable. (Cicero, *De Re Publica*, 3.33).

Natural law provides the *naturae norma*, the standard of legal validity for positive law and custom. The *naturae norma* provides the only means for separating good provisions from bad. Justice entails that laws and customs comply with the *naturae norma* and preserve the peace, happiness, and safety of the state and its citizens. Positive laws and customs that fail to do so are not regarded as laws at all.

Regarding Cicero's political dimension of law, the magistrate's limited role is to govern and to issue orders that are just and advantageous in keeping with the laws. Although the magistrate has some control of the people, the laws are fully in control of the magistrate. An official is the speaking law, and the law is a nonspeaking official.

Political rulers cannot alter, repeal, or abolish natural law precepts. Furthermore, political rulers have no role in interpreting or explaining natural law precepts. Every man can discern the precepts of natural law for himself through reason.

Political rulers must issue just commands as measured by natural law precepts. Individuals are protected against unjust coercion. Although rulers may use sanctions to enforce legitimate commands, every affected subject has the right to appeal to the people before enforcement of any sanction. Furthermore, no ruler can issue commands concerning single individuals. Any significant sanction against an individual, such as execution or loss of citizenship, is reserved to the highest assembly of the people. As a further protection, all laws must be officially recorded by the censors.

Like Aristotle, Cicero requires that magistrates be subject to the power of others. Successive terms are forbidden, and ten years must pass before the magistrate becomes eligible for the same office. Every magistrate leaving office must submit an account of his official acts to the censors. Misconduct is subject to prosecution. No magistrate may give or receive any gifts while seeking or holding office, or after the conclusion of his term.

Regarding Cicero's historical dimension of law, Cicero agrees with Aristotle that custom maintains social stability by encouraging obedience to law. Custom can even achieve immortality for the commonwealth. The commonwealth will be eternal if citizens conduct their lives in accordance with ancestral laws and customs.

### **Justinian's Corpus Juris Civilis**

The Corpus Juris Civilis (Body of Civil Law) codified Roman law pursuant to the decree of Justinian I. Completed in A.D. 529, the four works of the Corpus became the sole legal authorities in the empire. The Institutes was a law school text. The Codex contained statutes dating from A.D. 426. The Digest contained commentaries by leading jurists, and the New Laws was supplemented as new laws became necessary.

The Corpus is the direct ancestor of modern Western civil law systems. Its influence on canon law is seen in the medieval maxim *Ecclesia vivit lege romana* (the Church lives on Roman law). Common law jurisprudence never accepted the Corpus as binding authority. Nevertheless, its twelfth century revival profoundly influenced the formation of common law jurisprudence through the works of the father of the common law, Henry de Bracton.

The Corpus divides law into public law involving state interests and private law governing individuals. Private law is a mixture of natural law, the law of nations, and municipal law. The Corpus establishes a clear hierarchy among law's three dimensions. The moral dimension occupies the highest position and provides the standard of legal validity. The historical dimension of legal custom occupies the second position, and the political dimension of Roman municipal law occupies the lowest position.

The Corpus' moral dimension resides in two bodies of law, natural law and the law of nations. Like Cicero, the Corpus originates natural law in a divine lawgiver. "The laws of nature, which are observed by all nations alike, are established by divine providence." The precepts of natural law are universal, eternal, and immutable.

Natural law governs all land, air, and sea creatures, including man. "The law of nature is that which she has taught all animals; a law not peculiar to the human race, but shared by all living creatures." The Corpus extends natural law to "all living creatures" to repudiate the Sophist arguments that law is merely a human convention with no basis in nature, justice does not exist, and there is no duty to obey law. The Corpus' rebuttal focuses on the highly socialized behavior of such animal species as ants, bees, and birds. Although animals cannot legislate or form social conventions, they nevertheless follow norms of behavior. These norms affirm the existence of natural law.

The Institutes and the Digest state three precepts of natural law: "Honeste vivere, alterum non laedere, suum cuique tribuere." Live honorably, injure no one, and give every man his due. . These precepts track the Crito's admonishments to live well, harm no one, and honor agreements so long as they are honorable. Blackstone's Commentaries adopts these exact precepts.

The law of nations is the portion of natural law that governs relations between human beings. (Justinian, Digest, 1.4). Its rules are "prescribed by natural reason for all men" and "observed by all peoples alike." The law of nations is the source of duties to God, one's parents, and one's country. It recognizes human rights to life, liberty, and self-defense, and its recognition of property rights enables contracts and commerce between peoples.

The precepts of natural law provide the standard for legal validity. This standard voids any right or

duty violating natural law precepts. The Institutes provides illustrative examples: Contracts created for immoral purposes, such as carrying out a homicide or a sacrilege, are not enforceable. (Justinian, Institutes, 3.19.24). Immorality invalidates wrongful profits. Anyone profiting from wrongful dominion over another's property must disgorge those profits. (Justinian, Digest, 5.3.52).

Immorality invalidates agency relationships. Agents are not obliged to carry out immoral instructions from their principals. If they do, they are not entitled to indemnity from their principals for any liability the agents incur. (Justinian, Institutes, 3.26.7). Immorality even invalidates bequests and legacies if the bequest is contingent upon immoral conduct. (Justinian, Institutes, 2.20.36). The Corpus' historical dimension provides custom as a source of enforceable law. The Corpus defines legal custom as the tacit consent of a people established by long-continued habit. Since custom evidences the consent of the people, it is a higher source of law than positive or statutory law. Statutory provisions, if customarily ignored, are treated like repealed legislation. (Justinian, Digest, 1.1.3). Legal custom establishes the autonomy of law over political rulers. Custom binds judges. A judge's first duty is "to not judge contrary to statutes, the imperial laws, and custom." Legal custom even controls statutory interpretation. "Custom is the best interpreter of statutes."

The Corpus' political dimension resides in its six categories of Roman municipal law, the "statutes, plebiscites, senatusconsults, enactments of the Emperors, edicts of the magistrates, and answers of those learned in the law." In contrast to natural law and the law of nations, Roman municipal law was unique to Rome. Its provisions were also "subject to frequent change, either by the tacit consent of the people, or by the subsequent enactment of another statute."

## **Philosophical Counseling: Managing everyday problems**

**The Basic Premise**  
Our ways of thinking influence our ways of feeling, desiring, choosing, acting, creating, relating, and being in the world. But most of the time we don't even notice our patterns of thinking. They run on auto-pilot, fueled by old habits and operating assumptions. If we could slow down and reflect on our ways of thinking, we might better understand our orientation on the world, and have a chance to ask questions about it, find out how it serves us, and how it trips us up at times. If we could examine our ways of thinking, we might cultivate greater clarity, coherence, breadth and depth in our worldview. This worldview can have a big impact on our future actions, reactions, and general experience of life. If we can learn how to apply a worldview that we've developed carefully and reflectively to our actions in a deliberate way, we can live with a much greater sense of empowerment and authenticity.

A regular practice of self-examination and deliberate action – the cornerstone of a philosophical life, and the very thing we pursue together in philosophical counseling – has the power to increase our sense of understanding, meaning, purpose, freedom, and fulfillment in our lives. It also has the power to transform many of the emotional culprits that cause us suffering – fear, dread, angst, anger, sadness, excessive attachment, jealousy, resentment, and guilt.

Philosophical counseling is, thus, a process that is educative, empowering, and therapeutic.

## **What do we do in Philosophical Counseling?**

In philosophical counseling, we embark on an inquiry into your life.

Philosophical counseling is a collaborative and conversational activity between a trained philosopher and a client in which the client's life-problems are worked through by identifying, examining,

and revising as necessary the operating beliefs, values, and habits of action that in form those problems.

- (1) The process of identifying the client's implicit "truths" and values, and making them explicit, improves self-awareness and puts the client in a position to clarify and critically examine the fundamental principles that have been guiding their lives.
- (2) The process of critically examining the client's core truths and values helps them to analyze the reasons and evidence that support their beliefs, discover the strengths and weaknesses as well as the benefits and challenges of their ways of thinking, and compare them with alternative perspectives. It also helps them to become aware of inconsistencies between beliefs, and conflicts between beliefs and habits of action (what they say and do). These revelations help the client to become aware of instances in which they might be working at cross-purposes with themselves.
- (3) The revision stage is one of creative re-building, in which the client's core truths and values shift, expand, and sharpen, with the consideration of various perspectives from philosophical wisdom traditions. It is also a stage of application, in which the client experiments with putting new ideas into practice, and works to direct their actions, relationships, and ways of communicating with intentional choice.

In counseling, the three stages tend to move in a circular manner, rather than a linear one. As new insights emerge, it can be valuable to circle back to earlier stages with new ideas for deeper examination.

The ultimate goal of philosophical counseling is to help the client to conduct an inquiry into their own life, to develop their own coherent, empowered, and fulfilling philosophy of life, and to live it! Minimally, what a client can expect to get out of philosophical counseling is greater self-knowledge and understanding of their own problems. Maximally, they can become empowered to solve those problems, relieve suffering, and create greater fulfillment in their lives.

### **The Role of the Philosophical Counselor**

A philosophical counselor approaches their client as a fully functioning individual with the courage to deal with the perplexities and struggles central to the human condition. A philosophical counselor does not diagnose or treat emotional or behavioral disorders, and if problems arise of a medical nature, the philosophical counselor will help the client to seek an appropriate health care professional. A philosophical counselor works collaboratively with their client to solve life-problems by activating and cultivating the powers the client already possesses – like critical thinking, imagination, empathy, desire, self-discipline, and creativity. A philosophical counselor acts as a navigation partner on the client's own journey to gain awareness, find direction, create solutions, and develop a fulfilling life.

The philosophical counselor does not tell the client what to think or what to do, but instead asks questions, uses tools of critical examination, offers fresh perspectives, draws connections, and gives encouragement. Most importantly, a philosophical counselor listens carefully to their client, works to understand the client's problems and their operating worldview, and works with the client to develop a coherent philosophy of life that will serve their own well-being.

## **An old role**

It may seem that philosophical counseling is a new invention. Actually, it is as old as philosophy itself. The Ancient Greeks – Socrates, Plato, Aristotle, the Stoics, the Epicureans – saw philosophy as not only an educational activity, but as a kind of therapy for the soul that eased suffering, developed personal integrity, encouraged self-mastery, created justice, and cultivated the good life. Even in the era of academic philosophy, this ancient vision of philosophy has survived in the philosophical traditions of ethics, political philosophy, existentialism, pragmatism, feminism, and hermeneutics (among others). Modern day philosophical counselors revive the ancient art of philosophy, and put it to work in a one-on-one setting.

## **What kinds of problems are philosophical problems?**

We might wonder whether or not we've got any philosophical problems. Most of the time we characterize our problems in terms of a particular relationship we're struggling with, a big life change, or a feeling of sadness, loss, confusion, loneliness, frustration, powerlessness, burn-out, or worry. But, quite often these very problems are signs of broader philosophical problems that deserve attention.

Common philosophical problems include questions or difficulties with:

- Core beliefs and truths
- Critical thinking and questioning assumptions
- Creative thinking and trying out alternative perspectives
- Clear reasoning and consistency
- Ethics and values
- Meaning, purpose, and fulfillment
- Happiness
- Identity, self-discovery, self-improvement
- Change, loss, death
- Moderating emotional life
- Existential Angst
- Alienation
- Self-discipline
- Decision Making
- Power and Justice
- Communication and relationships
- Conflict resolution
- Freedom, responsibility, and self-determination
- Authenticity

It's important to recognize that not all life-problems are medical in nature. Not every instance of struggle, suffering, or unhappiness is a sign of a mental illness. There are times when it is appropriate to seek a health care professional with training in psychology for treatment of an emotional or behavioral disorder. There are instances in which a problem in one's brain-chemistry exists and it is appropriate to get the help of a psychiatrist who can prescribe medication. But when problems are not medical in nature, one needs a different kind of counsel.

Sometimes non-medical problems are narrow in scope, requiring legal, financial, business, or aca-

demic counsel. And sometimes the problems are more general, at their root having to do with questions like:

- What's true?
- What's right?
- What's good?
- What should I care about most?
- What are my responsibilities?
- What does it all mean?
- What should I do?
- Who am I, and who do I want to be?
- How do I fit into the bigger world?
- Why am I here?
- How can I best relate with others?
- How can I best deal with change?
- How should I live?
- How can I take better control of my life?
- How can I be happy?
- and how can I come to know the answers to any of these questions and cope with uncertainty about them?

These are classic questions of philosophy. Most everyday problems dealing with ethics, values, meaning, purpose, truth, certainty, justice, power, freedom, and happiness are not medical in nature and cannot be resolved with medical intervention. They are best approached through philosophical dialogue.

### **Differences between philosophical dialogue and psychotherapy**

Philosophical dialogue is a unique kind of dialogue. In it, we take our time to slowly and thoroughly clarify the meaning of our terms, examine lines of reasoning with critical thinking tools, compare our ways of thinking with other perspectives and worldviews, and consider the relationship between our ways of thinking and our ways of feeling, choosing, communicating, and acting. Unlike psychotherapy, philosophical dialogue is not diagnostic. A philosopher does not treat their interlocutor as a patient, nor assume that there is a disorder or illness present (beyond the challenges with the human condition that we all face). A philosopher does not presume causal explanations for their interlocutor's behaviors, feelings, or thoughts: He or she does not view their interlocutor as one who is "determined" to feel, act, or think in a certain way because of internal or external conditions.

Whereas many psychotherapists tend to approach problems by focusing on their interlocutor's emotional life, eliciting affect, tracing a personal history of trauma, and identifying childhood origins of current difficulties (a retrospective approach focused heavily on emotion); philosophical counselors approach ways of feeling as a starting point for understanding and examining our ways of thinking, our world views, judgments, and values, which influence the way we experience the world and the choices we make. Philosophical counselors work to elicit reasons and evidence for the ways one thinks, ask questions about what is true, good, and fair, open up different perspec-

tives for discussion, and help their clients to consider their future trajectory and range of possibilities (a prospective approach connecting thinking, feeling, and choosing).

Philosophical counselors also consider the ways in which one's personal history takes place within a wider context of social-political structures. There are times when one's distress has much to do with the power relations in which one exists or the state of injustice in the world, and the remedy is not so much about turning inward and learning to adapt to that injustice, but learning how to engage politically, and resist in active, creative, and fruitful ways that bring a sense of meaning, purpose, and agency to our lives.

There are a number of psychotherapeutic methods that are not in tension with, but have a strong kinship with philosophical approaches, as their strategies' theoretical roots can be traced back to Socratic, Stoic, Buddhist, and Existential philosophies, among others.

---

**291** | **DIWAKAR EDUCATION HUB**

In summary, philosophical counseling takes a holistic approach to the thinking- feeling-choosing-doing of the individual in a social-political world, and considers the individual's powers of examination, creative exploration, and reflective choice to be vehicles of movement and change.

### **A philosopher's training**

Philosophers have a kind of training that makes them well suited for the kind of dialogue-work described above. It is probably well known that philosophers have a knack for asking questions, clarifying ideas, challenging popular opinions, drawing connections, offering fresh perspectives, and getting involved in painstakingly careful inquiries into big questions. There are some other skills philosophers have that are particularly useful in a one-on-one counseling relationship.

- Philosophers have a trained ability to understand others' worldviews, to learn them inside and out, to explain them, compare them, evaluate their strengths and weaknesses, to analyze their benefits and challenges, and to think through their concrete implications in practice.
- Philosophers have a trained ability to listen carefully for an argument in what another person says, and to identify assumptions, implicit truth claims, and implicit values. They can trace carefully another's line of reasoning, and ask the questions needed to examine it.
- Philosophers carry around with them a toolbox of well-used critical thinking tools that allow them to recognize and remedy faulty reasoning, fallacies, and contradictions.
- Philosophers have experience with uncertainty and exploring uncharted territories of thinking without a map. They are accustomed to working without a formula, and dealing creatively with open-ended questions.
- Philosophers know how to inspire learning, activate and awaken the inner philosopher in others (Socrates' gadfly effect), and empower people to think for themselves and choose reflectively.
- Philosophers know how to learn from others, take what they say seriously, interpret their meaning, and engage in an ongoing practice of self-critique and revision of their own understanding, providing a helpful model to others who are on their own philosophical journey for the first time.
- Philosophers know how to recognize relativism, nihilism, solipsism, and other "tail-spin" positions.
- Philosophers have been trained in, and can discuss, a broad array of wisdom traditions (an-

cient and modern, eastern and western). They are also experts in a few of their favorite theories, about which they have usually taught, debated publicly with other experts, and published in a deep and thorough manner.

So, here's the punchline. A philosopher can make an excellent co-traveler on your journey into the big questions of life. A philosopher can offer a unique inquiry- experience that opens up distinct dimensions of thought, and that complements and moves beyond other forms of "talk-therapy."

# MCQs

1. Ethics is a-----science.
  - a. Positive
  - b. Negative
