**Classical Indian: Epistemology  
And Metaphysics**

## VEDIC CONCEPT OF ṚTA

It is a mode of "Being" because the gods, who are ṛtajāta, provide light, wide space, safety, security, freedom, stability, visions etc., through their association with, and by means of the power of ṛta. It is the foundation for the functions of gods and men through which these entities maintain both their relation with ṛta and the security of the cosmos as well. The sacrifice is identified with ṛta because that rite harnesses the power of ṛta by which men are able to gain the freedom, safety, security etc., which are necessary for the persistent existence in the cosmos. Sacred speech is ṛta because it is the mark of the ṛṣi; this type of speech is the result of an alaukika or supernormal vision of that which is real; Ṛṣi brings his acts and intentions into conformity with ṛta in such a way that he, like gods, is able to sieve upon ṛta as his mode of being. Therefore, ṛta may be regarded as the necessary precondition for the safety, freedom, reliability, truth, law, order of the sat which manifested through the intentions and acts of men and gods. The paper contains three sections. The first section deals with general concept of value, the second section deals with the concept of ṛta, according to the ṚG Veda and the third one deals with the concluding remarks from my own standpoint.

### Definition and Meaning of ṛta

Ṛta is related to all creatures of the universe. Ṛta may be defined as a kind of "force" or "power" which is the necessary precondition for the freedom, safety, security, truth, order, and law of the established cosmos. M. Monier-Williams derives the word "ṛta" from the root √r which means "to go, move, rise, tend upwards, to go towards, meet with, fall upon, reach, obtain, to excite, to erect, to raise." He then gives the meaning of ṛta as "proper, right, fit, apt, suitable, able, brave, honest; fixed or settled order, law, rule, sacred or pious action or custom, divine law, divine truth". (Monier-Williams, 1960: 223) Research on the word "ṛta" has led to a general consensus that it means law, order, and truth. Bergaigne, Roth, Grassmann and Ludders certainly endorse this understanding, and W. Norman Brown seems to accept it without contest.<sup>1</sup> Ṛta, the Eternal Moral Order in different Indian Systems: Indian Philosophy has often been criticized as pessimistic. But after analysis of this statement we shall find that pessimism is not final. Radhakrishnan also points out that pessimism in the Indian systems is only initial and not final.<sup>7</sup> (Radhakrishnan, 1997: 49-50) The outlook which prevents the Indian mind from ending in despair and guarantees its final optimism is what may be described as spiritualism, according to William James "Spiritualism means the affirmation of an eternal moral order and letting loose of hope.... This need of an eternal moral order is one of the deepest needs of our breast. And those poets, Dante and Wordsworth, who live on the conviction of such an order, owe to that fact the extraordinary tonic and consoling power of their verse." (James, 1995: 106-107) The belief in an 'eternal moral order' in the universe is a common character of the Indian Systems (except the Cārvāka), Vedic and non-Vedic, theistic and atheistic. It dominates the entire history of Indian philosophy. The faith in an order—a law makes for regularity and righteousness and works in the gods, the heavenly bodies and all creatures—pervades poetic imagination of the seers of ṚG-Veda which calls this inviolable moral order ṛta.

The Mīmāṃsā calls this idea apūrva, the law that guarantees the future enjoyment of the fruits of rituals performed now. This idea shapes itself into the Nyāya-Vaiśeṣika theory of adṛṣṭa, the unseen principle that controls even upon the material atoms and brings about objects and events in accordance with moral principles. Again it gradually forms itself into the general conception of karma, which is accepted by all Indian systems. The law of karma in its different aspects may be regarded as the law of the conservation of moral values, merits and demerits of actions. The law of conservation signifies that there is no loss of the effect of work done (kṛtapraṇāśa) and that there is no happening of events to a person except as the result of his own work (akṛtābhyupagama). The

law of karma is admitted by the six orthodox systems and even the Jainas and the Bauddhas.

## **The Law of Karma**

Generally, the law of karma means that all actions, good or bad, produce their proper consequences in the life of the individual who acts, if they are performed with a desire for the results thereof. This law helps us to explain particular differences in individual beings, which cannot be explained by the familiar circumstances of their lives. In this world we find that men who are born and brought under the similar circumstances differ very much in case of their developments and enjoyments in life. Some persons are happy, some suffers, some wise and some are ignorant. We see that some virtuous men suffer and many wicked persons prosper in this world. How can we explain these differences in our worldly life? We find that some of them are certainly due to various actions done by us in this present life. But many actions cannot be interpreted by reference to the works of this life. In these circumstances, provided some good or bad actions are found to produce certain good or bad effects in the present life, we have every reason to mention that all actions i.e. past, present and future will produce their appropriate results in this or another life of the agent. The law of karma is this general moral law that leads not only to the life and destiny of all individual beings, but even the order and arrangement of the natural world.

## **The Status of Karma**

According to Nyāya-Vaiśeṣika, the law of karma is under control and the guidance of God who creates the world in accordance with the law. It is regarded that the *adṛṣṭa* (i.e. the stock of merits) and demerits of karmas of the individual self, cannot by itself lead to their proper effects, for it is an unintelligent and unconscious law. It is the Supreme Being or God who controls our *adṛṣṭa* and distributes all the joys and sufferings of our life in accordance with our karma.

Systems like the Jaina, the Bauddha, the Mīmāṃsā and the Sāṃkhya advocate that the law of karma is autonomous and works independently of the will of God. These systems advocate that the source or origin and order of the world may be explained by the law of karma without the presupposition of God.

## **Limited Application of the Law of Karma**

Law of karma has a limited application to the world of actions performed with the influence of the normal passions and desires of our life. All actions, of which the motives are desires for certain gains here or hereafter, are controlled by the law. Disinterested actions (*niṣkāma karma*) do not produce any effect or bondage just as a fried seed does not germinate. Therefore, this law is applicable to the individuals who work with selfish motives and are influenced by the ordinary passions and impulses of life and hanker after worldly desires or gains. The performance of *niṣkāma karma* or disinterested actions do not produce fettering consequences and it also assists us to exhaust and destroy the accumulated (*sañcita*) effects of our past actions performed under the influence of attachment, hatred and infatuation or of interested hopes and fears and accordingly leads to liberation. With the attainment of liberating knowledge, the self rises above the law of karma and lives and acts in the state of freedom. The liberated self acts for the good of mankind i.e. for the *lokasamgraha*. But he is not bound by his karma because he is free from self-interest and all attachment.

## **Fatalism is a Misinterpretation of the Theory of Karma**

The faith in 'an eternal moral order' inspires optimism and leads man to make himself master of his own

destiny. It interprets the present wrongness of an individual as consequence of his own action and hope for a better future through the recent moral and spiritual development of himself. Hence there is every chance or reason for free will and there is a great role of personal endeavor (puruṣakāra) for individual prosperity. So determinism (fatalism) is a misinterpretation of the theory of karma. Destiny (daiva) or fate is obviously the collective force of one's own actions done in past lives. This fate can be overcome by efforts of this life, provided they are sufficiently strong just as the force of old habits of this life can be counteracted by the cultivation of opposite and new habits with firm determination.

## **The Universe as the Moral Stage and Ṛta as the Order of Phenomena**

Closely connected with this law, we may regard the universe as the moral stage, where all living beings get the dress and the part that befit them and are to act well to deserve well in future. After birth an individual gets the body, the senses, the motor organs and the environment in which he finds himself. According to the inviolable law of karma, these are endowments of nature or God. The connection between ṛta and the regular periodic movement of phenomena is indicated at ṚG.Veda. 1.123, which states that the dawns possess the same daily form (sadr̥ṣir adya; v. 8) because they follow the statute of Varuṇa (sacante varuṇasya dhāma; 8), which is the statute of ṛta (ṛtasya dhāma; v. 9). Similarly, in RV 4.51.8, the dawns begin their journey from the dwellings of ṛta (ṛtasya sadasafi.) and, thus, they do not miss the directions (na sarga usaso jarante). Ṛta, as the force which regulates the periodic movements of phenomena, is associated with the twelve-spoke wheel of the year; the wheel is called the "cakrāmṛtasya" (Wheel of ṛta; RV 1.164.11).<sup>3</sup> The regulating and stabilizing power of the ṛta is often effectuated through the rule of Varuṇa. Varuṇa drives the chariot of ṛta (ṛtasya rathyafi; RV 7.66.12); i.e., he rules by means of ṛta. His power of rule is manifested in holding things distinct yet related, and in creating definite spheres of activity. In RV 5.62.1, it is stated that Varuṇa established the ṛta by means of his own law, which means that because his sphere and mode of being is ṛta he brings all of the cosmos into conformity with ṛta. According to the same sūkta, Varuṇa established heaven and earth (pṛthivī/dyu), caused the cows (go; i.e., cows, rays of light, hymns, etc.) to stream forth, caused the plants: (auśadhi) to flourish, and made the rains (vr̥ṣṭi) fall (v. 3). In RV 7.87.1-2, it is said that Varuṇa cut out a pathway for the sun and make great channels for the days to follow. The dynamic nexus of ṛta clearly foreshadows this term's role as the force of order and stability in the cosmos. Ṛta, as the agent of freedom, creates a vast space within which for the cosmos to flourish. Within this vast space it establishes safe routes and pathways upon which individual entities may perform their functions. Thus, ṛta is manifested in the regular order of temporal and special phenomena.

**Ṛta as the Sacrifice:** ṛta is several times identified with the sacrifice (yajña) in the Veda. For instance, the sacrifice is clearly intended in RV 10.179.3 where the rsi (or Rishi) declares: "susrātam manye tad ṛtam naviyafi (well cooked I think, is this new ṛta)". ṛta and yajña are also apparently used to designate the same practice in RV 7.21 which states that Indra is roused by the sacrifice (yajña; v. 1) the gods come to the sacrifice (yajña; v. 2) and that they protect the sacrifice (ṛta; v. 5) from those who are not worthy to participate in it. The term "ṛta" is used to designate the sacrifice because it is the force which makes that rite effective. At RV 1.133.1, the sacrificer is able to purge the cosmos by burning up those demons who are against the god Indra (ubhe punāmi rodasī ṛtena druho dahāmi sam mahīranindrafi). Ṛta as the effective force of the sacrifice is clarified in connection with the god Agni. Agni the luminous god of fire who is the great envoy of the sacrifice was established among men as a friend to work according to the ṛta (RV 3.5.3). Accordingly, he makes the sacrifice agreeable to the gods by taking it to them along the path of ṛta (ṛtasya pathā namasā miyedho devebhyo devatamafi susūdat; RV 10.70.2). At RV 4.3.4, the ṛṣi implores Agni to "Be attentive to this

ourwork, the ṛta, O Agni, we who are the knower of the ṛta (tvam cin na samya agne asya ṛtasya bodhya ṛtacit svadhifi).<sup>4</sup> This injunction is followed by a series of declarations which praise the power of the ṛta: ṛtena hi sma vṛṣabhas cid aktafi pumān agnifi payasā pṛṣthyena. 5 By the ṛta certainly the bull, the male Agni, anoints with milking the mountains (v. 10). ṛtenādrim vyasanabhidantafi sāma aṅgirasō'navanta gobhifi | sunam narafi pari sadannusamavifi svarabhavajjate agnau. By the ṛta the Aṅgirasas, cleaving the mountain, opened it out. They cause their voice to resound with the cows. The heroes happily take their seats on the dawn Light appears after the birth of Agni (v. 11). This sūkta seems to say that ṛta, in the form of the sacrifice, is the fundamental force through which men and gods perform their functions in the cosmos. Those who observe, perform and maintain the ṛta and the yajña, and thereby gain access to the freedom, safety, security, stability, etc. which the sacrifice provides, are signified by several epithets in the Ṛg Veda. Agni gives special wisdom or power (medhā) to the one who is ṛtayat (who keeps the ṛta/sacrifice) in R. V. 5.27.4. All aspects of life are 'sweet' (madhu) for the ṛtayat (RV 1.90.6). Soma gives prosperity/happiness to the ṛtayat (RV 1.91.7). The sacrificer in RV 7.85.4-5, who is able to persuade the Ādityas to promote his welfare, is called ṛtacit (who knows/has intimate contact with the ṛta). The ancient fathers (pitṛ), who were ṛṣis, attained to the abode of light (svar) because they were ṛtasap 6 (who perform the ṛta), ṛtāvāna and ṛtavṛddha in RV 10.154.4.

### **Ṛta as Truth in Speech**

A close conceptual relation between ṛta and sat has been maintained. The meanings of both terms are so intertwined that it is difficult to maintain a rigid distinction between them. Thus, sat is being manifested by the establishment of the cosmos, while ṛta is the mode of being which promotes the freedom, safety security, and stability of the sat. ṛta is also closely aligned with satya—a derivative of sat. According to J. Gonda, the meaning of satya can be grasped in a variety of related ways: (Gonda, 1962: 72) satya ... may be paraphrased by "that what is real, true, essential; being in conformity with belonging to characterized by, sticking to what is really existent, reality, being, to what is verity; being essence of the universe, of nature, of (one's) nature etc.; truthfulness in mind, speech of action." Verbal truth is only one side of the concept which is much more general. A being who is satya acts in accordance with real facts and unshakable norms, with that order and truth on which the cosmos is supposed to be founded; he is true to the validity of his own nature and hence also reliable. Thus on Gonda's terms, it seems reasonable to understand the formal significance of satya as "the principle of conformity to the sat". Satya, when used as an abstract substantive is a principle as fundamental to the cosmos as ṛta. For instance, RV 10.190.1 indicates that ṛta and satya first arose from tapas (fervor/heat) and that the night (rātri) and the ocean were established after these. Similarly, RV 10.85.1 states that satya upholds the earth (satyenottabhitā bhūmifi) while the Ādityas stand secure because of the ṛta (ṛtenādityāstīsthanti). The principle of being in accordance with sat (satya) and the principle of freedom, safety, security and stability (ṛta) appear to be two fundamental preconditions for the existence of the cosmos.

### **Conclusive Remarks**

The concept of ṛta is the synthesis of images of light, wide space, safe pathways, nurturing womb, evil destroying sound etc. The term 'ṛta' is used in the specific sense in the text of the Ṛg Veda. Ṛta is a mode of being because the gods the gods, who are ṛtajāta, provide light, wide space, safety, security, freedom, stability, visions etc., through their association with , and by means of the power of ṛta. ṛta is the basis for the functions of gods and men through which these entities maintain both their relation with ṛta and the security of the cosmos. The sacrifice is identified with ṛta because that rite harnesses the power of ṛta by which men are able to gain the freedom, safety, security etc which are necessary for the persistent existence in the cosmos. Lastly, sacred speech is ṛta because such

speech is the mark of the ṛṣi (this type of speech is the result of an alaukika or supernormal vision of that which is real) who has brought his acts and intentions into conformity with ṛta in such a way that he, like gods, is able to siege upon ṛta as his mode of being. Therefore, ṛta may be regarded as the necessary pre-condition for the safety, freedom, reliability, truth, law, order of the sat which manifested through the intentions and acts of men and gods. If the Vedic literature, which includes Ṛg Veda, is the foundation of Indian thought and ṛta represents a key concept in this foundational literature, then one would expect to find that the ideas expressed in ṛta have had a direct influence on the philosophy of post-Vedic literature. The Bhagavadgītā is concerned with the significance of world order /truth/law and the order of men with the cosmos; so this document would provide a good place for testing the hypothesis that the ideas expressed in ṛta are reflected in post-Vedic philosophy. In this connection we can state that the concept of ṛta will be enriched with the discussion and investigation of the relation between Ṛg Veda and the Bhagavadgītā, and the relation between ṛta and mokṣa (liberation).

## Meaning of Value

The term “value” has different meanings in different contexts. Value is the intrinsic worth of an object. An object of better quality gets higher value. Man has two types of needs. The need for food, clothing and shelter is known as lower or basic needs. Higher needs like the need to pursue truth, goodness, beauty, self-esteem, etc., are called values. Values are inner imperatives which make us seek particular goals. Value is an abstract symbol; it does not appease our hunger. That is to say, “values” by themselves have no value, it is the reality behind them which is important.<sup>1</sup> Generally, a man or woman who has a good moral character, kind, virtuous, helping to others, sympathetic is regarded as a man of high value. He or she may be rich or poor, Brahmin or non-Brahmin or Sudra, but that does not matter. This type of person has a special regard in our society. In a society where majority gives priority to the values will naturally become a value-based society and this is urgently required for better and longer survival of human being in the world.

## Divine Realm

The **Divine Domain** or the **Divine Realm** is of a higher-order realm beyond the SkySpill Continent. It is a great domain that possesses hundreds of millions of years' worth of Legacies, physical training, martial arts, swordsmanship techniques, technical skills, arrays, all of it have been developed and honed to the extreme. It is a world reserved for the strongest of the Martial Way! The **Divine Realm** is an extremely expansive realm that encompasses all 3000 Great Worlds and billions of lower worlds within its domain.

This world had so many masters, so many geniuses, that the world was as wide as the heavens. Once one looked at the entire Divine Realm, there were truly more Ninefall masters than there were dogs, with Divine Lord masters everywhere. That broad and endless world was the Holy Land of all martial arts!

## Ascension

It is also the realm people ascend to from lower realms when they reach a certain boundary, usually the Divine Sea Realm to the Divine Lord Realm. In order for a cultivator to ascend to the Divine Realm they need the help of wardens that is stationed on each world.

Those disciples that ascended from the lower realms were usually the top masters of their own great world and correspondingly arrogant. But compared to the geniuses of the Divine Realm, they were far from being comparable.

But, in extremely rare cases, top elites would emerge from the lower realms. These elites would have limitless potential and have had great lucky chances. The lucky chances they had would be no worse than Empyrean level treasures! These inheritances were mostly the reason they could ascend into a divine dragon in the Divine Realm.

## **Environment**

The environment in the Divine Realm is much more brutal than the lower realms. Here, is the true law of the jungle. Here, strength is not everything, strength is the only thing. Here, the competition is far more intense, and the fate of those who are eliminated is also far more miserable.

Humanity's martial artists, animals' vicious beasts, plants' medicinal herbs, all of these were existences that defied the will of the heavens. They fiercely competed with each other and followed the survival of the fittest. In this extremely brutal competition, the winners would live and the losers would be used for nutrients.

## **Traveling**

The Divine Transformation realm was the boundary one needed to wander the vast Divine Realm by themselves with some semblance of safety. On a faraway tiny planet they could act as an overlord. As for a Divine Lord powerhouse, that was different. They could seek a position in a Holy Land. For instance, in an eighth-grade sect like Carefree Island, they could mix in and become an Elder.

Traveling in the Divine Realm was a great experience to any martial artist, but it was riddled with countless dangers and trials! Not just that, but to travel between great worlds – once the expenses and consumption of spirit ship energy were accounted for – required at least a million violet sun stones.

Moreover, to travel between great worlds required one to be at least a Divine Transformation realm powerhouse. This was because the spaces between the great worlds and within the great worlds were filled with robbers and killers. Murdering someone and stealing all of their possessions was a frequent occurrence. And if one were a beautiful woman, their fate would be extremely miserable. It was likely they would either be sold as a slave whore or used to cultivate and have all of their life essence sucked up.

## **Language**

It is not directly stated but the language that Divine Realm martial artists use is different compared to the languages of lower realms like the Sky Spill Continent. To lower realm mortals, the language of Divine Realm cultivators is akin to the decree of gods.

## **Martial Artists**

The martial artists of the Divine Realm would start cultivating at a young age. They took spirit pills and spirit foods from birth, and what they bathed in were medicinal baths. They lived in palaces and what they wore were array clothes. When they went out they would ride on spirit boats and visit others by passing through transmission arrays. If they wanted to train, they could visit any of the training grounds near their homes.

In the Divine Realm, one needed to be at least a Divine Sea powerhouse to go out and adventure.

Otherwise, one could die countless times. This was because there were far too many Divine Transformation realm powerhouses in the Divine Realm. Even someone whose talent wasn't all that great could still cultivate to the Divine Transformation realm. No matter how talented a Life Destruction genius was, if they ran into some garbage Divine Transformation martial artist, they would still be done for.

## **Wandering Martial Artists**

There were many wandering geniuses that stumbled into great lucky chances and were also very arrogant. Even when facing a World King level influence, they still wouldn't retreat.

They wanted to use the geniuses from the large sects as stepping stones on their martial path. It had to be said that many of these people had experienced some sort of fortuitous event in their lives, and many of them believed that they had the life of an emperor. They didn't think that they were worse than any of these World King Holy Land disciples.

But in the end, a frog in a well was still a frog in a well. Ultimately, they were far from comparing to a disciple of a World King Holy Land, let alone peak geniuses of those Holy Lands!

## **3000 Great Worlds**

Of the 3000 great worlds, every great world had an unimaginable population base and every great world also had over a hundred Holy Land level influences.

The Divine Realm had 3000 great worlds that were called primary worlds. And these were only the 3000 great worlds. Besides the 3000 great worlds there were also medium worlds and small worlds. Even these small worlds had top powerhouses. There were also countless medium and small worlds. Of course, these were only small worlds in comparison to the primary worlds. In truth, these small worlds were all as large as the world the Sky Spill Continent was on, if not larger.

### **First-Order**

- The highest ranked great worlds all had a title, and that was a first-order world also called primary worlds. Out of the 3000 great worlds, only 100 of them were considered first-order worlds.
- Not only were the first-order worlds larger but there were far more masters present on them. Moreover, many first-order worlds were occupied by Emphyreans! This was one of the implicit assessment marks of a first-order world.

### **Second-Order**

- A world like the True Martial World was a great world only inferior to first-order worlds. They were called second-order worlds and there were several hundred of them.

### **Third-Order**

- As for the Crimson Light World and Atlas World, they were considered third-order worlds. There was the greatest number of third-order worlds, over 2000 of them.

## **3600 Great Worlds**

The great worlds of the Divine Realm not only included the primary world, but also the greater space that surrounded it as well as the countless celestial bodies in this space.

The truth was that the so-called Divine Realm 3000 Worlds didn't really mean 3000. '3000' was just an empty term; the true number far surpassed 3000. Here, there were 3600 great worlds recorded, but there were many smaller worlds that weren't counted.

## **Inner Worlds**

In addition, a Divine Lord powerhouse was able to form a divine world within their bodies. This world could hold rivers, lakes, seas, deserts, grasslands, and allsorts of life could be raised within. Then, the master of this world could obtain strength from all the power of faith emanating from their inner world.

For instance, characters like Huo Highdragon and Monarch Sweetfox had divine inner worlds. If the population of this world was added together, that was also a huge number!

It was impossible to measure how vast the Divine Realm was. Even if a World King were to spend a million years wandering the cosmos, they would still find it difficult to explore even a ten thousandth of the Divine Realm.

## **Lower Realms**

Even in the lower realms, where the three thousand boundless universe referred to one billion worlds, even that one billion worlds was just an empty term. In truth, there were far, far more worlds in the lower realms than one billion worlds. The true number was immeasurable. As for the world that the Sky Spill Continent was on, the planet was over a hundred million miles wide, so this was a relatively large world that could be included in one of the billion worlds of the three thousand boundless universe. But, there were far more smaller worlds which only had a diameter of several hundred thousand miles or even several million miles.

These worlds were much smaller than the world of the Sky Spill Continent, thus they were all ignored.

Although these neglected worlds seemed small in comparison, the truth was that these worlds all had a population of several trillion individuals. If one added these innumerable worlds together, the number of lives was immeasurable.

In terms of martial artists' strength, even if all one billion worlds of the three thousands boundless universes were added together, it still couldn't compare to the tiniest corner of the Divine Realm.

## **First Order Great World**

The highest ranked great worlds all had a title, and that was a first-order world. Out of the 3000 great worlds, only 100 of them were considered first-order worlds.

A world like the True Martial World was a great world only inferior to first-order worlds. They were called second-order worlds and there were several hundred of them.

As for the Crimson Light World and Atlas World, they were considered third-order worlds. There was the greatest number of third-order worlds, over 2000 of them.

Not only were the first-order worlds larger but there were far more masters present on them. Moreover, many first-order worlds were occupied by Emphyreans! This was one of the implicit assessment marks of a first-order world.

## **Primary Worlds**

Every great world of the Divine Realm's 3000 great worlds had a central continent called the primary world. This primary world was a landmass of nearly unimaginable breadth, and was also considered the core of a Divine Realm great world. The heaven and earth origin energy here was the richest and the resources bred here were also of the highest quality. The number of people living on a primary world reached an incalculable number, the average strength of the martial artists was higher, and the inheritances they studied were also much better.

Even the common people practiced martial arts. If one walked into the marketplace of mortal nations, they would see Altering Muscle and Bone Forging realm martial artists everywhere. Even Houtian and Xiantian martial artists were relatively common.

If the foundation of people was excellent, then there would naturally be more masters and the sects would also be larger. Almost 90% of the Holy Lands were located on primary worlds.

## **Central Continents**

Within the Divine Realm, Soul World, or universes that the saints resided in, one could often see giant mainlands floating in the vast nothingness of space. These mainlands weren't like bare wooden planks, but were surrounded by layers upon layers of infinite nebulous space. From the outside, they often had the shape of ellipsoid domes, like unbelievably large eggs.

As for the nebulas surrounding these central mainlands, there were innumerable planets that dwelled within, most of them even larger than the Sky Spill Planet. From this, it could be seen just how vast the area of these mainlands was.

The Divine Realm's 3000 great worlds each had at least one such central mainland. And, without a doubt, each one of these central mainlands was the liveliest place of the entire great world. For instance, Immemorial Imperial City was situated in the central mainland of the True Martial Great World.

## **Celestial Stars**

In the universe, every celestial star represented a celestial body, coming in nearly infinite forms and shapes.

These celestial stars were large and small. Some were blazing fire stars, some were massive planets, some were giant meteors, and some were even black holes that were known as the closest existence in the universe to grandmist energy.

There were countless celestial stars, and most of them had extremely poor environments with nearly no heaven and earth origin. These were desolate stars, unsuited for the survival of mortals or martial artists.

But there were some celestial stars with had rich heaven and earth origin energy and were full of life, vibrant, with many mortals living on them. The resources they had couldn't compare with those on the primary world, but they were far superior to those of the lower realms. Amid these stars, Divine Sea masters, Divine Transformation masters, and even Divine Lord masters would emerge. There were even some stars that were developed by martial artists as their personal territories or abodes. These martial artists were often supreme elders of the Divine Realm. They kept themselves secluded from the world. But once they appeared, they would frighten an entire area. Whether it was ancient

or current times, the stars that existed in the skies of a Divine Realm primary world always had martial artists living on them and powerhouses with their own hidden abodes. Naturally, there were countless lucky chances that were passed down through time. On these stars, there were an immeasurable number of rare treasures to obtain. There were caves of ancient vicious beasts and even hidden lairs of God Beasts. If one could fully explore these stars, the wealth they would find would be endless!

Of course, even if a late Divine Lord realm powerhouse were to spend their entire life exploring these stars, they wouldn't even manage to visit 1/100,000 of them.

## **History**

For the last 10 billion years, humanity has been growing increasingly weak and our domains have been constantly encroached upon by the other two races. Now, several heaven domains that belonged to humanity have been occupied. Our fellow humans that live there have been slaughtered or turned into slaves. It's even possible that the only heaven domain still belonging to humanity is our current Divine Realm. Thus, the great war of 3.6 billion years ago concerned the survival of humanity itself. Even though there are differences between the various Empyreans, they are all able to lay down their prejudices and conflicts at the critical moment when their race is in danger and unite together against an external threat.

## **Divine Realm First Martial Meeting**

The Divine Realm First Martial Meeting is a grand event that only occurs every four or five thousand years in the Divine Realm, and that is the First Martial Meeting! It will encompass all geniuses of the Divine Realm's 3000 great worlds!

## **The centrality of the institution of yajña (sacrifice)**

The present paper attempts to discuss the nature and role of Vedic sacrifice in Vedic literature and the ways this topic is expressed by relevant commentators on the subject. Issues of Vedic practices will be discussed along with their purpose, in so taking into account the historical approach to sacrifice (yajna/ agnihotra/ homa/ agnihoma/ havan) and its evolution in time. The period covered is from the earlier era of Vedic literature, known as Samhitas period until the later era dominated by the Upanishads.

Issues of yajna practices in the present days will be addressed along with their relevance. Vedic period of Hinduism starts with the proto-historic Hinduism/ early Vedic period, (until approx. 5th c. B.C.E.) and continues into the classical period (until approx. the 5th c. C.E.) (Hinnells, 1994, pp. 194-196). The early Vedic and classical periods of Hinduism contain four layers of sacred literature namely Samhita (consisting of Rig Veda, Yajur Veda, Sama Veda and Atharva Veda) Brahmana, Aranyaka and Upanishads. The first two layers are usually referred as Karma Kanda, the section that emphasizes on action, whereas the last two layers are known as Jnana Kanda, the section that emphasizes on knowledge. The later section of Veda is seen as pertinent to the Classical period of Hinduism. Yet, most important of all is the fact that the above division is based mainly on the attitude towards sacrifice (yajna). Although the purpose of practicing yajna remains the same, the way of its performing evolved in time along with various layers of Hinduism.

Yajna in itself is to be seen as the very essence of Veda. From the early times, the ritual was understood to be the link between the human and the Divine and a vehicle towards liberation. By such a link the human could access the Divine and fulfill the very purpose of the human existence,

that being to worship the Divine as the Creator of all things. Yet, in its incipient form yajna practice was in connection with the cyclical natural phenomena particularly the seasons (ritu) and the overall order of things perceived in nature. The place of human beings within the whole system of things was attentively taken into account. In this manner, from empirical observations, the concept of Cosmic Order or Divine Order (rita) developed and the practice of yajna became gradually a rite. Vedic culture (note 1) evolved on the basis of yajna having primarily the purpose to create harmony. This harmony refers mainly to issues of nature and the place of human beings within the environment, but also to the harmony within the human body itself. Deities (gods) as principles of life, natural phenomena or psycho-social tendencies in the human were conceptually created and became instrumental to obtain the harmony looked for by the human. The archetypal and phenomenal, thought and action were integrated into a single reality and self-aware self-determination (Frawley D., p. 40) Yet, the human-Divine link played by the role of yajna was to obtain gods' favours either in the external world or in the internal (psychological) world of practitioners. The goals were to obtain benefits in the forms of good crop, cattle, good weather, progeny, good health, happiness of any kind, etc. Yet, besides the common goals during the entire Vedic period, yajna had specific characteristics pertinent to every Vedic era.

Vedic scriptures point out that sacrifice was essential from the very beginning of creation. Prajapati (Lit. 'lord of creatures'), a god having a major position in the early Veda, was described as the embodiment of sacrifice. In Br., I.2.7 (note 2) Prajapati identifying himself with the universe desires: "May this body of mine be fit for sacrifice" for the purpose of creating the world. Gradually the early Vedic pantheon emerged dominated by the fourfold godhead namely Indra, Agni, Soma and Surya. Extensive hymns were consecrated to these gods as is written in the Rig Veda (Lit. 'Veda of praise'), the most ancient sacred book of Hinduism. As offerings were done to honour somebody, the ritual was performed depending on those goals.

During the early Vedic period there were five great kinds of sacrifices namely brahmayajna, devayajna, pitriyajna, manushyayajna and bhutayajna as sacrifices to Brahman (the highest Reality), to devas, to ancestors, to human beings and to all living creatures respectively. (Satchidananda Murty K., 1993, pp. 85-86). They apply to the two manners of performing sacrifice, either the shrauta rite that was done by Vedic priests according to shruti (i.e. sacred literature of Divine revelation) rules or grihya (domestic) rite performed by a householder man in many cases assisted by his wife (patni). However the shrauta rite is much elaborated, its aims extending far beyond the purpose of a household.

The shrauta rite was particularly attentive to what were the necessary objects and how they have to be used within the sacrificial arena. Particular attention was given to how the actions were to be performed or how the participants had to behave during the time of ritualistic activities. The enclosure (vedi) of the sacrificial ground was systematically arranged in an arena suitable for that specific purpose according to what the ritualistic literature recommended. Some objects used were the woods sticks (arani or idhma) in order to help kindling the sacred fire by friction. Other objects were logs of wood (samidh) as fuel, the offering spoon as sacrificial instrument/ utensil (sruca or agnihotrahavani), the pressing-stone of soma stalks (gravan), the sacrificial vessel (camasa) holding soma and food offering, the list of objects being quite long. Within the vedi there was an area known as antarvedi surrounding the fire-pit (kunda) in which the sacrificial fire (agni) has to burn various offerings. The antarvedi area has to be strewn with sacred grass (kusha) on which water was sprinkled according to specific rules. The sacrifice/ offering/ oblation (agnihoma) was patronized by the Vedic priests (ritvija) (vide intra) in charge with putting into the sacrificial fire

articles consisting of nourishments (annahoma) like milk, clarified butter, cereals, fruits, various powders, vegetables and flowers, etc.

The basic shrauta rite involved the participation of four Vedic priests, each one having specific attributes. They were known as hotri, adhvaryu, udgatri and brahman (brahmin) each priest could have three helpers if necessary. The Vedic priests were all chanting priests. As tradition stipulates, hotri was the priest chanting the hymns of Rig Veda while performing oblation into the fire, adhvaryu was the one chanting the hymns of Yajur Veda while performing adhvara, i.e. his duties before the sacrifice itself. Udgatri priest was the one chanting the Sama Veda hymns, while brahman priest seen as the most learned was the supervisor of the entire ceremony and the one chanting the hymns of Atharva Veda. Yet, the central figure of the sacrifice was seen to be the adhvaryu priest for the fact that he was the one measuring the sacrificial ground, building all that was necessary and preparing the materials to be used like, articles of oblation, utensils, woods and water. He also used to kindle the fire for expected offerings. Thus, the adhvaryu priest's skills to perform correct his duties were of utmost importance for the sacrifice. The very success of yajna was dependant on having the right set-up before the ceremony of chanting and offering could start.

As the scriptures suggest, the ways of performing yajna was different according to the aim in sight by the sacrificer, the one beneficiary of the rite. As sacrifice could be an offering to brahma, deva, pitri, manushya or bhuta, the aims of the sacrifice itself has to be compatible with what was in their power. The shrauta rite was a personal affair between the sacrificer and the unseen Divine forces that could give to the sacrificer his objects of desires. With the completion of yajna ritual, its fruits were expected to materialize after a certain period of time, the power of the sacrifice being seen as transitory. Considering the Vedic periods of time, yajna ritual evolved, in so bringing the transformation of the Vedic ritual itself.

It is on the account of the transformation of the Vedic ritual that the Hindu tradition evolved to retain the concept of yajna in different forms. The change was mainly related to the gradual internalization of the ritual. Thus, from a rite of overt expression of much detail elaboration, the rite evolved around the human being as a central point. The internalization of the sacrifice into the microcosmic world of the human body becomes predominant during the Classical period of Hinduism dominated by Jnana Kanda. This period emphasized on knowledge as the way to obtain the same fruits that could be procured by the shrauta kind of ritual performed during the early period as above described. Thus, during the Aranyaka and especially the Upanishad periods of Vedic times, the elaborated shrauta rite lost its dominance, in so a new kind of approach to yajna taking the front stage.

The important development during the later periods of Veda was that devas (gods) descend in order to become homologous with the psycho-physiological functions of the human body. Hierophany was thus internalized within the human body in the following terms: "The organ of speech (vak) (of the sacrificer) is looked upon as Agni ('fire') (Br.,III.1.3), "the eye (cakshus) of the sacrificer is Aditya ('sun') (Br.,III.1.4) , "the vital force (prana) (of the sacrificer) is looked upon as Vayu ('air') (B4.,III.1.5), "the mind (manas) of the sacrificer is Candra ('moon') (Br.,III.1.6). The Self which was seen as of nature of Hiranyagarbha ('the golden egg') is identified in Br.,II.1.17 as being in the heart. The four Vedic priests were also internalized as Br.,III.1.3-6 points out: "speech is the hotri", "the eye is the adhvaryu", "the breath is the udgatri", "mind is the brahman". Now, the new kind of sacrificer taking the role of imago mundi is no other but the spiritual aspirant himself that strives towards the knowledge (jnana) of Brahman as the highest reality. Not only the external world finds correspondence within the aspirant's internal world, but also his internal world is reflected in the

external world (lokas) of magnifying proportions thus: "the organ of speech (vak) itself is the earth, the mind (manas) is the sky and the vital force (prana) is heaven" (Br.,I.5.4). Yet, the entire interconnectivity of macro and micro universes as seen in the Upanishads does persistently address the issue of spiritual liberation (kaivalya) by the means of knowledge.

Basically, the entire literature of the Upanishads emphasizing on knowledge of reality was conducive to kaivalya as fruit of the new approach towards sacrifice. The essence of the Upanishads are their most relevant conclusions, the four great sayings (Mahavakyas) namely: Tattvamasi, Ahambrahmasmi, Prajnanam Bramna, Ayamatra Brahma (note 3). They summarize the whole philosophical concept, in which the central figure becomes the human being. This shift of centrality is essential in order to understand what happened to the concept of yajna itself.

Not only Brihadaranyaka Upanishad but also other major Upanishads like Ishavasya, Chandogya, Katha, Kena, Aitareya, do emphasize on the knowledge of Brahman as essential to liberation. The transition of the outer yajna towards the inner yajna is suggestively described in Garbha Upanishad one of the minor Upanishads. According to it, the sacrifice could be performed by the sacrificer within one's own body that has all the necessary articles/ items and functions required by yajna of the shrauta rite.

This is how Garbha Upanishad sees the correspondence between the outer yajna and the inner yajna performed with and within the human body: "The mind and the organs of the senses become the sacrificial vessels; karmendriyas (organs of action) are the sacrificial instruments. ... In this (sacrifice), the body is the sacrificial place, the skull of the head is the fire-pit, the hairs are the kusha grass; the mouth is the antarvedi (the raised platform in sacrifice)" (Narayanasvami Aiyar K. 1979, pp.121-122). Furthermore, the above scripture goes into much detail to define the correspondence between the outer form of yajna and human physical body, its function, capacities and any qualitative experience it might have. In a total expression of the inner aspect of yajna, Garbha Upanishad concludes that the importance of the sacrifice becomes paramount: "All who are living (in this world) are the sacrificers. There is none living who does not perform yajna. This body is (created) for yajna, and arises out of yajna and changes according to yajna." (ibid., p. 122). The conclusion is that body and mind become the repositories of qualities that are consistent with the essence of the Upanishads presented in the Mahavakyas (vide supra) towards the attainment of liberation.

In practical terms liberation becomes a total experience of life in which the right mental attitude and knowledge are necessary. This fact is outlined by the concept of sacrifice known as atmarpana ('offering to Atma'). This all-encompassing concept is seen in a broad sense as the conscious attitude of a person to offer one's own actions to the Divine in order to sanctify the ordinary human existence. On these lines, the action of working with the hands becomes mudra, the gesture of praise of the Divine; the act of talking becomes japa, the uttering of sacred formulae; the act of eating becomes yajna, the offering of nutrients to the Divine; the act of breathing becomes agnihotra, the sacrifice/ consumption of the air into the act of breathing, etc.

Thus, it is not surprising that the sexual act of intercourse itself is seen as yajna. This is how Br.,VI.4.3 describes the correspondence of the bodily parts of a woman and the instrumentality of yajna: "Her lower part is the (sacrificial) altar, (her) hairs the (sacrificial) grass, her skin the soma-press. The two labia of the vulva are the fire in the middle." (Radhakrishnan S., 1997, p. 321). Although using a different terminology a much similar approach was developed in great detail in Hinduism by the concept of tantra. It becomes clear indeed that the act of union (yoga) in various forms is central to

the new approach to yajna. On these accounts the practice of yoga in itself, as union with the Divine, could be seen as performing yajna.

As the specialised literature stipulates, the yoga practice as life transforming allows somebody to aspire to the highest state of liberation known under different names, yet one word has become well-known that of jivanmukti. Thus, jivanmukta is that person who attained liberation but still manifests in a human body. Yet, the human body is not an ordinary body anymore, but is now sanctified by the yoga as an act of sacrifice. This is how Eliade (1975, pp. 199-200) writes on the qualitative experience of life as yoga that is much consistent with the idea of imitatio dei: "The ideal of yoga, the state of a jivanmukta, is to live in an 'eternal present', outside time. 'The man liberated in life' no longer possesses a personal consciousness – that is, nourished in his own history – but a witnessing consciousness, which is pure lucidity and spontaneity."

On these lines, relevant classical yoga literature presents the importance of sacrifice for the purpose of liberation. In the well-known Bhagavad Gita work, that is a book of yoga par excellence, one reads (BG, III.9): "The world is bound by action (karma), unless performed for sake of sacrifice (yajna)" (note 4).

Furthermore, "By this (yajna) we nourish the gods and the gods will nourish we; thus by nourishing one another we shall attain the Supreme goal (i.e. liberation)." (BG, III.11). In this manner the wishes of the sacrificer become fulfilled because "...the gods nourished by sacrifice shall bestow on we the enjoyments we desire" (BG, III.12). In an fundamental conclusion, yajna is seen at the basis of the creation itself because "Brahma, the Creator, in the beginning of the world created human beings together with yajna and said: By yajna we shall prosper and yajna shall fulfill all our desires." (BG, III.10).

Considering various forms of yajna and its development in time, as above described, the question of today's relevance of all forms of yajna does arise (note 5). Indeed, nowadays, mainly in India, all forms of yajna are still practiced. The shrauta rite could assemble together thousands of people to attend, each person could take a personal resolution (sankalpa), a wish sent to gods via the offerings in oblation (note 6). Yet, the domestic rite (grihya) is widely practiced in many households following the tradition within that family. Yajna in the form of yoga is popular all over the world.

Concluding this paper is to say that the sacrificial rites were performed from the dawn of Hinduism in various forms and for various purposes. The four layers of Veda outline the practice of yajna rites according to the scriptural literature at that time. The shrauta kind of ritual was very much elaborated and relied of the Vedic priests to perform the ceremony on behalf of the sacrificer. The sacrificial ground has to be set up in a proper manner, having the necessary articles and tools for the priests to start the offering into the fire along with their chanting.

In the last two periods of the Vedic era, the emphasis from the outer mode of offering shifted towards the internalization of the ritual. The gods and their expressions in the outer form of yajna were found to be in the human body itself. The Upanishads particularly point out that whatever manifests as Divine expression in the external world could be found in the internal world of a practitioner of yajna. Various correspondences were made in order to show that the Divine powers or expressions of divinity were present as potentialities in the human being. This approach was very much consistent with the teachings of the Upanishads.

Yajna evolved to be less ritualistic by a total mental attitude of surrender known as atmarpana, the offering of every action to Atma, the Divine. A systematic practical approach to yajna became yoga with its many forms and a good methodological approach towards the issue of freedom, the liberation in a spiritual sense. This form of yajna is better known than any other forms of yajna. I will conclude that the nature and role of Vedic sacrifice in its multiple forms, became integrated at the level of the present religious practices in India. It is tenable to say that by the practice of yoga in many parts of the world, yajna has acquired a worldwide recognition as a valuable spiritual inheritance for mankind.

## **The Concept of Atman or Eternal Soul in Hinduism**

Atman is the immortal aspect of our mortal existence, the individual Self, which is hidden in every object of creation including humans. It is the microcosm which represents the macrocosm in each of us, imparting to us divine qualities and possibilities and providing us with consciousness and the reason to exist and experience the pains and pleasures of earthly life.

Atman is Brahman Itself, the very Self which descends into the elements of Nature through self-projection or manifestation and participates personally in the game of self-induced illusion and pure Delight. However, bound by the senses and limited by the ego, bonds, duality and perceptual knowledge, we, the jivas, do not perceive the truth. We go out, become involved and in the process forget who we are. It is like a person who travels to distant lands under a spell and forgets his roots, identity, and homeland.

When we look around, we rarely look in. When we are deeply involved with the world, we lose self-awareness and become immersed in the task at hand. It is how Nature created our mind and body to keep us bound. "The self-existent Lord pierced the senses to make them turn outward. Thus, we look to the external world and see not the Self within us."

The Self is the silent partner in all our deeds and experiences, the observer and the indweller of all embodied beings. Its nature cannot be adequately explained or described in human language, as it is beyond the senses and the mind. "There the eyes cannot travel, nor speech nor mind. Nor do we know how to explain it to the disciples. It is other than the known and beyond the unknown."

It can only be experienced when all the sensory activity ceases to have an impact on the mind, when the mind itself is freed from the movement of thoughts and sense objects, and the torment of desires, which are the prime cause of all human activity and suffering, and subsides into quietude. The experience of the Self arises "When the mind and the five senses are stilled and when the intellect is stilled... They say that Yoga is complete stillness in which one enters that state of Oneness."

Although it is described as a flame, of the size of the thumb, which is said to exist physically between the eye brows, or psychically in the heart, its exact location is uncertain. It has no physical or mental aspect as such, other than as a mere reflection or an idea in the intelligence of the mind. However, unquestionably He exists, and He only is real. All else is false, or an illusion, which withers away, crushed by the weight of sins, decay of the world, and pressures of time.

We are told, "The adorable one is seated in the heart and rules the breath of life. All the senses pay homage to him. When He breaks out of the body in freedom from the bonds of flesh, what else remains? This Self is Supreme." We are also told, "Above the senses is the mind, above the mind the

intellect, above that is the ego and above the ego is the unmanifested cause. And beyond is Brahman, who is omnipresent and without attributes."

The ego is Atman's poor cousin, the false center, which assumes the lordship and ownership of the mind and body, whereas in actual reality it is a mere reflection, a product of illusion and a mental projection, born out of sensory experiences and the accumulation of memories and thoughts. While the basis of Atman is reality, permanence and Bliss, the nature of ego is illusion, impermanence and suffering.

The ego of a living being is permanently soaked in ignorance and gloom and needs to be rescued from eternal doom and damnation by the indwelling Atman. The ego is a false reflection of it. The Katha Upanishad explains the relative status of the two selves in this manner, "There are two selves, the separate ego and the indivisible Atman. When one rises above I, me and mine, the Atman reveals Itself as the real Self."

The Mundaka Upanishad is more explicit and poetic, "Like two birds perched on the same tree, intimate friends, the ego and the self, dwell in the same body. The former eats the sweet and sour fruits of life, while the latter looks on with detachment."

This symbolism is further expanded in this verse of the Katha Upanishad, "Know the Self as the Lord of the Chariot, body as the chariot itself, buddhi as the charioteer and mind as the reins. The senses are said to be the horses and selfish desires are the roads by which they travel. When the Self is confused with the body, the mind and the senses, they say that he appears to enjoy pleasures and suffer from sorrow."

Although Atman is located in all of us, we cannot know It or understand It adequately with our ordinary awareness. "There, no eye can penetrate, no voice, no mind. Nor do we know how to understand it or preach it." In the Kena Upanishad the teacher explains the difficulty of knowing the Self to the students in the following words, "If we think that we know the Self we know not." And the student admits, "I do not think I know the Self, nor can I say I know Him not."

In the Katha Upanishad, Yama, the Lord of Death explains to Nachiketa, "The Self cannot be known through the study of scriptures, nor through intellect nor through hearing learned discourses. It can be attained only by those whom the Self chooses." He reemphasizes the same point again elsewhere.

In the Kena Upanishad the problem is further explained and the way to reach Atman is also suggested, "The ignorant one thinks that the Self can be known by the intellect, but the enlightened one knows that He is beyond the duality of the knower and the known." Thus, intelligence may give us wisdom and discernment and pave the way, but it cannot give us the experience of pure Self. The idea which is implied or suggested in the Upanishads is that Atman cannot be realized by ordinary consciousness, when the senses are active and when the mind is unstable, and buddhi, intelligence, is under the influence of desires, delusion and duality, which interfere with the process of knowing and the discernment of truth and right knowledge. There cannot be an experience of Atman when there is the gulf of "knowing" between the knower and the known. He who knows It (as an object), knows It not really.

The mind and the senses stand between the two polarities of the knower and the known, or the

subject and object. They prevent the being from knowing and realizing Atman as its very Self. The mind is an imperfect instrument with an inherent inability to understand and discern Atman. "The truth of Self cannot come to him, who has not realized that he is the Self. His intelligence cannot reveal the Self to him, beyond its duality of subject and object."

How does one realize Atman? What is the solution, or the process by which Atman becomes self-evident? The Upanishads are clear. "The self cannot be known by a person who does not restrain himself from unrighteous ways, who does not control his senses and still his mind, and who does not practice meditation or austerity," explains Yama to Nachiketa in the Katha Upanishad. He also adds, "This awakening which we have known comes not through logic and scholarship, but from close association with a realized teacher."

However, mere association with a spiritual master may not be very helpful, unless there is an inner and deep commitment and aspiration to know the transcendental Self. "The Self cannot be known through the study of the scriptures, nor through intellect, nor through learned discourses. The self can be attained by only those whom the Self chooses. Verily to them does the Self reveal Itself." Establishing the connection between the outer and the inner worlds is neither easy nor direct and straightforward. One has to pass through many intermediate states and stages, overcome many obstacles, remove many impurities, silence many noises of the mind and body, suppress undesirable qualities and negative tendencies to reach the final goal.

In the mortal world, the Self is subject to the illusion of states. The Mandukya Upanishad informs us that the self is fourfold:

1. **The wakeful Vaishwanara**, the Universal Male (the ego),
2. **The dreaming Taijasa**, the enjoyer of subtle objects and the Lord of the luminous mind, (the astral),
3. **The mysterious Prajna**, the one who remains in deep sleep and who is the Lord of Wisdom
4. **Atman the eternal**, the incommunicable, the end of phenomena, and verily Brahman himself.

Every day, we go through these four states but we do not know who we truly are as we mistake the ego for the Self. Our minds do not have the purity or the force to know transcendental truths or the deepest truths of our own existence beyond the objective experience. The inward journey is difficult and mysterious, and we are inadequately equipped to discern the presence of the Self within us or its infinite truths. There may still be many profound truths and planes of consciousness between our wakeful and deep sleep states, which we may never know.

However, what can be said about the ultimate experience of knowing the Self? What happens when a seeker reaches there? No one seems to know clearly, or describe adequately what happens when a seeker achieves union with the Self or Brahman. From the experience of others, we understand that the state of self-realization is beyond the faculties of the human mind and cannot adequately be translated into any human language, since words, which belong to the domain of the conditioned mind, do not carry the intensity or the luminosity of transcendental truths. Mysticism itself is a vague field and mystic experiences are even vaguer.

At the same time, we know that there is a palpable secret somewhere in the recesses of our own consciousness. We know it is there because in profound moments we can feel its presence. We know we are different when we are silent and deeply contemplative. Even with all the distractions which the world offers, the delight of the Self cannot be contained forever in the secret caves of the heart.

In the expansive states of the mind, in sublime states and profound moments when we feel connected to the world or Nature, and in moments of great vulnerability when we feel lost or helpless, the joy and the love of the soul gushes forth into our wakeful mind with the thundering sounds of a wild river and wake we up to the truth of the Self.

Thus, the Self who is the eternal witness does not entirely forsake us. If we manage to express the best of human nature, if we have compassion, love, tolerance and equanimity, and if we overcome the demons of our own mind, we will increasingly feel connected to him and see the world with his eyes.

In the journey of knowing the Self, we may also need the grace of God. In the Isa Upanishad we come across a vague reference to it when a seeker prays to Brahman in the following words, suggesting the importance of devotion. "The face of truth is hidden behind a golden lid, O, Pusan, may we remove the lid so that I may see the golden Truth!" When the request is granted and the Truth, which he was seeking, manifests itself, he reaches the indisputable conclusion in a state of bliss and exclaims, "In truth I am Him."

The Self is the ultimate mystery of human life. To know it is the ultimate goal, which a person may be destined to achieve after numerous births by earning great merit. In him the cycle of creation reaches its full circle, when he discovers the Truth that remains hidden behind the golden lid. While people struggle and strive in the mortal world with vague yearnings and unfulfilled desires, a few manage to achieve the almost impossible dream of knowing who they are. And the world worships them.

### **Atma, Atman, the Eternal Soul**

"Our individual soul is the immortal and spiritual body of light that animates life and reincarnates again and again until all necessary karmas are created and resolved and its essential unity with God is fully realized."

"Our soul body was created in the image and likeness of the Primal Soul, but it differs from the Primal Soul in that it is immature. While [God] is unevolutionary perfection, we are in the process of evolving."

### **"Are Souls and World Essentially Good?"**

The intrinsic and real nature of all beings is their soul, which is goodness. All is in perfect balance. There are changes, and they may appear evil, but there is no intrinsic evil. The soul radiates love, is a child of God going through its evolutionary process of growing up into the image and likeness of the Lord. Goodness and mercy, compassion and caring are the intrinsic, inherent or indwelling nature of the soul. Wisdom and pure knowledge, happiness and joy are the intrinsic nature of the soul. Can we believe the soul is anything but goodness, purity and all the refined qualities found within super-consciousness? When God is everywhere, how can there be a place for evil?"

### **Yearning for Divine Self**

"Each one of us is God (Atman). Nobody is deprived of this. When we realize our Infinite Self, we are replete. There is nothing more to desire. But as long as we do not recognize our own Divinity, we have a yearning. It is yearning for our Divine Self but, blinded by the maya ("illusion") of the world, we mistake this yearning as desire for material pleasures."

## The Soul and Its Illusion

Atman or the soul is in reality identical with Paramatman or the Oversoul, which is One, Infinite and Eternal. The soul is, in fact, beyond the gross, subtle and mental worlds, but experiences itself as being limited owing to its identification with the Sharira or gross body, Prana or the subtle body (which is the vehicle of desires and vital forces), and Manas or the mental body (which is the seat of the mind). The soul in its transcendental state is One—Formless, Eternal and Infinite—and yet identifies itself with the phenomenal world of forms, which are many and finite and destructible. This is Maya or the cosmic illusion. The soul and its illusion."

**Avastha** (devanāgarī: avasthā) is a Sanskrit word that means "state," and it is frequently applied to the three (or four) states of consciousness described in Hinduism known as jāgrat (waking state), svapna (dreaming state) and suṣupti (deep sleep state). A fourth state of consciousness is turīya (literally, "the fourth"), which is normally regarded as a spiritual state of pure consciousness.

### Jagrat

In Indian philosophy *jāgrat* is the waking state of consciousness, with external, sensual, experience. In this state the same universe with its laws is presented to all.

H. P. Blavatsky defined it as follows: Jagrata (Sk.). The waking state of consciousness. When mentioned in Yoga philosophy, Jagrata-avastha is the waking condition, one of the four states of Pranava in ascetic practices, as used by the Yogis.

### Sushupti

In Indian philosophy *suṣupti* is the dreamless state of deep sleep, where there are no objects of which to be conscious.

H. P. Blavatsky defined it as follows: Sushupti Avasthā (Sk.). Deep sleep; one of the four aspects of Prānava. The Sushupti, or causal state [is] produced by, and through Karanopadhi, or what we call Buddhi.

### Turiya

In Indian philosophy *turīya* is a state where there is union with Brahman.

H. P. Blavatsky defined it as follows: Turīya (Sk.). A state of the deepest trance—the fourth state of the Tāraka Rāja Yoga, one that corresponds with Âtmâ, and on this earth with dreamless sleep—a causal condition. Turīya Avasthā (Sk.). Almost a Nirvânic state in Samâdhi, which is itself a beatific state of the contemplative Yoga beyond this plane. A condition of the higher Triad, quite distinct (though still inseparable) from the conditions of Jagrat (waking), Svapna (dreaming), and Sushupti (sleeping).

### Svapna

In Indian philosophy *svapna* is the dreaming state of consciousness, with internal mental experience, where everyone fashions his or her own world.

H. P. Blavatsky defined it as follows: Svapna (Sk.). A trance or dreamy condition Clairvoyance. Svapna Avasthā (Sk.). A dreaming state; one of the four aspects of Prānava; a Yoga practice.

## **Swapna Theory**

Ayurveda is a science that is completely based on its eternal and consistent principles and concepts. Even with the changing era and modernization these principles have stood their ground. The literature on some of these concepts shows significant similarity with the other oriental ancient texts like the Vedas, Puranas, Darshanas, and so on. In fact for a detailed understanding of the principles propounded in the Ayurvedic texts, the Acaryas have also advised the study of these texts. But what if the principles and concepts elaborated in these texts are obscure and mystic? What if these concepts seem to be jaded with mythology giving them a very unscientific and illogical outlook? Could they still be considered worthy of studying, to understand and explore the scientific aspect of Ayurvedic principles?

One such concept that has been shrouded with myth and philosophy and is hardly applied and evaluated on a scientific basis is 'Swapna' or dreams. The description of Swapna is found abundantly in the ancient oriental classics, specifically the Atharva Veda, Upanishadas, Puranas, Darshanas, and Ayurveda. However, with the exception of Ayurveda, its description in the other texts seems to be more philosophical. A detailed analysis of these descriptions, however, leaves a lingering thought that there could be a strong scientific indication behind this mask of mythology.

### **Aims and objectives:**

The present study was aimed for compilation of the description of Swapna (dreams) in the Indian classics and an in-depth evaluation of these concepts.

### **Materials and Methods**

- Classical texts of Ayurveda and the allied Indian sciences were scanned for references regarding dreams.
- These references were compiled, analyzed, and discussed for a thorough and in-depth understanding of the concept of Swapna.

### **Conceptual review**

The literature available could be divided into that of the Vedas, Upanishadas, Puranas, Darshanas, and Ayurvedic scriptures.

#### **Vedas**

The earliest Indian reference to dreams is in the Rg Veda (4000 or 6000 BC). In this text a nightmare is described; Rg-Veda also explains the waking dream, which is mentioned as an evil that wishes to visit one's enemies. Yet another verse tells of an incubus who bewitches a sleeping woman in her dream. References regarding Swapna are also available in the Sama Veda.

The significance of the content of the dream was particularly the subject of the sixty-eighth appendix of the Atharva Veda, composed in 1500 BC. This text organized dreams with reference to the objective, waking world – for example, according to the physical temperament of the dreamer (i.e., the Doshika dominance in the Prakriti of the person), the time of the night the dream took place, and so forth, which was very much in synchronization with the description of Swapna available in the Ayurvedic texts.

#### **Upanishadas**

By the time of the Upanishadas (700 BC) the question of the reality of dreams was approached in a more systematic way. The Mandukya Upanishada spoke of four states of the Atman; waking, that is, Jagrta, dreaming (Swapna), dreamless sleep (Supta), and the supernatural, transcendent fourth state, (Turiya) the identity with ParmAtman. Other Upanishadas including the Manduka, Katha, Brahma, Taitiryopanishada, Yogasara, Kenopanishada, Paingala, and so on added certain significant details to the outline of these four states mentioned earlier, to emphasize the importance of the soul and to understand its Karma better.

Mandukyopanishada has further given the nomenclature for the Atma in each of these stages; Jagrta, where the soul is called Vaisvanara, is the soul in wakefulness, and it enjoys gross things. Swapna, where the soul is Taijasa, sunk into its own light in the state of the dream, where it enjoys subtle things. Sushupta, where the soul Prajña, that is, it inspires man even while he has fallen into deep sleep and he enjoys mere bliss. Lastly Turiya, wherein the soul is called Atma; it is the pure self-conscious soul constituting the four dimensions of metaphysics and enjoys nothing but its own state and is tranquil in its singleness.

As per the description in the Mandukyopanishada, the Taijasa or Swapnawastha is inwardly cognitive, having seven limbs, 19 mouths, enjoying the exquisite (Pravivikta Bhujā).

The Upanishadas articulate two perspectives on dreams. The first maintains that dreams are merely expressions of inner desires. The second closely resembles the Chinese belief of the soul leaving the body and being guided until awakened. It was also thought that if the sleeper was awakened abruptly, the soul might not return to the body quickly enough and the sleeper could die.

Brihadaranyaka sees no distinction between the Atma and the objects seen in the dream and states that the spirit serves as a light for itself. It states that the Atma itself takes the form of the objects in the Swapna. In this process when the Buddhi is initiated toward seeing the dream, the form taken by the Buddhi is also adopted by the Atma, as it along with Buddhi initiates toward the dream.

In Prashnopanishada, Maharshi Pippalada states that in the Swapnawastha, the JivAtma along with the Manas and Suksma Indriyas experiences its glory.

Whatever was seen, heard, and experienced by it in the past births, is again seen, heard, and experienced by it in the dream state.

Descriptions of dreams signifying omens are also elaborately available in the Upanishadas. Chhandogya Upanishada mentions that if rites are performed for the fulfillment of a wish, the seeing of a woman in the dream at such a time is an omen of success.

In the Brahma Vaivartya Purana also Shubha Swapna are described. It is enumerated here that seeing of Brahmins, God like men, merchants, Gods guiding the path, the sun, a Sanyasin, a Brahmacharya, cows, fire, Gurus, elephants, lions, white horses, and so on, implies a good omen.

## **Puranas**

The Hindu Epics and Puranas also incorporated into their narratives many of the traditional dreams analyzed in other philosophical and medical texts.

In Valmiki's Ramayana, when Sita had been stolen by the demon Ravana and is being held captive on the island of Lanka, the ogress Trijata has such a dream that symbolized the defeat of Ravana at

the hands of Rama. Likewise the dreams of Bharata symbolizing the death of his father and that seen by Lord Hanumana also are described in detail.

In the Mahabharata the Swapna of the Kurus signifying their defeat at the hands of the Pandavas is described.

## **Darshanas**

All Astika as well as Astika Nastika Darshanas describe dreams. However, the Nastika Darshana, Charvaka do not contribute in this aspect.

Kanada defines dream-cognition as the consciousness produced by a particular conjunction of the self with the mind (Manas), in co-operation with the subconscious impressions of past experience, like recollection.

Although, Prasastapada describes Swapna as, "Swapnas are such sensations which are experienced only from the Manas, which are similar to those experienced by the external sense organs in the sleeping state when the external sense organs are inactive and the functions of the Manas are also declined, that is, it is in a Pralinawastha".

He further states three causes of Swapna; first Samskarapatava, which includes those objects or people in the environment, experienced during the day. Second, those dreams seen due to Dhatudusti, that is, the dreams which are seen due to the Doshika dominance in the Prakrti of the person. They are again divided into three according to the Vata, Pitta, and Kapha Prakrti. Finally the Adrishta dreams, which arise from an unseen agency, due to Dharmadharmas. The phenomenon of Swapnantika Jñana 'dream-end cognitions', or dreams within dreams are also described here.

## **The commentators**

of Vaisheshika Darshana namely, Prashastapada, Shridhara, Shamkara Misra, Shiv aditya, and others, also recognize the central origin of dreams, similar to the original author. Although they hold that certain dreams are produced by organic disorders within the body, they do not recognize the origin of dreams from the external sense-organs. Thus the Vaisheshikas and the ancient Naiyayikas generally advocate the presentative (i.e., that they are direct and immediate presentations of a definite and determinate character) theory of dreams.

The commentators Nyaya, Bhasarvajna, and Keshavamisra described the dream consciousness to be a kind of false recollection. Jayanta Bhatta seems to regard them as recollections of a past experience, whereas, Jagadisha adds that they are also due to the merit and demerits of his actions as well as intra-organic disorders.

Patanjali in the Yoga Darshana, also gives the description of Swapna when describing Prasanna Chitta Sthairyopaya. Texts like Yoga Vasishtha denote the whole universe to be a Swapna. It states that as the objects that are seen in the dream lie in our Hridaya, similarly the objects of the universe lie in the Hridaya of Brahma who is watching this big dream, that is, the universe, which is as false as the object seen in the dream.

The commentators on Yoga Darshana also state that the Sakshi or Atma keeps a watch over the dream, arousing mechanism, initiating, and inhibiting it.

In the Yogika physiology, these Manovaha Srotas are called the Manovaha Nadis. These are described by Dr. B.N. Seal, as "A generic name for the channels, along with centrally initiated presentations (as in dreaming or hallucination) that come to the sixth lobe of the Manaschakra." Here Dr. B.N. Seal further states according to the writers on Yoga and Tantras that, "The Manovaha Nadi is the channel of communication of the Jiva with the Manaschakra at the base of the brain. It has been stated that the sensory currents are brought to the sensory ganglia along different nerves of the special senses. However, this is not sufficient for them to rise to the level of discriminative consciousness (Savikalpajana). A communication must now be established between the Jiva (in the Sahasrara Cakra, upper cerebrum) and the sensory currents received at the Manas, and this is done by means of the Manovaha Nadi. When the sensations are centrally initiated, as in dreams and hallucinations, a special Nadi (Swapnavaha Nadi), which appears to be only a branch of the Manovaha Nadi, serves as the channel of communication from the Jiva (soul) to the Manas." These Manovaha Nadis are termed as Swapnavaha Nadis by Shamkara Misra.

In Yogvasishtha again, detailed descriptions of dreams that are seen due to Shlesma Atma, that is, when the Atma enters the channels which are filled with Shlesma and Rasadi, Annarasa are available. Furthermore, dreams that are caused due to all three Doshas (Sannipata) and activated by Vayu are also described in Yogvasishtha. These dreams seem to be more destructive and represent a more disturbed psyche.

Again descriptions of dreams wherein the Annarasa is vitiated by Mani, Mantra, Aushadha, and so on, are also seen in the above-mentioned text. This cosmic mind acts in the cosmic world in a similar manner as the individual Manas acts in the personal life of an individual. The seven stages of the cosmic mind are described in Yogvasishtha, two of which are Swapna Jagara and Jagrta Swapna.

The Mimamsakas also recognize the representative character of dreams. Kumarila Bhatta, Parthasarathimisra, and so forth, support this theory. Prabhakara regards the presentative character of dreams, but adds the theory of obscuration of memory (Smritipramosha).

Literature on the Advaita Vedanta also describes dreams, but shows difference in opinions as compared to the Nyaya Vaisesika and their explanation of dream cognition.

Vedanta Darshana also accepts the terminology 'Taijasa' for the Rajayukta Atma, which experiences the dream. Here particularly the Taijasa experiences mental states dependant on the predisposition left by the waking experiences. In this state the soul fashions its own world in the imagining of the dreams.

Shamkara has also commented on the representative theory of dreams in Shamkara Bhashya. Accepting this theory he states Swapna exists according to the nature of recollection. However, his follower Dharmarajadhvarindra, advocates the presentative theory.

The Bauddha texts also carry descriptions of the several significant dreams seen by Lord Gautam Buddha before his enlightenment, and these were corroborated by the dreams of his father and wife on the night before his departure from the palace. Again the descriptions of the dreams of Emperor Ashoka in relation to his son Kunala, also feature in the later Buddhist texts.

The interpretation of dreams to enlighten a king was a recurrent Buddhist motif. In a Kashmiri text that contains many dream adventures, a Buddhist monk interprets a king's dream in order to convert

him. Another Buddhist treatise “The questions of King Milinda” also gives an elaborate explanation of Swapna.

### **Ayurvedic texts**

The Brihatrayi, that is, Charaka Samhita, Sushruta Samhita, and Ashtanga Samgraha, along with Astanga Hridaya has mentioned Swapna. Even as each treatise has mentioned its importance as the Purvarupa, Rupam and as Arishta Lakshanas; Susruta has described specific dreams denoting the sex of the unborn child; and along with both the Vagbhatas has mentioned it for assessing the Doshika Prakrti. Charakacharya who has given an in-depth description of the Purusha or Atma, has also described Swapna as its Linga. He also states that the absence of Vaikrita Swapna is an indication of health, similar to the description among the Vikaropashamana Lakshanas, according to Sushruta. Swapnas have also been described by the other Acharyas like Sushruta and Sharangdhara, as an omen, that is, Su-Swapna and Duh-Swapna, hinting toward recovery or the Vyadhi Utpatti or deathstage, respectively. The regimen followed in case of a Duh-Swapna is also described.

Other books of the same time period like Bhela and Harita Samhita have also given the description of Swapna, especially in the context of Prakrti, Purvarupa, and Arista Lakshana. In fact in the Harita Samhita a whole chapter ‘Swapnadhyaya’ is devoted to the description of dreams.

A considerable description of Swapna, specifically in the mother, denoted the health of the child, is also seen in the Kasyapa Samhita. In the other texts like Bhavaprakasha, Swapna is described in the Garbhaprakarana, signifying the gender of the fetus, in relation to Prakriti and so on. In Madhava Nidana the description of Swapna is only pertaining to the Purvarupa of Rajayakshma.

### **Observations**

1. The concept of Swapna is elaborately explained in the Indian classics.
2. The description of Swapna is more pronounced in the Vedic, Upaniṣadic, and Darshanic literature, as well as in the Ayurvedic literature of the Samhita Kala. Later the description of Swapna in the Ayurvedic and the allied texts decreased and very less description is found in the texts other than the Brhatrayi and Laghutrayi.
3. Although this literature in the ancient classics was written thousands of years ago, it seems to be scientific in explanation even when compared to modern science, if analyzed and interpreted in depth.
4. The description of Swapna in various texts differs in terms of the outlook or the angle of analysis on the part of the intellectual scholars. Hence the description of Swapna is observed to be in accordance with the theory propounded by the scholars of that Darshanas. For example Vedanta described the world as an illusion as if in a dream, Vaiseshika exhibited the Pañchabhautika influence by stating the Dhatudushti Janya Swapna, and the like.
5. The listing of dreams as Rupa, Purvarupa, Arishta, Su-Swapna, Duh-Swapna, and so on, however, at times, seems to be lacking in logical explanation.

### **Discussion**

In the Indian as well as the western ancient traditions, the available theories of Swapna are entwined with religion and mythology; wherein, they are considered to be premonitions or messages sent by God. However, these theories, if evaluated scientifically, show a strong hint of psychotherapy, which had only been modified to easily convince the less educated god-fearing people.

The social condition at that time may have been such that science enveloped in religion and mythology was accepted better than science in its bare form.

The Vedas, Upanishadas, and Puranas elaborated tales of dreams related to the Gods and renowned men to underline the importance of dreams, especially as premonitions. All the same, dreams were ably used to prove the existence of metaphysical subjects like Atma or the illusionary aspect of the materialistic world, to the common man. Its somatic relevance was also equally highlighted, as in the AtharvaVeda, where dreams are described according to their Doshika dominancy.

The descriptions of the Dosika dreams of the Atharvaveda or Yogavasishtha is similar to that in Ayurveda. However, the physiology described by Yogavasishtha that of the Atma entering the Vatika and so on, Dosika Srotas due to which dreams are seen, seem to be a bit different to the other texts. Ayurveda emphasizes on the Atma, Manas, and the Manovaha Srotas. Acarya Caraka has stated that the Srotas through which the Manas and Dosha travel are the same and all-pervading in the Chetana Sharira, that is, in the presence of Atma. The vitiated Doṣa hence tends to block the Manovaha Srotas. In the living body, the conjunction of the Atma and Manas is inevitable, hence in the Swapnawastha the Manas loses association with the external Indriyas and bonds with the Atma. Here it seems that Manas is only replaced by Atma in the Yogavasishtha, as they both lie in close association.

The Vedas, which mainly focus on the social ethics, values, norms, and spirituality, probably meant to portray the futility of seeing a day dream, by engaging in which the person only wastes time, hence it is described as an evil.

From the above it can be inferred that the description in the Atharva Veda was primarily concerned with the subjective symbolism of dreams, or rather, with the objective results of subjective contents. Although ancient, its approach and description about dreams in relation to Doshas and the like, are very similar to the later medical texts of Ayurveda and are in synchronization with the physiological Gunas and Karmas of the Doshas.

The impact of the physical constituents of the body and the effect of the Ahara and the Vihara on dreams is highlighted by Yogavasishtha. It has described the dreams caused due to the impact of the Ahara Rasa vitiated by Mani, Mantra, and Aushadha. It also underlines the impact of the Shabda Tanmatra on the Panchabhautika Sharira, which is a principle, which acts not only in the pathology, but also in treatment modalities like Sattvavajaya and Daivavyapashraya. The stages of the Atman described by the Mandukyopanisada including Swapna, not only represents the condition of the Atman, but of the person as a whole. The person exists in these four stages itself, throughout the sustenance of Ayu; and the other three factors, that is, Sarira, Sattva, and Indriya also play a role in the causation of three of these stages, except Turiya.

The importance given to the Atman in the process of dreaming by the ancient texts is similar to the opinions of the modern psychiatrists like Velappand and Carl Jung, who identified dreams as an interaction between the unconscious and the conscious. They also assert together that the unconscious is the dominant force of the dream.

These omens depict good or bad and their interpretation changes in the Ayurvedic as well as other ancient texts, with change of tradition, culture, and place. It is actually the combination of natural

symbols, cultural restrictions, and the values of the author of the texts, which determines whether a particular dream will be interpreted as portending good or evil for the dreamer. For example, the texts on Ayurveda are primarily health-oriented and those of the Buddhist and philosophical texts are primarily Moksha oriented. To an impressive degree, they agree on what people dream about, but they often differ about whether the dream portends good or evil. The Puranas especially derive interpretations based on the situation of the dreamer.

The descriptions of dreams as good and bad omens may be the manifestation of the mental status of the person, but on the whole do not show much relevance or any scientific reasoning behind the specifications of these omens. It could probably be a list of dreams, which were seen in an exhaustive mass survey.

The Charvaka has not described Swapna as elaborately as in the other Darshanas, probably because only Pratyaksha Pramana is accepted by them; whereas, Swapna cognition and analysis requires Anumana Pramana.

The description of dreams in the Buddhist texts reflect the actual Buddhist practice, other sources corroborate the tradition that Buddhists converted many Indian kings by a combination of public debate, private counseling, and a kind of primitive psychoanalysis, of which interpretation of dreams played a major part.

## Conclusions

The descriptions of Swapna in the ancient texts including Ayurveda reflect an in-depth and methodical study. Some of the conclusions derived by the Acharyas in relation to Swapna, especially the listing of dreams according to omens and so on, seem to be derived from the analysis of physiology and pathology or a mass survey. The descriptions are given a mythological presentation only to be easily accepted by people of all intellectual gradients. Further in-depth evaluation of these descriptions could open more doors to the understanding of the physiology, pathology, and the utility of dreams.

## Cārvāka

**Charvaka**, also called **Lokayata (Sanskrit: "Worldly Ones")**, a philosophical Indian school of materialists who rejected the notion of an afterworld, karma, liberation (moksha), the authority of the sacred scriptures, the Vedas, and the immortality of the self. Of the recognized means of knowledge (pramana), the Charvaka recognized only direct perception (anubhava). Sources critical of the school depict its followers as hedonists advocating a policy of total opportunism; they are often described as addressing princes, whom they urged to act exclusively in their own self-interest, thus providing the intellectual climate in which a text such as Kautilya's Arthashastra ("The Science of Material Gain") could be written.

Although Charvaka doctrine had disappeared by the end of the medieval period, its one-time importance is confirmed by the lengthy attempts to refute it found in both Buddhist and orthodox Hindu philosophical texts, which also constitute the main sources for knowledge of the doctrine.

## Classification of Pramāṇa

Every system of Indian philosophy accepts pramāṇa as a valid knowledge. But there is a difference of opinion among all the systems about the numbers of pramāṇa. The Cārvākas accept only perception as pramāṇa. The Buddhists and the Vaiśeṣikas accept perception and inference as

pramāṇas. The Sāṃkhya and the Yogas recognize perception, inference and verbal testimony as pramāṇas. The Naiyāyikas recognize perception, inference, comparison and verbal testimony. Prabhākara Mīmāṃsakas adds presumption to perception, inference, comparison and verbal testimony. Kumārila Bhāṭṭa and the Advaita Vedāntins accept six pramāṇas, viz., perception, inference, comparison, verbal testimony, presumption and nonapprehension.

But the Jainas do not agree with the above classification. They recognize only two pramāṇas, viz., (i) pratyakṣa-pramāṇa and (ii) parokṣa-pramāṇa. All other pramāṇas come under these two types of pramāṇas. Pratyakṣa-pramāṇa is of two kinds, viz., (a) sāmvyavahārika-pratyakṣa and (b) mukhya or pāramārthikapratyakṣa. Sāmvyavahārika-pratyakṣa is of two kinds, viz., (i) sensuous and (ii) non-sensuous. It has four stages, viz., (i) avagraha, (ii) ṭhā, (iii) avāya and (iv) dhāraṇā which actually come under mati- jñāna. Mukhya or pāramārthikapratyakṣa is of three kinds, viz., (i) avadhi, (ii) manafiparyāya and (iii) kevala. Parokṣa-pramāṇa is divided into five categories which are caused by pratyakṣa-pramāṇa. Its five categories are—smṛti, pratyabhijñāna, tarka, anumāna and āgama. Now in the following lines, these two kinds of pramāṇas i.e. pratyakṣapramāṇa and parokṣa-pramāṇa and their divisions are discussed in details:

### **(a) Pratyakṣa-pramāṇa:**

The Jainas hold that the word pratyakṣa is derived from the word akṣa. Here akṣa means the self or jiva which knows all the objects in space.

Māṇikyanandi defines pratyakṣa or perception as clear or distinct (viśadam) knowledge. Prabhācandra points out that whatever knowledge is not clear, that is not called pratyakṣa, just as, inference is not clear, so, it is not pratyakṣa. So, pratyakṣa-pramāṇa means clear knowledge.

But what is this clarity of knowledge. Māṇikyanandi says that clarity means the apprehension of an object without the mediation of any other cognition or the apprehension of the objects as possessed of its distinctive character. Thus, clarity of knowledge means that knowledge which does not require any other knowledge in order to manifest its object. So, perception means clear knowledge. Inference is not clear knowledge, because it is based on the other knowledge like the vyāptijñāna. But perception is clear, because it is not based on any kind of other knowledge for manifesting its object.

Some arguments are also put by the opponents that the definition of clarity of knowledge is not true, because in perceptual knowledge like ṭhā, etc., there is found mediation of avagraha etc., and so, it cannot be called clear in the above sense. Prabhācandra replies that this argument is not tenable because avagraha etc. are produced by the operation of different sense-organs and as such they are not required for ṭhā etc. This implies that avagraha etc. are independent knowledge and do not depend on the mediation of any other knowledge. Hence, the definition of pratyakṣa as clear knowledge stands proved.

Prabhācandra, however, argues that perception does not arise from the sense- object contact. If it arises from the sense object contact, then there would be no omniscience. Secondly, if perception arises from the sense object contact, then there is no contact between the sense-organ and pleasure pain etc. because, pleasure and pain etc. are known by itself. So, pratyakṣa-pramāṇa means only the clarity of knowledge.

By this definition of perception, Prabhācandra rejects the Buddhist point of view. The Buddhists hold that when there is cognition of fire immediately after seeing smoke, then there is the vyāptijñāna in

the form of that, which has smoke, must have fire. This vyāptijñāna, though aspaṣṭa is regarded as pratyakṣa. But Prabhācandra points out that these are not perceptions, because these are aspaṣṭajñānas, whereas perception means only clear knowledge. It may be asked here what is apprehended in the knowledge of fire which arises from suddenly seeing the smoke? Is it sāmānya, i.e., generality or is it viśeṣa, i.e., a particular fire? If the knowledge is sāmānya, then that cannot be pratyakṣa, because according to the Buddhists sāmānya is not an object of perception. If the knowledge is viśeṣa, i.e., the knowledge of fire is not universal of fire but a particular fire, then there would not arise any doubt in the mind of the cogniser who apprehends the particular fire that whether this fire is from grass or from leaves? When one perceives nearby fire then one does not have any doubt. If any kind of doubt arises in case of nearby fire, then the knowledge which arises either from śabda or from a mark also will be doubtful. Then the Buddhist point of view that the knowledge of particular fire which arises from word or from a mark does not have any doubt will be fallacious. So, by seeing smoke, the knowledge of fire is not perception; it is only inferential knowledge. If one knows all smokes and all fires clearly, then nothing would be left for inference. Hence, inference will become useless. But, one cannot clearly know the knowledge of smoke and fire. So, vyāptijñāna is not perception. Thus, if the knowledge is not clear, then it is not perception.

The Buddhists, however, argue that if unclear knowledge is not perception, then this vagueness (aspaṣṭatā) will be the quality of either knowledge or object. If vagueness is the quality of knowledge, then how the object of knowledge is called vague? Vagueness of one thing cannot be attributed to another thing, because that will lead to over-pervasion. If vagueness is the quality of the object, then how can this vagueness be found in vyāptijñāna? The same difficulty arises also in the cause of clearness (spaṣṭatā). So, by vagueness and clearness of the object, one cannot know the knowledge as vague and clear. Prabhācandra replies here that clearness and vagueness are the qualities of knowledge and not of the object. Moreover, the Jainas maintain that clearness and vagueness depend on the destruction of the āvaraṇa or the veil. The destructions of spaṣṭajñānāvaraṇakarma and aspaṣṭajñānāvaraṇakarma are the causes of clarity and unclarity of knowledge. That means the knowledge which is clear is known as pratyakṣa and which is unclear is known as parokṣa.

### **Types of Pratyakṣa-pramāṇa:**

Pratyakṣa-pramāṇa is divided into two categories, viz., (i) sāmvyavahārika-pratyakṣa and (ii) mukhya-pratyakṣa. Now, the detail account of sāmvyavahārika-pratyakṣa and mukhya-pratyakṣa are given in the following:

#### **(i) Sāmvyavahārika-pratyakṣa:**

According to Māṇikyanandi, sāmvyavahārikapratyakṣa or empirical perception means that clear knowledge which is caused by sense-organs and mind and which is partial. Explaining this sūtra, Prabhācandra says that the word saṃvyavahāra means right and uncontradicted action either of the nature of pravṛtti or nivṛtti. The knowledge which is the cause of such vyavahāra or action is known as saṃvyavahāra. The perception which has the necessity of this saṃvyavahāra is known as sāmvyavahārika pratyakṣa.

From the definition of sāmvyavahārika-pratyakṣa, it is clear that it is divided into two categories, viz., arising from indriya (sense-organ) and arising from anindriya (mind). Indriyas or sense-organs are sub-divided into two categories, viz., dravyendriya and bhāvendriya. Dravyendriya are made of matter (pudgala) which possess qualities of colour, taste, smell and touch and which have been transformed into definite shapes like eye, ear etc. Bhāvendriya is of the nature of consciousness. It is of two kinds, viz., labdhi and upayoga. Labdhi means the power of the sense-organ due to which

the object is apprehended after the veils of karman is destroyed. If there is no labdhi, then the sense-organ cannot apprehend the object. Upayoga means the activity of consciousness of the self towards the object. If there is no upayoga, then the object cannot be apprehended. Thus, labdhi and upayoga are the special properties of bhāvendriya. Anindriya or mind is also divided into two categories, viz., dravyamana and bhāvamana. Hence, the clear knowledge which arises from indriya and anindriya is partial and it is called sāmvyavahārikapratyakṣa.

Some opponents hold that the sense-organ and mind are not only the causes of sāmvyavahārikapratyakṣa, but also the self, the object and light are the causes thereof. Rejecting this Prabhācandra says that the self is not only the cause of sāmvyavahārikapratyakṣa but of parokṣa-pramāṇa also. As here the extraordinary cause of pratyakṣa is accepted, so the self is not mentioned here, self being a general cause of other pramāṇas also. Regarding object and light the sūtra clearly states that objects and light cannot be the cause of cognition, being objects of knowledge like darkness. Darkness is the pratibandhaka or obstruction of knowledge due to which it is not the cause of knowledge, but the object of knowledge. So, the self, the object and light are not the causes of knowledge.

The opponents ask Prabhācandra, what is the harm if the object and light are accepted as the causes of knowledge, though they are the objects of knowledge? Then Prabhācandra replies that if the object and light are accepted as the causes of knowledge, then they would not be the objects of knowledge at the same time; just as the eye, which is a cause of knowledge and not its object at the same time. The opponents argue that by an inference it is proved that the object and light are the causes of knowledge, because knowledge is the effect of the object and light. Because, there is a relation of anvaya-vyatireka (concomitance) between knowledge and object or light. When there is an anvaya-vyatireka relation between the two things, then those two things are known together as cause and effect; just like fire and smoke. Fire is the cause of smoke, because smoke is related by the relation of anvaya-vyatireka with fire. In the same way, knowledge is related by the relation of anvaya-vyatireka with the object and light.

This anvaya-vyatireka is not a fallacious hetu, because if there are object and light, then there would be knowledge; but if there is no object and light, then there would be no knowledge. So, the object and light are the cause of knowledge, because knowledge is the effect of object and light. But Prabhācandra rejects this view. He says that knowledge is not the effect of object and light, because there is no relation of anvaya-vyatireka between them. As for example, when there is knowledge of snake in a rope, then there is not found the object of knowledge, i.e., snake, yet there is knowledge. In this example, knowledge is not the effect of object, because the object itself is absent. Again, the light is also not the effect of knowledge, because there is no relation of anvaya-vyatireka between them. As for example, nocturnal animals can see in darkness. Though there is no light, yet there is knowledge. Some kinds of perceptual knowledge are also possible in darkness, just as knowledge of taste. So, the object and light are not the causes of knowledge, because knowledge is possible in the absence of both object and light. Therefore, the object and light are not the causes of sāmvyavahārikapratyakṣa. The sāmvyavahārikapratyakṣa is caused by the sense-organs and mind.

The Jainas further hold that the sense-organ and mind are the instruments by which sāmvyavahārikapratyakṣa is known. That means, the knowledge of sāmvyavahārikapratyakṣa arise through the sense-organs and mind. The nature of the knowledge of sāmvyavahārikapratyakṣa is analyzed in term of its stages. It has four stages, viz., (i) avagraha, (ii) īhā, (iii) avāya and (iv) dhāraṇā. These four stages actually come under mati-jñāna. Among these four stages, avagraha is the first stage of

knowledge through which one catches the general features of an object after the contact of the object with the sense-organ and mind. For an example, in the stage of avagraha, a man is known simply as a man. It is divided into two types, viz., (a) vyañjanāvagraha and (b) arthāvagraha. The next stage is called īhā which means one has a desire to have the definite and specific knowledge of the object known by avagraha. As for instance, in avagraha, one knows a man simply as a man, while in the stage of īhā, he wants to know what kind of man he is, i.e., to which country he belongs etc. The third stage is called avāya which means the determinate and specific knowledge about an object. For an example, in the stage of avāya, one can get a clear knowledge about a man to be belonging to a particular place by observing some nature. The last stage, i.e., dhāraṇā means the condition of memory of the object by previous knowledge. It is because of dhāraṇā that a thing which is perceived at an earlier time is remembered at a later time. Hence, these four stages arise one after another. These four stages which arise one after another are not totally different, because the succeeding stage comes after the preceding one.

### (ii) Mukhya-pratyakṣa:

According to Prabhācandra, mukhya or pāramārthikapratyakṣa or transcendental perception means that knowledge which arises in the self directly without the help of the sense-organ and mind. It arises when the obstruction of the karmans are destroyed. In the Parīkṣāmukhasūtra it is said, mukhya-pratyakṣa is that absolutely clear, non-sensuous and infinite knowledge in which all the obstructions or veils are removed completely by some special conditions (sāmagrīviśeṣa). Explaining this sūtra, Prabhācandra says that special conditions are right faith, direct cognition, space, time etc. Among these, right faith is the internal condition, while cognition, space, time etc. are the external conditions. When all of these conditions are found as favorable, then the karmans are removed completely. After the destruction or subsidence of all the veils of karmans, there arises mukhya-pratyakṣa. Thus, after the destruction of the āvaraṇas of avadhijñāna, manafiparyāyajñāna and kevalajñāna, the resulting avadhijñāna, manafiparyāyajñāna and kevalajñāna arise. Hence, when all the veils are removed the knowledge of mukhya-pratyakṣa is known clearly.

The proof for mukhya-pratyakṣa is forwarded by Prabhācandra in the form of an inference. Thus, wherever there is clear and true knowledge, there is the destruction of all veils, just as in the case of perception of trees, which are being enveloped by clouds of mist or dust. When all kinds of dust or mist are removed the tree can be clearly perceived. So, mukhya-pratyakṣa means clear and true knowledge.

Mukhya-pratyakṣa is non-sensuous because it does not depend on mind and sense-organs. As it does not depend on mind and sense-organ it is free from all impurity. Hence, it is non-sensuous (atīndriya), perfect and infinite. Whatever knowledge is not non-sensuous, that knowledge is not independent, because it is dependent on sense-organ and mind, just like our ordinary knowledge of perception, i.e., sāṃvyavahārika-pratyakṣa which is caused by the sense-organ and mind. So, if a knowledge is not non-sensuous then that knowledge is also not mukhya.

The Jainas further hold that there are three types of mukhya-pratyakṣa, viz., (i) avadhijñāna, (ii) manafiparyāyajñāna and (iii) kevalajñāna. Firstly, it is divided into two kinds, viz., (i) sakala-pratyakṣa and (ii) vikala-pratyakṣa. Under these two kinds of pratyakṣa, avadhi, manafiparyāya and kevala come. Vikalapratyakṣa means partial knowledge. It is of two kinds, viz., avadhijñāna and manafiparyāyajñāna, while sakala-pratyakṣa means the complete knowledge. Kevalajñāna comes under this pratyakṣa. Firstly, avadhijñāna means that kind of knowledge which arises after its own veil is destroyed or subsided. Avadhijñāna is non-sensuous. It is the knowledge of limited objects

having some particular form of dravya, kṣetra, kāla and bhāva. It arises in the self without the help of the sense organs and mind. It apprehends very fine objects, such as atoms.

So, avadhi means that kind of knowledge by which one can apprehend the objects of limited form without the help of sense-organs and mind. It is of two kinds, viz., bhāvapratyaya which belongs to the gods and (b) guṇa-pratyaya which belongs to man and other beings. Manafiparyāyajñāna means the clear and definite knowledge of the thoughts of past, present and future of another's mind without the help of the sense-organ and mind. It arises after the destruction or subsidence of its own āvaraṇa. It is of two kinds, viz., ṛjumati and vipulamati. Kevalajñāna means pure, perfect and infinite knowledge. By this knowledge, one apprehends all the substances and all their qualities directly without the help of the sense-organs and mind. This knowledge arises by the destruction of its own veil (kevalajñānāvaraṇa).

After that the self attains kevalajñāna. So, kevalajñāna is pure knowledge by which one can apprehend the true knowledge of all the objects. Hence, all of these three jñāna arise without the help of the sense-organs and mind.

### **Parokṣa-pramāṇa:**

Māṇikyanandi, defines parokṣa-pramāṇa as that which is other than pratyakṣa-pramāṇa. Prabhācandra explains parokṣa-pramāṇa or indirect knowledge as unclear knowledge. That means, it is not known clearly. By an inference it is proved that the knowledge of parokṣa-pramāṇa is unclear, because it is indirect.

Whatever knowledge is not unclear, that knowledge is also not indirect, just like the knowledge of mukhya-pratyakṣa and sāmvyavahārika-pratyakṣa. So, these are not indirect. Hence, parokṣa-pramāṇa means unclear knowledge. Its five categories are—smṛti, pratyabhijñāna, tarka, anumāna and āgama.

### **(i) Smṛti-parokṣa-pramāṇa:**

Māṇikyanandi defines that the knowledge of an object which is known by earlier retention or dhāraṇā is called smṛti or recollection. It arises due to the awakening of the disposition (saṃskāra) and takes the form of "it is that". That means, recollection is the revival state of disposition of the previous perception of an object. An example of recollection is "That is Devadatta". Explaining this sūtra, Prabhācandra points out that whatever knowledge determines the real nature of an object, that knowledge is a valid pramāṇa. Just as perception, which determines the real nature of an object and so is a valid pramāṇa, in the same way, recollection also determines the real nature of an object perceived in the past. Hence, it is a valid pramāṇa. Prabhācandra also says that if smṛti is not a valid pramāṇa, then anumāna is also not a valid pramāṇa. Because anumāna is known by the recollection of vyapti-jñana. So, smṛti is a valid pramāṇa.

### **(ii) Pratyabhijñāna-parokṣa-pramāṇa:**

In the Parīkṣāmukhasūtra pratyabhijñāna or recognition is defined as that knowledge which is produced by the combination of perception and recollection.

It apprehends an object in the form: "this is that", "this is like that", "this is different from that", "this is correlated to that" etc. The examples are: this is that Devadatta"; "gavaya is like a cow"; "a buffalo is different from a cow"; "that thing in the distance is the tree" etc. From this, it is clear that recognition apprehends the knowledge of an object of identity, similarity, difference, correlation etc.

According to Prabhācandra, recognition is a distinct kind of valid knowledge, though it is produced by the combination of perception and recollection.

Recollection cannot apprehend an object of past and present simultaneously. It can only know past object. In the same way, perception apprehends only the object of present time and not of past. The knowledge of the object of past and present can be known simultaneously only by pratyabhijñāna. That means, pratyabhijñāna apprehends a present perceived object which is known in the past; as for example, "this is that Devadatta". In this example, by perception only "this" part is known, while by recollection only "that", by recognition the whole, i.e., "this is that" can be cognized. Hence, recognition means the knowledge of an object which is known jointly by perception and smṛti, i.e., recognition knows past and present objects simultaneously. So, it is a distinct kind of valid pramāṇa. He also says that upamāna-pramāṇa is included in recognition.

It is not treated as a distinct kind of valid knowledge. Because in case of upamāna also there is the combination of the knowledge of similarity and oneness and as such this is not different from recognition. So, pratyabhijñāna-pramāṇa is a distinct kind of pramāṇa.

### **(iii) Tarka-parokṣa-pramāṇa:**

Māṇikyanandi says that tarka or uha (reasoning) means the knowledge of universal concomitance or vyapti-jñāna between two things, i.e., the middle-term and the major-term in the past, present and future, which is caused by observation (upalambha) and non-observation (anupalambha) in relation to one another. It is not based upon frequent observation or infrequent observation, but it depends on the destruction and subsidence of one's karman. Observation takes the form thus: if there is the existence of major-term (sādhyā), then there is the existence of middle-term (sādhana or hetu). Non-observation points to the knowledge that when there is non-existence major-term, the middle-term also cannot exist. That means, tarka-pramāṇa arises in the form: "if this is, then that is", "if this is not, then that is not". As for instance, if there is smoke (sādhana) then there is fire (sādhyā); while if there is no fire (sādhyā), then there is no smoke (sādhana). So, tarka means vyāpti-jñāna.

Prabhācandra points out that vyāpti means inseparable relation (avinābhāva- sambandha) of sādhyā and sādhana and its knowledge is called tarkapramāṇa, which is a distinct kind of valid pramāṇa. By an inference, Prabhācandra proves that tarka is a valid kind of pramāṇa, because it is the anugrahaka (supporter) of other pramāṇa. Whatever knowledge is the anugrahaka of other pramāṇa, that knowledge is a valid pramāṇa; just like, the anugrahaka of āgama is pratyakṣa or anumāna. So, tarka is a valid kind of pramāṇa.

Other Jaina philosophers also say that tarka is a distinct kind of pramāṇa, because the knowledge of vyāpti is known by tarka-pramāṇa, it is not known by perception; because perception knows only the present object. It also cannot be obtained by inference, because without vyāpti-jñāna inference is not being possible. Therefore, reasoning or tarka is a separate means of valid knowledge.

### **(iv) Anumāna-parokṣa-pramāṇa:**

Inference or anumāna-pramāṇa means the knowledge of sādhyā or probandum or major term which is derived from sādhana or probans or middle term. That means, anumāna means that kind of knowledge which arises from hetu or sādhana. As for example, fire is inferred from smoke. Here, smoke is the middle-term or sādhana and fire is the major-term or sādhyā.

A sādhana or hetu is ascertained from its being inseparably related with the sādhyā. The knowledge of this inseparable relation or avinābhāva-sambandha of sādhyā and sādhana is called vyāpti; which is derived from tarka. Vyāpti is the main feature of anumāna. So, inference is based on universal concomitance or vyāpti-jñāna of the middle-term with the major-term.

Anumāna-pramāṇa is of two types, viz., (i) svārthānumāna and (ii) parārthānumāna. Svārthānumāna means that kind of knowledge of sādhyā which is arising from sādhana by one's own-self. That means, svārthānumāna is the knowledge of probandum which is caused by the recollection of the relationship and the knowledge of the proban by one's own-self. As for example, when one person has perceived the smoke (sādhana) in the mountain (pakṣa) and has also recollected the vyāpti-jñāna that wherever there is smoke, there is fire (sādhyā); then on the basis of that relation he says that "the mountain contains fire". Here, three parts are necessary to know svārthānumāna, viz., sādhyā, sādhana and pakṣa. Sādhyā, pakṣa and hetu are the main basis of inference. Sādhyā or major-term is that which has to be proved. Pakṣa or minor-term is that where one has to prove the sādhyā. Hetu or middle-term is that by which one has to prove the sādhyā, because there is a relation of vyāpti between hetu and sādhyā. As for example: "All the places of smoke are the places of fire. The mountain has smoke. Therefore, the mountain has fire". In the above example—sādhyā is fire, pakṣa is mountain and hetu is smoke. Parārthānumāna means that cognition resulting from a statement that refers to the knowledge of svārthānumāna. In other words, it is the knowledge of the probandum or sādhyā derived from the communication made by another person. As for instance, if a person knows the vyāpti-jñāna between sādhyā and sādhana of fire and smoke that wherever there is smoke, there is fire, he derives the knowledge that the mountain contains fire seeing smoke in the fire. From the statement of this cognition, if another person cognizes the knowledge of the sādhyā from the sādhana, then it is called parārthānumāna. Like the svārthānumāna, parārthānumāna has two parts, viz., (i) pakṣa (here it means pratijñā)—e.g., the hill is fiery and (ii) hetu—e.g., because it is smoky. But the Naiyāyikas accept five numbers of parārthānumāna. These are: (i) pakṣa or pratijñā—the hill is possessed of fire; (ii) hetu—because it is possessed of smoke; (iii) dṛṣṭānta—whatever is possessed of smoke, that is possessed of fire, like a kitchen; (iv) upanaya—the hill is possessed of smoke and (v) nigamana—therefore, the hill is possessed of fire. Of these five numbers pratijñā is āgama (tenet). Hetu is the anumāna proper, because the tenet or sādhyā can be inferred only through this hetu. Dṛṣṭānta is pratyakṣa, i.e., it is based on perception. Upanaya is upamāna because it is based on the similarity between the dṛṣṭānta and sādhyā. Nigamana is the result or conclusion that all these four are applicable to one thing only. So, parārthānumāna is known by these five avayavas. But Prabhācandra does not subscribe to this view of the Naiyāyikas and says that parārthānumāna consists only of two parts, viz., pakṣa or pratijñā and hetu. The example is not necessary for the recollection of vyāpti; because the recollection of vyāpti is known by the relation of sādhyā and sādhana. Like dṛṣṭānta, upanaya and nigamana are also not necessary, because all kinds of doubts or errors are destroyed by the knowledge of inseparable relation or vyāpti-jñāna of sādhyā and sādhana. So, for intelligent person, inference is known by the two parts, i.e., pakṣa and hetu. However, the Sūtrakāra makes some concession to the Naiyāyikas here and says that though anumāna consists of only two parts, yet the example (dṛṣṭānta), the application (upanaya) and the conclusion (nigamana) can be included in inference to convince persons of dull intellect who want to know the truth of an inference. This is done only in context of instruction and not for argumentation.

The example or dṛṣṭānta is that in which the middle term is perceived to be accompanied by the major term. The example is of two kinds, viz., (i) anvaya and (ii) vyatireka. That is called anvaya-dṛṣṭānta where the sādhana is pervaded by the sādhyā. Thus wherever there is smoke, there is fire,

as in the kitchen is an example of anvaya-dṛṣṭānta. That is called vyatireka-dṛṣṭānta where the absence of sādhanā is demonstrated wherever sādhyā is absent. Thus wherever there is the absence of fire, there is the absence of smoke, e.g., a lake. The application or upanaya is reassertion of the presence of the middle-term in the minor-term in which the presence of the major-term is to be proved. The conclusion or nigamāna is reassertion of the presence of the major-term in the minor-term. So, for dull intelligent persons, parārthānumāna consists of five parts: (i) The hill is fiery—pratiñāvacana; (ii) because the hill is smoky—hetuvacana; (iii) whatever is smoky is fiery, e.g., the kitchen—dṛṣṭāntavacana; (iv) the hill is smoky—upanayavacana and (v) therefore, the hill is fiery—nigamanavacana.

The Jainas hold that like the anumāna, hetu or sādhanā is of two types, viz., (i) upalabdhi-hetu and (ii) anupalabdhi-hetu, which are both positive and negative. The former is divided into two types, viz., (i) aviruddhopalabdhi-hetu which is positive, i.e., it proves something positive and (ii) viruddhopalabdhi-hetu which is negative, i.e., it proves something negative. Aviruddhopalabdhi-hetu is sub-divided into six categories, viz., (a) aviruddhavyāpyopalabdhi-hetu; aviruddhakāryopalabdhi-hetu; (c) aviruddhakāraṇopalabdhi-hetu; (d) aviruddhapūrvacaropalabdhi-hetu; (e) aviruddhottaracaropalabdhi-hetu and (f) aviruddhasahacaropalabdhi-hetu. Like aviruddhopalabdhi-hetu, viruddhopalabdhi-hetu is also of six kinds, viz., (a) viruddhavyāpyopalabdhi-hetu; (b) viruddhakāryopalabdhi-hetu; (c) viruddhakāraṇopalabdhi-hetu; (d) viruddhapūrvacaropalabdhi-hetu; (e) viruddhottaracaropalabdhi-hetu and (f) viruddhasahacaropalabdhi-hetu.

The later hetu, i.e., anupalabdhi-hetu is also of two types, viz., (i) aviruddhānupalabdhi-hetu which is negative, i.e., it proves something negative and (ii) viruddhānupalabdhi-hetu which is positive, i.e., it proves something positive. Again, aviruddhānupalabdhi-hetu is sub-divided into seven categories, viz., (a) aviruddhasvabhāvānupalabdhi-hetu; (b) aviruddhavyāpakānupalabdhi-hetu; (c) aviruddhakāryānupalabdhi-hetu; (d) aviruddhakāraṇānupalabdhi-hetu; (e) aviruddhapūrvacarānupalabdhi-hetu; (f) aviruddhottaracarānupalabdhi-hetu and (g) aviruddhasahacarānupalabdhi-hetu. The later viruddhānupalabdhi-hetu is sub-divided into three categories, viz., (a) viruddhakāryānupalabdhi-hetu; (b) viruddhakāraṇānupalabdhi-hetu and (c) viruddhasvabhāvānupalabdhi-hetu. Hetu or sādhanā means that which exists in the presence of sādhyā, but without the existence of sādhyā, the existence of sādhanā will not be possible. By this nature of tathopapatti and anyathānupapatti, the hetu is known.

So, hetu means that which is related with sādhyā by the inseparable relation. A question may arise here thus: what is the nature of this inseparable relation or avinābhāva? Avinābhāva means the constant regularity of sahabhāva, i.e., simultaneous accompaniment and kramabhāva, i.e., consecutive occurrence. Sahabhāva or yugapad events are those which are the co-products of the same set of causal conditions, such as colour and taste of a fruit; or which are related as vyāpya (middle-term) and vyāpaka (major term), such as śiśāmpā or aśoka tree and vṛkṣa. Kramabhāva events are those which are found in the successive occurrence of preceding and succeeding things, such as the appearance of the star Kṛttikā after Śakaṭa; or which are related as effect and cause, such as smoke and fire.

Sādhyā or major-term is to be inferred by the hetu or middle-term. Sādhyā means that which is neither known, i.e., asiddha nor contradicted, i.e., abādhita and desirable, i.e., iṣṭa. The epithet of “neither known” excludes those objects which come under doubt. The epithet of “not contradicted” has been given here to avoid the acceptance of that object as sādhyā, which is contradictory to direct perception etc. The epithet of “desirable” is given to prove that an undesirable thing cannot be an

sādhya. So, sādhya is that which has the characteristics of asiddha, abādhita and iṣṭa. From the point of view of universal concomitance, dharma itself is sādhya, because otherwise it cannot be established; whereas from the point of view of inference, dharmī together with dharma is sādhya. Dharmī is also called pakṣa. Pakṣa or dharmī is the object which is qualified to be proved by the quality of dharma. Though these two dharma and dharmī are related with sādhya, yet dharma is related with sādhya in universal concomitance, because otherwise it cannot be related with sādhya by avinābhāva relation.

### **Hetvābhāsa:**

Among the five properties of anumāna, hetu is the most important, because if hetu is not proper, then the process of anumāna will not be possible.

Faulty hetu will lead to faulty anumāna. Faulty or fallacious hetu is called hetvābhāsa. It has been mentioned that a false inference occurs due to the fault of hetu. That means, hetvābhāsa is that which appears to be as hetu but does not possess the characteristics of a hetu. There are four types of hetvābhāsa, viz., (a) asiddha, (b) viruddha, (c) anaikāntika and (d) akiñcitkara.

(a) **Asiddha-hetvābhāsa:** That hetu is called asiddha which is devoid of existence or certainty. It is of two types, viz., svarupāsiddha-hetvābhāsa and sandigdhasiddha-hetvābhāsa. Svarupāsiddha-hetvābhāsa means that which does not have existence. It means the hetu which is not proved by its very nature. The example here is: sound is changeable, because it is perceived by the eyes. Here 'perceivable by the eyes' is absent by nature in case of śabda. Sandigdhasiddha-hetvābhāsa means that hetu whose certainty is not proved. As for example, to a less intelligent person: there is fire here, as there is smoke. Here it is Sandigdha because the person confuses smoke with fog.

(b) **Viruddha-hetvābhāsa:** The hetu which is concomitant with opposite of the sādhya is called viruddha. As for example, śabda is not changeable, i.e., eternal, because it is produced. Here the sādhya is non-changeableness of śabda, while the hetu is kṛtakatva (produced). Now the hetu kṛtakatva has inseparable connection with changeableness which is opposite of the sādhya here.

(c) **Anaikāntika-hetvābhāsa:** The hetu whose existence in the vipakṣa also is not contradicted is called anaikāntika. Here two terms, viz., sapakṣa and vipakṣa are to be explained. A sapakṣa is that where the co-existence of hetu and sādhya is already established. A vipakṣa is that where the non-existence of the sādhya is already established. Hence, a true hetu cannot exist in a vipakṣa. Anaikāntika-hetvābhāsa is of two kinds, viz., niścitaṅgī and śaṅkitaṅgī. Niścitaṅgī is that whose existence in the vipakṣa is certain. As for example sound is non-eternal, because it is knowable, just like ghaṭa. Here the hetu prameyatva exists in ākāśa also which is eternal. Śaṅkitaṅgī means whose existence in the vipakṣa is doubtful, e.g., the person under discussion is not an omniscient, because he is a speaker. Here the quality of being a speaker is not contradicted by the quality of being an omniscient person.

(d) **Akiñcitkara-hetvābhāsa:** The hetu which is applied to prove a sādhya that is already proved by other pramāṇas like perception etc. As for example, sound is audible, because it is śabda. This hetu does not prove the sādhya, i.e., śrāvaṇatva, because that is established by perception itself. Prabhacāndra has merely explained the sutras dealing with hetvābhāsa, refraining from adding anything of his own. However, he has added some sub-varieties of asiddha-hetvābhāsa and anaikāntika-hetvābhāsa.

### (e) Āgama-parokṣa-pramāṇa:

The last division of parokṣa-pramāṇa is āgama. It is also known as śabda-pramāṇa. The knowledge which is produced by the word of a reliable person is called āgama-pramāṇa. He who possesses right knowledge and makes a right-judgment is said to be reliable or āpta. A reliable person is one who knows the real nature of the things and also expresses his ideas correctly. He cannot tell alie. Āgama-pramāṇa is of two types, viz., (i) laukika and (ii) śāstraḥ. Laukika-āgama-pramāṇa means that kind of knowledge which is derived from the words of reliable persons. Śāstraḥ-āgama-pramāṇa means that kind of knowledge which is known from the scriptures, i.e. the records of the truth by the omniscient beings.

## ANUMANA - INFERENCE

Vaisesika recognises only two Pramanas- perception and inference and reduces comparison and verbal testimony to inference. But Nyaya system recognises all the four Pramanas namely perception, inference, verbal testimony, and comparison.

According to Nyaya philosophy, The term anumana literally means after knowledge i.e., knowledge that follows other knowledge. It is mediate and indirect and are arranged through the medium of some mark which is called 'hetu' and bears the relation of invariable concomitance with the observed feature. The basis of the inference is invariable concomitance. The invariable relation between the hetu and the sadhya is called Vyapti. The knowledge of the qualities of the 'pakṣa' through the 'hetu' is called paramarsa. Hence inference or anumana is said to be knowledge gained through paramarsa, or in other words, the knowledge of the presence of sadhya in the pakṣa through the hetu, which is in the quality of pakṣa and is invariably related by Vyapti.

This may be explained with the help of the typical example of inference, the presence of fire on the perception of smoke. When one sees smoke on distant hill one remembers one's experience of the universal concomitance (Vyapti) between smoke and fire and concludes that there is fire on the distant hill. The character which is inferred (fire) is called sadhya; the mark on the strength of which the character is inferred is the hetu (smoke); the subject where the character is inferred is pakṣa (hill). The three terms corresponds to the major, minor and the minor terms in the Aristotelian syllogism. The following is a typical nyaya syllogism.

1. This hill has fire (pratijna),
2. Because it has smoke (hetu),
3. Whatever has smoke has fire e.g. an oven (udaharana),
4. This hill has smoke which is invariably associated with fire (upanaya),
5. Therefore this hill has fire (nigamana).

The first, the pratijna, is the logical statement which is to be proved. The second is hetu or reason which states the reason for the establishment of the proposition. The third is udaharana which the universal concomitance together with example. The fourth is upanaya or application of the universal concomitance to the present case. The fifth is nigamana or conclusion drawn from the preceding propositions. These five members of Indian syllogism are called Avayavas.

**Linga paramarsa:** The Nyaya syllogism has five terms. Among them, middle term works as a bridge between the major and the minor terms. Therefore, the middle term has main responsibility to prove a syllogism valid or invalid. How a middle term is related to major term is lingaparamarsha. There are five characteristics of a middle term-

1. It must be present in the minor term (pakṣadharmata); e.g., smoke must be present in the hill.
2. It must be present in all positive instances in which the major term is present; e.g., smoke must be present in the kitchen where fire exists. (sapakṣasattva).
3. It must be absent in all negative instances in which the major term is absent; e.g., smoke must be absent in the lake in which fire does not exist. (vipakṣasattva).
4. It must be non-incompatible with the minor term; e.g., it must not prove the coolness of fire (abadhita).
5. It must be qualified by the absence of counteracting reasons which lead to a contradictory conclusion; e.g., 'the fact of being caused' should not be used to prove the 'eternality' of sound (aviruddha).

**Hetvabhasa:**-In Indian logic a fallacy is called hetvabhasa. It means that middle term appears to be a reason but is not a valid reason. All fallacies are material fallacies. We have mentioned the five characteristics of a valid middle term. When these are violated, we have fallacies. Five kinds of fallacies are recognised.

1. Assiddha or sadhyasama- This is the fallacy of unproved middle.
2. Savyabhicara- this is the fallacy of irregular middle.
3. Satpratipaksa- here the middle term is contradicted by another middle term.
4. Badhita- It is the non-inferentially contradicted middle.
5. Viruddha- It is the contradictory middle.

According to Jainas, Tarka, Logic is the knowledge of Vyapti between pakṣa and sadhya. It depends upon the perception whether two things exist together or not in past, present, and future. Vyapti is of two kinds- Anavaya Vyapti and Vyatireka Vyapti. In the former the concomitance of two things is established. In the latter Vyapti is shown in the absence. 'where there is fire, there is smoke' is an example of Anavaya Vyapti. On the other hand, 'where there is no fire, there is smoke', exemplifies Vyatireka Vyapti. The relationship of universal accompaniment- gradual or concurrent- exists in Vyapti. This relationship is ascertained by logic (Tarka). Inference (anumana)- It is the knowledge of sadhya with the help of hetu. This inference is either svarthanumana or pararthanumana. The former is the grasp for one's own self. Hence it needs no amplification. For example, the frequent visibility of fire under smoke together suffices to convince us of their concomitance. Afterwards, when we see smoke, we infer the existence of fire also with the help of Vyapti, which is already known to us. It is, svarthanumana. In the place of smoke is pakṣa, smoke is pakṣa dharma. In svarthanumana both Vyapti and pakṣa dharma are essential. Pararthanumana is used for convincing others. So it must be more systematised and vivid. It is five-fold. In five fold Pararthanumana an inference is drawn in five sentences. These sentences are called the propositions (avayava) of inference, e.g.,

- (a) Pratijna- The hill is fiery,
- (b) Hetu- because of smoke,
- (c) Drstanta- Wherever there is smoke there is fire, such as in the kitchen,
- (e) Upanaya- The smoke, which does not exist without fire (Vyaptivisistdhum) is in the hill,
- (f) Nigamana- Therefore the hill is fiery.

Inference is twofold- (1) Svarthanumana- inference for one's own sake and (2) Pararthanumana- inference for the sake of others. The former is not expressed in the form of a syllogistic argument. The latter is a syllogism which helps to direct the mind of the listener to think in the required manner.

The validity of inference is rejected by Carvakas. Inference is said to be a mere leap into the dark. We proceed here from the known to the unknown and there is no certainty in this, though some inferences may turn out to be accidentally true. A general proposition may be true in unperceived cases. But there is no guarantee that it will hold true in even in unperceived cases. Deductive inferences is vitiated by the fallacy of *petitio principii*. It is merely an argument in circle since the conclusion is already contained in the major premise, the validity of which is not proved. Inductive inference undertakes to prove the validity of the major premise of deductive inference. But induction too is uncertain because it proceeds unwarrantedly from the known to the unknown. In order to distinguish true induction from simple enumeration, it is pointed out that the former, unlike the latter, is based on casual relationship which means invariable association or *Vyapti*. *Vyapti*, therefore is the nerve of all inference. But the Carvaka challenges this universal and invariable relationship of concomitance and regards it a mere guess work. Perception does not prove this *Vyapti*. Nor can it be proved by inference, for inference itself is said to presuppose its validity. Testimony too cannot prove it, for testimony itself is not a valid means knowledge. Secondly, if testimony proves *Vyapti*, inference would become dependent on testimony and then none would be able to infer anything by himself. Hence inference cannot be regarded as a valid source of knowledge. Induction is uncertain and deduction s argument in a circle. The logicians therefore find themselves stuck up in mud of inference.

The Carvaka position has been vehemently criticised by all systems of Indian philosophy all of which have maintained the validity of at least perception and inference. To refuse the validity of inference from the empirical standpoint is to refuse to think and discuss. All thoughts, all discussions, all doctrines, all affirmations and denials, all proofs and disproof are made possible by inference. The Carvaka view that perception is valid and inference is invalid is itself a result of inference. Carvaka Can understand others only through inference and make others understand him only through inference. Thoughts and ideas not being material objects cannot be perceived but can only be inferred.

For Vaibhashikars, inference is of two types: *Svartha* (for the self) and *parartha* (for others). In the former the *linga* is inferential, i. e., in the inference there is fire on the hill, the hill is *linga* and the fire is inferential. In it the *linga* remains in self side (*svapaksa*), just as the kitchen. The *linga* does not remain in the oppositeside (*vipaksa*), e.g., a pool of water, etc. According to Sautrantikas they are subject to inference. There are four causes of knowledge.

- (1) *Alamban*—It is the cause of external objects like jug etc, because the form of the knowledge and born due to it.
- (2) *Samanantara*—This is so called because it is only after the previous mental stage that the following stage attains consciousness.
- (3) *Adhipat*—The senses have been called as the *Adhipati Pratyaya* of the knowledge. It is the normative cause. Without the senses there can be no external knowledge even after the presence of the first two causes.
- (4) *Sahkari Pratyaya*—these are the subsidiary conditions necessary for knowledge, e.g., light, form, etc. Without which knowledge becomes almost impossible.

The knowledge of the external objects becomes possible due to the above mentioned four causes or conditions. The Sautrantikas do not admit that the external objects have no existence and all knowledge is in the consciousness. Nor do they believe like the Vaibhasikas that we know anything

by direct perception. As opposed to Vaibhasikas, the Sautrantikas maintain that we have no direct perception of the external objects but only the knowledge of their appearance. It is by the distinction in these appearances which are the basis of the knowledge. Hence they are in the mind itself, though the things which they represent as external objects are not known by their perception, but by the inference based upon the mental modifications aroused by them. This view is known as Bahyanumeyavad. It is representationalism or indirect realism.

Vijnanavadins believe that all things external to mind are mental modifications. Thus the knowledge of the external things is impossible. Hence the thing which appears to be external; should be taken as a mental concept. It can be questioned here that if the object is a mere concept of the mind why does it not appear, disappear, and change as desired. To this the Vijnanavadins reply that the mind is a mere stream in which the past experiences remain in the form of expression and whenever there is favourable condition for a certain impression the same impression manifests and results into knowledge. From the multiple point of view Vijnanavadins admit two types of knowledge - Grahana and Adhyavasaya.

Grahana is indirect and Adhyavasaya direct inference. The Vijnanavadins believe that the proof of things depends on something else. (Paratah Pramanyavada).

They made two distinctions in the empirical truth – Paratatra and Pari-kalpa.

Generally, there are varieties of inference recognised. The first is syllogistic inference which is based on perception. The second corresponds to analogical reasoning in modern logic. Such inference is called samanyatodrsta. For e.g., From the observed fact that an effect like a jar requires for its production, an agent like potter, it is concluded that the world also should have been brought into existence by a competent being God.

## **SABDA - TESTIMONY**

Sabda is defined as the statement of a trustworthy person (aptavakya) and consists in understanding its meaning. It is based on the words of trustworthy persons, human or divine. A person is trustworthy if he knows the truth and conveys it correctly. Sabda is interpreted as aptavacana. Testimony is valid if the source is reliable. It may come not only from the scriptures, but also from persons who are trustworthy (apta). Testimony is of two kinds- Vaidika and secular (laukika). The vaidika testimony is perfect and infallible because the Vedas are spoken by God. Secular testimony, being the words of human beings who are liable to error and so not infallible.

For the Jainas, sabda pramana is called Agama. It is the knowledge of a thing through the words of reliable people. A person who knows things in their true form and expresses his views correctly, is reliable and apta. He is free from prejudice. His words benefit the object which they are seeking to express. Agama is of two kinds- Laukik and Alaukik.

According to Advaita, God is the author of Veda in a special sense. It is not His work in the literal sense. Like everything else, Veda also disappears at the end of the cycle and God repeats it at the beginning of the next cycle. So far as its substance is concerned, it is independent of God, i.e., Apuruscya. According to Nyaya, God is the sole author of Veda and according to Mimamsa, Vedas are self-existent. In Advaita, we find a midway position between these two systems.

According to Ramanuja, all knowledge points to a complex or qualified object. Knowledge never

reveals anything as nirguna. According to Ramanuja, nirgunadoes not mean having no qualities at all but the absence of evil qualities. With respect to sabda , there are two points to be noted-

- (1) all sections of the Veda are equally important. There is no need to distinguish between the ritual portion and the knowledge portion as is done by Sankara.
- (2) Ramanuja gives much importance to the Agamas as to the Veda and to the Upanishads.

According to the Nyāya Philosophy, sabda (verbal testimony) is the fourth and last valid source of knowledge. 'Sabda' literally means verbal knowledge. It is the knowledge of objects derived from words or sentence. But all verbal knowledge is not valid. Thus, Nyāyikas expressed that sabda is a pramāna of valid verbal testimony.

Sabda is the instructive assertion of a reliable person. Now a question probably comes to our mind, i.e. who is a reliable person? A reliable person may be a risi, mlechha, arya who is an expert in certain matter and is willing to communicate his/her experience of it.

Example:

Suppose that a lady came to the side of a river to cross the river and can't ascertain depth of water in the river. In this case, she asked a fisherman who is fishing there that 'can I cross the river?' Since the fisherman is a local person over there and has no enmity with her replied that we can cross the river easily. Here, the word of the fisherman man is to be accepted as a means of right knowledge called verbal testimony.

## Types of Sabda

These are two different kinds of Sabda.

1. Drustārtha
2. Adrustārtha
3. Laukika
4. Alaukika

The former classification is made on the basis of objects of meaning and the later classification is based on the origin of words. Sabda deals with perceptible objects called drstārta, e.g. table is brown, grows is green etc. A sabda deals with imperceptible object is called 'adrsta', e.g. Duty is god, Truth is noble, etc.

Laukika sabda is known as secular whereas alaukika sabda is known as divine or vaidika. The Vedas are spoken by god. This vaidika testimony is divine and perfect. According to Nyāyikas, since human beings are not perfect only the words of trustworthy person can be considered as laukika sabda.

The verbal testimony is defined as that 'sentence in which the relation among the meaning of words, that is the object of its intention, is not contradicted by any other means of valid knowledge'. According to Advaita, the purport of the scriptures is Attributeless Brahman (Nirguna Brahman) which is known by scrutinizing the intention of scriptures based on six indicatory marks, they are, Introduction-Conclusion (upakrama-upasamhara), Repetition (abhyasa), Uniqueness (apurvata), Result (phala), Eulogy (arthavada) and Logical presentation (upapatti). A word can reveal its meaning in the primary sense and in cases where primary sense is unfitting, they are known by their secondary sense. Deriving the meaning of a word through its secondary implication is of three kinds, namely, Exclusive (jahallakshana), Inclusive (ajahallakshana) and Exclusive-Inclusive

(jahalajahallakshana). The identity statements (mahavakya), according to Advaita, reveals the identity meaning by the application of exclusive-inclusive implication.

According to the Mimamsa philosophy, testimony is a reliable statement uttered by a trust worthy person similar to Nyaya Philosophy. It is stated that a sentence consists of a group of words, and a word is considered as an entity which has the power to express some meaning. Testimony is a valid knowledge, which is derived from word or sentence. But all words or sentences can't be treated as testimony because all verbal expressions are not necessarily regarded as valid knowledge.

So, on the account of Mimansikas, sabda must be based on the verbal assertion of a trust worthy person who knows the truth and desires to speak the truth for the guidance of others. Verbal testimony is used as meaningful words or sentences.

The mere combination of letters or the words don't provide a valid knowledge. Therefore, words and sentences must be used in a specific sense whose meaning will be clear, as a result, it would be treated as a valid pramana.

### **COMPARISON (UPAMANA)**

It is knowledge derived from similarity. It has been defined as the knowledge of the relation between a word and its denotation. According to the Nyāya Philosophy, comparison (upamāna) is the third source of valid knowledge. The expression 'upamāna', is derived from two words, 'upa' and 'māna'. The word 'upa' means similarity or 'sādrusya' and the word 'māna' means 'cognition'. Thus, generally speaking, upamāna as a source of knowledge is derived from the similarity between two things/objects. It is a source of knowledge of the relation between a word and its denotation (what the word refers to).

Example of Upamāna:

A person does not know what a 'squirrel' is? S(he) is told by a forester that it is a small animal like rat, but it has a long furry tail and strips on its body. After some period of time, when s(he) sees such an animal in the forest, s(he) knows that it is a squirrel.

There are four steps involved in acquiring knowledge of an object in comparison (upamāna).

- First: We have an authoritative statement that a word denotes objects of a certain description.
- Second: When one observes any such objects she/he has the knowledge that it answers to the given description.
- Third: There is a recollection of the descriptive statement received from authority.
- Four/Finally: There is the resulting knowledge that, this kind of objects are denoted by the word is same.

Here, it is important to note that Buddhism (Buddhist philosophy) does not accept comparison as an independent source of valid knowledge. On their account, comparison can be reduced to perception and testimony. The Sāmkhya and the Vaisesika Philosophy believe that comparison can be reduced to inference.

Upamana is a pramana recognized by the Mimansikas as similar to Nyayikas' views. In upamana, knowledge of an object is determined by comparing it from other similar kinds of objects. Thus roughly it is treated as analogy. For example, assume a situation where a man has not seen a gavaya or a wild cow and doesn't know what it is. A forester told him that a wild cow is an animal like a

country cow but she is more furious and has big horn in her forehead. In a later period becomes across a wild cow in a forest and recognizes it as the wild cow by comparing the descriptions made by the forester. This knowledge is possible due to the upamana or comparison. Thus, upamana is the knowledge of the relation between a name and the object it denotes by that name.

### **ARTHAPATHI (PRESUMPTION)**

According to Kumarila Bhatta, valid knowledge is that which provides the experience of an unknown object, that which is not contradicted by other knowledge and which is free from other defects. The Mimamsakas uphold svatah pramanya vada or self validity of knowledge. Knowledge is valid by itself. The conditions of freedom from defects and non-contradiction being satisfied, all knowledge arises as self-valid. Coherence and self-consistency is the nature of valid knowledge. Both Prabhakara and Kumarila regard knowledge itself as Pramana or means of knowledge. Jaimini admits three Pramanas- perception, inference and testimony. Prabhakara adds two more – comparison and implication. Kumarila further adds non-apprehension.

Prabhakara and Kumarila both, admit Arthapathi as an independent means of valid knowledge. Through this Pramana we discover a fact as a result of a contradiction between two facts already known to be well established. A common example is- Devadutta does not take his food during day time. Yet he is quite strong and fat. We presume that he must be taking food at night. The assumption of Devadutta eating at night is a postulation. We have never seen him eating his food at night. Hence the knowledge gained by postulation is not perception. This kind of knowledge is a peculiar or unique kind of knowledge and it has to be considered separately. But some Indian logicians bring this Pramana under inference-disjunctive inference.

All fat persons who do not eat during day are persons who eat during night. Devadutta is a fat person what does not eat during day Therefore Devadutta is a fat person who eats during night.

### **POSTULATION (ARTHAPATI)**

This is a unique source of valid knowledge upheld by the Mimamsikas. In other words, the Mimamsikas expressed arthapathi as a valid method of cognition. The expression “arthapathi” is a combination of two words namely ‘artha’ and ‘apatti’.

The term artha means fact and apatti means ‘kalpana’ which is understood as ‘supposition’ in English. Thus, etymologically speaking, arthapathi is that knowledge which resolves the conflict between two facts. It entails a presupposition which solves the problem that occurred between two facts.

Arthapathi is the assumption of an unperceived fact in order to reconcile two apparently inconsistent perceived facts. When a known fact can't be accounted without another fact, we have to postulate the existence of third fact. The valid and justified knowledge of the third fact is known as arthapathi.

For example, Devadatta is a fat man by fasting in the day. In this proposition we find two facts. One, Devadatta is a human being alive and he is fat. Second, he is not eating in day time. In order to resolve this conflict, i.e. how a person will be fat and not eating anything in day time, we postulate the existence of third fact, i.e. he must be eating in the night. Another example, “John is living and who is not in home”. The problem observed here is how John alive and is not found in his home. To resolve this conflict, we postulate the fact, i.e. he may be staying in a rented house outside his home. Thus, postulation or presumption is a valid source of knowledge.

It is presumption of an explanatory fact (upapadaka) from knowledge of the thing to be explained (upapadya). The knowledge of the thing to be explained is the instrument, and the knowledge of the explanatory fact is the result. This is explained by the well-known example of 'Devadatta'. Devadatta does not eat during the day time, he is fat, these are known facts. If one does not postulate that 'Devadatta eats at night' the seen fact remains unexplained. Postulation, according to Advaita, also proves falsity of the world. The scriptural statement 'the knower of self transcends sorrow' reveals falsity of world by application of postulation. Here, the word 'sorrow' indicates bondage which can be removed by self-knowledge, since the statement says 'knower of self'; if the falsity of bondage is not postulated then removal of bondage by knowledge cannot be said. Hence, bondage or world as false is known by postulation. In postulation, we presume something present elsewhere; there cannot be anything else to arrive at Brahman by postulation.

### **ANUPALABDHI (NON-APPREHENSION)**

Anupalabdhi is the immediate knowledge of the non-existence of object. Kumarila admits this but Prabhakara rejects it. It is related to the category of abhava. For e.g., an umbrella which is expected to be seen in a particular corner of a room is not seen there. We know about the non-existence of the umbrella through a separate Pramana, anupalabdhi. Nyaya, though it accepts non-existence as a category has no separate Pramana to understand it. According to them, the non-existence of an object can be known by perception itself as in the case of perceiving the bare floor. But according to Mimamsa since there is no sense object contact, we require a new Pramana to know the non-existence of an object. This is a unique feature of Mimamsa epistemology.

This is an independent source of valid knowledge subscribed by the Mimamsa Philosophy. Non-apprehension is the immediate knowledge of the non-existence of an object. An object doesn't exist in a particular place and a particular time. But it exists elsewhere. To perceive the non-existence of that particular object in a given situation/place is known as anupalabdhi.

For example, 'there is no book on the table'. Here, an individual does not perceive the book directly through his/her sense organs. But the knowledge of the absence or non-existence of the book on the table arises because of the non-perception of the perceivable object. The absence of an object from the situation in which it should be available is said to be its non-existence. And, to possess the knowledge of non-existence of objects in an existence form is called as anupalabdhi.

The means of valid knowledge known as non-apprehension is the extraordinary cause of that apprehension of non-existence which is not due to knowledge as an instrument. A thing can be known by non-apprehension which has the capacity to be apprehended at a different time. For instance, one can understand the absence of a pot in a place, since pot as an object is apprehended previously or at a later period. Here, non-existence of a thing is known and Brahman being ever-existent (Sat) it is never available for non-apprehension.

### **Consciousness as epi-phenomenon**

"Conscious will is a symptom, not a cause; its roots... are invisible to it... material" George Santayana, *The Realm of Matter* (1930) "A disgrace... more awful than dualism" (Ted Honderich, *Philosopher – A Kind of Life*, 2001, pp.247, 278); "a dreaded relic" (Daniel C. Dennett, *Brainchildren*, 1998, p.65). These are just some of the epithets thrown at any position doubting the potency of conscious will. After all, don't we clearly consciously decide to do something, and then do it? Our conscious will certainly seems to be the cause of our subsequent actions. Yet this piece of common sense is

denied by epiphenomenalism, one of the classic theories in the philosophy of mind.

Spanish/American philosopher and essayist George Santayana (1863-1952), however, saw conscious will as only a symptom – the expression of the underlying activity of the brain. Consciousness is a phenomenon arising from and ‘sitting above’ the brain’s action – an epiphenomenon. Consciousness is caused by, but not itself the cause of, the changes effected by the brain.

There is a clear statement of epiphenomenalism towards the end of Thomas H. Huxley’s address to the British Association for the Advancement of Science in Belfast, 1874: “all states of consciousness in us, as in [brutes], are immediately caused by molecular changes of the brain-substance. It seems to me that in men, as in brutes, there is no proof that any state of consciousness is [itself] the cause of change in the motion of the matter [brain] of the organism.”

(T.H. Huxley, On the Hypothesis that Animals are Automata) I believe neuroscience is steadily accumulating detailed evidence to justify Huxley’s foresight – especially the close associations seen between scanned images of brain events and subjective experiences. Making straightforward extrapolations from ideas implicit in current brain science, we can extract two propositions which may be considered the two equally-important axioms of epiphenomenalism, and which together formulate it: Axiom 1. Every conscious state is determined by a simultaneous brain state. Axiom 2. Every brain state evolves solely in accordance with physical law.

Axiom 1 asserts that all the contents of a conscious state, however complex, are what they are because of the state of the brain. This is not to be thought of as an instance of ‘efficient causation’ in the Aristotelian sense – where the cause precedes the effect – but rather, of Aristotle’s ‘material causation’, where the effect, in this case, the experience, appears simultaneous with its material cause, in this case, the state of the brain.

Axiom 1’s hypothesis of psychoneural correlation was stated by the physicist John Tyndall in 1868 (for more information see my piece ‘John Tyndall’s Materialist Philosophy’ in Ethical Record, Vol 109, 4, 2004). The correlation is many-one, in that many slight variations in brain state could produce the conscious mind state – it is unlikely that the numerous differences at the smallest physical levels, within atoms, would make any difference to brain behaviour, and so what we consciously experience.

Axiom 2 asserts that nothing will take place in the brain which is not in conformity with the laws of physics, which Tyndall again supposed. This axiom is now sometimes referred to as ‘the causal closure of the physical’. It excludes the intervention into the physical realm of any non-physical entity (eg, a soul) and implies that the cause of each brain state is in practice the prior physical state of the brain. Axiom 2 is valid whether physics concludes that causality is deterministic (each state of the universe, that is, of everything in it, being the necessary consequence of its immediately previous state), or whether it confirms the indeterminism in current quantum theory. Quantum randomness is probably too small-scale to cause arbitrary change to the groups of neural switches on which brain action depends, so the brain is de facto deterministic.

In asserting that consciousness is dependent upon the brain, epiphenomenalism is a natural outcome of the materialist tradition in philosophy. Although by adding consciousness it specifies two attributes of matter, it is misleading to classify it as a form of dualism, because it doesn’t propose two entities with independent existence, nor two sources of efficacy.

Matter's two properties or attributes are therefore:

a) Physical: the unified entity of space-time matter which constitutes the substance of the universe. Physical science, including chemistry and neuroscience, is charged with discovering the nature of the physical world and the laws it follows. Since the time of Galileo, no physics textbook has needed to include consciousness in the equations it expounds; current neuroscience would not be satisfied to take a 'thought' or a 'sensation' as the efficient cause of a brain event: it seeks instead for the neural (physical) process underlying them.

b) Conscious: an attribute which occurs automatically in human and possibly in animal brains when a certain (presently unspecifiable) neural organisation is established. When this occurs, the conscious content is immediately and certainly known to its subjects – and solely to them, because its content is nothing other than their subjectivity. Consciousness is real but not 'substantial' in the philosophically technical sense, as it cannot exist alone, that is, without that small portion of the space-time-matter world in the brain with which it is co-extensive.

Although correlatable with brain states, the contents of conscious awareness – all sensations, feelings and thoughts, including self-consciousness – are not, as many physicalists' claim, identical to brain substance: "consciousness is not cells" is how Ted Honderich puts it. Theorists who do assert a 'mind-brain identity' hope thereby both to dissipate the mystery of consciousness by asserting that it just is the physical brain, and thus guarantee consciousness a causal role. Epiphenomenalism denies this identity, asserting that the physical brain alone is responsible for the consciousness it generates, and for subsequent brain events. Mind-brain identity theorists maintain that consciousness is causal by analogy with the causal role of the temperature of a gas, which can be mathematically proved to be identical to its atoms' average kinetic energy. Indeed, solid butter is caused to melt by raising its temperature, which turns out to be identical to the process of increasing the kinetic energy of its atoms, but no means are available to prove that consciousness is necessarily identical to neural events. Thus unlike identity theorists, epiphenomenalists can conceive of the logical possibility (in another world) of creatures physically identical to us but lacking sentience: zombies.

## **Animal Choices**

Unlike a plant, an animal can move about, and therefore has to incorporate a mechanism for making decisions about which way to go. A fly may spot a drop of water, alight near it to take a sip, and then fly off. Unless the Jains are right, insects are not conscious (that is, they can react to the world, but they have no contents of consciousness: there is nothing it is like to be a fly). Nevertheless, we find it quite easy to be anthropomorphic about them. We can say the fly was thirsty, it saw the water, chose to alight because it desired a sip, and took off satisfied. We have spattered the account with conscious intentions, while knowing that neurologists could give a purely physiological account of how the fly accomplished its objective without invoking 'insect conscious purpose' or 'fly freewill'.

If we see this account of the fly's behaviour as reflecting the pattern of human projects, while realising that it was brain physiology that did the work, we risk becoming an epiphenomenalist. Of course human reasoning is considerably more complex than the fly's, comparing many more factors whose strength we vaguely feel.

The epiphenomenalist sees the process of voluntary action as follows:

a	.....	b	.....	c	stream of conscious states: epiphenom ena
↑		↑		↑	
A	⇒	B	⇒	C	brain states [⇒ = physical cause, such that A causes B, etc]
0	.....	2	.....	4	seconds

Thus a brain state A, having received a nerve signal that one's throat is dry, gives rise to a simultaneous conscious experience a, the sensation of dryness, coupled with the desire to drink water. A unconsciously initiates (⇒) activity that evolves into brain state B, which gives rise to b, the satisfactory feeling produced when succeeding in one's freely chosen aim, lifting a glass to drink. Hitting no impediment in raising the glass and sipping the water, B evolves into C, the brain state resulting from a fresh signal from the throat. C gives rise to c, the sensation of having slaked one's thirst.

Note that the subjective experience of carrying out a decision to drink (a..b..c) is perfectly compatible with that decision's physical correlates (A ⇒ B ⇒ C) being an integral part of the physical world's causality. (The brain's interaction with the rest of the world has been omitted for simplicity.) It's plausible, but an error, to think that any intention or volition enters as a link in the chain of physical causation – that a physical brain event causes a conscious event, which then causes a further physical event, as if we had A ⇒ a ⇒ B. But as Huxley said, "the feeling we call volition is not the cause of a voluntary act, but the symbol of that state of the brain which is the immediate cause of that act." (Collected Essays Vol.I, 1894). The author of the Bhagavad Gita seems to share that insight: All things are everywhere by Nature wrought In interaction of Nature's qualities.

The fool, cheated by self, thinks, "This I did" And "That I wrought". If the two Axioms are true, our undoubted effect on the world is not accomplished by a conscious self or 'free will' acting by magically originating a sequence of brain events. The I that thinks (in 'cogito ergo sum') is therefore perhaps best regarded as the label our brain's language programme uses when it refers to itself, and not, as Descartes supposed, an independent source of change in the brain. We are causal agents in the world by virtue of being physical beings. Our nervous system has evolved to manage our practical animal needs without our consciously knowing the details. We can work to achieve the future conscious states we desire and diminish the undesirable states. To this end, adapting Friedrich Engels, we shall find that the 'knowledge of necessity', ie, knowledge of the physical laws operating in the world, is a condition of our success.

Epiphenomenalists proclaim the supreme importance of consciousness while accepting its total impotence.

### Some Objections to Epiphenomenalism

1. We have free will, showing that consciousness exerts control over brain activity. The term 'free will' is unfortunately used in two distinct senses, leading to interminable wrangles. I will refer to them as the Primary and Secondary senses.

The Primary Sense: Free will in the libertarian sense alleges we possess a special faculty, the 'will', capable of initiating actions from various alternatives. No doubt there is in the brain (or mind) a

continual jostling for dominance amongst the contenders. Presumably, the role of the 'free' will is to choose between the alternatives and select one action. On what basis is this done? Unless by pure chance (which the libertarians dislike because they discern, rightly, that this eliminates moral responsibility from the act), how can this act of will not automatically select whatever is the strongest motive at that moment, or the argument with the greatest weight? How can it fail to be determined by what one has become and wants at that moment? Perhaps the libertarian pictures free will as a homunculus with free will whose free will is itself a smaller homunculus with free will whose... In fact, the Russian doll 'solution'.

Because the libertarian doctrine of free will rejects both the possible physical processes for events or thoughts – the causal/deterministic, and its negation, the random/indeterministic – it is beyond the realm of logic to which even the gods (say the theologians) are confined. Libertarian free will is bogus. The neuroscientist Benjamin Libet conducted experiments demonstrating that the brain prepares unconsciously what we are going to think and will before we consciously think and will it. He believed that at the penultimate moment, consciousness could veto any decision – thereby, he said, demonstrating free will in action. However, determinism has never meant our opinions cannot change; and according to Axiom 1, any such 'second thoughts' will also have been generated by their fluctuating neural basis. Such thoughts are thus an example of the secondary, but more common, sense of the term 'free will': The Secondary Sense of free will is compatible with determinism. An epiphenomenalist contends that those who claim that free will is compatible with determinism are using the term 'free will' simply as a description of the conscious sensation of choosing accompanying a successful voluntary act. But to be effectively realised, the sensation of free choice a..b..c requires the determinism of  $A \Rightarrow B \Rightarrow C$ .

The sensation of acting freely, according to one's own desire, is of course highly valued – unlike the sensation of being coerced. The cashier who hands cash to an armed robber can credibly say, "I acted under duress and not of my own free will." He wants the court to understand the reason for his behaviour, and giving this explanation implies that his behaviour must be seen as determined by it – that is, viewed deterministically.

In dealing with the robber, and wanting to condemn anti-social actions, the law has found it expedient to employ the doctrine of free will in the primary sense: "The robber could have acted otherwise – he misused his free will, and deserves retribution." But everyone's current brain state is the inevitable result of its history of that person's interactions with the world, including every benign and malign influence, so it's clear the robber could not have done otherwise. Now, although every past event and past human action could not have been other than it was, the expression of our approval or disapproval of them affects future actions, and is necessary for progress. As society comes to appreciate this, it may realise (with reluctance, perhaps) that retributive punishment is unjustified because retrospective. Justifiable sanctions, such as the deprivation of liberty, should always involve attempts at reform, directed to the future – to their prospective effect on the individuals concerned.

2. Epiphenomenalism implies fatalism. This is a mistake. Yes 'what will be, will be' – but this tautology contains no information about the future. No one is privy to a 'Flash Forward' (the name of a TV series where people get a glimpse of their future). We can afford to be optimistic, since the future is unknown to us.

3. Surely mental contents cause actions? It seems right to say "I shall visit the dentist because I have

toothache,” assigning a conscious experience, the ache, as the cause of a physical action, going to the dentist.

For the epiphenomenalist, the word ‘toothache’ functions as a label in our language for that group of neural processes which are the cause not only of the ache, but which also initiate the process of visiting the dentist. These neural processes are the real cause of the behaviour. The label ‘toothache’, like a good computer file name, aids communication. We shall continue to say “because I have toothache” just as we still say “the sun rose” because these statements still convey our meaning – but not the objective truth.

4. Epiphenomenalism is self-refuting, because if the brain is driven by the inhuman forces of physics, any conclusion it reaches, eg ‘epiphenomenalism is true’, is unreliable, since good conclusions are the result of thought.

By applying Axiom 1, we can see that what appears in our consciousness as the compelling reasons for a particular conclusion corresponds with what at the neural level is the cause of those reasons and that conclusion. Just as a computer’s chess programme necessarily obeys the laws of physics as it derives lawful chess moves, so brains, driven by physics, can exhibit logical reasoning, if educated correctly.

5. Consciousness would not have evolved unless it were advantageous to living organisms. Consciousness must have survival value. It must have been specially selected for, and so must have specific biological effects.

We can have no direct indication of animal consciousness. Other humans are presumed conscious because they are members of one’s own species – bats are not. We therefore have no sure ground for assuming, as we are wont to do, that an animal does what it does because of its possession of consciousness. If a species becomes successful in the Darwinian sense, we have no right to assume that it was guided by pleasure and pain experiences – only by appetitive and aversive reactions. We continue to refer to the alleged causal powers of pain even when we know it is not a cause, for example in the case of a reflex action. That pain is not the cause of the action which ends it was pointed out by Shadworth Hodgson in 1870.

A change in the architecture of an animal’s nervous system resulting from a spontaneous variation in its DNA may increase its relative fitness, giving it a selective advantage. If the new architecture happens to produce consciousness as an epiphenomenon, then consciousness will automatically be passed down the generations without having to be coded for explicitly. If consciousness increases in quality and variety as brains increase in complexity, and animals with complex brains are more likely to survive, then a sufficient condition for the evolution of consciousness will have been satisfied. Not that nature cares for what we may consider its finest product – dolphins may experience sensations beyond our imagination, but living in their evolutionary cul-de-sac the sea, gives them no opportunity to explore sophisticated intellectual realms; and large-brained Neanderthals became extinct in the last ice age.

6. If humans were not conscious this article would not have been written, not least because brains would not have needed to create words for the components of consciousness, nor the word ‘consciousness’. This article’s very existence demonstrates the causal efficacy of consciousness. The formation of the abstract noun ‘consciousness’ requires the prior existence in language of such

nouns as 'colour', 'sound', 'taste', 'feeling' etc. These in turn, arise from their constituents, eg particular colours such as green, particular tastes such as bitter, etc. For the epiphenomenalist, a word such as 'red' labels not only the sensation but also that sensation's neural basis, and the word earns its keep by performing a useful function in the brain's economy.

The brain's language system could evolve words labelling neural entities whether or not they are experienced as sensation. Thus zombies – physically human replicas without sentience (which, by Axiom 1, cannot exist in this universe) – would invent sensation words. They could say they'd 'seen a red light' whenever their non-conscious brains detected photons of a certain energy, even though they never experienced red. Similarly, our sensation of redness is not required for us to speak of 'seeing red'. This applies to all sensations and the abstract nouns based on them: no sensation is necessary for the brain's reference to its neural correlates.

The word 'consciousness', the collective noun for the totality of sensory and emotional experience, may be culturally important. Ideologies and cults can be built around concepts (eg 'god'), and wars can be fought for them. Once the word 'consciousness' exists, consciousness gets treated in our language as if it has causal powers, but like phlogiston, the fictitious fuel, it has none. Consciousness of one's 'self' is a further instance of the brain's ability to create concepts (see the Gita above). Yet the power of a concept derives from its human patrons. Its impact on our thinking is not proof that it can move matter. Thus all the detritus left by our talk of 'consciousness', and even of 'self-consciousness', is no more evidence of their causal effect than a library of books on fairies is evidence of fairy activity.

7. Epiphenomenalism cannot explain how the brain generates consciousness. True, but at least it acknowledges a problem other philosophies of mind don't. Eliminativists deny the existence of the contents of consciousness; physicalists award consciousness a dubious identity with neurons to grant it a spurious efficacy; and Cartesian dualists, heedless that it cannot survive a whiff of ether, readily (but unjustifiably) accord consciousness immortality ... In 1868 the epiphenomenalist and Alpine climber John Tyndall anticipated what in 1995 David Chalmers was to call the 'hard problem' of consciousness. Tyndall saw an "intellectually impassable chasm" existing between the physics of the brain and the corresponding states of consciousness, even if all the details about both were known: "If we knew that a right-handed spiral motion of molecules of the brain was associated with the feeling of love, and a left-handed spiral motion with the feeling of hate, the question Why? would remain as unanswerable as before." ('Scientific Materialism' in *Fragments of Science* Vol II, 1889.) Neuroscience has not yet even solved Chalmers' 'easy' problem, which is specific knowledge of the above-mentioned associations. If we eventually reach that stage and arrive at the edge of the chasm of the hard problem, will we have the intellect to find it passable?

## Jainism

Jainism is an ancient religion from India that teaches that the way to liberation and bliss is to live lives of harmlessness and renunciation.

The essence of Jainism is concern for the welfare of every being in the **universe** and for the health of the universe itself.

- Jains believe that animals and plants, as well as human beings, contain living souls. Each of these souls is considered of equal value and should be treated with respect and compassion.
- Jains are strict vegetarians and live in a way that minimises their use of the **world's resources**.

- Jains believe in **reincarnation** and seek to attain ultimate liberation - which means escaping the continuous cycle of birth, death and rebirth so that their immortal soul lives for ever in a state of bliss.
- Liberation is achieved by eliminating all **karma from the soul**.
- Jainism is a religion of self-help.
- There are no **gods** or spiritual beings that will help human beings.
- The three guiding principles of Jainism, the '**three jewels**', are right belief, right knowledge and right conduct.
- The supreme principle of Jain living is non violence (**ahimsa**).
- This is one of the **5 mahavratas** (the 5 great vows). The other mahavratas are non-attachment to possessions, not lying, not stealing, and **sexual restraint** (with celibacy as the ideal).
- **Mahavira** is regarded as the man who gave Jainism its present-day form.
- The texts containing the teachings of Mahavira are called the **Agamas**.
- Jains are divided into **two major sects**; the Digambara (meaning "sky clad") sect and the Svetambara (meaning "white clad") sect.
- Jainism has no priests. Its professional religious people are **monks and nuns**, who lead strict and ascetic lives.

Most Jains live in India, and according to the 2001 Census of India there are around 4.2 million living there. However, the Oxford Handbook of Global Religions, published in 2006, suggests that census figures may provide lower than the true number of followers as many Jains identify themselves as Hindu. The Handbook also states that there are around 25,000 Jains in Britain.

## Concept of reality Reality: Preamble

Looking at the colorful and different forms of existences in the universe, it is natural to be inquisitive about the form and nature of reality i.e. their ultimate source of origin. Is it one entity with its manifold modifications or manifestations or the reality itself is manifold. Therefore all philosophers and philosophies start their enquiry about self and the universe around, with first understanding the reality (**sat**) and its nature. They soon came up with two related alternatives namely:

1. The problem of change - Is changing real?
2. The problem of one and many - Is reality one or many?

The views of western and Indian philosophers are discussed in a separate paper on Jain views of reality with reference to western philosophers.

## Indian philosophers

Like the western philosophers, we find Indian philosophers also made similar statements, e.g.: Śaṅkara's Advait-Vedānta presents the thesis of unchanging, eternal, and conscious and one reality - **Brahm**. For him change, plurality and all worldly things are illusory.

- On the other hand Buddhists consider change as real. (Only Nāgārjuna like Śaṅkara denies the reality of worldly things. Other schools of Buddhism<sup>[6]</sup> do not deny worldly things)
- Sāṅkhya<sup>[45]</sup> believes in duality of existence. They talk of Puruṣa<sup>[35]</sup> (sentient) and Prakṛti<sup>[31]</sup> (insentient)
- Nyāya<sup>[27]</sup> talk of multiplicity of existences like air, water, fire and earth as different forms of insentient besides soul<sup>[40]</sup> being sentient.

Jain philosophers and spiritual leaders accept existence of all beings as real and multiple with broad grouping as sentient and insentient beings. Basic considerations about their views on reality are based on the following:

- It accepts permanence, change, multiplicity and identity or similarity simultaneously because in our experience we always find particularity and universality or generality simultaneously.
- They look at an explanation that is free of fallacy of partial view of reality as any generalization about reality on the basis of single characteristic suffers from the ekāntika doṣa<sup>[11]</sup> (mono-ism).
- It is therefore based on the doctrine of multiplicity of viewpoints (Anekāntavāda<sup>[3]</sup>). Hence the reality should be viewed both from permanence viewpoint (substance) as well as momentary (mode) viewpoint also.
- It therefore considers both permanence as well as change as real. So they consider reality as permanence with change.

### **Nature of Reality in Jainism<sup>[18]</sup>**

The nature and characteristics of reality (sat) are given by the three sutras from Tattvāratha sutra<sup>[44]</sup> Jain ācārya Umā Svāmi Sat dravyalakṣaṇam Utpāda-vyaya-dhrauvyayuktaṅ sat Guṇaparyavavad dravayam.

This means that **substance (dravya<sup>[12]</sup>)** is the indicator or representation of reality; sat is with origination, destruction and permanence simultaneously and substance is with modes and attributes. These will be discussed further in section while discussing the characteristics of substance later on. Basically Jains talk of duality of existence / reality namely:

- Living beings (jīva<sup>[20]</sup>)
- Non-living beings (ajīva<sup>[2]</sup>).

### **Need to know the nature and form of substance/dravya<sup>[12]</sup>.**

As per Jain philosophy, this cosmos (loka<sup>[24]</sup>) is another name of an amalgam of infinite substances. Therefore to know this cosmos, it is essential that we understand properly the concept and nature of substance (dravya<sup>[12]</sup>). Without knowing the nature of substance, we cannot understand the characteristics of any entity properly / correctly. As the cosmos is said to be an amalgam of infinite substances, knowledge of the nature of substance will help us understand the entire process of origination, destruction and changes taking place in the cosmos better. One of the Jain ācārya has gone to the extent of saying the foundation of all worldly or spiritual knowledge is the knowledge of the dravya<sup>[12]</sup> itself.

Ācārya Nemi<sup>[25]</sup> Candra<sup>[7]</sup> Siddhānta Deva<sup>[9]</sup>, in the first gāthā (verse) of his text Dravya<sup>[12]</sup> Saṅgraha, given below, says that the main reason of our worshipping the Jain preceptors (Jinendra<sup>[19]</sup> Deva<sup>[9]</sup>) is that they gave us the true description of the substances like jīva<sup>[20]</sup> (living beings).

Jīvamajīvaṅ davvaṅ jīṇavaravasahaṇa jeṇa nidditthaṅ, Devīṇdaviṇdavaṇdaṅ vaṇde taṅ savvadā sistrā.

### **Meaning:**

We pay our homage by bending our heads to Jinendra<sup>[19]</sup> Ṛṣabha Deva<sup>[9]</sup>, who has given us the sermons of jīva<sup>[20]</sup> (living beings) and ajīva<sup>[2]</sup> (non living beings) and who is adored by the entire community of heavenly gods, Thus without having the knowledge of dravya<sup>[12]</sup>, how can any body<sup>[5]</sup> know correctly the supreme soul<sup>[40]</sup> (Jinendra<sup>[19]</sup> Deva<sup>[9]</sup>). If one does not know the true nature of the

supreme soul<sup>[40]</sup>, how can one worship them properly and with all obeisances? Therefore, one of the most respected ācāryas today, Kunda Kunda says that the main reason to destroying delusion is to know the substance, its attributes and modes as given in the following verse.

Jo jāṇadi arihaṅgaṅ davvatta guṇatta pajjayattehiṅ, So jāṇadi appāṇaṅ moho khalu jādi tassa layaṅ

### **Meaning:**

One who knows the supreme soul<sup>[40]</sup> by its substance, modes and attributes, knows his-self and destroys the delusion in the process. We therefore infer that the knowledge of substance, its modes and attributes enable us to have the correct knowledge of soul<sup>[40]</sup> and supreme soul<sup>[40]</sup> thereby destroying delusion, the root cause of all our problems. Hence it is not only important but also essential to have full knowledge of the nature and concept of substance.

### **Characteristics of substance / dravya.**

Dravya<sup>[12]</sup> is a definitive term of Jain philosophy<sup>[17]</sup> that in general represents an entity or an object. This is why Jain ācārya Umā Svāmi (2nd century AD) writes: Sat dravyalakṣaṇam i.e. dravya<sup>[12]</sup>/substance is the characteristics/indicator of reality (existent). What is real is substance. Now the question arises what is reality/sat? He then proceeds to say the following in this regard: Utpāda-vyaya-dhrauvyayuktaṅ sat i.e. reality is with origination - destruction and permanence. As per Jain philosophy<sup>[17]</sup>, all objects / entities in this cosmos, whether sentient or insentient, are with origination-destruction-permanence characteristics i.e. substance/dravya is with origination - destruction and permanence simultaneously. New form of an entity is called its origination; giving up its old state is called destruction and the continuation of the nature of the substance is permanence; e.g. destruction of the state of milk results in origination of the state curd and the continuation of its being dairy product i.e. a by-product of cow (go-rasa) for use by us continues its existence.

This way each and every entity in this cosmos goes through origination- destruction-permanence continuously at every moment. Hence all these entities are termed as substance and are real /sat. Besides reality /existent, another characteristic in Jain philosophy<sup>[17]</sup> of substance is that it is always with attributes and modes (paryāya<sup>[29]</sup>) as given by Umā Svāmi in the following sutra<sup>[44]</sup>. Guṇaparyayavad dravyam.

Those parts of the substance, which co-exists with it, are called attributes (guṇa<sup>[15]</sup>) and those that occur serially (krama) are called modes (paryāya). There is no entity in this cosmos, which is not always accompanied with attributes and modes. Knowledge, intuition, happiness etc are the attributes of living beings while mind-based knowledge, verbal testimony etc are the modes of knowledge. Similarly form, taste, odour and touch are the attributes of matter (pudgala) and black / white /yellow etc are the modes of attribute colour.

Thus we conclude that dravya is what is real and real is with origination-destruction and permanence or with attributes and modes.

Jain texts use the word dravya primarily to represent substance. However we also find the terms like object (artha), thing (padārtha), object of knowledge (jñeya or prameya<sup>[32]</sup>) etc. 'aryate gamyate parichidyate vā eti artha fi' i.e. the entity cognized is the object. Similarly all other terms used are

with the object of acquiring knowledge about them. Dravya is also called existent (vastu) as 'vasanti guṇāfi yasmin tat vastu' or an entity in which attributes exist is called substance.

### Number / quantity of dravyas.

There are infinite substances in this cosmos which can all be classified in six categories namely:

Jīva:	Living being
Pudgala:	Matter / Mattergy
Dharma:	Principle of motion
Adharm:	Principle of rest
Ākāśa:	Space
Kāla:	Time

It is significant to know that most of the philosophies of the world talk of Mono-ism or advaitvāda i.e. only one type of existence and everything emanating from it. But Jain philosophy talks of duality of existence / reality i.e. it propagates Duopoly of existence of living and non-living beings. Jains say that both living beings as well as non-living beings are existent and hence eternal truth and not imaginary or pseudo-reality. Similarly knowledge and object of knowledge, eternal and temporary, soul and supreme soul etc are all existent and real.

We shall briefly discuss each of these now. Jain literature however discuss at length the nature of living beings and matter as these are primary substance types which are helpful in following the path of spiritual purification and attaining emancipation.

#### A. Jīva or living beings.

An entity with consciousness<sup>[8]</sup> and its manifestation as knowledge and intuition etc are found is termed as living being. From absolute viewpoint, living beings do not possess attributes like taste, touch, odour or colour and hence are non-concrete. While existing in the cosmos as empirical living being, it lives/ exists due to its capabilities of breathe, sense organs, life span and overall energy while as pure soul<sup>[40]</sup>, it exists at the summit of the cosmos and exists/ lives forever with its attributes of knowledge, intuition and bliss.

Ācārya Nemi Candra Siddhānta Deva, in his text Dravya Saṅgraha, has in a lucid manner explained the true nature of jīva<sup>[20]</sup> based on its nine special characteristics as given below:

##### i. Jīvatva

An entity which lives, as per absolute viewpoint with the force and capability of its consciousness and as per practical viewpoint with its four forces / capabilities of breathe, life span, sensual organs and its energy, is called to have jīvatva or is called jīva.

##### ii. Upyogamaya or able to manifest

Here upyoga means primarily manifestation of consciousness<sup>[8]</sup> into intuition (darśanopyoga) and knowledge (jñānaopyoga). There are further sub divisions of these two manifestations of consciousness that we do not discuss at this stage. However it is to be understood that this manifestation of consciousness<sup>[8]</sup> is the primary or main characteristic of jīva<sup>[20]</sup> in Jain philosophy<sup>[17]</sup> e.g. the verses ‘upyogo lakṣaṇam’ and ‘cetanālakṣaṇo jīva<sup>[20]</sup>fi’ indicate this concept clearly.

### **iii. Amūrtika - non-concrete**

Jīva<sup>[20]</sup> by its nature is non-concrete and attributes like touch, taste, colour and odour are not associated with it.

### **iv. Kartā or Doer/ Agent**

From absolute viewpoint, it is the doer of its nature and from practical viewpoint it is the doer of its matter karmas.

### **v. Svadehaparimāṇa or is of the size of the body<sup>[5]</sup> it owns.**

Jīva<sup>[20]</sup> expands or contracts in shape and size according to the body<sup>[5]</sup> it lives in at different times. When it is liberated of all its kāmika impurities, it is of the size and shape slightly less than the last body it owned.

### **vi. Bhoktā or enjoyer**

From absolute viewpoint, it is the enjoyer of its nature and from practical viewpoint it is the enjoyer of its matter karmas.

### **vii. Saṅsāraṣṭha or exists in this cosmos.**

From the beginning-less time, it exists in this cosmos at different places and destinies.

### **viii. Siddha or Pure soul**

When it is fully free from all the kāmika impurities, then it attains the status of siddha (one who attained its objective) or mukta (free from bondages). It stays in this status forever and is omniscient<sup>[28]</sup>, detached and in a state of bliss. It does not get born again in any other form (no reincarnation).

### **ix. Urghvagamana or to move upwards**

Like the flame of a fire, its nature is to always move straight up but due to kāmika bondage it appears to moving in different directions.

## **B. Pudgala<sup>[34]</sup> or matter**

Pudgala<sup>[34]</sup> is a substance type that is concrete i.e. with touch, taste, smell and color attributes. It is active like jīva. However unlike jīva, its activity is not purposive to spontaneously result in its manifestation of its nature. It is thus affected to a large extent by jīva<sup>[20]</sup> and is capable of greatly affecting jīva<sup>[20]</sup>, due to its omnipresence. It is a major component of empirical soul<sup>[40]</sup> and almost all knowledge acquired by empirical soul<sup>[40]</sup> is through the use of matter as a means or the medium. Tattvārtha sūtra<sup>[44]</sup> (V.19-21) describes the benefits and uses of pudgala<sup>[34]</sup> for jīva<sup>[20]</sup> (śārīravādmamanafiprāṇāpānāpudgalānām, sukḥdukhajīvitamaraṇopagrahāśca, parasparagrahojīvānām).

Thus matter is of immense use to the jīva. Identification of empirical soul and its activities are all due to matter associated with it. Even acquisition of knowledge by jīva to rid / dissociate itself of matter is matter. Spoken words, activities of mind, body and speech, thoughts are all matter.

The entire universe and its contents are perceptible due to matter only as it is the only concrete substance. Its basic or distinguishing characteristics are to join with or dissociate from other matter (of same type or different) or to be attracted to jīva and be of use to it. The word pudgala a definitive term of Jain philosophy is a union of pud (to complete or combine) + gala (to separate) i.e. fusion

and fission. Thus matter particles can combine to form lumps/ aggregate (skandha) or the lumps can break to form smaller lumps and continue the process to reach the last stage i.e. parmāṇu which is the smallest part which cannot be further subdivided. Some characteristics of matter are: Matter in its primitive form is of just one type i.e. parmāṇū. It is the basis of all matter and energy. Both energy and matter can be interchanged. Light, Heat and other forms of energy are thus matter. Light is a skandha of matter. Its speed is said to be 186000 miles per second by Einstein<sup>[14]</sup>. Parmāṇu, as per Jains can travel at the highest speed of 14 rajjus per samaya. Ācārya Amrita Candra in Tattvāratha Sāra says that the parmāṇu has a natural tendency to move downwards versus of jīva<sup>[20]</sup> to move upwards.

Matter is of two types namely lump (skandha<sup>[39]</sup>) and parmāṇu. Lump is a collection of parmāṇus and is perceptible. Lump /aggregate is further classified as of six types namely fine-fine, fine, fine-coarse, coarse-fine, coarse, coarse-coarse. Parmāṇu even though with perceptible qualities cannot be perceived by

senses and is classified as absolute (non divisible) and real like atom to give molecules. Skandha is further classified in six categories as follows:

<b>Gross-gross:</b>	Lump, which can be broken in parts and the parts, cannot be lumped together again e.g. wood, stone.
<b>Gross:</b>	Lumps, which cannot be broken in parts but divided and can be mixed together again e.g. milk, water etc.
<b>Gross-subtle:</b>	Those which can be seen but cannot be touched or held e.g. shade, light etc.
<b>Subtle-gross:</b>	Those which cannot be seen but cognized by some other sense organs e.g. words, sound, heat, odour etc.
<b>Subtle:</b>	Cannot be cognized by any sense organ directly like karma <sup>[21]</sup> particles.
<b>Subtle-subtle:</b>	Even smaller e.g. lumps of two or three parmāṇus.

- Matter has eight types (4 pairs of existent-non existent attributes) of touches (2 out of 4 present at a time in any parmāṇu), 5 colors, 5 tastes and two smell types. Thus a total of 200 different types of aggregate (i.e. of different characteristics) can be formed. Science has to date found 102 types of basic elements.
- Matter types which are of use to jīva are called clusters/vargaṇās and are of eight types namely kārmaṇ, luminous (Tejas), gross body (Āudārika), protean body (Vaikriyika), conveyance body (Āhāraka), mind material (Mano vargaṇā), speech material (Bhāśa vargaṇā) and breathe material (śwāsocchāsa vargaṇās). Gross bodies, protean bodies and conveyance bodies are three types of matter endowed with associability. All vargaṇās are respectively used by jīva<sup>[20]</sup> to have kārmaṇ, tejus (electric), physical and protean/celestial (for hellish and heaven beings) bodies, āhāraka or knowledge body<sup>[5]</sup> for ascetics of higher order and remaining vargaṇās for mind, speech, body<sup>[5]</sup> and breathe.
- Parmāṇu is the smallest and indivisible part of aggregate. It cannot be destroyed even by the sharpest and most lethal arm / fire or water. It is without space points, besides its own one

space<sup>[41]</sup> point<sup>[42]</sup>. It is slightly concrete and slightly non concrete.

- Parmāṇu, which is the basic part of matter has special characteristics and is defined as the smallest indivisible part of matter. It is like a dimensionless and mass-less geometric point that has existence but almost no size and weight. It travels in a straight line if unobstructed otherwise it can travel in any direction including in waveform but under the influence of other entities.
- Parmāṇu in normal state occupies one space point but in special conditions, one space<sup>[41]</sup> point<sup>[42]</sup> can have almost infinite parmāṇus in it. Scientists have proved that specific gravity of matter in nebulae is approx  $10^{-24}$  while some stars are said to be composed of matter which is 2000 times denser than gold. Parmāṇu can have one each color, smell, taste and two touch (hot or cold and hard or soft) qualities. As per Einstein's theory of relativity,  $e = mc^2$ , matter can be converted into energy. So a parmāṇu can have almost infinite speed as parmāṇu which is almost mass-less and can travel 14 rajjus (i.e. the whole universe) or  $1.4 * 10^{21}$  miles per samaya at its fastest speed while its normal speed is one space point (pradeśa) in one samaya<sup>[36]</sup>. (smallest unit of measure of time).
- Bonding of parmāṇus is only due to the dry (arid) and cohesive (smooth) attributes present in different proportions. This is similar to positive and negative charges of protons and electrons. The remaining five substance types are non-concrete and cannot be cognized by our sense organs directly. Word, Bondage, subtle, gross, darkness, shadow, light, heat etc. are the modes of matter.

According to Jainism consciousness or awareness is the essential quality of each individual soul. By itself a soul does not require any external means to gain knowledge because knowledge is inherent in its essential nature and by that it has omniscience or the all knowing awareness without the need to depend upon perception or cognition.

Knowledge does not arise because of perception or mental activity. It exists in itself, whether we know or not and whether we perceive things or not. In other words the world is real, not an illusion. However, in a state of bondage such knowledge becomes covered by the impurity of karma and remains inaccessible to the souls. Thereby the souls lose their omniscience temporarily and rely upon limited means and intermediate sources such as the mind and the senses to gain knowledge and make sense of their experiences and existence.

In this condition beings gain the knowledge of the world sequentially first through perceptions and then through intelligence. Perceptions help them to acquire the generalities of the objects perceived, while intelligence helps them to gain specific details of each of them. These methods are not foolproof since they are prone to errors.

In beings this process of knowing happens in five different ways. Of them the first three are imperfect and prone to error, while the last two are perfect and convey the truth without error. These five means or instruments of knowledge are explained below.

## Means of Knowledge

1. **Mati:** Mati is mind. Mati jnana is the knowledge of the mind, usually gained through our senses, memory, remembrance, cognition, and deductive reasoning. It is something which we know with the help of our mind and its various faculties. From a soul's perspective, this is indirect knowledge derived through the agency of the mind and its faculties (senses).
2. **Sruthi:** When we learn something from other sources, other people or beings, through our observation of signs, symbols or words, we call it sruthignana or the knowledge of sruthi or hearing.

This type of knowledge is gained through association (labdhi), attention (bhavana), understanding (upayoga) and naya or varied interpretations of the meaning of things (naya). This is indirect knowledge obtained through description, authority, study, hearing and listening.

3. **Avadhi:** We gain this type of knowledge not through physical means such as the senses or the mind, but through our psychic abilities, or through clairvoyance and intuitive awareness, by overcoming the limitations of time and space. It is beyond the boundaries of our ordinary awareness and faculties and not generally available to everyone. This is direct knowledge.

4. **Mahaparyaya:** This knowledge is gained by reading the minds and thoughts of others. It is also direct knowledge obtained from others through extra sensory perception such as telepathy or mind reading. Mahaparyaya is facilitated when an individual attains or nears the state of perfection. In that state his own ego becomes silent and dormant. Thereby he is able to enter into any consciousness at will and experience oneness with it.

5. **Kevala:** It is the highest knowledge gained when we transcend our ordinary self and attain perfection or aloneness (kaivalya). Hence only a Jina or Kevalin has access to it, and through him others may learn it as shruti. By itself this knowledge does not require any outward agency for its transmission because it is always there, in the consciousness of the soul which flowers full in an enlightened Jina, unattached, unlimited and without any constraint of time and space, duality and objectivity. Since it is transcendental, it cannot be conveyed or expressed adequately to the satisfaction of others. However, it can be obtained omnisciently in a state of perfection, when the soul becomes liberated from the bondage to the cycle of births and deaths.

## **Direct and indirect knowledge**

As we stated already, the first two are indirect means of knowledge (paroksha) since we have to depend upon an external and intermediate source such as the senses or the mind to know it, while the other three are direct, where we do not have to depend upon an external or intermediate source in the field of objectivity to know it. We gain it directly (pratyaksha) and immediately by coming into contact with it and hence more reliable and useful in liberation. The knowledge gained through the senses is also considered in some classifications as direct (pratyaksha). However, the senses are vulnerable to desires and delusion, we cannot entirely depend upon it. Perceptual knowledge also arises in four different ways, through visual sensations, non-visual sensations, extra-sensory perception and through unified perception without duality by becoming absorbed in the knowledge itself.

Of the three, the first three are not considered valid knowledge because they are prone to errors and create doubt (samsaya), confusion and delusion, while the last two are valid and error free. Their source is from the higher realms inhabited by perfect beings who personify wisdom and can never be wrong. Invalid knowledge arising from the first three is also prone to faulty logic, mistaken notions (viparayana) and wrong knowledge (anadhyavasaya) arising from carelessness or indifference.

## **Perception and discerning knowledge**

The essential nature of jiva is consciousness or chaitanya, which is made up of both perception (darsana) and discerning knowledge (jnana). The former is more general (samanya) and superficial and the latter more specific and detailed (visesa) in providing the souls with knowledge. From perception arises simple apprehension or grasping of the generalities (samanya) of the objects perceived without their particularities (visesa), while from intelligence comes discerning wisdom in which there is the grasping of both particularities and generalities, with the ability to discriminate between one object and another. Jain philosophers identify five stages to perception (darsana).

**Vyanjanagraha** in which a stimulus activates the senses and brings them into primary contact with the object.

**Arthavagraha** in which the mind becomes involved with the senses and cognition is activated whereby one becomes vaguely aware of the object.

**Iha** in which the mind is brought to here and now and begins to pay attention to the particularities of the object whereby a distinct idea of the object is formed in the mind.

**Avaya** in which the mind compares the present experience with the previous experiences of similar kind stored in the mind and integrates it into the memories retaining its distinction such as time, place and context.

**Dharana** in which the memory or the impression of the experience is firmly held in the mind whereby it may be recalled and retrieved later.

## **Knowing and Knowledge**

Jainas hold that while through perception one becomes aware of the objects present in the perceptual world, the objects in themselves are extra mental realities and exist in their own space and time. In other words, the world and its objects are not mere mental illusions or constructs created by our thoughts, desires and perceptions but are real in themselves. They do not change by our knowing or not knowing, and they exist by themselves. So also the knowledge of the object. It exists whether we know it or not. Knowledge is thus independent of perceptions and in itself an absolute reality. While ordinary beings may access it through perceptions and sense organs, it can be accessed without these intermediaries by overcoming the obstacles that interfere with the awareness of such knowledge.

Since the knowledge of the object is not dependent upon perceptions alone, a jiva does not have to depend upon his senses or perception to know it. In an ordinary being, perception (darsana) precedes knowledge (jnana) while in a perfect being, knowledge arises without perception because knowledge is inherent in the being, but remains covered by the impurities of karma. These impurities are of two kinds, those that clog the perception (darsanavaraniya karmas) and those that clog the conceptual knowledge (jnanavaraniya karmas). Because of them we become selective in our perceptions, knowledge and understanding, choosing what is immediately useful and necessary and ignoring the rest. When they are removed, knowledge reveals itself to the being and the being develops omniscience or all knowing awareness encompassing the knowledge of all things, past, present and future. The knowledge of the perfect being is free not only from the impurities we have mentioned before but also from the three mental errors, namely doubt (samsaya), delusion (vimoha) and perversion (vibrahama).

## **Knowledge and perspective**

Another peculiarity of Jainism with regard to perception and knowledge is the theory of standpoints. It recognizes two types of knowledge: standard knowledge (pramana) and relative knowledge (naya). Standard knowledge is the knowledge of the thing in itself without the involvement of perceptions and relationships.

Relative knowledge is the knowledge arising in relationship to the object when it is viewed from a particular standpoint. Relative knowledge depends upon the way we perceive an object and

conceptualize it. It is a limited view of the object.

Hence from that particular view it may hold good, but not necessarily from others. To say that a particular viewpoint is correct does not mean that other viewpoints are wrong. These different viewpoints may represent a particular aspect of the object, but not the totality of the object. At times they may be contradictory and confusing. One cannot know an object truly by solely relying upon a few standpoints. To know the truth of anything one has to consider all the possible standpoints. This is known as the theory of standpoints.

## Nayas

The nayas are classified in various ways. Their number also varies from one to seven. A well-known system identifies seven nayas, which are listed below. When considered independently each of them leads to fallacies (abhasas). Of them four are related to the objects and the meaning and three to words.

1. **Naigamanaya** relates to the end purpose or general purpose of a thing or activity. For example the end or purpose of the sun is to sustain life and provide energy. According to another interpretation naigamanaya relates to a general and non-distinguishing reference to an object without calling attention to its particulars, in such statement as "people live here," without specifying who or what.
2. **Samgrahanaya** relates to the common features or the specific class or category features of an object. The class by itself does not represent the object but it helps us to distinguish it for a specific purpose rather than its general purpose.
3. **Vyavaharanaya** relates to the empirical knowledge or practical exposure to the object whereby we become experientially familiar with it as a whole and in specific detail.
4. **Rjusutranaya** relate to the empirical knowledge in relation to a specific point of time or the present moment without any reference to its identity or continuity as if we have perceived it never before and never after.
5. **Sabdanaya** relates to the verbal viewpoint or the knowledge arising from the specific name, or names by which the object is known. An object may be known by different names or synonyms. Each name evokes in us specific knowledge and the relation between a name and its specific meaning may often give rise to fallacies about the object.
6. **Samabhirudhanaya** relates to the knowledge arising from the root words that give rise to names.
7. **Evambhutanaya** relates to the specific functional aspect of an object in a specific condition. An object may have many aspects in different conditions and each may refer to a specific functional state of the same object.

## Syadavada or Saptabhangi

Closely related to or rather a derivative of the nayavada is the theory of standpoints known as Syadavada, which is often referred to as Saptabhangi, or the doctrine of "May be" according to which one may either affirm or negate a proposition in seven ways. Each approach is called a bhanga (mode, strand or predication) or vada (argument or opinion). This is based upon the profound realization that there is no absolute or universal position on any truth but only conditional and relative possibilities of affirmation or negation. There are many alternatives to understand the indeterminate and many-sided reality and it can be grasped fully only when we consider these various approaches or possibilities that represent it in its totality, and examine each standpoint in detail together with the various strands of truth that go into its making. Thus, "in a certain sense," we can either affirm or negate a thing or its attributes at least in seven different ways or points of view, namely is (asti), is

not (nasti), is and is not, is inexpressible (avyaktaya, is and is inexpressible, is not and is inexpressible, is not and is inexpressible. We are not stating the Syadavada theory in further detail here as we have explained it elsewhere.

## **Buddhism**

Buddhism originated in India, but inspired the world for centuries before the great decline happened, which the Buddha himself predicted during his lifetime as the inevitable consequence of all things that are impermanent. It is debatable how far the Buddha deviated from the tenets of Vedic religion which his parents practiced. However, it is true that his leadership and organizational skills and the dedication of his early disciples played a significant role in the formation and progress of Buddhism in ancient India as a distinct tradition.

Buddhism differs from Brahmanism mainly with regard to the nature of soul and creation, but in several other aspects concurs with its doctrines such as karma, rebirth, self-purification, liberation, and renunciation. It is mainly an ascetic or renunciant tradition with few provisions for the lay followers to prepare for monastic life through successive stages of mental preparation and detachment.

Buddhism is very much relevant today as it was two thousand years ago. The practice of Buddhism provides insightful solutions to the vexing problems of humanity such as violence, stress and suffering. Buddhism is essentially a religion of the mind rather than the spirit. It is grounded in reality, and its practices and solutions are verifiable and repeatable. The Buddha taught the world the best

way to realize the Four Noble Truths through meditation and mindfulness techniques and by following the painless Eightfold Path. In this section on Buddhism, we bring to you comprehensive information on Buddhism, Buddhist philosophy and practice based upon the techniques and teachings of the Buddha himself. Both advanced practitioners and lay followers of Buddhism can benefit from the information provided here on various aspects of Buddhism and its main beliefs and practices

## **The Four Noble Truths**

The Four Noble Truths comprise the essence of Buddha's teachings, though they leave much left unexplained. They are the truth of suffering, the truth of the cause of suffering, the truth of the end of suffering, and the truth of the path that leads to the end of suffering. More simply put, suffering exists; it has a cause; it has an end; and it has a cause to bring about its end. The notion of suffering is not intended to convey a negative world view, but rather, a pragmatic perspective that deals with the world as it is, and attempts to rectify it. The concept of pleasure is not denied, but acknowledged as fleeting. Pursuit of pleasure can only continue what is ultimately an unquenchable thirst. The same logic belies an understanding of happiness. In the end, only aging, sickness, and death are certain and unavoidable.

The Four Noble Truths are a contingency plan for dealing with the suffering humanity faces -- suffering of a physical kind, or of a mental nature. The First Truth identifies the presence of suffering. The Second Truth, on the other hand, seeks to determine the cause of suffering. In Buddhism, desire and ignorance lie at the root of suffering. By desire, Buddhists refer to craving pleasure, material goods, and immortality, all of which are wants that can never be satisfied. As a result, desiring them can only bring suffering. Ignorance, in comparison, relates to not seeing the world as it actually is. Without the capacity for mental concentration and insight, Buddhism explains, one's mind is left

undeveloped, unable to grasp the true nature of things. Vices, such as greed, envy, hatred and anger, derive from this ignorance.

The Third Noble Truth, the truth of the end of suffering, has dual meaning, suggesting either the end of suffering in this life, on earth, or in the spiritual life, through achieving Nirvana. When one has achieved Nirvana, which is a transcendent state free from suffering and our worldly cycle of birth and rebirth, spiritual enlightenment has been reached. The Fourth Noble truth charts the method for attaining the end of suffering, known to Buddhists as the Noble Eightfold Path. The steps of the Noble Eightfold Path are Right Understanding, Right Thought, Right Speech, Right Action, Right Livelihood, Right Effort, Right Mindfulness and Right Concentration. Moreover, there are three themes into which the Path is divided: good moral conduct (Understanding, Thought, Speech); meditation and mental development (Action, Livelihood, Effort), and wisdom or insight (Mindfulness and Concentration).

## **Karma**

Contrary to what is accepted in contemporary society, the Buddhist interpretation of karma does not refer to preordained fate. Karma refers to good or bad actions a person takes during her lifetime. Good actions, which involve either the absence of bad actions, or actual positive acts, such as generosity, righteousness, and meditation, bring about happiness in the long run. Bad actions, such as lying, stealing or killing, bring about unhappiness in the long run. The weight that actions carry is determined by five conditions: frequent, repetitive action; determined, intentional action; action performed without regret; action against extraordinary persons; and action toward those who have helped one in the past. Finally, there is also neutral karma, which derives from acts such as breathing, eating or sleeping. Neutral karma has no benefits or costs.

## **The Cycle of Rebirth**

Karma plays out in the Buddhism cycle of rebirth. There are six separate planes into which any living being can be reborn -- three fortunate realms, and three unfortunate realms. Those with favorable, positive karma are reborn into one of the fortunate realms: the realm of demigods, the realm of gods, and the realm of men. While the demigods and gods enjoy gratification unknown to men, they also suffer unceasing jealousy and envy.

The realm of man is considered the highest realm of rebirth. Humanity lacks some of the extravagances of the demigods and gods, but is also free from their relentless conflict. Similarly, while inhabitants of the three unfortunate realms -- of animals, ghosts and hell -- suffer untold suffering, the suffering of the realm of man is far less. The realm of man also offers one other aspect lacking in the other five planes, an opportunity to achieve enlightenment, or Nirvana. Given the sheer number of living things, to be born human is to Buddhists a precious chance at spiritual bliss, a rarity that one should not forsake.

## **Distinction between Brahmiṇic and Śramiṇic traditions**

### **KEY POINTS**

- Sramana was an ancient Indian religious movement with origins in the Vedic religion. However, it took a divergent path, rejecting Vedic Hindu ritualism and the authority of the Brahmins—the traditional priests of the Hindu religion.
- Sramanas were those who practiced an ascetic, or strict and self-denying, lifestyle in pursuit of spiritual liberation. They are commonly known as monks.

- The Sramana movement gave rise to Jainism and Buddhism.

## **TERMS**

### **Sramana**

An ancient Indian religious movement that began as an offshoot of the Vedic religion and focused on ascetic lifestyle and principles.

### **Brahmin**

A member of a caste in Vedic Hinduism, consisting of priests and teachers who are held as intermediaries between deities and followers, and who are considered the protectors of the sacred learning found in the Vedas.

### **Sramanas**

Sramana followers who renounced married and domestic life, and adopted an ascetic path. The Sramanas rejected the authority of the Brahmins.

### **Vedic Religion**

The historical predecessor of modern Hinduism. The Vedas are the oldest scriptures in the Hindu religion.

### **Ascetic**

A person who practices severe self-discipline and abstention from worldly pleasures as a way of seeking spiritual enlightenment and freedom.

Sramana was an ancient Indian religious movement that began as an offshoot of the Vedic religion and gave rise to other similar but varying movements, including Buddhism and Jainism. Sramana, meaning “seeker,” was a tradition that began around 800-600 BCE when new philosophical groups, who believed in a more austere path to spiritual freedom, rejected the authority of the Brahmins (the priests of Vedic Hinduism). Modern Hinduism can be regarded as a combination of Vedic and Sramana traditions; it is substantially influenced by both.

## **Vedic Roots**

The Vedic Religion was the historical predecessor of modern Hinduism. The Vedic Period refers to the time period from approximately 1750-500 BCE, during which Indo-Aryans settled into northern India, bringing with them specific religious traditions. Most history of this period is derived from the Vedas, the oldest scriptures in the Hindu religion. Vedas, meaning “knowledge,” were composed by the Aryans in Vedic Sanskrit between 1500 and 500 BCE, in the northwestern region of the Indian subcontinent.

There are four Indo-Aryan Vedas: the Rig Veda contains hymns about their mythology; the Sama Veda consists mainly of hymns about religious rituals; the Yajur Veda contains instructions for religious rituals; and the Atharva Veda consists of spells against enemies, sorcerers, and diseases. (Depending on the source consulted, these are spelled, for example, either Rig Veda or Rigveda.)

## **Sramana Origins**

Several Sramana movements are known to have existed in India before the 6th century BCE. Sramana existed in parallel to, but separate from, Vedic Hinduism. The dominant Vedic ritualism

contrasted with the beliefs of the Sramanas followers who renounced married and domestic life and adopted an ascetic path, one of severe self-discipline and abstention from all indulgence, in order to achieve spiritual liberation. The Sramanas rejected the authority of the Brahmins, who were considered the protectors of the sacred learning found in the Vedas.

Emaciated Fasting Buddha. Buddha practiced severe asceticism before his enlightenment and recommended a non-ascetic middle way.

Brahmin is a caste, or social group, in Vedic Hinduism consisting of priests and teachers who are held as intermediaries between deities and followers. Brahmins are traditionally responsible for religious rituals in temples, and for reciting hymns and prayers during rite of passage rituals, such as weddings.

In India, Sramana originally referred to any ascetic, recluse, or religious practitioner who renounced secular life and society in order to focus solely on finding religious truth. Sramana evolved in India over two phases: the Paccekabuddha, the tradition of the individual ascetic, the “lone Buddha” who leaves the world behind; and the Savaka, the phase of disciples, or those who gather together as a community, such as a sect of monks.

## **Sramana Traditions**

A “tradition” is a belief or behavior passed down within a group or society, with symbolic meaning or special significance. Sramana traditions drew upon established Brahmin concepts to formulate their own doctrines.

The Sramana traditions subscribe to diverse philosophies, and at times significantly disagree with each other, as well as with orthodox Hinduism and its six schools of Hindu philosophy. The differences range from a belief that every individual has a soul, to the assertion that there is no soul.

In terms of lifestyle, Sramana traditions include a wide range of beliefs that can vary, from vegetarianism to meat eating, and from family life to extreme asceticism denying all worldly pleasures.

The varied Sramana movements arose in the same circles of ancient India that led to the development of Yogic practices, which include the Hindu philosophy of following a course of physical and mental discipline in order to attain liberation from the material world, and a union between the self and a supreme being or principle.

The Sramana traditions drove the so-called Hindu synthesis after the Vedic period, which spread to southern Indian and parts of Southeast Asia. As it spread, this new Hinduism assimilated popular non-Vedic gods and other traditions from local cultures, as well as the integrated societal divisions, called the caste system.

Sramaṇa traditions later gave rise to Yoga, Jainism, Buddhism, and some schools of Hinduism. They also led to popular concepts in all major Indian religions, such as saṃsāra, the cycle of birth and death, and moksha, liberation from that cycle.

## **Pratīyasamutpāda**

Pratīyasamutpada means something in Buddhism, Pali, Hinduism, Sanskrit. If we want to know the exact meaning, history, etymology or English translation of this term then check out the descriptions on this page. Add our comment or reference to a book if we want to contribute to this summary article.

Pratīyasamutpāda refers to the twelve factor “conditional origination” as defined in the Dharma-saṃgraha (section 42):

1. avidyā (ignorance),
2. saṃskāra (volitions),
3. vijñāna (consciousness),
4. nāmarūpa (name and bodily-form),
5. ṣaḍāyatana (the six sense spheres),
6. sparśa (contact),
7. vedanā (feeling),
8. tṛṣṇā (craving),
9. upādāna (attachment),
10. bhava (continuity),
11. jāti (birth),
12. jarāmaraṇa (old age and death).

The Dharma-saṃgraha (Dharmasaṅgraha) is an extensive glossary of Buddhist technical terms in Sanskrit (eg., pratīya-samutpāda). The work is attributed to Nagarjuna who lived around the 2nd century A.D.

The doctrine of pratīyasamutpada, often translated as "dependent arising," is an important part of Buddhist phenomenology and, some argue, metaphysics.

Common to all schools of Buddhism, it states that phenomena arise together in a mutually

interdependent web of cause and effect. It is variously rendered into English as "dependent origination", "conditioned genesis", "dependent co arising", "interdependent arising", or "contingency".

Pratītyasamutpāda or Pratītyasamutpādavāda refers to a division of Asatkāryavāda: one of the philosophical systems regarding the cause and effect relation prevalent in Ancient India.—The Buddhists also do not accept the pre-existence of the effect in the cause. Hence, they are also asatkāryavādins. The Buddhist theory is known as Pratītyasamutpāda-vāda. The term means that the emergence of something after the presence of something else. The Buddhists hold that causation means the succession of two events, of which the former is the cause and the latter is the effect. They hold that a thing can never change into another thing, because a thing is what it is (svalakṣaṇa).<sup>39</sup> Causation, according to them, is dependent origination. There being some event, another event is sure to follow. It is generally believed that the cause continues to exist in the effect. But the Buddhists uphold that the effect is produced only after the cause is destroyed. According to them, the sprout (i.e., the effect) arises only after the destruction of the seed (i.e., the cause).<sup>40</sup> Thus, the Buddhists are also asatkāryavādins.

## Schools of Buddhism Vaibhashika

**Sarvastivada**, (Sanskrit: "Doctrine That All Is Real") also called **Vaibhashika**, a school of early Buddhism. A fundamental concept in Buddhist metaphysics is the assumption of the existence of dharmas, cosmic factors and events that combine momentarily under the influence of a person's past deeds to form a person's life flux, which he considers his personality and career. Differences arose among the various early Buddhist schools concerning the ontological reality of these dharmas. While, like all Buddhists, the Sarvastivadins consider everything empirical to be impermanent, they maintain that the dharma factors are eternally existing realities. The dharmas are thought to function momentarily, producing the empirical phenomena of the world, which is illusory, but to exist outside the empirical world. In contrast, the Sautrantikas (those for whom the sutras, or the scriptures, are authoritative) maintained that the dharma factors are not eternal but momentary, and the only actually existing dharmas are the ones presently functioning. The Sarvastivada school is also known as the Vaibhashika because of the c. 2nd-century-CE commentary Mahāvibhāṣā ("Great Elucidation"). This text itself was commented upon by the important 4th- or 5th-century Buddhist thinker Vasubandhu in his *Abhidharmakośa*, prior to his conversion to the Mahayana tradition of Buddhism. Thus, elements of the Sarvastivada school came to influence Mahayana thought.

## Yogachara

**Yogachara**, (Sanskrit: "Practice of Yoga [Union]") also called **Vijñānavāda** ("**Doctrine of Consciousness**") or **Vijñaptimātra** ("**Consciousness Only**"), an influential idealistic school of Mahayana Buddhism. Yogachara attacked both the complete realism of Theravada Buddhism and the provisional practical realism of the Madhyamika school of Mahayana Buddhism. The name of the school is derived from the title of an important 4th- or 5th-century text of the school, the *Yogacharabhūmi-shāstra* ("The Science of the Stages of Yoga Practice").

Another name for the school, Vijñānavāda, is more descriptive of its philosophical position, which is that the reality a human being perceives does not exist, any more than do the images called up by a monk in meditation. Only the consciousness that one has of the momentary interconnected events (dharmas) that make up the cosmic flux can be said to exist. Consciousness, however, also clearly discerns in these so-called unreal events consistent patterns of continuity and regularity; in order to

explain this order in which only chaos really could prevail, the school developed the tenet of the *alaya-vijnana*, or “storehouse consciousness.” Sense perceptions are ordered as coherent and regular by a store of consciousness, of which one is consciously unaware. Sense impressions produce certain configurations (*samskaras*) in this unconscious that “perfume” later impressions so that they appear consistent and regular. Each being possesses this storage consciousness, which thus becomes a kind of collective consciousness that orders human perceptions of the world, though this world does not exist. This doctrine was cheerfully attacked by the adherents of the *Madhyamika* (“Middle Way”) school of Mahayana Buddhism, who pointed out the obvious logical difficulties of such a tenet.

Apart from human consciousness, another principle was accepted as real, the so-called suchness (*tathata*), which was the equivalent of the void (*shunya*) of the *Madhyamika* school. The school emerged in India about the 2nd century CE but had its period of greatest productivity in the 4th century, during the time of Asanga and Vasubandhu. Following them, the school divided into two branches, the *Agamanusarino Vijnanavadinah* (“Vijnanavada School of the Scriptural Tradition”) and the *Nyayanusarino Vijnanavadinah* (“Vijnanavada School of the Logical Tradition”), the latter subschool postulating the views of the logician Dignaga (c. 480–540 CE) and his successor, Dharmakirti (c. 600–660 CE).

The teachings of the Yogachara school were introduced into China by the 7th-century monk-traveler Xuanzang and formed the basis of the Faxiang school founded by Xuanzang’s pupil Kueiji. Because of its idealistic content it is also called *Weishi* (“Consciousness Only”).

Transmitted to Japan, as *Hossō*, sometime after 654, the Yogachara school split into two branches, the Northern and the Southern. During the 8th century it enjoyed a period of political influence and produced such celebrated priests as *Gembō* and *Dōkyō*. In modern times the school retained the important temples of *Horyū*, *Yakushi*, and *Kōfuku*, all located in or near Nara and all treasure-houses of Japanese religious art.

## **Mādhyamika**

**Mādhyamika**, (Sanskrit: “Intermediate”), important school in the *Mahāyāna* (“Great Vehicle”) Buddhist tradition. Its name derives from its having sought a middle position between the realism of the *Sarvāstivāda* (“Doctrine That All Is Real”) school and the idealism of the *Yogācāra* (“Mind Only”) school. The most renowned *Mādhyamika* thinker was *Nāgārjuna* (2nd century AD), who developed the doctrine that all is void (*śūnyavāda*). The three authoritative texts of the school are the *Mādhyamika-śāstra* (Sanskrit: “Treatise of the Middle Way”) and the *Dvādasā-dvāra-śāstra* (“Twelve Gates Treatise”) by *Nāgārjuna* and the *Śataka-śāstra* (“One Hundred Verses Treatise”), attributed to his pupil *Āryadeva*.

Buddhism in general assumed that the world is a cosmic flux of momentary interconnected events (*dharmas*), however the reality of these events might be viewed. *Nāgārjuna* sought to demonstrate that the flux itself could not be held to be real, nor could the consciousness perceiving it, as it itself is part of this flux. If this world of constant change is not real, neither can the serial transmigration be real, nor its opposite, nirvana. Transmigration and nirvana being equally unreal, they are one and the same. In the final analysis, reality can only be attributed to something entirely different from all that is known, which must therefore have no identifiable predicates and can only be styled the void (*sunyata*).

Mādhyamika thinkers thus strongly emphasize the mutations of human consciousness to grasp the reality of that which is ultimately real beyond anyduality. The world of duality could be assigned a practical reality of vyavahāra (“discourse and process”), but, once the ultimate meaning (paramārtha) of the void is grasped, this reality falls away. These ideals influenced Hindu thinkers, principally Gauḍapāda (7th century) and Śaṅkara (usually dated AD 788–820); the latter is therefore called a crypto-Mādhyamika by hisadversaries.

The basic Mādhyamika texts were translated into Chinese by Kumārajiva in the 5th century, and the teachings were further systematized (as the San-lun, or Three Treatises, school) in the 6th–7th century by Chi-tsang. The school spread to Korea and was first transmitted to Japan, as Sanron, in 625 by the Korean monk Ekwan.

## **Sautrāntika**

**Sautrāntika**, ancient school of Buddhism that emerged in India about the 2nd century BC as an offshoot of the Sarvāstivāda (“All-Is-Real Doctrine”). The school is so called because of its reliance on the sutras, or words of the Buddha, and its rejection of the authority of the Abhidharma, a part of the canon.

The Sautrāntikas maintained that though events (dharmas) have only momentary existence, there is a transmigrating substratum of consciousness that contains within it seeds of goodness that are in every person. The Sautrāntika sometimes is characterized as a transitional school that led to the development of the Mahāyāna tradition, and many of its views influenced later Yogācāra thought. Buddhism was transmitted into Tibet mainly during the 7th to 10th centuries.

Notable early teachers were the illustrious 8th-century Tantric master Padmasambhava and the more orthodox Mahayana teacher Shantirakshita. With the arrival from India in 1042 of the great teacher Atisha, a reform movement was initiated, and within a century the major sects of Tibetan Buddhism had emerged. The Dge-lugs-pa, or One of the Virtuous System, commonly known as the Yellow Hats, the order of the Dalai and the Panchen Lamas, was the politically predominant Tibetan sect from the 17th century until 1959, when the hierocratic government of the Dalai Lama was abolished by the People’s Republic of China.

By the 14th century the Tibetans had succeeded in translating all available Buddhist literature in India and Tibet; many Sanskrit texts that have since been lost in the country of their origin are known only from their Tibetan translations. The Tibetan canon is divided into the Bka’-’gyur, or “Translation of the Word,” consisting of the supposedly canonical texts, and the Bstan-’gyur, or “Transmitted Word,” consisting of commentaries by Indian masters.

In the second half of the 20th century Tibetan Buddhism spread to the West, particularly after the subjugation of Tibet to Chinese Communist rule sent many refugees, including highly regarded “reincarnated lamas,” or tulkus, out of their homeland. Tibetan religious groups in the West include both communities of refugees and those consisting largely of Westerners drawn to the Tibetan tradition.

## **Nyaya**

**Nyaya**, (Sanskrit: “Rule” or “Method”) one of the six systems (darshans) of Indian philosophy, important for its analysis of logic and epistemology. The major contribution of the Nyaya system is its working out in profound detail the means of knowledge known as inference.

Like the other systems, Nyaya is both philosophical and religious. Its ultimate concern is to bring an end to human suffering, which results from ignorance of reality. Liberation is brought about through right knowledge. Nyaya is thus concerned with the means of right knowledge.

In its metaphysics, Nyaya is allied to the Vaisheshika system, and the two schools were often combined from about the 10th century. Its principal text is the Nyaya-sutras, ascribed to Gautama (c. 2nd century BCE).

The Nyaya system—from Gautama through his important early commentator Vatsyayana (c. 450 CE) until Udayanacharya (Udayana; 10th century)—became qualified as the Old Nyaya (Prachina-Nyaya) in the 11th century when a new school of Nyaya (Navya-Nyaya, or “New Nyaya”) arose in Bengal. The best-known philosopher of the Navya-Nyaya, and the founder of the modern school of Indian logic, was Gangesha (13th century).

The Nyaya school holds that there are four valid means of knowledge: perception (pratyaksha), inference (anumana), comparison (upamana), and sound, or testimony (shabda). Invalid knowledge involves memory, doubt, error, and hypothetical argument.

The Nyaya theory of causation defines a cause as an unconditional and invariable antecedent of an effect. In its emphasis on sequence—an effect does not preexist in its cause—the Nyaya theory is at variance with the Samkhya- Yoga and Vedantist views, but it is not unlike modern Western inductive logic in this respect.

Three kinds of causes are distinguished: inherent or material cause (the substance out of which an effect is produced), non-inherent cause (which helps in the production of a cause), and efficient cause (the power that helps the material cause produce the effect). God is not the material cause of the universe, since atoms and souls are also eternal, but is rather the efficient cause.

## **Pramā**

Pramā literally means ‘the knowledge’. Technicalities of Treatises Philosophical treatises often use four technical terms:

1. Pramā - The correct knowledge that is got through the pramāṇas is ‘pramā’.
2. Pramāṇa - The means of knowledge that gives us its correct understanding is ‘pramāṇa’.
3. Prameya - An object that has to be known is ‘prameya’.
4. Pramātṛ - The person who knows it thus is the pramātṛ.

For instance, a pot is ‘prameya’. The eye that sees it and the process of seeing is ‘pramāṇa’. The knowledge got that it is a mud pot of small size, black in color, containing water, is ‘pramā’.

### Classification of Pramā

Pramā is the true knowledge which is not negated by later perceptions. If negated, like seeing a snake in a rope in insufficient light and then discovering it in bright light that it is a rope, it is only a bhrama. Sometimes, false knowledge is called apramā and three more varieties of it are predicated:

1. Smṛti - insufficient memory
2. Sanśaya - doubt

### 3. Tarka - false logic

#### **Pramāṇas**

Pramāṇas literally means 'those which measure,' 'valid means of knowledge'. All the six darśanas accept certain basic sources or means of knowledge known as 'pramāṇas' upon which they further develop their theories. These pramāṇas vary from a minimum of three to a maximum of six. They are as follows.

#### **Classification of Pramāṇas Pratyakṣa**

Pratyakṣa means a direct or immediate perception having two stages of development. As soon as the sense-organ comes into contact with the sense-object, there is a general awareness of it, as something existing. This is called nirvikalpa-pratyakṣa. In the next stage, all the details will be noted in the light of past experience which is savikalpa-pratyakṣa.

#### **Anumāna**

Anumāna means inference. It gives us the knowledge of a thing indirectly, when we see some liṅga or sign invariably connected with the original. For instance, by seeing smoke on a yonder hill, we can infer that there is fire there, even though we do not see it directly, since it is known from previous observations and experience that smoke is invariably associated with fire.

#### **Upamāna**

Upamāna means comparison which is another source of knowledge. On seeing a rat, one recalls that it is like the mouse he had seen earlier. He then comes to know that the remembered mouse is like the perceived rat. This type of knowledge comes through upamāna.

#### **Śabda**

It means verbal testimony. The Mīmāṃsā Darśana pays the greatest attention to this since it has to justify the undisputed authority of the Vedas. The words of a reliable person are believed to be true.

This is called āptavākya. However, the Verbal testimony is of two types:

1. Pauruṣeya - personal, same as āptavākya
2. Apauruṣeya – impersonal

The Apauruṣeya denotes the Vedas since they were not created by any human agency. The Vedas are supremely authoritative since they are the 'Book of

Commandments' and also give us authentic knowledge of the unseen and the unknown truths. Again, their main purport and purpose lies in propagating sacrificial rites. The Vedas are eternal, not as the printed Book nor as the orally transmitted mantras but as the eternal teachings contained in them. These teachings are conveyed through the ṛṣis or sages in every age. Since the Vedas are mainly concerned with giving commands about the yāgas or sacrificial rites and other associated rituals, only those sentences containing such commands as expressed through the verbs couched in 'vidhīṅ' and other forms should be taken as authoritative and the rest as aids to it. Such verbs have an innate power of urging the hearer to do the sacrifice. This is called 'bhāvanā'. The urge contained in the Vedic words is known as 'śābdi- bhāvanā'. On hearing it, the person who hears it, gets the urge to perform it. This secondary urge is named 'ārthībhāvanā'. All this depends upon the correct understanding and interpretation of the Vedic sentences. For this, the Mīmāṃsā gives six steps:

1. Upakrama - beginning
2. Upasanhāra - concluding
3. Abhyāsa - repetition for the sake of emphasis
4. Apurvātā - not being known earlier by any other means
5. Phala - utility
6. Arthavāda - mere eulogy
7. Upapatti - logic and reasoning

Once the correct meaning is thus ascertained, the command may be implemented.

### **Arthāpatti**

Arthāpatti means postulation or presumption. It is the necessary supposition of an unperceived fact which alone can explain an anomaly satisfactorily. For instance, if a person is noticed to be getting fat even though he does not eat during the day, it can safely be presumed that he is secretly eating at night!

Knowledge obtained by arthāpatti is distinctive since it cannot be got by any other means.

### **Anupalabdhi**

Anupalabdhi means non-perception. It has also been accepted as a source of knowledge since it gives the immediate cognition of the non-existence of an object. If it is found that a jar which had been kept on a table earlier is not perceived now, its non-existence is cognized.

### **Conception of God**

The current essay tries to present the concept of God in Nyāya- Vaiśeṣika philosophy. The exposition will be mainly focused on the critical review of arguments given in support of existence of God which are thoroughly described in Udayanāchārya's Nyāyakusumāñjali (10 century CE).

Nyāya is one of the six orthodox or āstika schools of Hindu philosophy. The Nyāya school of philosophy is based on Nyāya Sūtras (2<sup>nd</sup> century B.C.), which were written by Gautama. Nyāya accepts four sources of knowledge (pramāṇas): perception, inference, comparison, and testimony. Early Naiyāyikas wrote very little about God, i.e., Īśvara (literally, the Supreme Lord). In Nyāya sūtras also we don't find any clear mentioning about God. Later Nyāya philosophers rendered God as the Paramātmān.

"The attributes of Jīva are also the attributes of God, so Jīva and God are both the same that is Ātman" But the attributes of Jīva are limited but in the case of God they are perpetual.

Jīva is tied with bondage and liberation but the God is always emancipated. Jīvātmās are many but God is one.

And there came the Navya-Naiyāyikas, the concept of those about God was quite different than the old school Naiyāyikas. They consider God as: The instrumental cause of the world, the Authority which distributes fruits to Jīvātmās according to their deeds, and who gives sermons of Vedas at the time of creation of this world.

Later Bauddhās in India had become from agnostic to strictly atheistic. As a reaction, the later

Naiyāyikas entered into disputes with the Bauddhās and tried to prove the existence of God through logic. They made this question a challenge to their own existence. At times Nyāya philosophers tried to prove the existence of God through Śabda pramāṇa, but Śabda pramāṇa was not acceptable to the Bauddhās, so Udayana took the uphill task to prove the existence of God and also His attributes through inference because inference or anumāna was acceptable to his opponents.

Udayana was born in a Brahmin family in Maṇaroṇī at the bank of Kamalā river. Udayana comes eighth in the history of Bauddha-Naiyāyika debate. Same as the old Naiyāyikas he also had to face the arguments of Bauddha and Jaina critics. To answer them he composed Nyāyavārtikatātparyāḍīkāparīśuddhi, Nyāyakusumāñjali and Ātmatattvaviveka. The latter is also known as Bauddhādhikāra and Bauddhadhikkāra.

Udayana's Nyāyakusumāñjali is perhaps the most important text in the context of Īśvarasiddhi in which he has vindicated theism in a very efficient manner. It was composed mainly to refute claims of Īśvarabhangakārikā of Kalyāṇarakīta.

Udayana compressed his arguments in cryptic kārikās, most of which are not understandable without his auto-commentary, because the basic text of Nyāyakusumāñjali is hard enough to comprehend. It is divided into five stāvakas in which he has refuted five objections against existence of God. However in view of the word limitation, we will be focusing on the eight main arguments which he has given in the fifth stāvaka of Nyāyakusumāñjali. But first of all, Udayana said that all followers of all the schools in principle or in practice believe in God:

Now, although with regard to that Being whom all men alike worship, whichever of the (four well known) ends of man they may desire: thus the followers of the Upanīśadas worship it as the very knower, the disciples of Kapila as the perfect first Wise, those of Patañjali as Him who, untouched by pain, action, fruit or desert, having assumed a body in order to create, revealed the tradition of the Veda and is gracious to all living beings, the Mahāpāśupatās as the Independent one, undefiled by Vedic or secular violations, the Śaivās as Śiva, the Vaiṇavās as Puruṣottama, the followers of the Purāṇas as the great Father (Brahmā), the Ceremonialists as the Soul of the sacrifice, the Saugatās as the Omniscient, the Jainās as the Unobstructed, the Mīmāṃsākās as Him who is pointed out as to be worshipped, the Cārvākas as Him who is established by the conventions of the world, the followers of the Nyāya as Him who is all that is said worthy of Him, why farther detail whom even the artisans themselves worship as the great artisan Viśvakarmā?

Then also Nyāyacarceyamīśasya mananavyapadeśabhāk |Upāsanaiva kriyate śrava<sup>a</sup>antarāgatāĒ ||  
Now Udayana in his Nyāyakusumāñjali lists the objection of the Sāṅkhya in the fifth stāvaka of his book:

### **Tatsādhakapramā<sup>a</sup>ābhāvāt**

It means in the opinion of the followers of Sāṅkhya school "there is lack of any evidence to prove the existence of God".

Then Udayanāchārya refutes this objection by saying this famous verse – Kāryāyojana dhṛityādeĒ padāt pratyayataĒ śruteĒ |

Vākyāt sa,kyāviśeīacca sādhyo viśvavidavyayaĒ ||

An eternal omniscient Being is established on the grounds of products, concrete activity, sustaining

effort, etc. (destruction), introduction of empirical usages, infallibility, śruti, sentences thereof, and particular number.

It means the Supreme Īśvara's existence can be decisively proved by the above mentioned eight arguments. Now we shall discuss the all the eight arguments separately in detail.

Kāryatvāt (literally "From effect"): This is causal argument to prove the existence of God. This universe is an effect same as the pot. As we know that a pot cannot be there without potter who is the creator of the pot, so the universe must have an intelligent creator that is Īśvara. The attribute of creation consists of upādānagocara, aparokīajnāna, cikirīā and kĀti, where upādānagocara is related to material cause, aparokīajnāna is knowledge through perception and cikirīā is the will to create the world. So through this argument the existence of God is evident.

Āyojanāt (literally "From combination"): In the beginning of universe the combination of atoms into dyads is an action same as the actions which we do, so it must be preceded by a conscious being, that being God. Atoms are inactive and properties are unphysical. So it must be God who creates the world with his will by causing the atoms to join. Self-combination of inanimate and lifeless things is not possible; otherwise atoms would only combine at random, creating chaos.

There is to be seen the hand of a wise organizer behind the systematic grouping of the ultimate atoms into dyads and molecules. That final organizer is God. Also man cannot be who causes the atoms to join despite being conscious because the creation of world is not yet done and atoms are not joined, so there is no question of existence of man.

DhĀiti (literally "From support"): This is the first part of the third argument. Just as a material thing falls off without a support, similarly, God is the supporter and bearer of this world, without which the world would not have remained integrated. For example just like a piece of grass being carried by a bird in the sky in its beak does not fall on the ground, this world is integrated and well placed in this universe because it is the God who holds it. This universe is hence superintended within God, which proves his existence.

DhĀtyādeĀ: DhĀti and ĀdeĀ = DrityādeĀ Here the term ādi is important. Ādi means destruction. This universe is destructible same as the cloth. But as the cloth never tears up on its own, this universe is also not annihilated by itself. To destruct it there must be a conscious entity that is Īśvara. This is the final part of the third argument.

Padāt (literally "From word"): As we cannot know anything till we are taught by somebody, also at the time of creation it is the God who teaches us all the knowledge (science, art, etc.), any mortal man is not capable of doing that.

Moreover, every word has the capability to represent a certain object. It is the will of God that a thing should be represented by a certain word. Similarly, no knowledge can come to us of the different things here unless there is a source of this knowledge. The origin of all knowledge should be omniscient and, consequently, omnipotent. Such a being is not to be seen in this universe, and so it must be outside it. This being is God.

PratyataĀ (literally from faith): Here in the fifth argument the Nyāya theory of parataĀ prāmāya comes into action. The Hindu holy scriptures, the Vedas, are regarded as the source of eternal

knowledge. Their knowledge is free from fallacies and is widely believed as a source of proof. Their authors cannot be human beings because human knowledge is limited. They cannot obtain knowledge of past, present, and future, and in depth knowledge of mind. Hence, only God can be the creator of the Vedas. Hence, his existence is proved from his being the author of the Vedas, which he revealed to various sages over a period of time.

ŚruteĒ (literally "From scriptures"): Śruti, e.g., the Vedas extol God and talk about his existence. "He is the lord of all subjects, omniscient, and knower of one's internal feelings; He is the creator, cause and destroyer of the world", say the Śruti. Śruti is regarded as a source of proofs by Naiyāyikas. Moreover, Vedas are paureseya same as the Āyurveda. It means as we know that Āyurveda is preached by someone, so Śruti being Veda same as Āyurveda must have its author. That author must be God and nobody else. Hence, the existence of God is proved.

Vākyāt (literally "From precepts"): Veda must have been produced by a person because it has the nature of "sentences," same as the sentences of Mahābhārata which we consider to be created by Vedavyāsa. Again the sentences of the Vedas were produced by a person because they have the nature of sentences, just as the sentences of beings like us. That person must have been God. This is the seventh argument for the existence of God.

Sa,ḥyāviśeīāt (literally "From the specialty of numbers"): The cause of the size of dyads (dvaya<sup>a</sup>uka) is the number 'two' (dviṭvasa,ḥyā) belonging to two atoms; and two and the higher numbers are all products resulting from the enumerative cognition (apekīābuddhi) of the person who counts. At the beginning of creation, it is the omniscient God to whom such enumerative cognition can be attributed to and nothing else because at the time of creation man was not present, so the objection of this enumerative cognition belonging to man cannot be raised. In other words, the size of a dyad or a molecule depends on the number of the atoms that constitute it. This requisite number of the atoms that form a particular compound could not have been originally the object of the perception of any human being; so its contemplator must be God. This is the eighth and the final argument in support of the existence of God given by Udayanāchārya in his Nyāyakusumāñjali.

So, we can say that in his treatise, Udayana has exerted to prove the existence of God through pure reason. By his book he was able to decisively defeat the Buddhists in the debate that lasted for centuries and perhaps millennia and he has this credit to his name because afterwards no other heterodox philosopher came forward to refute his claims. His efficiency is that he used only the evidences (pramā<sup>a</sup>ās) and examples which were acceptable to all. Scholars such as Sir Oliver and Flint have accepted the causal argument of Udayana as very important one and refuted the arguments of Armstrong and John Stuart Mill who have claimed the creation of this world as the result of random conjunction of atoms.

Classical Indian Philosophy accepts perception (pratyakṣa), or perceptual experience, as the primary means of knowledge (pramāṇa). Perception (pratyakṣa) is etymologically rooted in the sense-faculty or the sense-organ (akṣa) and can be translated as sensory awareness, while pramāṇa, on the other hand, is derived from knowledge (pramā) and, literally means 'the instrument in the act of knowing'. However, the standard interpretation of perception accepted by classical Indian philosophers, barring the Buddhists and the Vedāntins, is that it is a cognition arising within the self—the knowing subject—from mental operations following a sense-object contact. It, therefore, is neither an instrument in the act of knowing, nor a mere sensory awareness. Definitions of perception from various classical Indian philosophy schools are given in section 2 below.

The same is true of concepts. There is no one agreed notion or definition of concept understood as the meaning of a general term in Classical Indian Philosophy. Rather, we have a variety of views ranging from robust realism about concepts as real properties, essences or universals to extreme nominalism which admits only of unique particulars with versions of conceptualism in between. The robust realist position is defended by the Nyāya-Vaiśeṣika and Mīmāṃsā schools, the nominalist by the Buddhist schools and the conceptualist by the Vedāntins and Jainas. I will not be discussing the conceptualist position or their arguments here because ultimately this position ends up collapsing into a version of realism or nominalism.

## **Vaisheshika**

**Vaisheshika**, (Sanskrit: “Particular”) one of the six systems (darshans) of Indian philosophy, significant for its naturalism, a feature that is not characteristic of most Indian thought. The Sanskrit philosopher Kanada Kashyapa (2nd–3rd century CE?) expounded its theories and is credited with founding the school. Important later commentaries were written by Prashastapada, Udayanacharya, and Shridhara.

After a period of independence, the Vaisheshika school fused entirely with the Nyaya school, a process that was completed in the 11th century. Thereafter the combined school was referred to as Nyaya-Vaisheshika.

The Vaisheshika school attempts to identify, inventory, and classify the entities and their relations that present themselves to human perceptions. It lists six categories of being (padarthas), to which was later added a seventh. These are:

1. Dravya, or substance, the substratum that exists independently of all other categories, and the material cause of all compound things produced from it. Dravyas are nine in number: earth, water, fire, air, ether, time, space, spirit, and mind.
2. Guna, or quality, which in turn is subdivided into 24 species.
3. Karma, or action. Both guna and karma inhere within dravya and cannot exist independently of it.
4. Samanya, or genus, which denotes characteristic similarities that allow two or more objects to be classed together.
5. Vishesha, or specific difference, which singles out an individual of that class.
6. Samavaya, or inherence, which indicates things inseparably connected.

To these six was later added abhava, nonexistence or absence. Though negative in content, the impression it makes is positive; one has a perception of an absence where one misses something. Four such absences are recognized: previous absence, as of a new product; later absence, as of a destroyed object; total absence, as of colour in the wind; and reciprocal absence, as of a jar and a cloth, neither of which is the other.

The Vaisheshika system holds that the smallest, indivisible, indestructible part of the world is an atom (anu). All physical things are a combination of the atoms of earth, water, fire, and air. Inactive and motionless in themselves, the atoms are put into motion by God’s will, through the unseen forces of moral merit and demerit.

## **Padārtha**

Padārtha .—A padārtha is what is knowable and nameable—i.e the ultimate of intellectual analysis.

Padārtha has its nearest equivalent in English in 'Category'. The categories are the objects of right knowledge. This means that right knowledge fulfils its function in comprehending these categories.

Vaiśeṣika: According to the Vaisheshika school, all things which exist, which can be cognised, and which can be named are padārthas (literal meaning: the meaning of a word), the objects of experience.

All objects of experience can be classified into six categories,

1. dravya (substance),
2. guṇa (quality),
3. karma (activity),
4. sāmānya (generality),
5. viśeṣa (particularity)
6. and samavāya (inherence).

Later Vaiśeṣikas (Śrīdhara and Udayana and Śivāditya) added one more category abhava (non-existence).

### **Asatkāryavāda**

Asatkāryavāda literally means 'the theory of non-existent effect'. The relationship between a cause (like clay) and its effect (like the pot) has provided enough material for discussion in philosophy. Several theories have been advocated in which this relationship has been sought to be explained. 'Asatkāryavāda' is the theory that has been put forward by the schools of Buddhism and Nyāya Vaiśeṣikas. When the pot, the effect, is produced from clay, its cause, two explanations are possible. The effect, which already existed in its cause in a subtle form, was manifested when favorable circumstances were created; because a real effect cannot be produced from an unreal or non-existing cause. This theory is called 'asatkāryavāda' and is advocated generally by the Sāṅkhya system.

The other explanation is that the effect, which is something new, is produced as a result of the efforts of the potter and his implements, even though it did not exist earlier. If the clay and the pot were not different from each other, we should have used the same name for both and they should have served the same purpose. But this is not so. Hence according to this view, a real effect ('kārya') is produced from the cause though it did not exist earlier (hence unreal or 'asat') in that cause. Therefore it is named as 'asatkāryavāda.'

### **Kāraṇa**

Kāraṇa literally means 'that by which something is accomplished'. Philosophical systems have highlighted the problem of kāraṇa or cause and kārya or effect and their mutual relationship. Kāraṇa or cause is of various kinds:

- **Upādānakāraṇa** is the material cause like the clay for a pot.
- **Nimittakāraṇa** is the efficient cause like the potter's wheel, stick and the potter for the pot.
- **Samavāyikāraṇa** is the inherent cause and the threads are for the cloth out of which it is woven.

Other examples for samavāyikāraṇa are the existence of a part in a whole. It is a quality in a qualified object or movement in a moving object.

- **Asamavāyikāraṇa** is the non-inherent cause like the color of the threads which causes the color of the cloth after it is woven. Color is related to the threads directly and indirectly to the cloth.
- **Mulakaraṇa** is the original cause of the universe, i.e., Brahman or God.

## Samkhya

**Samkhya**, (Sanskrit: “Enumeration” or “Number”) also spelled **Sankhya**, one of the six systems (darshans) of Indian philosophy. Samkhya adopts a consistent dualism of matter (prakriti) and the eternal spirit (purusha). The two are originally separate, but in the course of evolution purusha mistakenly identifies itself with aspects of prakriti. Right knowledge consists of the ability of purusha to distinguish itself from prakriti.

Although many references to the system are given in earlier texts, Samkhya received its classical form and expression in the Samkhya-karikas (“Stanzas of Samkhya”) by the philosopher Ishvarakrishna (c. 3<sup>rd</sup> century CE). Vijnanabhikshu wrote an important treatise on the system in the 16th century.

The Samkhya school assumes the existence of two bodies, a temporal body and a body of “subtle” matter that persists after biological death. When the former body has perished, the latter migrates to another temporal body. The body of subtle matter consists of the higher functions of buddhi (“consciousness”), ahamkara (“I-consciousness”), manas (“mind as coordinator of sense impressions”), and prana (“breath,” the principle of vitality).

Samkhya posits the existence of an infinite number of similar but separate purushas, none superior to any other. Because purusha and prakriti are sufficient to explain the universe, the existence of a god is not hypothesized.

The purusha is ubiquitous, all-conscious, all-pervasive, motionless, unchangeable, immaterial, and without desire. Prakriti is the universal and subtle nature that is determined only by time and space. The chain of evolution begins when purusha impinges on prakriti, much as a magnet draws iron shavings to itself. The purusha, which before was pure consciousness without an object, becomes focused on prakriti, and out of this is evolved buddhi (“spiritual awareness”). Next to evolve is the individualized ego consciousness (ahamkara, “I-consciousness”), which imposes upon the purusha the misapprehension that the ego is the basis of the purusha’s subjective existence.

The ahamkara further divides into the five gross elements (space, air, fire, water, earth), the five fine elements (sound, touch, sight, taste, smell), the five organs of perception (with which to hear, touch, see, taste, smell), the five organs of activity (with which to speak, grasp, move, procreate, evacuate), and mind (as coordinator of sense impressions; manas). The universe is the result of the combinations and permutations of these various principles, to which the purusha is added.

Largely outside the above system stands that of the three primal qualities of matter that are called gunas (“qualities”). They make up the prakriti but are further important principally as physiopsychological factors. The first is tamas (“darkness”), which is obscurity, ignorance, and inertia; the second is rajas (“passion”), which is energy, emotion, and expansiveness; and the highest is sattva (“goodness”), which is illumination, enlightening knowledge, and lightness. To these correspond personality types: to tamas, that of the ignorant and lazy person; to rajas, that of the impulsive and passionate person; to sattva, that of the enlightened and serene person.

## Satkāryavāda

Satkāryavāda literally means 'the theory of the effect really existing previously in the cause'.

Satkāryavāda refers to one of the philosophical systems regarding the cause and effect relation prevalent in Ancient India.—Satkāryavāda is upheld by the Sāṃkhya-Yoga and Advaita Vedānta philosophers. According to Satkāryavāda the effect already exists in the cause in a potential condition. So, it is not basically new creation and different from the material cause. But effect is only an explicit manifestation of that which are contained in its material cause.

For example, a pot is not different from the clay, a cloth is not different from the threads.

There are two divisions of Satkāryavāda— a) Pariṇāmavāda and b) Vivartavāda. They are called to be Pariṇāmavādins, who believe that the effect is a real transformation of its cause, but who believe that the effect is unreal, they are Vivartavādins. Sāṃkhya-Yoga's view is known as Prakṛti-Pariṇāmavāda, Rāmānuja's view is known as Brahma-Pariṇāmavāda, Śaṅkara is Vivartavādin. It is the Sāṃkhya who have actually established the theory satkāryavāda by different arguments. Īśvaraḥ has discussed the theory of satkāryavāda in his Sāṃkhyakārikā. He gives five arguments to prove this theory. The five arguments are discussed here as follows:

1. asadakaraṇād,
2. upādāna-grahaṇāt,
3. sarvasambhavābhāvāt,
4. śaktasya-śakyakaraṇāt,
5. kāraṇabhāvāt.

Since a real effect cannot come out of an unreal cause, this theory put forward by the Sāṃkhya philosophy argues that the effect must have pre-existed in the cause, in a subtle form before manifestation. This is satkāryavāda. This theory is also called ārambhavāda and pariṇāmavāda. Satkāryavāda is a hypothesis according to which the effect pre-exists in a potential state. The causal process involves a modification of a stable underlying reality. The effect is not produced as a reality that is distinct from its underlying cause. It is a specific rearrangement of that causal substrate.

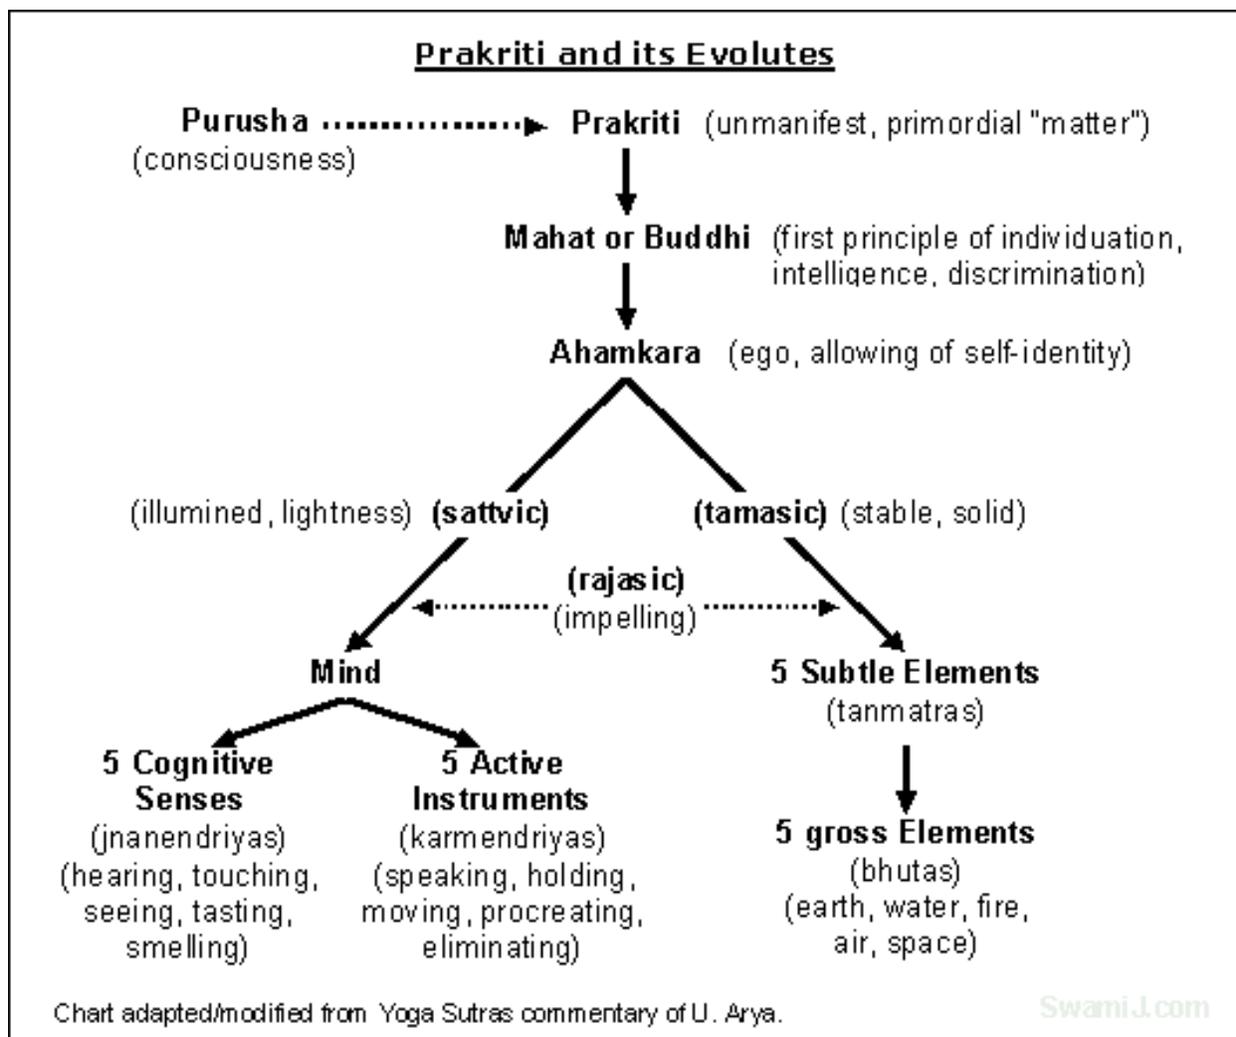

The Sāṃkhya system is based on the principle of Satkāryavāda. The effect pre-exists in the cause here. Cause and effect are seen as temporal aspects of the same thing. It is considered as theory of existent causes. The effect lies latent in the cause which in turn seeds the next effect. It maintains that effect is real.

Before its manifestation it is present in the cause in a potential form. According to Satkāryavāda principle the cause is hidden inside the effect. This effect exists due to several reasons-

1. what is nonexistent cannot be produced;
2. for producing a specific material cause is resorted to;
3. everything cannot be produced;
4. a specific material cause is capable of producing a specific product along with that effect;
5. there is a particular cause for a particular effect.

Adi Sankarācharya found Satkāryavāda as a useful tool against the doctrine of Annica or momentariness. Two branches of Satkāryavāda are vivartavāda and pariṇāmavāda.

## Prakṛti and its evolutes

**We don't have to know much:** As we read through the descriptions below, please keep in mind that it really does not take a tremendous amount of understanding of these subjects to begin doing the self-awareness and meditation practices.

If we understand the general principle of systematically shifting awareness inward through the evolutes, then the process of meditation can truly be directed towards Self-realization, and not merely relaxation designed for stress management (as useful as that might be). The subtler and subtler practices and insights will come with practice, built on the foundation of simple

understanding. With practice, the principles of Purusha and the evolutes of Prakriti become ever more clear.

**Real and Unreal:** Sankhya philosophy views anything that is subject to change, death, decay or decomposition as being "unreal" rather than "real." This does not mean that the objects are not there in front of us. Rather, they are not ultimately "real" in that their form keeps morphing from this to that to the other. What is considered "real" is that final substratum which never changes, cannot die, and cannot possibly decay or decompose. It is the direct experience of that "absolute reality" which is being sought.

**Something evolves out of something:** Ornaments can be said to evolve out of metal. Pots can be said to evolve out of clay. Our world is filled with objects.

Objects are made of compounds. Compounds are made of molecules. Molecules are made of atoms. Atoms are made of particles. Particles are made of a subtler substratum. While one evolves out of the other, all of these levels of reality coexist and interact with one another.

**Humans are also multi-leveled:** So too, is the construction of the human being. We are multi-leveled beings, with the next level emerging out of the previous, while those levels still coexist and interact with one another (see the charts).

While the human is made of physical material, we are also constructed of subtler levels of reality, which are products of the unmanifest, primordial essence called Prakriti in Sanskrit.

**Familiar human evolutes:** We are all familiar with the process by which our quiet mind has a memory arise, which triggers emotions, causing chains of thoughts to emerge from that, and to then further emerge into actions and speech. Each of these is a process of one level of functioning emerging or evolving out of the previous, while each of those levels still exists on its own.

In this way, the actions and speech (which emerged from mind) still coexist with the whole of the conscious mind, as well as with the whole domain of the unconscious mind, and also with the still, silent center of pure consciousness (whatever we might call this consciousness, or however we might individually perceive it). All of these coexist, while one leads to the next, with the grosser emerging from the subtler. So it is with all the levels of Prakriti.

**Evolutes of Prakriti:** Similarly, our whole being, in the spiritual sense, is multi-leveled, with the next stage emerging or evolving from the previous. This is the subject of Prakriti, which can be loosely described as unmanifest, primordial matter (which is subtler than the gross realm of quantum physics). This Prakriti ("matter") is infused with pure consciousness, which is called Purusha. Here, however, we are not just talking about the evolutes of chains of thought and emotions, but also the evolutes of the instruments by which we think and emot. This is taking us to the core of our being.

**Experiencing consciousness alone:** Yoga has been described as a process of realizing the direct experience of consciousness (Purusha) as independent of all levels of false identity (manifestations of Prakriti). These false identities are all seen as evolutes of the primordial stuff or matter (Prakriti) from which they emerge. Purusha (consciousness) is actually at all times independent of the interplay, but has become falsely identified with all of this.

**Retracing our way back:** The reason this is important is that the process of enlightenment (or awakening) is one of reversing the process, of tracing our way back through the stages of evolutes. The chart above shows the evolutes, and the chart below shows the journey of tracing our way back to consciousness alone, which is the meditation process of systematically withdrawing consciousness from the evolutes.

**Sankhya-Yoga:** What we now call "Yoga" or "Raja Yoga" has also been called "Sankhya-Yoga," since the practical Yoga methods rest on the philosophical foundation of Sankhya, which is represented in the chart above. This is a widelyheld view of the relationship between Sankhya and Yoga (See also the article entitled Six Schools of Indian Philosophy). Some may not agree with this perspective, but that is a matter for the scholars to debate. Sankhya is thus the foundation for the Yoga described by Patanjali in the Yoga Sutras.

**To debate or not debate:** Some intellectuals will also debate furiously and endlessly about whether the ultimate nature of reality is dualistic or non-dualistic. Some will say that Purusha (as consciousness) and Prakriti (as matter) are eternally separate, and therefore, ultimate reality is dualistic. Others will argue that the two are ultimately seen to be one and the same, and ultimate reality is non-dualistic. However, the seeker of direct experience through the practices of Yoga need not enter these debates intensely. While there may be some value in reflecting on these principles, and maybe even forming a provisional opinion, what is far more important is to understand and actually do the practices. (See also the article, Dualism and Non-Dualism)

**This is very practical:** Here, in this article, the evolutes of Prakriti are being presented as practical information for the modern seeker who is not a scholar or philosopher, but is a seeker trying to gain a basic understanding that will facilitate personal meditation practices. By having a working knowledge of the evolutes of Prakriti, the journey of moving attention in the reverse direction (involution) makes much more sense.

**Universal principles:** It is most important to note that the principles here are also contained in many other systems, although they may not be explained or used in precisely the same way. For example, the concepts of mind and senses, gross and subtle elements, and ego and intelligence, are universal principles. These are also included, for example, in Vedanta and Tantra as well, and also many other traditions. This is not said to force all of the many traditions into one box, but to help allow us to seek and see the underlying reality that is trying to be explained and reached through the practical application of the practices.

**Uncovering false identities:** The practices have to do with systematically uncovering the many false identities we have taken on by Purusha (consciousness) commingling with Prakriti (matter) (Yoga Sutra 1.2). By starting with the gross levels (Yoga Sutras 2.1-2.9) of these false identities, and gradually discerning deeper and deeper (Yoga Sutras 2.10-2.11), our true nature will ultimately be revealed through direct experience (Yoga Sutras and particularly Yoga Sutra 3.56).

**Descriptions of the Evolutes of Prakriti:** Following are some brief descriptions of the evolutes of Prakriti, which are in the two tables shown in this article. The most important principles are that of Purusha and Prakriti, which are consciousness and primordial matter. Everything else emerges from Prakriti, and then is infused with Purusha. So, for example, all the levels of manifestation of the human (gross and subtle) are Prakriti, but have life due to the infusion of Purusha. One of the easiest ways to grasp this process of evolving and infusing, as well as arising from and receding into Prakriti,

is to scroll down and read about the way the senses operate. The other evolutes arise and recede in a similar way.

**Purusha:** Of the two companion principles, Purusha is consciousness that is untainted, ever-pure. It is self-existent, standing alone from other identities of individuality; conscious being-ness; the principle of spiritual energy.

**Prakriti:** The other of the two companion principles, Prakriti is the unconscious, unmanifest, subtlest of the material aspect of energy. It is the primordial state of matter, even prior to matter as we know it in the physical sense. Prakriti manifests as the three gunas and the other evolutes.

**Mahat or Buddhi:** This is the purest, finest spark of individuation of Prakriti (primordial matter). It is very first of the evolutes of Prakriti. It is individuation, but yet, without characteristics. Buddhi is the word, which applies to the individual person, while mahat refers to the universal aspect of this process.

**Ahamkara:** This is the process of ego, by which consciousness can start to (incorrectly) take on false identities. Here, the word ego is used not to mean the actual qualities such brother or sister, or loving or cruel, but the capacity itself to take on the countless identities.

**Gunas:** Prakriti (primordial "matter") has three characteristics or attributes of lightness (sattvas), activity (rajas), and stability (tamas). These three combine and combine so as to form the various aspects of mind, senses, and the five elements: earth, water, fire, air, and space.

**Mind:** Mind (manas) is the instrument, which is the driving force behind actions, speech, and the thinking process. It is also the recipient of the sensory input. It is useful to know that, here, mind is being used in this more limited way, rather than the whole of the inner process called antahkarana, which includes manas, ahamkara, buddhi, chitta, along with the senses and the five elements.

**Senses/Instruments:** The five senses and five instruments of expression are likened doors of a building. Five are entrance doors, and five are exit doors. These ten indriyas are evolutes of mind. One way to understand this process of the senses being evolutes of mind is to notice what happens when we fall asleep, into dreamless sleep. What happens to our senses, our ability to perceive through those senses? They seem to go away, yet they return after sleep. Where did they go? It is in that sense that we might say the senses are still there, but that they have receded back into the field of mind from which they arose in the first place.

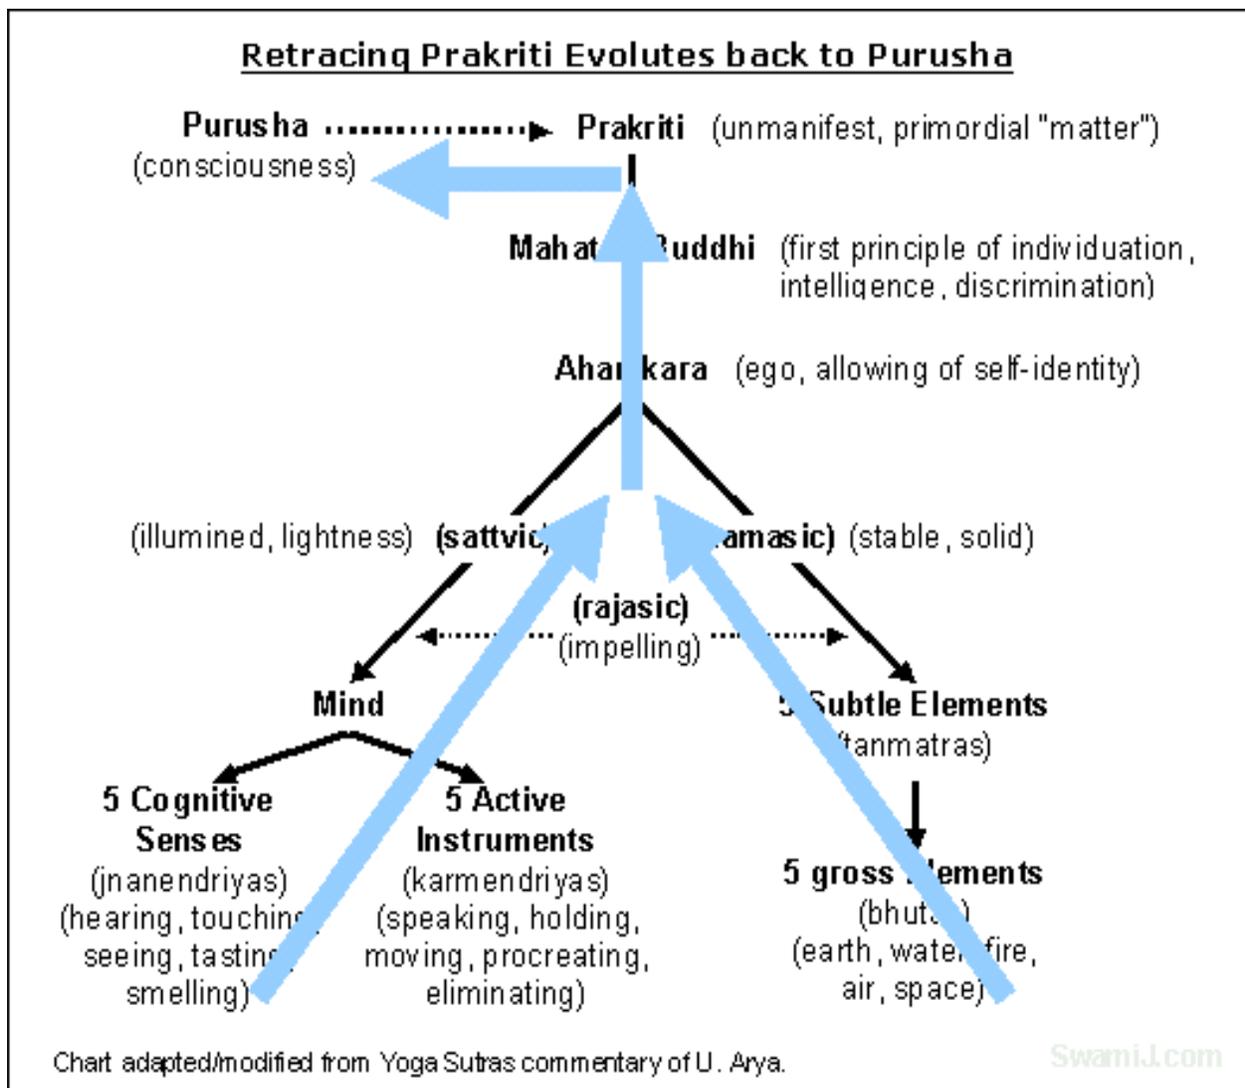

This same process of arising and receding happens not only with the senses, but all of the evolutes of Prakriti.

Also, if the senses arise from and recede into the field of mind, then it is also easy to see that during times when the senses are operating, they are also infused with mind, the next subtler level of Prakriti. In other words, senses without mind operating through them simply do not work. The idea of senses operating without mind infusing them seems rather silly, in fact. It is that simplicity that is in the whole concept of Prakriti manifesting outward, and the process of meditation retracing that process inward.

**Elements:** A further outpouring of Prakriti is when it bursts forth as the equivalent of space, as

experienced in the subtle (non-physical) realm. From, and within that emerges air (thinness, lightness, airiness), then fire (energy), then water (flow, fluidity), then earth (solidity, form). When these five elements are in the subtle realm, they are known as tanmatras. When they further come outward, manifesting into the physical world, they are known as bhutas. From these, all of the many objects of the external world are composed.

**Senses experiencing the Elements:** Notice that the Senses and Instruments of action (Indriyas) emerge out of unmanifest matter, or Prakriti. Notice that the five Elements also emerge out of Prakriti. Thus, one set of evolutes (Senses and Instruments of action) are relating to another set of evolutes (the five Elements in the form of many objects). This is one way of explaining the mechanics of how it can be that all is one can appear to be multiplicity.

## CONCEPT OF PRAKRITI AND PURUṢA

In Hinduism, God is generally regarded as the creator, preserver, destroyer and also the ruler of the universe, who controls everything in the world. But Indian seers with close observation and deep reflection found that there are many phenomenon of nature, such as sunrise, sunset, seasons, tides and phases of the moon etc. - all of which occur with predictable regularity. There has been no evidence of interference by supernatural beings. Accordingly, two distinct but related and

complementary aspects of God, viz., Puruṣa and Prakṛti are found. Of them, Puruṣa is person or self or spirit and possesses intelligence and feelings, while Prakṛti is impersonal or jaḍa or inert and devoid of both intelligence and feelings. Both, Prakṛti and Puruṣa are regarded as the two basic principles essential for the creation of the universe. They participate, regulate and implement the universal creation process.

The dictionary meaning of the term prakṛti is the nature, natural form, natural condition or state of anything. In philosophy, it means nature, the original source of the material world, consisting of the three essential qualities, viz., sattva, rajas and tamas. Another meaning is the personified will of the Supreme Spirit in the creation identified with māyā or illusion. The term puruṣa means a male being, mankind, an officer, agent or a member or representative of a generation. It also means the soul or the Supreme Being, God (soul of the universe). In philosophy, the word puruṣa means the soul, as distinguished from Prakṛti it is passive and the looker-on of the Prakṛti.

The concept of Puruṣa and Prakṛti are available in the Vedas, Upaniṣads, the epics and Purāṇas also. The term puruṣa is traced first in the Puruṣasūkta<sup>3</sup> of the Ṛgveda. According to this hymn, Puruṣa is embodied spirit or 'man' personified and regarded as the soul and original source of the universe, the personal and life giving principle in all animated beings. It is said to have thousand that is innumerable heads, eyes and feet, as being one with all created life. In the Ṛgveda, the Prakṛti is known as nature. The boneless or unsubstantial is Prakṛti, nature, the original source of the substantial that is the material and visible world. The Nāsadīyasūkta<sup>4</sup> seems to be the earliest mention of the eternal co-existence of a spiritual principle of reality and an unspiritual principle of unreality, i.e. the Puruṣa and Prakṛti. The word prakṛti is also called māyā, which can be found in its primitive meanings in the Ṛgveda. In the Ṛgveda, the term māyā is used in the sense of illusion or appearance.

In the Upaniṣads and later texts of Hindu philosophy, the concept of Puruṣa moved away from the Vedic definition of Puruṣa and was no longer a person, cosmic man or entity. Instead, the concept flowered into a more complex abstraction in the Upaniṣads. The meaning evolved to an abstract essence of self, spirit and universal principle that is eternal, indestructible, without forms and all pervasive. In the Upaniṣads, the concept of Puruṣa is explained with the concept of Prakṛti. The Prakṛti is often used in the Upaniṣads as synonym for avidyā or māyā.<sup>8</sup> The Upaniṣads mention that the universe is envisioned as a combination of perceivable, material reality and non-perceivable, non-material laws and principles of nature. Material reality of Prakṛti is everything that has changed, can change and is subject to cause and effect. Puruṣa is the universal principle that is unchanging, uncaused but is present everywhere and the reason of the changes of Prakṛti.

In the Purāṇic tradition, Puruṣa is regarded as the Highest God and Prakṛti is female goddess, and both are responsible for creation of the universe. The Brahmāṇḍapurāṇa mentions that as he fills (āpūrayati) all the bodies with (his) grace, he is known to be Puruṣa. Again, due to his reposing in the town, i.e. body (puriṣatvāt) or due to the firm conviction of having a town (purapratyayikafi) in his case or as he sleeps in the town, he is called Puruṣa. The word prakṛti is generally accepted as the main source for the creation of the universe. According to the Brahmavaivartapurāṇa,<sup>13</sup> the word pra denotes excellence and kṛti means creation. Thus, the goddess who is excellent in creation is known as Prakṛti.

In the Mahābhārata and the Purāṇas, the concept of Prakṛti and Puruṣa are discussed mostly in accordance to Vedānta philosophy than the Sāṃkhya-Yoga philosophy. According to them, Prakṛti

and Puruṣa are nothing but two forms of the Supreme deity who is identified with one of the principal gods as per to the sectarian character of the work. Now, the concept of Prakṛti and Puruṣa as reflected in the Sāṃkhya-Yoga philosophy and the Sāttvikapurāṇas will be discussed.

### **PRAKṚTI AND PURUṢA IN THE SĀMĀKHYA PHILOSOPHY:**

It has already been mentioned that the Sāṃkhya system is known as a dualistic system, because it advocates the dualism of Prakṛti and Puruṣa. According to this system, the world has been explained only with the reference to Prakṛti and Puruṣa, described as two distinct and independent principles. Of them, Puruṣa means the self and Prakṛti is the ultimate ground out of which the world evolves. The Sāṃkhya does not establish the existence of God, because according to them, Prakṛti and Puruṣa are sufficient to explain this universe.

### **NATURE OF PRAKṚTI IN SĀMĀKHYA:**

The word prakṛti literally means the nature. It is, according to Hinduism, the basic nature of intelligence by which the universe exists and functions. In the Sāṃkhya system, it is explained as Mūla. It is the Mūla-Prakṛti (root evolvent) because it is the root of all other evolves, while it has no root of its own.<sup>14</sup> If Prakṛti has a cause, then this cause will have another as its cause and it will lead to infinite regress.

Prakṛti is known by various names, such as – Pradhāna, avyakta, anumāna, brahma, kṣetra, akṣara, māyā, brāhmī, vidyā, śakti etc.<sup>16</sup> As the uncaused root cause, it is called Prakṛti; as the first principle of this universe, it is called Pradhāna; as the unmanifested state of all effects, it is known as avyakta; as the extremely subtle and imperceptible thing which is only inferred from its products, it is called anumāna; as the unintelligent and unconscious principle, it is called jaḍa; and as the ever active unlimited power, it is called śakti. The Sāṃkhyakārikā of Īśvarakṛṣṇa describes Prakṛti as – ahetumat (uncaused), nityam (eternal), vyāpī (all-pervading), niṣkriyam (immobile), ekam (one), anāśritam (unsupported), aliṅgam (non-mergent), niravayavam (partless), svatantram (independent), avyaktam (unmanifest), triguṇam (constituted of the three guṇas), avivekī (indistinguishable), viśayafi (objective), sāmānyam (common), acetanam (non-intelligent) and prasavadharmī (prolific).

In other words, Prakṛti is uncaused; it is eternal and all-pervading. It is immobile only in the sense that in the avyakta state, there is no manifestation of products like mahat, ahaṃkāra etc. Motion and changes take place also in this equilibrated state. Further, Prakṛti is one and is nothing but the unity of the three guṇas in the state of potentiality and incoherence. Being the cause of all it supports all, but it is not supported by anything else. It is aliṅga for it does not serve as the middle term to prove the existence of any other category. Prakṛti is partless also, since in this state, the production of different evolutes, does not commence. It is independent, non-manifested and unconscious, and also the objective ground of all cognitions. Again, as such, it is not limited to individual consciousness, but enters into the knowledge of all.

In the Sāṃkhyapravacanasūtra, it is stated that Prakṛti is constituted by the three guṇas, viz., sattva, rajas and tamas. Prakṛti is the unity of sattva, rajas and tamas held in a state of equilibrium. The three guṇas are not the qualities as in the Nyāya-Vaiśeṣika system says; they are the ultimate elements in the constitution of Prakṛti. Hence Prakṛti is not beyond the guṇas. The Sāṃkhyasūtra mentions that Prakṛti has two functions – sāmāya (equilibrium) and vaiśamāya (disturbance).<sup>19</sup> When the three guṇas are held together in a state of equilibrium (sāmāyāvasthā), there is no action. This is

the natural condition of Prakṛti. When a disturbance (vaiṣamya) arises in the equilibrium state of the guṇas, then starts the process of creation.

The most important characteristic of Prakṛti is that it is out and out productive. It undergoes changes. It changes into forms and categories. Hence, movement or becoming is also another inconvertible principle of experience and this principle is Prakṛti or Pradhāna. Prakṛti has two movements: anuloma (forward) and pratiloma (backward). In its forward movement Prakṛti becomes the generating agent of all sargas (evolutes), while in the backward movement, it retraces the stages through which it is developed.

The Sāṃkhya gives rational justification for postulating an avyakta Prakṛti as the inexhaustive source of the manifest world. Īśvarakṛṣṇa advances in his kārikā the following **arguments for the existence of Prakṛti** - because of the finite nature of specific objects, because of homogeneity, because of evolution being due to the efficiency of the cause, because of separation between cause and its product; and because of the merging of the whole world of effects.

1. The world-objects are all finite. The difficulty in presupposing a finite cause of the world-objects involves the unending process of finding a finite first cause. If the first cause happens to be finite in character, it would always be dependent on something and hence cannot be independent and complete. Logically it follows, then, that something finite cannot be the first cause and that the infinite Prakṛti can only be the first cause of the material world.
2. All the individual objects share at least three common characteristics (derived from the three guṇas), like the tendency to manifest, the activity or force that will make the manifestation possible, and the obstacle on the way to such manifestation. Thus all objects contain the three guṇas, and this common feature points to a common source that contains the three guṇas.
3. It is well-known that effects evolve due to efficiency of the cause; for, no effect can ever arise from an inefficient cause. This efficiency is latent in the cause and is no other than the existent effect in its unmanifest condition. Thus, on the hypothesis that effect already exists in its cause, the existence of any other form of causal efficiency other than the latent form at the unmanifest effect, cannot be proved in the cause. The difference between sand and sesamum seed which is the material cause of oil, lies in the fact that it is only in the sesamum seed that oil exists in its unmanifest state and not in the sand.
4. An effect arises from its cause, and is again resolved into the cause at the moment it is dissolved. The effect is the manifestation of the cause into which it is re-absorbed at the moment of destruction. The empirical universe is the manifestation of Prakṛti.
5. The perfect order and harmony in the world of objects imply that everything is governed by a single principle, just as the different branches of a tree belong to the same tree. As the main trunk of the tree gets divided into several branches, so the single material cause, i.e. Prakṛti gets divided and sub-divided, thus leading to increasing differentiation.

### **NATURE OF PURUṢA IN SĀMĀKHYA:**

According to the Sāṃkhya, Puruṣa is a pure spirit and entirely different from Prakṛti and its evolutes. Thus, the Puruṣa is beyond the three guṇas also. As it is pure, Puruṣa is free from merits, demerits, pleasure, pain, delusion, attachment, aversion, desire etc. The Puruṣa in its real nature is beyond of all empirical attributes. Puruṣa is unchangeable and immutable. It is eternal in the sense that it is not affected by the change of time, and that it is an uncaused ultimate principle. It is independent and is not supported by anything else. The Sāṃkhya holds that the Puruṣa is of the nature of pure consciousness. Consciousness is not a product of elements, since it is not present in the body,

intellect etc.<sup>23</sup> Again, it is not a mode or attribute of the Puruṣa as some philosophers like the Naiyāyikas opine, but it is the very essence of it. The Puruṣa should not be regarded as blissful consciousness also, because bliss and consciousness, being two different entities, cannot be essence of the same reality. Further, bliss is but another name of pleasure which belongs to Prakṛti and as such cannot be the essence of the Puruṣa.

As the nature of pure consciousness, the Puruṣa is sadāprakāśasvarūpa or always self-manifested.<sup>25</sup> It is different from all the elements of the world of objects. It is different from matter or the material body, the senses, the mind and the intellect. Puruṣa is different from matter, because the latter is the known, while the former is the knower. It is different from the senses, since the latter are the instruments of the knowing, while the former is the subject thereof. It is different from the mind; because the mind is active and composed of guṇas, while the Puruṣa is inactive and devoid of guṇas. Puruṣa is different from buddhi or intellect, since the latter is unconscious, but the former is conscious. Though the Puruṣa is different from all these elements, it holds together all the different stages of an individual and illuminates the whole sphere of thought and feelings.

According to Sāṃkhya, the Puruṣa is incapable of movement and on attaining release it does not go anywhere.<sup>27</sup> The Puruṣa is not of limited magnitude or madhyama-parimāṇa. Neither it can be atomic in size, because an atomic self cannot account for the fact of our cognition throughout the whole body. Hence, the Puruṣa should be regarded as of unlimited size or vibhu-parimāṇa, i.e. all pervasive.

Puruṣa is also called pumān. The Sāṃkhyakārikā describes Puruṣa or pumān as atriguṇa, viveki, cetana, aprasavadharmī etc. and all these characteristics reveal that Puruṣa and Prakṛti are diametrically opposite.<sup>29</sup> However, both are equally free and fundamental; and both lie at the root of the world. The fundamental point regarding the point of Puruṣa is that it is always the subject of knowledge and never an object of it.

The author of Sāṃkhyakārikā mentions the five characteristics of the Puruṣa. These are – sākṣitvam (witness), kaivalyam (solitary), mādhyaṣṭham (neutral), draṣṭṛtvam (seer) and akartṛbhāvafi (non-doer).<sup>30</sup> According to the Sāṃkhya system, Puruṣa is like a light. All the products of Prakṛti can be seen by the light of the self. Puruṣa is self-manifested. With the help of the light of Puruṣa, Prakṛti and its products are manifested. But all the activities belonging to Prakṛti and its products, not belongs to the Puruṣa because of its inactivity. Though not kartā, the Puruṣa is bhoktā or enjoyer. Actually enjoyment is also not natural to the self; it is ascribed to the empirical self, because of abhimāna or the egoistic sense which, on its part, is born of aviveka or non-discrimination.<sup>31</sup> When true knowledge arises all the attributes like pleasure, pain, agency, enjoyment etc. wither away, only pure consciousness remains. In its real nature, the Puruṣa is eternally free and perfect. Hence, bondage and liberation, birth and death, pleasure and pain – all belong to Prakṛti, not to Puruṣa. Puruṣa is never bound nor is he release nor does he migrate.

The Sāṃkhya philosophers have advanced a number of **arguments for the existence of Puruṣa**. These arguments are presented in different forms by different Sāṃkhya writers. For the purpose of authentic presentation, we shall take up these arguments as presented by Īśvarakṛṣṇa in his kārikā. These arguments are as follows –

The Puruṣa exists because – (i) the aggregate is for another's sake, (ii) of the absence of three guṇas and other properties, (iii) there must be some controller, there must be some enjoyer and (v) of the tendency of activities towards final beatitude.

The first argument suggests that all the composite objects (saṁghātas) are for another (parārthatvāt). Here the word para or another is to be understood in an absolute sense, i.e. it must be non composite in character. It is meant for some non composite being, which is no other than Puruṣa. Both the commentators, Gauḍapāda and Vācaspati Miśra talk about the analogy of bed and its user, while commenting on this argument.<sup>34</sup> In the language of Gauḍapāda – “In like manner as a bed, which is an assemblage of bedding props, cotton, coverlet and pillows, is for another use, not for its own and its several component parts render no mutual service; hence it is concluded that there is a man who sleeps upon the bed and for whose sake it was made. So this world, which is an assemblage of the five elements, is for another’s use; or there is a soul, for whose enjoyment this enjoyable body, consisting of intellect and the rest, has been produced.”

The second argument says that Puruṣa must exist because it is reverse of that which has the three attributes and the rest. All the knowable has three elements involved in it, first the element of sattva, by which we have the intelligence staff causing all manifestations; second the element of rajas, which is always causing transformations and the third is the tamas, which is the mass which serves the potentiality for the rajas to actualize. Now such a Prakṛti, composed of these three elements, cannot be a seer itself. For the seer must be always the same, unchangeable, actionless entity - the ever-present constant factor in all stages of our consciousness.

The third argument suggests just like a chariot which is controlled by a charioteer, so also the triṣṭātmikā Prakṛti requires an adhiṣṭhāna, i.e. Puruṣa. Gauḍapāda suggests that chariot can function only in so far as it is controlled and run by a charioteer. Pradhāna functions only when it is controlled by the Puruṣa.<sup>35</sup>

The fourth argument (bhoktṛbhāvāt) attempts to establish Puruṣa as an enjoyer. This is substantially the same as the first proposition. Gauḍapāda, thus, has joined them together by a common interpretation. The difference is that the first argument refers to an arrangement of utility and implies that it has been made for someone use, while the fourth argument indicates ownership or possession and therefore a possessor, as an estate implies an owner. Vācaspati has explained the bhoktṛbhāva of Puruṣa in the sense of draṣṭṛbhāva, whereas Vijñānabhikṣu has interpreted bhoktṛbhāva of Puruṣa in the sense of enjoyment through reflection.<sup>36</sup>

The fifth argument kaivalyārtham pravṛtti seeks to prove the existence of Puruṣa on the basis of the observed facts of the world. It says that because there is a tendency in all scriptures and among all the intelligent persons towards freedom, there must be something beyond the great principle and the rest; and this is the spirit.<sup>37</sup> The whole creation of this world is marching towards freedom which belongs to the Puruṣa.

Thus, all these arguments which are advanced by the Sāṁkhya philosophers do prove the existence of Puruṣa as consciousness and illumination.

The Sāṁkhya system believes in the plurality of the Puruṣa. According to them, the self or Puruṣa is not one, but many and it is different in different organisms. Further reasons are adduced by the Sāṁkhya philosophers for the plurality of the Puruṣas. The arguments are as follows – (i) from the individual allotment of birth, death and the instruments, (ii) from the simultaneity of activities and (iii) from the diverse modifications due to the three guṇas.<sup>38</sup> In this way, the Sāṁkhya have established the plurality of the Puruṣa on logical ground. They hold that in their fundamental form

these Puruṣas are the same but they are many in number. Their essence is consciousness, which is the same in all the Puruṣas.

## **RELATION BETWEEN PRAKṚTI AND PURUṢA IN SĀMĀKHYA:**

It is already stated that Prakṛti evolves the world of objects when it comes into relation with the Puruṣa. The evolution of the world has its starting point in the contact between the Puruṣa and Prakṛti. However, the relation between these two is the most perplexing point of the Sāṃkhya system. The Sāṃkhya holds that though Prakṛti and Puruṣa are quite opposite natures, there is harmony between these two realities. In their view, there can be no evolution unless these two realities are somehow related to each other. According to Sāṃkhya, the contact between Puruṣa and Prakṛti is not an ordinary kind of conjunction. The said contact means that the Prakṛti is influenced simply by the presence of Puruṣa, just as our body is sometimes moved by the presence of a thought or a piece of iron is moved by a piece of magnet.<sup>39</sup> Prakṛti is unconscious and active, while Puruṣa is conscious but inactive. But through the union or contact between these two, the unconscious Prakṛti appears as if it is conscious and similarly the neutral Puruṣa appears as if it were the agent.<sup>40</sup> However, the evolution of the world cannot be due to the Puruṣa alone, for its inactivity; nor can it be due to Prakṛti alone, because it is unconscious. Hence for the evolution of the world, the activity of Prakṛti must be guided by the intelligence of the Puruṣa. In this context the question arises as how can these two different realities co-operate to serve their respective purposes? In reply, Sāṃkhya philosophers say that though distinct from each other, Prakṛti and Puruṣa can co-operate for the evolution purposes, just as a lame man and a blind man can co-operate with each other and came out of the forest.<sup>41</sup> The Puruṣa is compared to a lame man and Prakṛti is compared to a blind man. Just as a lame man guides a blind man, so the Puruṣa guides Prakṛti. Prakṛti is blind and unconscious and evolves the manifold world under the guidance of the Puruṣas to realize their ends. When Prakṛti acts, the Puruṣa experiences the fruits, since the activity of Prakṛti is interested for the experience of Puruṣa.<sup>42</sup> Prakṛti requires the presence of the Puruṣa in order to be known or appreciated by it, and the Puruṣa requires the help of Prakṛti in order to discriminate itself from the latter and thereby attain liberation.<sup>43</sup> In reality, the Puruṣa is neither bound nor released nor transmigrates from one to another individuals. Prakṛti, in the form of mind, egoism, subtle essences and the sense-organs, is bound, released and transmigrated. The Sāṃkhya philosophers hold that Prakṛti though unconscious, has an immanent teleology because of which it acts for fulfilling the needs of the Puruṣa, just as unconscious milk flows for the nourishment of the calf.<sup>44</sup> When a particular Puruṣa is liberated, Prakṛti stops its activities with reference to that Puruṣa, like an actress who desists from dancing when the spectators are satisfied.<sup>45</sup> When the Puruṣa apprehends its distinction from Prakṛti through knowledge, it becomes completely fulfilled, and then Prakṛti stops its creative acts from it. When Prakṛti stops its acts, then Puruṣa abides in its intrinsic nature, realizes its innate purity, and remains as indifferent seer. And when the Puruṣa recognizes its distinction from the ever-evolving and dissolving world of Prakṛti, the latter ceases to operate towards it.<sup>46</sup> The evolution of Prakṛti is due to their non-discrimination, not the mere presence of the Puruṣa. This non-discrimination brings about a temporary union between Puruṣa and Prakṛti.

However, the union is not real, because it dissolves on the rise of true knowledge. According to the Sāṃkhya system, *aviveka* is the cause of conjunction between the Puruṣa and Prakṛti. The conjunction is not real change, because no new properties are produced in the Puruṣa. The relation between these two is sometimes viewed as that of the enjoyer and the enjoyable.

## **Proof for the Existence of Puruṣa**

Puruṣa is not perceived yet the Sāṃkhya forwards different arguments for proving the existence of Puruṣa. Sāṃkhyakārikā advocates several arguments to establish the existence of Puruṣa on the some important grounds.

Anima Sengupta states that spirit exists as distinct from matter since (a) collection serves the purpose of something other than them; (b) since the other must be the reverse of what is composed of these three constituents (c) since, there must be control of collocations. (d) since, there must be an enjoyer and (e) since, there is activity for the purpose of release from threefold misery' Sāṃkhyakārikā advocates several arguments as follows (i)

### **i. Saṃghātaparārthatvāt**

All compound objects exist for the sake of the Puruṣa. The body, the senses, the mind and the intellect are all means to realize the end of the Puruṣa. The three guṇas, the Prakṛti, the subtle body – all are said to serve the purpose of Puruṣa. Prakṛti evolves itself in order to serve the Puruṣa's end. From the existence of assemblage things of the world, the existence of Puruṣa is inferred. He is the self, must exist, to enjoy or to realize that he is happy or unhappy.

The first argument says that any assemblage of material objects which are created on account of the use of some other than itself. Like a bed which is an assemblage of bedding, props, cords, cotton, coverlet and pillows, is for another's use not for its own, and its several component parts render no mutual service. So it can be said that there is person who sleeps upon the bed and for which use it was made. So this body which is an assemblage of the five elements is for another use, or there is Puruṣa for whose enjoyment this enjoyable body, consisting of an aggregate of intellect and the rest has been produced. Therefore, there must be an entity in order to enjoy the creations of Prakṛti. The body, the sense, the mind and the intellect are all means to realize the end of the soul. 'The three guṇas, the Prakṛti, the subtle body, all are meant to serve the purpose of Puruṣa'.

Prakṛti is unconscious so cannot make use of compound objects. There must be a conscious principle that is being served by the three guṇas, the Prakṛti and the subtle body. Evolution is teleological and purposive. This teleological evolution must help Puruṣa to release itself from bondage. So Puruṣa must exist.

### **ii) Trigūṇādiviparyayāt**

All material objects of the world are composed of three guṇas. These are sattva, rajas and tamas. They presuppose the existence of Puruṣa. Puruṣa is the witness of the three guṇas and is himself beyond them. The three guṇas imply the conception of a nistraigūṇya – that which is beyond them. Hence Puruṣa must exist.

### **iii) Adhiṣṭhānāt**

Puruṣa is pure conscious and is capable of synthesizing and creating a harmony among all our experiences. All material objects of this world are inactive. They are unconscious. These things cannot act without the help of a conscious being. There must be a conscious being by whom unconscious become active. It is impossible to move all worldly objects without the co-ordination of a conscious being. Puruṣa is the foundation (adhiṣṭhāna), the fundamental postulate of all empirical knowledge. Hence, Puruṣa must exist. In the words of Gauḍapāda just as a charioteer guides a chariot drawn by horses similarly the Puruṣa guides the body in every step.

### **iv) Bhokṛtṛbhāvāt**

There must be a enjoyer to enjoy the products of Prakṛti, because Prakṛti is non-intelligent. Non-intelligent Prakṛti cannot enjoy its own products. In the words of Vācaspati Miśra the enjoyable great principle and the rest are meaningless without any observer.

There must be an intelligent principle to account the enjoyment of the objects of experience in the form of pleasure and pain. Pleasure and pain are felt by each one as agreeable and disagreeable respectively. But feelings can not be agreeable or disagreeable to the mahat or buddhi and other products, as that would involve the anomaly of things operating upon them, as the buddhi etc., are composed of pleasure, pain and delusion. Therefore, there must be something else and that must be the spirit.

It is understood that all the material objects of the world exist for the sake of Puruṣa who is the foundation of all material objects. Hence, Puruṣa must exist. Anima Sengupta states that the first four arguments seek to prove the existence of the soul on the ground that as the controller and enjoyer of the world of composite things, some intelligent being must be recognized to exist and that this intelligent being must be the nature of pleasure, pain and indifference. This whole process, therefore, is not moving and developing aimlessly, there is the eternal principle of pure, eternal which through inactive, yet through reflection, co-ordinates, synthesis and gives meaning to our worldly experience. These arguments, therefore, may be regarded as teleological in the sense that they refer to the spirit as the central purpose of this world of change and mutation.

#### **v) Kaivalyārtham Pravr̥tteḥ**

The last argument for the existence of Puruṣa is ontological and scriptural. All scriptures prescribe the way of release for misery as kaivalya. Kaivalyam means liberation or emancipation from the bondage of three guṇas. When jīva feels that he is under the influence of the three guṇas and tries to liberate himself from three guṇas, the strive for release presupposes a being which is devoid of pleasure, pain and delusion. This is Puruṣa. Hence, there must be Puruṣa as the striving force of liberation. Anima Sengupta states that the last argument seeks to prove the existence of Puruṣa on the basis of the observed facts of the world. In this world, we find that the world of creation is marching towards freedom which seems to be its supreme goal. So, we are led to believe that there must be bound souls which are to be made free and through this process of world creation. In other words, the world is marching towards the freedom of these souls.

#### **Plurality of Puruṣa**

According to Sāṃkhya philosophy, Puruṣa is not one, there is the multiplicity of Puruṣas. Īśvarakṛṣṇa, in his Sāṃkhyakārikā states about the plurality of Self (Puruṣa). The plurality of Self follows from the distributive nature of the incidence of birth and death and of the endowment of the instruments of cognition, action etc.

Except the Advaita Vedānta, all other darśanas believe in the plurality of selves. Vācaspati Miśra supports that the birth of Puruṣa consists in its connection with a new set of body, sense organs, mind etc., formed of a composite particular nature. It does not mean modification, since it is essentially unchangeable. In the same way also death consists of the giving up the body and the rest. It cannot mean destruction as Puruṣa is unchangeable and eternal. The sense organs are thirteen, beginning with the great principle. The definite adjustment of their body etc., is connected with only one Puruṣa. If the Puruṣa were one and the same in all body, then on the birth of one all would be born and on the death of one, all would die.

Gauḍapāda remarks if there were one soul, then when one were born, all would be born, when one will die, all would die, if there is any defect in the vital instruments of one, such as deafness, blindness, dumbness mutilation, or lameness, then all would be blind, deaf, dumb but this is not seen and therefore multiplicity of soul is demonstrated.

Anima Sengupta states that we can not say that there is one spirit only and that this one spirit appeals as many due to the imposition of different upādhis on it. In the case of space, limited by a chair, the chair can be removed and the portion of space can be saved from limitation by such a removal of its upādhi. Even then there is the possibility of that this same portions of space may, again, be limited by the imposition of some other thing on it. So if one spirit is recognized, bondage and liberation, limitation and freedom will become absurd and meaningless.

The next argument in support of plurality of selves is related to the activity of the selves. Though activity is a function of the internal organs, yet it is here attributed to the spirit. Hence, it is argued that if the self were one, the activity of man would lead to the same activity in all other men.

Again, the Sāṃkhya argues that the self must be many because there is diversity due to the three attributes. Some persons have the abundance of sattva e.g., the gods. Others again abound in the rajas, e.g., human beings and some others again have tamas in abundance, e.g., animals. This diversity due to the distribution of the guṇas in various entities could not be explained if the spirit were one and the same in all.

So the Puruṣa is not one, but many. Hence, different arguments are advocated by Sāṃkhya to show the plurality of Puruṣa.

### **Conclusion**

Sāṃkhya admits Puruṣa is infinite, unchangeable, all pervasive and eternal. Puruṣa is different in each body, having their different organs and actions and separate birth and death. Puruṣa is the knower. It is the seer and an experiencer. It is pure and free. It is wisdom which is pure and absolute. The self is neither the mind, body nor the intellect. It is consciousness itself. It is formless, all pervading and eternal.

### **Atheism and Hinduism**

"Atheism is a necessary protest against the wickedness of the churches and the narrowness of the creeds. God uses it as stone to smash these soiled card-houses." In Hinduism the belief in the nonexistence of God is a perspective or a distortion which arises from ignorance and delusion, or the play of Maya. It is viewed not as a blasphemy against God but as a missed opportunity to worship him and attain liberation.

Of the numerous schools of thought that gained prominence during the epic period as a reaction against the excessive ritualism and empty dogmatism of vedic religion or perhaps the increasing rigidity of caste system, one school of thought attracts the attention of present day scholars not only for its radical approach to the problems of blind belief but also for its similarities with the modern day rationalism and materialism of the west. It was the lokayata school of thought, believed to have been founded by Charvaka, whose history is shrouded in great mystery and myth.

The world lokayata was used to refer to the person who believed in the reality of this world and the physical existence of man and of other beings on earth and nothing else. 'Loka' means the world and

'lokyata' means he who is centered around or relies upon this world only. The lokayatas believed in the existence of this world only, neither in heaven nor in hell, neither in vice nor virtue. They accepted only that reality which they could subjectively perceive and interact with, not in any imaginary world or some kind of ideal world. Practical and down to the earth, they believed in the existence of four elements only, namely the earth, water, fire, and air instead of the five elements of the vedic scriptures of which space or ether was the fifth element.

The Charvaka system of thought believed neither in God nor in the after life of man. Their doctrines are traced to an ancient scripture called the Charvaka Dharma probably written by an author of the name of Charvaka. Reference to the Charvakas or the Lokayatas was found in some ancient Hindu and Buddhist Scriptures such as the Prabhodha Chandrodya, an allegorical play in which a character sums up the beliefs of this school, and also the epics, the Ramayana and the Mahabharata.

One of the chief protagonists of this school existed during the time of the Buddha and his name was Ajita Kesakamabali. He recognized only four elements and declared that a combination of these four elements produced certain vitality called life, which is very much in tune with the modern theories of creation of life on earth. At the time of death these four elements would return to their respective sources, earth to earth, air to air and so on. There was no mystery of life beyond this. " When the body dies both fool and wise alike are cut off and perish. They do not survive after death."

According to the Charvakas there was no soul. Death was the end of all existence. The body itself was Atman and enjoyment of this life in the bodily form should be the chief purpose of life. Whatever was within the field of perception was true and it alone existed. Anything beyond the senses was false, a mere illusion or self induced delusion. Inference by itself could not be the basis of truth and therefore it was invalid. We should not depend upon the experience of others to know the truth. We should not base our belief upon the teachings of others as long as they were not confirmed by our own personal experience. Subjective experience was therefore the basis of all truth and of one's conduct in this world.

The Charvakas did not accept the Vedas, nor the vedic rites prescribed by the Vedas. They contended that one should not practice these religious rites, whose results no one could verify with certainty. They did not believe in karma or the concept of sacrifice. What was the use of sacrificing something today, in the hope of getting some future benefit whose arrival was never certain? Earthly enjoyment was the highest ideal and it should not be sacrificed in the hope of some better after life. Since matter was the only thing that was perceivable by the senses, matter alone was real. Intelligence was also a form of matter, like the body, because it was produced by the modification of the four elements and was destroyed the way the body was destroyed when these elements were dissolved. The physical self alone was real and the mind and the body were part of this physical self.

Two interpretations are given for the word Charvaka. According to one interpretation, the word 'char' means 'charming and alluring and the word 'vak' means speech. Probably the Charvakas were good orators and their words were instantly appealing to the audience as they appealed to the senses directly and required no blind faith to sustain themselves. According to another interpretation, the word 'charva' means grinding and chewing and the word 'Charvaka' means he who grinds both vice and virtue. The Charvakas are also known as Brihaspatayas because it is believed that Brihaspathi was the author of this doctrine. Another sect which was close to the lokayatas in their thinking was the sect of the kapalikas, who believed in the practice of sex and gory rituals to gain siddhis or spiritual powers. Probably the Charvaka school must have provided some background from which

the later schools of Tantricism emerged both in Hinduism and Buddhism as a way of compromise between materialism and spiritualism.

The disbelief and atheism of ancient India is summed up in the following lines from the Savradarshana Samgraha.

"There is no heaven, no final liberation, nor any soul in another world, Nor do the actions of the four castes, etc., produce any real effect. The Agnihotra, the three Vedas, the ascetic's three staves, and smearing one's self with ashes, Were made by Nature as the livelihood or those destitute of knowledge and manliness."

The Charvaka school of thinking had many drawbacks. Its chief weakness was its excessive reliance upon subjective experience and upon sensory perceptions, as the basis of truth. These two are not perfect and reliable instruments of truth and they would not always guarantee complete wisdom. The Charvakas ignore the fundamental fact that our perceptions can be very misleading and that they are colored by our own prejudices, fears, anxieties, expectations, desires, thoughts and most important of all by our own ignorance. They also fail to explain the role of Nature, the rationale for good social conduct or the need for social harmony. The Charvakas provide very simplistic solutions to the complex problems of pain and suffering, and fall short of providing lasting solutions to the real problems of human life and society. In short they fail to explain such human needs and aspirations that are not purely physical or mental but spiritual, and the importance of such morals and social values in human life that distinguishes us from the world of the animals.

## **Yoga**

Yoga poses are great to strengthen and relax the body, however there's a lot more to Yoga than that. Derived from the Sanskrit word 'yuj' which means 'to unite or integrate', yoga is a 5,000-year-old Indian body of knowledge. Yoga is all about harmonizing the body with the mind and breath through the means of various breathing exercises, yoga poses (asanas) and meditation.

## **Concept of citta and chitta**

There is a lot of confusion among people, and even scholars as to what citta is, which is also spelled as chitta. Roughly speaking citta or chitta means consciousness.

The Yogasutras begins with the declaration that the purpose of yoga is cessation of the citta vrittis, or the modifications (vrittis) that arise in the citta. The scripture identifies five types of modifications which are responsible for the restless state of citta. Until these are subsided fully through the practice of the eightfold yoga and the cultivation of sattva through self-transformation, one cannot achieve stability, equanimity and self-absorption. Everything in life, including knowledge, ignorance, imagination, even sleep cause disturbances in our consciousness. We become disturbed for all the right reasons as well as wrong reasons.

Mental disturbance, whether it is caused by good things in life or bad things in life, is disturbance only, which will eventually harm us physically, mentally and spiritually. We cannot escape from life. Hence we cannot escape from these sources of modifications also. We cannot change this world. We cannot also run away from it. The best way to deal with the sources of our misery, therefore, is to change the way we respond to them and deal with them. This is possible only when we establish a center of stability within ourselves. Yoga helps us to find that center of stability or create it with austere effort. It helps us become a master of the world in us rather than a victim of the world.

in which we live.

Yoga is not a mumbo jumbo scheme to lure us into spiritual life and make we think about God or put ourselves completely under the hypnotic gaze of a strangely attired guru who is all out to rob us of our sanity. When yoga was introduced in the USA in the eighteenth century, a lot of people actually thought so about yoga with this mindset. Some even filed court cases, alleging that yoga caused people to lose their minds. It is true yoga makes us lose our mind, but in a positive way. It helps us lose our monkey mind that is restless and find peace and balance with a new awareness that is not of this world. Yoga makes us strong mentally and stand on our own feet with a stable mind as we navigate through the circus we call Samsara or the phenomenal world.

Citta is loosely translated as the mind. However, citta is not just mind alone. The mind goes by another name, manas. According to our beliefs, manas is not the creator of thoughts or the source of thoughts. It is rather a receptacle of thoughts and emotions. Thoughts arise from desires and desires arise because of the repeated activities of the senses, in which the ego (anava) or the self-sense becomes involved by forming attachments with the sense objects.

Citta is not confined to the mind alone. It is rather the whole mind and body awareness pervading the mind, the ego, the intelligence, the senses, the organs of action, the nervous system, and various types of breathes. Citta is a kind of energy field, made up of the three gunas, namely, sattva, rajas and tamas, having the ability to reflect the objects internally in the consciousness that are perceived through the senses. In other words, citta is a recording mechanism. It records everything that happens to us and creates in the process thoughts, desires, memories, sensations, feelings, emotions, attachments, aversion, habitual thought patterns, and latent impressions. All these keep the citta in a state of flux and do not permit it to stabilize. As long as citta is in turmoil, there is no peace and balance. Desires, attachment, attraction and aversion to the pairs of opposites are chiefly responsible for this turmoil, which results in various kinds of mental and physical afflictions, which we collectively group under the generic term suffering.

Ashtanga yoga says we can stabilize the citta by cultivating sattva or inner purity. When citta is pure with sattva, then it loses its grossness, becomes very subtle and allows the light of the Self to shine through in our internal organ, especially our intelligence, whereby we learn to discriminate between good and bad, cultivate detachment, dispassion, sameness and self-absorption. A truly refined person is one whose citta is pure like the sun, shining brilliantly with the effulgence of purity that is similar to that of the soul. When we become as pure as our soul, we become a divine person, God Himself. In that state, God speaks through us, lives in us and becomes one with us. Yoga is one well known and established vehicle which can bring God to us or take us to God. It is the bridge across the vast chasm that exists between our world and the world of the immortals.

Much of our effort to control our minds fails because we focus upon only one aspect of our awareness. If we want complete results, if we want to truly experience peace and inner stability, we have to concentrate upon our whole body and mind awareness. We have to devise a holistic system whereby we manage to transform ourselves completely, not in parts or superficially but fully and comprehensively. It is precisely for this reason, classical yoga recommends not one but eight methods of inner purification. The rules and restraints (yamas and niyamas) and the withdrawal of the senses help us to cultivate detachment, and purify our organs of action, organs of perception and speech. The breath control practices help us to purify and regulate breath (prana).

Concentration and meditation help us to stabilize our minds and the internal organs. In self-absorption we integrate all these efforts to reach a culminating point in the state of self-absorption. In this state the mind remains in deep sleep and only the state of "I am I am" remains. This goes by many names and it has different states too. Some call it nirvikalpa samadhi. Some call it dharma megha samadhi. It is interesting that a grave is also called a samadhi and we can understand why it is so. Many people find freedom from citta vrittis only upon death! Thus, practically everyone who dies goes into samadhi.

Citta is thus not just mind. It has a physical aspect and a subtle aspect. It is total mind and body awareness. The sum total of what we feel and experience in our waking, dreaming and sleeping states. It is our ethereal body, which carries within itself our latent impressions and our karmic fruit. Upon the death of an individual, a part of the citta becomes attached to the soul and goes to the other world. One achieves freedom from births and rebirths only when one's citta is so pure that it burns away all the latent impressions and arrests the formation of karma.

### **The Purpose of yoga and the nature of citta**

The purpose of yoga is to prevent the modifications or afflictions of the citta. These modifications arise because of the outgoing nature of the senses and our desire for sense objects. The citta which the Yoga speaks about is not the same as the mind we know in the modern science. Manas is perhaps a more appropriate word for it, although there are some serious fundamental differences between the two. For example the mind in Hinduism is a receptacle that does not create thoughts. It rather receives various thought forms from the universal consciousness according to its receptivity and transmits them back into it according to its intentions and inclination.

The citta, which yoga refers, is a complex internal mechanism, chiefly responsible for our perception, cognition, memory and intelligence. It is not a product of electric impulses or brain mechanism, but a luminous substance made up of fine particles of energy and consciousness. It is difficult to translate the word citta into English because of the complexity of its structure and functions. Each living being is permeated with the substance of citta not just in its head region but its entire body and also around it. The citta serves as the substratum or support for other agencies of a living being, namely intellect (buddhi), mind (manas), senses (indriyas), ego (aham) and the five elements (mahabhutas). Together they are often called the internal organ (antahkarana).

Although it is difficult to translate the word "citta" into English we may loosely translate it as dynamic consciousness formed by the association of the cit (pure consciousness) with shakti (pure energy). The citta constitutes the waters of life from which further creation comes forth. It should not be mistaken as an extension of the brain because it has the ability to travel long distances at unimaginable speeds and interact with the objects it perceives through the senses and replicates them exactly in itself. In other words the citta is not just a perceiving mechanism but an interactive mechanism in which it acts both as the perceiver and the replicator of the things perceived. All the three qualities or gunas, namely sattva, rajas and tamas are present in it. Sattva plays an important role by providing it the luminosity to perceive things clearly, while the other two keep it in different states of activity and inertia.

The citta has different states (bhumis) which arise in a being according to its level of evolution. It has the ability to expand or contract, depending upon the type of being and its state of evolution. It has a working component called karyacitta, which dies with the being and a causative component called karana citta which survives death and becomes a blueprint for the next life of the soul. The

citta is susceptible to five different types of modifications or whirls known as citta vrittis caused by different types of perception, namely correct perception, wrong perception, imagination, sleep and memory. The purpose of yoga is to control the whirls and stabilize the citta so that one is able to perceive things clearly and find one's own essence hidden in everything. This is accomplished through progressive stages of purification in which the quality of sattva in the consciousness is increased while rajas and tamas are proportionately reduced or suppressed.

### **The two way process of perception**

Modern science affirms that perception is an inward process. That is, outside objects make their impressions upon the mind through the senses. Various schools of Hinduism do not think so. They believe that perception is mostly an outward process. The senses are called agents of Indra (Indriyas) because they serve their master (Indra represented by the mind in the human body) as his workhorses or spies. They go out to gather information about the objects they grasp and feed it to the mind. While the senses are moving among the objects the citta also moves with them replicating the objects grasped by the senses internally in itself. This replication is responsible for the modifications (vrittis) of the citta resulting in both perception and cognition.

The citta functions like a multi dimensional copier and recorder with an ability to absorb itself in the object of its concentration and become that which it concentrates upon. Thus perception is not just a reflective process but a truly creative and bidirectional process in which the world is internalized in the citta and the citta is externalized in the world. The citta does not always reflect and recreate the objects of the world faithfully. It depends upon whether the perception has taken place correctly or incorrectly.

Patanjali describes the mirroring as the modifications of the citta (citta vrittis). He identifies five types of modifications arising from five types of perception, namely right perception, (pramana), wrong perception (viparyaya), imagination (vikalpa), unconscious perception (nidra) and perception influenced by memory (smriti). The citta is attached to the body, but it has the ability to extend itself freely wherever the senses can go. It actually keeps wandering all the time in the objective world following the senses and their activities. This outward movement of the citta and the senses give rise to suffering, restlessness, attachment and the like, which yoga aims to resolve through various means.

### **The problem of suffering and its solution**

Classical yoga holds that our suffering (klesa) arises from two sources: from our present actions and from the latent impressions (samskaras) that are stored in our consciousness. Suffering is present in every aspect of our existence because of the instability and impermanence that is weaved into it and the objects we interact with which in themselves are impermanent and destructible. Even the seemingly happy moments are laced with a shadow of suffering. Our lives vacillate between the extremities of suffering and happiness, despair and hope and many similar pairs of opposites with which we are familiar.

According to the Yogasutra, for a discerning yogi (vivekin) everything appears to be suffering, because of the evolving and transforming nature of the things of the world, the ever changing composition of the qualities of Nature (gunas) and the modifications arising in the citta due to various kinds of perception. Ordinary people with untrained minds, may not even notice the suffering underlying what we consider normal and daily routine, because a great deal of our suffering happens in the unconscious and subconscious layers of our consciousness. But a discerning yogi finds it

everywhere and knows its true significance.

## **Dukha**

Dukha is another word used in yoga to denote suffering. Dukha means bad (du) axle hole (kha). Etymologically dukha means any suffering that arises from the various apertures and weaknesses present in the body and the mind. Indian schools of philosophy recognize three forms of human suffering:

- suffering caused by oneself,
- suffering caused by others and
- suffering caused by gods.

Each person creates suffering for himself through his own egoism, ignorance, vices, weaknesses, desires, thinking and actions. This is suffering caused by oneself. Some times suffering is brought upon us by other people, such as our friends, colleagues, acquaintances, family members, strangers and government authorities and creatures like poisonous snakes, insects, dogs, tigers, lions and elephants. This is suffering caused by others. Finally, we also suffer from the actions of gods when they intervene in our lives in the form of fate, planetary influences, unforeseen obstructions, accidents, death and natural calamities. When in His unbound love God bestows favors upon evil characters like Ravana everyone suffers.

## **Desires as the root cause of our suffering**

Long ago our ancient thinkers identified desires as the root of our suffering. Hinduism, Jainism and Buddhism are unanimous on this point, although they differ in their interpretation of its nature and cure. According to classical yoga, desires arise from the activity of the senses and the outgoing nature of citta, which result in passion (raga). Passion leads to the preponderance of rajas and rajas which lead to the five common problems of human existence, namely sexual desire (kama), anger (krodha), pride (mada), matsarya (envy) and greed (lobha). They in turn give rise to ignorance (avidya), delusion (moha) egoism (asmita) and bondage to the cycle of births and deaths.

Since the citta and the senses are primarily responsible for our suffering, a person can alleviate his suffering by withdrawing them from the objects and moving them in the direction of his inner self inwardly. The eightfold practice of yoga and the self-purification that arises from it in the form of increase in the quality of sattva results in equanimity, which is the foundation to achieve more stable states (bhumi) of citta and experience self-absorption (samadhi).

Establishing equanimity in the citta, however, is not an easy process. Distractions (citta vikshepas) arise in the consciousness in the form of suffering and mental disturbances, as a yogi strives to control his mind and body. Sometimes it leads to more acute problems like sickness, mental turmoil, negative thoughts, nightmares and the like, which require the intervention of his guru or a divinity. Except for a few blessed souls who have achieved progress on the path of yoga in their previous lives, many who practice yoga have to be perseverant, follow years of discipline and practice (abhyasa) intense methods of self-purification to change the habitual modes of their minds and bodies to become stabilized in themselves. For them Patanjali prescribes:

- study (svadhyaya),
- discrimination (viveka),
- devotion to self (Isvara),

- detachment (vairagya), self-purification and
- constant muttering (japa) of the sound Aum (pranava).

Even after all this effort their suffering may not cease, because the latent impressions (samskaras) present in their cittas have to work themselves out in their own time and space.

## **Patañjali's Theory of Pramāṇa**

Pramana, in the yoga sutra, refers to those mental modifications (vrttis) which are based on correct information or knowledge. In other words, when our thoughts correspond to reality, the mental modifications fall into the category of pramana. Let us first understand what we mean by right knowledge in the first place.

The theory of knowledge is called epistemology. In Indian Philosophy, when true knowledge of reality is revealed, it is "prama" (valid knowledge), and when the revelation of reality is false it is called 'aprama' (invalid knowledge). Right knowledge means perceiving an object as it is. The cognition of the object is the same as the reality of the object. We could also simply say that it is the knowledge of "that as that".

Different schools of Indian Philosophy have different opinions regarding what exactly should be accepted as valid knowledge, and what the different sources, or means, for valid knowledge are. Samkhya Philosophy and Patanjali's raja yoga which is largely based on Samkhya accepts three means to valid knowledge. Nyaya Philosophy mentions four, Buddhism two, and the Charvaka school only one means to valid knowledge. Let us look a bit closer at the three different means to valid knowledge as per Patanjali.

As per the Yoga Philosophy there are three ways of gaining correct knowledge:

- 1) Perception (pratyaksha)
- 2) Inference (anumana)
- 3) Testimony (agamah)

Each of these three ways are equally valid, and can provide us correct information. However, if more than one source to knowledge is accessible to us, they must be in agreement with each other.

Pratyaksha pramana refers to direct perception or a direct experience of something. A yoga practitioner should seek direct experiences of the truth through the method of yoga practice. In our everyday lives and during early stages of yoga practice we gain experiences of worldly affairs through the sense organs. As the yoga practice advances we can gain spiritual experiences during deep states of meditation when the senses are withdrawn from the external world.

Anumana pramana refers to inference. According to Samkhya and Yoga anumana is based on the modification of citta, brought about by the relation that exists in objects of homogeneous nature and does not exist in the objects of heterogeneous nature.

This sounds a bit complicated but what it really means is this: If we see smoke, we accept that somewhere there is a fire that has caused the smoke. There is a relation between the object of smoke and fire. We have not actually directly perceived the fire, but we have been able to come to the conclusion of a fire through a closely related event or object that we perceived (smoke).

The third means to correct knowledge is *agamah*, which can be called testimony in English. In simple words, it means "something that another trustworthy person has said". The various schools of Indian Philosophy which consider *agama* as a valid source of correct knowledge argue that a human being needs to know numerous facts, and with the limited time available, he can learn only a fraction of those facts and truths directly. Hence we must rely on scriptures and gurus, to gain a sufficient amount of knowledge during our lifetime.

Note that direct perception (*pratyaksha pramana*) is a part of the other two means to valid knowledge as well. In the case of inference and the example I have given above, we have a direct experience of the smoke that we can see, even though we don't have a direct experience of the fire. The object that we infer something from, in this case the smoke, is called "*hetu*" in Indian Philosophy. Direct perception is also part of *agamah pramana* because it involves someone else having had a direct experience of something previously. Hence, *pratyaksha* - direct perception - is always involved either directly or indirectly in the process of gaining correct knowledge.

## The Five Vrittis

Generally we can consider the *vrittis* as types of thoughts but they are broader than that. There are five main fluctuations that affect our outer consciousness:

1. Correct knowledge (*pramana*)
2. Incorrect knowledge (*viparyaya*)
3. Imagination or fantasy (*vikalpa*)
4. Sleep (*nidra*)
5. Memory (*smrti*)

We all are subject to these five turnings in our minds, and they are not necessarily bad. Correct knowledge can help us do the right thing at the right time. But we can also do the right thing for the wrong reason; even incorrect knowledge can be helpful at times. The truth is, these fluctuations can be good or bad. Even right knowledge can be used in a harmful way. We have often seen things done with the best of intentions turn out drastically wrong. It is not that these *vrittis* are good or bad that makes them worthy of study, it is their effect upon the state of our mind that is of interest. These turnings of the mind obscure the view of our real self and need to be calmed. Like the surface of a mountain lake on a clear moonlit night (our mind) when still, reflects perfectly the full moon (reality). But with even a small ripple, caused by a *vritti*, the moon's appearance is distorted. The *vrittis* are the whirlings of the mind.

Yin yogis, like all practitioners of modern yoga, can gain from understanding the Yoga Sutra's model of *citta* and the *vrittis*. Knowing that these five *vrittis* are operating during our practice, and during our life, can help we increase our ability to calm them. Being aware that the mind moves in notable,

observational ways gives us a way to understand what is arising. Knowing that the vrittis exist gives us the opportunity to watch for them.

## **The role of God in Yoga**

Yoga is a practical philosophy. It teaches us to take responsibility for our actions and offers an entirely different understanding of God than do the religionists. Because the goal of yoga is to attain perfect freedom from the binding forces of our personalities as well as from the forces of nature, it places God in that realm of perfect consciousness which is not governed by anything other than itself. Yoga defines God as a special Purusha, a supreme soul, which was not, is not, and will never be affected by afflictions, vehicles of afflictions, karma, and the fruits of karma. All other souls at some time in the past, present, or future somehow fall under the sway of karma and the attendant afflictions of ignorance, egoism, attachment, aversion, and fear of death. According to yoga, this supreme soul is the only spiritual preceptor of all teachers who were ever born, for God is beyond origin and end. In addition to perfect freedom, unrestricted power of will, creativity, and eternity, in God also lies the “unsurpassed seed of omniscience.”

### **Yoga defines God as a special Purusha, a supreme soul, which was not, is not, and will never be affected by afflictions, vehicles of afflictions, karma, and the fruits of karma.**

This particular notion of God, described in the Yoga Sutra, highlights three intrinsic characteristics: perfect freedom from and transcendence of all karmas and afflictions; the role of primordial spiritual master, the eternal guide of all living beings; and omniscience, perfect knowledge of everything. These three characteristics clearly indicate where the interest of the yogis lies. Yogis strive to attain freedom from the bondage of karma and afflictions, such as ignorance, ego, attachment, and the host of miseries—anger, hatred, jealousy, greed, desire—that originate from these afflictions. The yogis realize that once we are caught in this apparently unending cycle of confusion, attachment, desire, and so on, our vision becomes clouded and it is hard to disentangle ourselves. Only one who was never entangled in the first place can help us free ourselves. Similarly, only one who is already free can help guide us in attaining freedom from the long chain of karma and the fruits of karma. According to yogis, the Supreme Purusha is very special; God is not bound like ordinary souls. Ordinary souls are those that experience a sense of incompleteness, lack of freedom, and lack of perfect knowledge, and thus have an inherent urge to be absorbed in God.

### **Then does yoga teach us to be totally dependent on God? If so, how can we be responsible for our actions?**

Yoga does not teach us to lean on God or to use God as an escape. Rather, it teaches us to make the best use of all the resources we have received as a gift from above to unfold our human potential to its fullest. It diligently introduces the idea of the teacher within because, according to the yogis, God alone is the true primordial master. We cannot expect this primordial master within to take care of our mundane needs, but in the form of inner inspiration, inner guidance, motivation, enthusiasm, courage, and determination, God—the inner teacher—helps us think, speak, and act in a manner which enables us to attain freedom from our karmic bonds.

In no way does yoga make us dependent on God. On the contrary, a yogi would say that God helps us gain freedom from the deluding forces of the world. Once a person knows the liberating force of the omniscient God, who dwells eternally within each of us, this realization naturally manifests in the form of love and faith. This, in turn, makes it possible to surrender ourselves to God. This natural unfolding of surrender is not an act of helplessness but one of clear understanding between us and the omniscient Divine Being, who constantly guides us along the path. We do not need to make

an effort to surrender ourselves to God; rather, the spontaneous wave of gratitude toward that inner guide creates a mental climate of self-surrender. We then need to continue working with ourselves while remaining aware of the fact that anything we do is due to the guidance of the true teacher—God. In this way, we are able to take full responsibility for our present actions without feeding our egos by telling ourselves, “I’m wise and capable of doing what I’m supposed to do without being dependent on anyone else.” We also take full responsibility for our previous karmic deeds, doing our best to undergo karmic purification. Upon realizing that even with intense effort we can hardly even scratch the surface of our previous karmas, without any conflict or hesitation we automatically surrender ourselves to God and attain freedom.

**I don’t have any sense of receiving inner inspiration or guidance from within, although this is where the process of surrender we describe seems to start.** That’s correct—it begins with inner inspiration. We receive inner inspiration in its truest sense only after we have gained access to the inner realm, where the Divine Being dwells in Her full glory. Spiritual practice is the way to gain access to that realm. This requires effort. Passively waiting for the Divine Grace to illuminate our inner core is futile. Grace is already there. We have to work hard to remove the factors that are blocking it. Through yogic exercises, pranayama, meditation, contemplation, prayer, and selfless service we attenuate the veil that blocks the flow of inner inspiration and guidance. The thinner the veil, the easier it is to perceive this inner inspiration. With that recognition, the process of surrender naturally unfolds.

**Grace is already there. We have to work hard to remove the factors that are blocking it.**

**We said that yogis conceptualize God the way they do because of their concern with attaining freedom from the bondage of karma and the afflictions of ignorance, ego, etc. that lead to misery. Does this concept of God have anything to do with truth or the reality of an actual God?**

Because of the touchy nature of the subject, yogis and yoga texts generally avoid discussing God. Patanjali’s Yoga Sutra, the main text of yoga, brings up this topic within the context of working with the mind and its modifications. Yogis are fully aware that Truth is God and that God is infinite and indescribable. Therefore, any description of God is bound to be incomplete. Moreover, each of the followers of the many religions and sects on the face of the Earth have their preferred notions of God. Any description that conflicts with those notions will offend and anger.

According to the experience of the yogis, if our hearts are purified and our minds are one-pointed we’ll gain an intuitive understanding of God, which is infinitely clearer and more encompassing than our intellectual understanding. This is the reason they place such emphasis on the techniques that lead to purification and one-pointedness. That is also why when Patanjali discusses God, he does so within the narrow frame of how God can help us attain freedom from those elements which disturb our minds and pollute our hearts. Out of the countless powers and characteristics that are intrinsic to God Patanjali mentions only omniscience, eternal freedom from all karmas, and the fact that God is the primordial spiritual teacher. According to yogis, God exists as the Absolute Truth and it is due to this existence that everything else can exist. But the totality of God consciousness cannot be captured in words.

The early Buddhist thinkers emphasised the unitary nature of the mind. The Sarvastivadins in order to explain the unity of the mind described the mind as a ground or base which they called **Cittabhumi**. They rejected the realm of unconsciousness, *alaya-vijnana*, postulated by the Yogacarins of Mahayana Buddhism who believed that from the realm of unconsciousness arose

the conscious mind and the objects. But the Sarvastivadins recognised five types of Cittabhumi from which psychological phenomenon arose.

Citta i.e. the mind, that alongside Manas, Buddhi and Ahamkara is an internal organ, whose function is recollection, constituted by three Gunas viz Sattva, Rajas and Tamas, reflects the self in accordance with any one of its modified states, vritti, which are Pramāṇa with its three kinds of cognition – perception, inference and verbal testimony, Vikalpa which is mere verbal idea caused by meaningless words, Viparyaya which is knowledge of things as they are not, Nidra or dreamless sleep and Smṛti or memory. These reflections result in the self being afflicted by Klesas – Avidya (wrong or false knowledge), Asmita (false notion or perception), Raga (attachment), Dveṣa (aversion), and Abhinivesha (fear of death). Thus, the mind may remain in five different levels which mental levels or functions or stages, five in number, are known as Cittabhumi. These five stages of the mind, as defined by Vyasa, are:-

- Kṣipta or distracted. The distracted mind being overpowered by Rajas is extremely unsteady unable to concentrate or decide, and is the source of pleasure or pain.
- Mudha or infatuated. The infatuated mind being overpowered by Tamas succumbs to commit unrighteous acts influenced by violent emotions.
- Vikṣipta or occasionally steady. The occasionally steady mind, unsteady for most part, influenced by Sattva is able to withdraw itself from painful objects and become fixed on pleasurable objects.
- Ekagra or one-pointed. The one-pointed mind influenced by pure Sattva is able to withdraw from all objects i.e. totally introverted, to remain focussed on one object.
- Niruddha or restrained. The restrained mind also influenced by pure Sattva arrests all mental functions i.e. there is complete suspension of all mental modes and sub-conscious dispositions.

The first three afore-mentioned stages of mind are unfit for concentration for they are attended by mental modes. Yoga is not possible in these conditions. Ordinary people live on the level of Kṣipta or Mudha.

The last two mentioned stages are conducive to yoga and for Samadhi. Ekagra stage is also called Sampramata yoga in which the mind assumes the form of the object itself. Niruddha stage is known as Samprajñata yoga or Samadhi in which nothing is known or thought of by the mind. In the Yoga system Buddhi (intellect), Ahamkara (ego) and Indriyas (senses) are often called Citta.

## **Purva Mimamsa**

The first major orthodox philosophical system to develop was Purva Mimamsa. The other one to follow was the Uttar Mimamsa. The orthodox systems accept the authority of the Vedas.

The Sanskrit word 'mimamsa' means a 'revered thought'. The word is originated from the root 'man' which refers to 'thinking' or 'investigating'. The word 'mimamsa' suggests "probing and acquiring knowledge" or "critical review and investigation of the Vedas".

Each of the Vedas is considered to be composed of four parts: The Samhitas, the Brahmanas, the Aranyakas and the Upanishads. The first two parts are generally focused on the rituals and they form the Karma-kanda portion of the Vedas. The later two parts form the Jñāna-kanda (concerned with knowledge) portion of the Vedas.

Purva-Mimamsa is based on the earlier (Purva = earlier) parts of the Vedas. Uttar-Mimamsa is based on the later (Uttar = later) parts of the Vedas.

Purva-Mimamsa is also known as Karma Mimamsa since it deals with the Karmic actions of rituals and sacrifices. Uttar-Mimamsa is also known as Brahman Mimamsa since it is concerned with the knowledge of Reality. In popular terms, Purva-Mimamsa is known simply as Mimamsa and Uttar-Mimamsa as Vedanta.

Jaimini is credited as the chief proponent of the Mimamsa system. His glorious work is Mimamsa-Sutra written around the end of the 2<sup>nd</sup> century A.D. Mimamsa-Sutra is the largest of all the philosophical Sutras. Divided into 12 chapters, it is a collection of nearly 2500 aphorisms which are extremely difficult to comprehend.

Earlier scholars wrote commentaries on Mimamsa-Sutra. Unfortunately they are lost with the passage of time. The earliest available commentary is Sabarasvamin's Sabara-bhasya, which is still the authoritative basis of all subsequent works on Mimamsa. Renowned scholars Kumarila Bhatta and Prabhakara independently wrote their commentaries on Sabara-bhasya. Prabhakara was a student of Kumarila Bhatta. However, they differed, to some degree, on the interpretation of Sabara-bhasya and wrote separate commentaries. (Mandan Mishra, the erudite scholar, was a follower of Kumarila Bhatta. He also wrote a commentary, but at a later stage he changed his thinking and became a disciple of Shamkaracharya.)

This system rightly accepts the Vedas as the eternal source of 'revealed truth.' Thus though it differs from the earlier four philosophical systems (Vaisheshika, Nyaya, Samkhya, Yoga which neither accept nor reject the authority of the Vedas), a great chunk of Mimamsa philosophy is derived from the Vaisheshika-Nyaya duo.

Mimamsa system attaches a lot of importance to the Verbal testimony which is essentially the Vedic testimony. Jaimini accepts the 'Word' or the 'Shabda' as the only means of knowledge. The 'word' or the 'Shabda' is necessarily the Vedic word, according to Jaimini. This system strongly contends that the Vedas are not authored by an individual. Since they are 'self-revealed' or 'apaurusheya', they manifest their own validity.

The system is a pluralistic realist. It endorses the reality of the world as well as that of the individual souls. The soul is accepted as an eternal and infinite substance. Consciousness is an accidental attribute of the soul. The soul is distinct from the body, the senses and the mind. Though Kumarila Bhatta and Prabhakara differ on issues like the self, the soul and its attribute. The earlier mimamsakas do not give much importance to the deities. Hence they do not endorse God as the creator of the universe. But later mimamsakas show a bent towards theism.

This system has a profound faith in the Vedas. The system supports the law of karma. It believes in the Unseen Power or 'apurva'. Apart from accepting the heaven and the hell, the system supports the theory of liberation.

## **The Vedanta**

The Vedanta essentially refers to the philosophy pronounced in the Upanishads, the final parts of the Vedas. In a broad sense, the Vedanta covers the fundamental philosophy enunciated by the Prasthantrayi – the Upanishads, the Brahma-Sutra and the Bhagavad Gita.

The Brahma-Sutra (Vedanta-Sutra) and the Bhagavad Gita are based on the philosophy of the Upanishads. The Vedanta offers the sublime knowledge in its most exalted form. The knowledge may be relative or absolute. Relative knowledge pertains to the senses and the intellect. It is concerned with the physical world and worldly objects. But the Vedanta transcends beyond the realms of relative knowledge. It leads a seeker to transcendental knowledge and finally to absolute knowledge.

The Brahma-Sutra is also referred to as Vedanta-Sutra or Uttar-Mimamsa-Sutra. The Brahma-Sutra has 555 sutras. Most of them are aphoristic. Being cryptic, they are almost unintelligible at first sight and need elaborate explanation by an expert. Hence, a number of commentaries were written to interpret them.

Shamkaracharya, Ramanujacharya and Madhavacharya wrote commentaries on the Brahma-Sutra. This led to the rise of three schools of the Vedanta as mentioned earlier.

They were: **Shamkaracharya's Advaita Vedanta, Ramanujacharya's Vishishtadvaita Vedanta and Madhavacharya's Dvaita Vedanta.**

Though the three schools differ on several counts, the underlying basic concepts of the Vedanta are similar. We shall study only the basic Vedanta concepts here.

All the three schools of the Vedanta present three categories of 'realities'. The first category is the Jagat or the Universe.

The second category is the Jiva (individual) or the atma (Atman or the soul) that lives in the jagat or the world.

The third category is the Brahman, the substratum behind the Jagat and all the Jivas. The Brahman is the Supreme Being and governs the destiny of the Jagat and the Jivas. The Vedanta philosophy is focused on the Jagat (the universe), the Jiva (individual soul) and the Brahman (the Supreme Being). Brahman is the repository of all knowledge and power. Jivas, out of ignorance, gets trapped in the Jagat. Attached to the physical world and driven by passions and desires, they are tempted to act with selfish, mundane motives. They remain chained to ceaseless actions (karma). As a result, they subject themselves to countless births in various forms. Their transmigration from this birth (life) to the next depends on the karma (the quality of action). Moksha or mukti (liberation) is the goal of life. This philosophy, in general, is accepted by all the three schools.

These are the basic concepts common to all three schools of the Vedanta. Now let us see how they differ.

Dvaita means dualism. This system believes that the Brahman and the Jiva are two different entities. This system believes that the God, the soul and the Universe are three separate realities. God governs the world. The soul in its ignorance remains attached to the physical world. By developing faith and devotion in God, he can seek God's mercy and then the soul may migrate to the Heaven above. Such a jiva may attain Mukti. Thus he may liberate himself from the cycle of life and death and live with God forever in the Heaven.

Vishishtadvaita literally means “qualified non-dualism”. Ramanujacharya stresses that God alone exists. He says that Brahman is God. He is not formless. The Cosmos and the Jivas form his body. When the Jiva (soul) realizes that he is a part of Paramatman (God), the soul is liberated. With self-realization and liberation the soul enjoys infinite consciousness and eternal bliss of God. Advaita literally means non-dualism. This system contends that the Brahman and the atman (individual soul) are not different entities. Brahman is the Ultimate, Supreme Reality. Brahman is beyond names and forms. Brahman can not be described in words. Brahman is Sat-Chit-Ananda. Brahman and atman are not different realities. They are identical. They are the eternal, all-pervading realities underlying all existence.

## The Basic Concepts of Advaita Vedanta

The Advaita Vedanta focuses on the following basic concepts: Brahman, atman, vidya (knowledge), avidya(ignorance), maya, karma and moksha.

1. Brahman is the Ultimate, Supreme Reality. Brahman is eternal. Brahman is beyond words. It is beyond names and forms. Brahman can not be perceived nor could it be described by words. It is beyond senses and intellect. It is indefinable. However, if at all it has to be described; Brahman can be considered as Pure Consciousness.

In Vedanta philosophy, the svaroop of Brahman is referred to as Sachchidananda. Brahman is Sachchidananda i.e. **Sat-Chitta-Ananda**(Pure Existence-Pure Consciousness-Pure Bliss). Brahman is eternal, immutable, inexpressible and unthinkable pure-existence, but it is not the cause or the creator of the universe.

2. Atman is the inmost Self or Spirit of man but different from the ‘empirical ego’. Atman is the fundamental, ultimate, eternal, immutable pure consciousness. Thus, it appears that Brahman is the ultimate reality behind all world-objects and Atman is pure spirit in all beings. Truly speaking, both Brahman and Atman are not different realities. They are identical. For practical purposes, they are referred to separately, which they are not. They are the eternal, all-pervading realities underlying all existence. They are two different ‘labels’ for one and the same reality behind all the objects, all matter, all beings of the universe.
3. Maya is the unique power (shakti) of Brahman. Maya is trigunatmika; it has three gunas or attributes. But Shuddha Brahman is nirguna and is free from attributes. Shuddha Nirguna Brahman alone is the Supreme Reality. When Nirguna Brahman comes to acquiesce Maya and acknowledges the gunas of maya, it is known as Saguna Brahman. Saguna Brahman is God, the creator, sustainer and destroyer of the world. Saguna Brahman is Ishvara or a ‘personal god.’ Man worships gods in different forms and names.
4. Brahman manifests itself in the world with the help of Maya. The world and the world objects come into existence due to the power of maya. Maya and its creation is termed illusory. It does not mean that the world is not real. Unreality and illusion are different. An illusion may not be an unreality for an illusion is grounded in reality. Reality is that which exists on its own. Maya is dependent on Brahman. Maya has created the world of appearances. So the world is illusion. But this does not mean at all that the world is non-existent. The Advaita Vedanta, with the help of the famous “rope–snake” illustration, maintains that ‘it is neither ultimately real, nor wholly unreal, illusory and non-existent.’

5. Avidya (ignorance) has its seat in the human intellect. Avidya means not only absence of knowledge, but also erroneous knowledge. A man trapped in Avidya does not know what is real and thinks that the appearances are real. An individual identifies himself with empirical self. He equates his existence with the physical body. Under the influence of Maya and Avidya, he dissociates himself from the Ultimate Reality. When the man acquires knowledge, the duality of the self and Brahman disappears. He realizes that the self is really one with Brahman. This realization of the self puts an end to the ignorance (avidya).
6. Moksha is freedom from bondage of ignorance. Man suffers in the grip of incessant desires and ignorance. Upon realization of the self, one becomes free from the shackles of desires, aspirations, passions, karma and avidya. This is Moksha (kaivalya) or liberation. Moksha is to be attained here and now during this life-span only.
7. Knowledge and truth are of two kinds: the lower one and the higher one. The lower, conventional knowledge and truth is referred to as vyavavahrika satya. It is a product of the senses and the intellect. The higher one is referred to as paramarthika satya. It is absolute. It is beyond words, thoughts, perception or conception. It is in no way, related to the senses and the intellect. It is non-perceptual and non-conceptual. It is a product of sublime intuition and "divine vision". The higher knowledge and truth brings about radical transformation in an individual so it is soteriological.
8. Advaita Vedanta recognizes the six pramanas (sources and criteria of valid knowledge) on the basis of the Mimamsa school of Kumarila Bhatta. They are as follows:
  - a. Perception (pratyaksha)
  - b. Inference (anumana)
  - c. Testimony (shabda)
  - d. Comparison (upamana)
  - e. Postulation (arthapatti)
  - f. Non-cognition (anupalabdhi)

## **Pramanyavada**

Pramanyavada, Pramana means the means of accumulating or achieving a valid knowledge and valid knowledge is known as Prama. Now, Pramanyavada means a theory of validity; that means, whenever we cognize an object, we cognize because of some other factors responsible. Factors means, intrinsic factor as well as the extrinsic factors; extrinsic factors means, there is a light minimum distance etcetera and the object is not hiding, it is presented before us and intrinsic means, all our memory should function well, we are not caught with jaundice disease, we are in a healthy climate condition, we are healthy and also we behave like an ordinary human being, we are equally fit to cognize an object. Therefore, they are saying that whenever there is cognition, it deals with both internal condition as well as the external condition.

What Naiyaikas intrinsic is means that, the effect exist in its material cause prior to its production and what extrinsic means, the effect after production is different from the cause. There are two types of concept here, further they said that, the knowledge is valid or invalid sometimes it depends on the conditional situation, sometimes it depends on the external condition, sometimes it depend on the internal conditions, because there are many situations. Since a person is affected with the jaundice disease, everything appears to him or she is yellow; however, the nature of that object is not

yellow, the attribute yellowness may not be finding to that object and henceforth, the knowledge he or she has to that particular object and with a particular name cannot be considered as a valid knowledge. In the same way, there are many kinds of external conditions, matters when we cognize an object. If it is a dark room, a human being though he is a normal human being cannot see anything in the dark.

So, whatever knowledge he has in that room on a particular object, that may not be a valid knowledge, because we need a sufficient light to cognize that object and also we need a minimum distance to cognize that object. If an object is placed in a long distance, we cannot claim that object with a particular name because we need a particular distance to cognize an object and we cognize all its features, which we also need to be a confirmative to that object. Therefore, they said that the validity and invalidity depends on the internal and external conditions also. There are two types of Pramanyavada, one is Svatah Pramanyavada and another is Paratah Pramanyavada. What is Svatah Pramanyavada means, the knowledge will be valid or invalid depends on say internal condition or intrinsic factors.

### **What is Paratah Pramanyavada?**

Paratah Pramanyavada means the knowledge which is a valid or invalid depends on the external conditions. If the external conditions are good then, the knowledge will be valid, though some other parameters have to be there. The subject, object, the instrument and the means of cognizing that object, apart from all these, we have say, internal and external conditions required.

So, there are two types of Pramanyavada that we can see, one is Svatah Pramanyavada another is paratah Pramanyavada and different schools have the different opinion on this two Pramanyavada. There are many times people claim that the knowledge will be invalid, it may be depends upon again intrinsic factor as well as extrinsic factor. The invalid knowledge is known as apramanya, the invalid knowledge is known as apramanyavada, whereas valid knowledge is called Pramanyavada, because valid knowledge Prama and the means through which we get the valid knowledge is Pramana.

Therefore, they are saying that any knowledge we have called Pramanyavada, the particular means through particular Pramana, we gain a knowledge known as Prama. So, here we find, there are four kinds of knowledge, Naiyaikas are talking about. One is Svatah Pramanyavada, another is Svatah apramanyavada, the third one is paratah Pramanyavada and the fourth one is paratah apramanyavada.

### **What is Svatah Pramanyavada means?**

The validity of the knowledge is depends on internal conditions or intrinsic condition. Svatah apramanyavada means the invalidity of knowledge depends on the internal conditions or intrinsic nature. The third one paratah Pramanyavada; that means, a knowledge is valid depends on the external condition and the fourth one is paratah apramanyavada, what it means? The knowledge is invalid depends on the external condition. Now, we will see what are the schools, what are the systems prescribed how knowledge can be valid and how knowledge can be decided, whether based on internal or external condition, whether the valid knowledge can be an intrinsic or extrinsic and what are the system's opinions.

Here, I will just read it for our help. This theory, theory means Pramanyavada, this theory expresses about when the knowledge will be true and when it will be false. Svatah Pramanyavada it is constituted and determined by intrinsic condition it is self-evident; it is intrinsic because the effect

is found in the cause. Paratah apramanyavada on the other hand, it is constituted and ascertained by extrinsic conditions, it is extrinsic because the effects is different from cause, the effect is anew phenomenon which is not found in the cause.

So, now we can know, what is intrinsic and extrinsic according to Nyaya philosophy and how they mean, when they speaks about Pramanyavada. Basically, their aim is to identify the knowledge we have, whether the knowledge is a valid or invalid. If at all valid, under which condition it is valid, if it is invalid, why it is invalid and under which condition it is invalid. Now, let us discuss schoolsopinion, different system have their given their own opinion to consider whether knowledge will be valid or invalid depends on whether intrinsic or extrinsic factors.

Now, schools opinion if you can see that, the Nyaya as a realist philosopher, they said that paratah Pramanyavada. What they mean is that, the knowledge is valid or invalid depends on the extrinsic factor, validity and invalidity of knowledge are extrinsic. Contracting to this view, samkhya philosophy or samkhya system claim that, Svatah Pramanyavada; that means, the validity and invalidity of knowledge are intrinsic here Svatah is stands for intrinsic and Pramanyavada is validity or invalidity knowledge.

Buddhism, buddhism has given two view on Pramanyavada, first they say that, Svatah apramanyavada. That means, a knowledge will be invalid which it dependson its intrinsic nature, a knowledge is to be invalid which depends on the intrinsic nature and paratah Pramanyavada means a knowledge is to be valid depends on its extrinsic factors or extrinsic in nature.

Therefore, Buddhism has a two opinion the knowledge will be invalid depends on intrinsic factors and the knowledge will be valid it depends on external factors. The fourth schools you know vedantins as well as mimansikas, combinedly they argued that Svatah Pramanyavada and paratah apramanyavada; that means, knowledge will be valid, when it is supported by the internal conditions or intrinsic conditions and knowledge will be invalid, when it is supported by the extrinsic condition.

## **The Meaning and Concept of Sruthi in Hinduism**

Sruthi or Sruti means that which is or was heard. Sru means to hear. Iti meanthus. Sruti means thus heard. In a general sense, sruti means anything that you hear from others, including a rumor or news. Srutam is the object of hearing. Srotha means the audience, or those who hear a speech. In a religious or spiritual sense, sruti means the knowledge which was heard by revelation. It includes the knowledge heard from God, a divine being, a spiritual teacher or an enlightened person.

The Vedas are considered sruthi because they were believed to have been originally heard from Brahma by the Vedic seers who then transmitted it to their successors and pioneered a tradition that continued for several generations. Until two hundred years ago, the Vedas were transmitted only orally by teachers to a student. Thus, sruthi means that which is heard from God or from a guru. Since the knowledge of the Vedas is gained by hearing, they are also known as anusravaor that which has been heard.

Although this is the general meaning and there are several texts which trace their origin to Brahma, Vishnu, Shiva or other divinities, for reasons not clear to us only the Vedas are considered sruthi and the rest are considered smriti or smriti, meaning the memorial texts. Examples of Smriti texts are the Dharmashastras, the Sutra literature, the Vedangas, several bhashyas, gitas, gathas, itihisas, tantras and Puranas. They may contain divine teachings, as in case of the Bhagavadgita. However,

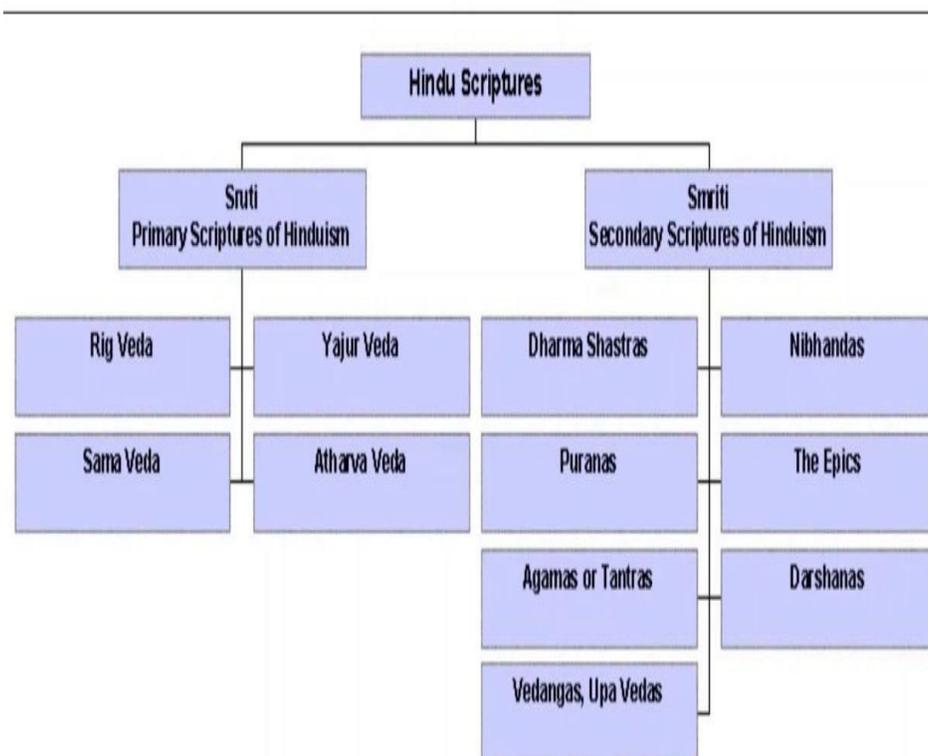

they are not considered sruthi.

The Vedas are four namely the Rigveda, the Samaveda, the Yajurveda and the Atharvaveda. They contain thousands of hymns which are mostly invocations to various gods. Each Veda is further divided into Samhita, Brahmana, Aranyaka and Upanishad. Knowledge of the first two is useful to perform Vedic rituals and sacrifices while that of the last two is useful in spiritual and contemplative practices.

Since the knowledge of the Vedas is considered divine in origin, they are used as verbal testimony (sabda pramana) to establish truths that cannot be easily ascertained with the help of the senses, the mind or human intelligence. For example, we do not know the nature of Brahman, who is beyond the mind and the senses, invisible and beyond our grasp. How can we know him who is indescribably, indefinable, unknown, invisible and infinite? He may be known in transcendental states of self-absorption. However, how can we be sure that what we have experienced is indeed the state of Brahman or the Self? It is by studying the Vedas, especially the Upanishads, and comparing our experience to the knowledge of Brahman which they declare to be true. The same knowledge can be used to strengthen our faith or beliefs about God and existence, which cannot be validated by other means.

## Classification of śruti-vākyas

### Classification of Major Scriptures

Introduction In the Mimamsa system of interpretation, the raw material to which its rules applied, consisted mainly of Vedic texts. But once the system was evolved it was utilised for the interpretation of material contained in works relating to other branches of learning, including law. 1 It is the method

oMimansa, rather than the matter to which it was applied, that seems to have invested it with a certain attraction. Its method is sound and its subject matter is of positive nature and, as has been said, in most cases, its reasoning is convincing.

## **Vedic texts as classified by Jaimini**

Jaimini, the founder of Purva Mimansa, has classified the texts of the Vedas\* into

- (1) Vidhi,
- (2) Nishedha,
- (3) Arthavada,
- (4) Namadheya, and
- (5) Mantra.

- A Vidhi is an obligatory text. It is positive in character.
- A Nishedha (also called Pratishedha) is an obligatory text, but it is negative in character.
- An Arthavada is a non-obligatory text, connected with a particular Vidhi. It is not a command or prohibition in itself, but is, rather, explanatory of the reason for another (substantive) command or prohibition, or illustrates it or explains its benefit.
- A Namadheya is in the nature of a general definition and is not connected with any particular command or prohibition.
- A Mantra is a peculiar class of texts, occurring only in the Vedas and need not be considered for the present purpose.

While the first two classes of texts mentioned above are substantive in nature (positive or negative), the next two are not substantive. In this manner, the first two can be distinguished from the third and the fourth. The third (Arthavada) is connected with some particular Vidhi, thus distinct from the fourth (Namadheya), which is in the nature of a general definition having a bearing upon the general scope of the subject.

An Arthavada is not allowed to control the meaning or force of a Vidhi, but can facilitate the understanding of a Vidhi and is thus its concomitant." work is the study of duty (Dharma). And he explains that duty is a purpose which is inculcated by the command. The "command" spoken of, is intended to refer to the passage of the scripture in which it is mentioned.<sup>1</sup> The "duty" spoken of here, necessarily leads us to the question of sanctions. To stress the element of sanction (which is not explicit, though it is implicit in a command), writers on Mimansa have adopted a definition of Vidhi in these terms<sup>2</sup> "Aprapta parpako Vidhi". Translated into English, it means, "A Vidhi is that which puts one in a position which ordinarily one is not apt to get into". What is meant is, that the command indicates the necessity of a compelling power. The command - "Maintain your forsaken wife", - for example - urges the doing of something which the man would not otherwise do.

### **Nishedha Conversely,**

Nishedha is explained<sup>3</sup> as a prohibition against ragaprapti- doing something by the impulse of some particular passion is prohibited. The classical illustration of a Nishedha in Mimansa literature is - "Na Kalanjam Bhakshayet" (Do not eat Kalanja, i.e. fermented food).

### **Other examples are –**

- (a) "Na hinsyeta" (Do not injure another).
- (b) "Nanritam Vadeta" (Do not utter untruth).

All these are regarded as absolute prohibitions.

### **The relevance of Vidhi**

The reason why scholars of Mimamsa concentrated on Vidhi (injunction) may be explained at this stage. The main object of the persons engaged in this discipline was to interpret the Vedic texts. For this purpose, it became necessary to distinguish between what was mandatory and what was not. The object was to secure the correct performance of sacrificial ceremonies.<sup>6</sup> Since the content of these ceremonies is fixed by the injunctions (Vidhi) of the Veda, the Mimamsa propounds rules which enable the scholar to recognise a true injunction and to determine its sense and significance. It has been pointed out that one reason why these rules were extended to the interpretation of legal doctrines was that the regulation of disputes was presented by the authors of the Dharmashastra as if it were a sacrificial act and hence the rules thereof must be scrupulously observed under pain of sin.

### **Arthavada**

For the purpose mentioned in the preceding discussion, it became also necessary to distinguish between a Vidhi and Arthavada. The former is a positive injunction, while the latter is only an explanation for it. An Arthavada does not express the will of the law maker, unlike the Vidhi. It is only an observation in the nature of a commentary, "just as if the law maker descended from his position as such, and condescended to point out the merit of the law laid down, from the point of view of the ordinary run of people".

If a thing is a requisite part and parcel of a Vidhi - what is called the *angangi* relation with the Vidhi - then it is itself of an authoritative character. But an Arthavada, according to the conservative theory, does not have an authoritative character, but only explains something else which has such a character. No doubt, according to the view of some writers, some Vidhis themselves create a liking for the command and such injunctive texts might not have any Arthavada texts relating to them. But, by and large, when a Vidhi has an Arthavada text related to it, it is assumed that the Vidhi-vakya does the work of only enjoining the act, while the task of creating a liking for the act is performed by the Arthavada. "The Vidhi has an expectancy for the Arthavada. The Vidhi and the Arthavada together form one sentence, so that the Vidhi has an expectancy for the Arthavada".

### **Namadheya**

In the Mimamsa learning, one also finds the expression *Namadheya*. This is distinct from the injunction. It is regarded as an independent clause. It is not in the nature of a gloss on a Vidhi. "It is a statement made by the law maker in his character as such, and is in this sense authoritative; but it simply states what is what. Such a statement does not directly bear upon any particular Vidhi. By defining things, it serves to elucidate the main purpose of the Vedic law".

### **Classification of Vidhi**

For practical purposes, it became necessary to think of various classifications of Vidhis. Some of the modern studies of ancient Hindu Law, in fact, offer a detailed discussion of such classifications. This became necessary because the primary object of the Mimamsa system was the study of the injunction and the system had to determine and examine the different forms under which the injunction could present itself in the Vedic texts; and, accordingly, it undertook to define their respective scopes of application.

Thus, "beside the primary injunction pure and simple (utpatti-vidhi), it distinguished also the injunction of application (viniyoga-vidhi) which fixes the relation between the principal rite and a subsidiary action; the injunction of employment (prayoga-vidhi) which fixes the order in which the different parts of the rite should be performed; the injunction of qualification (adhikara-vidhi) which fixes the conditions required if the doer of the action is to obtain the fruits of the ritual he has put into effect; the restrictive injunction (niyama-vidhi) which submits the doing of the act to determined conditions, excluding others which are equally possible; and the injunction of exclusive specification (parisankhya-vidhi) which operates as a prohibition, and so forth.

"These subtle distinctions furnish the shastric interpreter with readyformed means to analyse and classify the precepts of the smriti and to define their nature and significance rigorously."

### **Practical application of the distinctions**

The distinction between an obligatory text and mere gloss had practical consequences in many cases. If a text is a Vidhi, then it is mandatory. But if it is an Arthavada, then it is not. The controversy about adoption of an only son provides an example.

Vasistha (XV.3) prescribed that one should neither receive nor give in adoption an only son. "For (he should stay) to continue the line of his ancestors". The question may arise whether the consideration of the continuance of the line of ancestors is to be taken as a mere gloss or whether it is to be read as part of the main prohibition against the adoption of an only son. If it is read with the main prohibition, then the adoption of an only son, though it may be a sin on the part of the father, would not be invalid. This, in fact, was the view taken in Anglo-Hindu law after some debate. However, some of the writers on Hindu law treated the prohibition in question as an absolute one. Thus, Vijnanesvara (Mit., on Yaj., 11.129-133), Nandapandita (Datta/fca-mimansa IV. 1.6), the author of the Dattakachandrika (1.27) and Nilakantha (Vyav. may., IV.v.9,16) pronounce in favour of absolute prohibition.

### **Basis of classification of Vidhis**

Two main bases of classification of Vidhis are met within the Mimansa literature. The first is on the basis of the degree of obligatory force of the Vidhi, while the second is on the basis of the purpose thereof.

With reference to the degree of the obligatory force (in regard to positive injunctions), Jaimini classifies them into Vidhi proper, Niyama and Parisankhya. If a benefit to be derived from a Vidhi is not at all possible of being attained by other means, then it is mandatory. If such benefit can be partly attained by complying with the Vidhi and partly by other means, then it is imperfect and not absolute. If the benefit can be wholly attained by other means (though it can also be attained by following the Vidhi), then the Vidhi is a mere recital or statement of the benefit without any real obligatory force.<sup>2</sup> The later commentator Kumarila Bhat explains the distinction in these words:- "A Vidhi tends to secure what is otherwise not attainable at all." "A Niyama tends to secure what is partially otherwise attainable."

"A Parisankhya consists in a statement or recital as to a benefit which is commonly attainable in its entirety, either by acting according to the statement or by other means."

Sarkar has expressed the effect of the above, in the language of the modern law, in the following

form:-

- "A Vidhi is a perfect (imperative) command.
- ANiyama is an imperfect (directory) rule.
- A Parisankhya is a monitory precept."

Thus, the direction "Take a goodly meal after the fasting on the 11th day of the moon", is regarded as a Niyama, implying that the meal is to be taken unless one has a good reason for abstaining from it. In contrast, the direction "The flesh of animals whose feet are divided into five nails is eatable", is an example of Parisankhya. It only means that one may eat such flesh and not that one shall eat it.

## **Dharma Classification**

**Dharma** is broadly classified into two groups – general or universal (samanyadharmas) and special or particular (visheshadharmas). In the category of samanyadharmas, all the basic values which generally never change with space and time are included. Here, the divisions of caste, creed, occupation, nationality, gender, race and other distinctions are not decisive. What we would call as human values today – values like truth, non-violence, freedom from greed, purity of thought, word and action, self-control, etc. are prescribed as universally applicable dharmic features by great thinkers and champions of sanatana dharma.

Manu, in his treatise Manusmriti goes to the extent of defining the features of dharma in terms of values like self-possession, forbearance, bodily discipline, non-theft, purity of body and mind, sense-control, intellectual efficiency, wisdom or knowledge (awareness), truth and non-anger and declares that they are the characteristics of dharma (Manusmriti 6.92).

Visheshadharmas are essentially spatiotemporal in nature and include among others such things as varna dharma (duties of different social sectors), ashrama dharma (duties of individuals at different stages of their life), raja dharma (duties of political authority), apaddharma (alternative duties and exemptions during odd and critical times), etc. This list itself tells us that these were a few relevant in some space-time frame. The challenges facing us today may be different and might demand different policies. All these new policies will find a definite place in the broad phrase of dharma. Even specific concepts like varna and ashrama can be redefined to suit the times. Such corrections have been constantly going on in the annals of sanatana dharma. In fact, that is one of the secrets of its relevance and sublime dynamism.

Without a compassionate understanding and wise execution of different dharmas coming under the categories of both samanya and vishesha, none can prescribe anything or describe anything in sanatana dharma. There is a subhashita (wise saying) in Sanskrit according to which the wicked should become good and the good should get peace. The peaceful one should get liberated from the clutches of ignorance, which only makes him wrongly identified with this ego and the materialistic world and such a liberated soul should aid others in the path of liberation. Thus, in our cultural context, constant accountability here and now, verily verifiable by one and all is the essential qualification of a true dharmic person. Those who are not up to this find no place in the world of values since they are essentially meant for practice and not preaching. In the words of Adi Shankara, samanyadharmas is not merely a human-made convenience (purushatantra), but is a self-realized universal conformity (vastutantra). Values are like music and painting which mean little when they are described in words. It is only by practice that one derives the sustained, self-enriching joy that these values bring.

Even samanyadharmas, such as truth, non-violence and others must be understood in the light of sacchidananda and the purusharthas. For example, truth which normally means verbal sincerity, or non-violence, which normally means not hurting others can take different connotations in different situations. A doctor uttering a lie to save his patient from a rude shock or a sincere police officer uttering a lie to catch hold of a crook who is trying to escape from law or a doctor operating on a patient shedding his blood or a teacher turning harsh to teach a lesson to his arrogant student cannot be considered as cases of violation of truth or non-violence. In all these and such similar cases, we naturally think about the intentions of the persons and the results of their acts. In this respect, sanatana dharma upholds the acts of persons who are selfless and self-realized and try to do the end good even if the chosen means is not "just" due to the restrictions imposed by situations. Here, one can remember a telling situation from the Mahabharata (Karna parva) where Krishna tries to forge affection between Yudhishthira and Arjuna, who were on a row regarding the issue of maintaining their oaths. Krishna pacifies the two brothers' heated arguments over the nature of truth and declares that that which is really good at the cosmic level is the bed rock of it: yad bhutahitamantantam tat satyamiti dharana. This should be our real interest in the pursuit of values in general and fundamental values in particular.

## **Viśiṣṭādvaita**

Vishishtadvaita is one of the most popular schools of the Vedanta school of Hindu philosophy. Vedanta literally means the end of the Vedas. Vishishtadvaita (literally "Advaita with uniqueness; qualifications") is a non-dualistic school of Vedanta philosophy. It is non-dualism of the qualified whole, in which Brahman alone exists, but is characterized by multiplicity. It can be described as qualified monism or qualified non-dualism or attributive monism. It is a school of Vedanta philosophy which believes in all diversity subsuming to an underlying unity.

Ramanuja, the 11–12th century philosopher and the main proponent of Vishishtadvaita philosophy contends that the Prasthanatrayi ("The three courses"), namely the Upanishads, the Bhagavad Gita, and the Brahma Sutras are to be interpreted in a way that shows this unity in diversity, for any other way would violate their consistency. Vedanta Desika defines Vishishtadvaita using the statement, Aśeṣa Chit-Achit Prakāśam Brahmaikameva Tatvam: Brahman, as qualified by the sentient and insentient modes (or attributes), is the only reality.

Among the well-known philosophical systems, the Vedānta system which is also called as the 'Vedānta Darśana' has carved out an eminent place for itself. It is based mainly on the prasthānatraya

1. The Upaniṣads
2. The Brahmasutras
3. The Bhagavadgītā

In course of time, this system has branched off into three main streams:

1. Advaita
2. Viśiṣṭādvaita
3. Dvaita

The **Viśiṣṭādvaita Vedānta Darśana**, is not the creation of Rāmānuja as many believe, but actually it is a much older scripture than him. The twelve Ālvārs like Nammālvār, Kulaśekhara, Āṇḍāl and the Ācāryas like Nāthamuni, Yāmuna and Rāmānuja evolved the system out of the more ancient

teachings contained in theprasthānatraya and gave it a definite shape. However, Rāmānuja was its best exponent. The pioneering and stupendous work he has turned out in the cause ofthis system justifies in its being sometimes called as ‘Rāmānuja Darśana’.

The demise of Rāmānuja was followed by a period of sectarian split among his followers generally called as ‘Srīvaiṣṇavas’ which ultimately ended in a permanentdivision of their ranks into two sects of:

1. Vaḍagalais - They are the followers of Northern school.
2. Teṅgalais - They are the followers of Southern school.

The two sects developed separate sets of works, separate lineage of gurus or teachers and separate traditions in many matters of practical importance. Theapostolic successors of Rāmānuja who were responsible for establishing the system on a firm foundation, were as follows:

1. Vedānta Deśika
2. Pillai Lokācārya
3. Māṇavāla Māmuni

## **Jiva**

**Jiva**, (Sanskrit: “living substance”) in Indian philosophy and religion, and particularly in Jainism and Hinduism, a living sentient substance akin to an individual soul.

In the Jain tradition, jivas are opposed to ajivas, or “nonliving substances.” Jivas are understood as being eternal and infinite in number and are not the same as the bodies that they inhabit. In a pure state (mukta-jiva), they rise to the top of the universe, where they reside with other perfected beings and are never againreborn. Most jivas are, however, bound to samsara (rebirth in mundane earthly existence), because they are covered with karmas—fine particulate substances that accumulate on the jiva (in the same way that dust particles accumulate on oil) on account of both actions and emotions.

Jivas are categorized according to the number of sense organs possessed by thebodies that they inhabit. Humans, gods, and demons possess the five sense organs plus intellect. Lesser beings have between two and five sense organs.

Clusters of minute beings, called nigodas, belong to the lowest class of jivas, which possess only the sense of touch and undergo such common functions asrespiration and metabolism but have little hope of ever progressing to a higherspiritual or bodily state. The whole space of the world is packed with nigodas. They are the source of souls that take the place of the infinitesimally small number that have been able to attain moksha, release from samsara.

Many Hindu thinkers employ the term jiva to designate the soul or self that is subject to reincarnation. Since many Hindu schools of thought do not regard selfhood as intrinsically plural, however, they typically understand these individual jivas to be parts, aspects, or derivatives of the atman, the universal selfthat is in turn identical to brahman, or absolute reality. In this usage, jiva is short for jiva-atman, an individual living being.

## **Differences between Bhakti & Prapatti**

Bhakti is the path of devotion. It is meditating towards the lord, longing for his union, lamenting on his separation, doing as much service as possible to his pleasure. Karma and gnana are ancillaries for bhakti. Bhakti is a "upAya" - "means" to reach our Lord. Bhakti is sAdhya upAya - achieved by our efforts or even known as pravritti marga - endeavouring in action. Bhakti as a upAya is known as sAdhana.

Prapatti - is "absolute surrender" to the lotus feet of Sriman Narayana. In other words having faith that Sriman narayana's lotus feet is the upAya (means). Prapatti also known as nyAsa or saraNAgati is siddha upAya - ie "means" that is pre existing and not achieved by our efforts (unlike bhakti). This is so because the lotus feet is not achieved or created by our efforts. It is already existing and ever waiting to respond. This is nivritti marga - abstaining from action - abstaining from doing anything as means for liberation other than requesting and accepting the Lord as the means. Reference for Bhakti - manmanA bhava.gItA 9th chapter last sloka. Reference for prapatti - tvamEva upAyabhUtO mE bhava iti prArthanA mati: saraNAgati:. For easier understanding let us draw a chart differentiating bhakti and prapatti.

## **Bhakti Prapatti**

1. sAdhya upAyamsiddha upAyam.
2. pravritti margamnivritti margam
3. Only a select few can practice - those who are eligible for Vedas. Anyone including animals can surrender.
4. Gives mOksha after burning out the prArabdha karmas which might take many births. Gives mOksha at the end of that birth in which one surrenders.
5. to bear fruit, one has to meditate towards the Lord till the last moment. Once surrendered there is no need to think of him in the death bed. (there is a need for antimasmrti)(no need for antimasmrti)
6. expects karma and gnana as ancillaries (anga) to bear fruit. Does not expect anything as it is the will of the Lord
7. Bhakti is acit (non sentient) prapatti is absolutely cit (sentient) as it is the Lord himself.
8. expects some other than itself to give the fruit (Lord has to give) Itself gives the fruit (as prapatti is Lord's will which itself gives the fruit)
9. Atma swarUpa viruddham - not a right mean considering the absolute slavery Atma swarUpa anugunam - the right mean considering the absolute slavery nature of jIva. As bhakti casts some independence on him which is not Atma's nature of jIva. No independence on the jIva.
10. Not a fitting means for the great fruit mOksha which we get, as this is acit fitting means for the great fruit mOksha which we get, as this is cit.

Interestingly, a bhakta also performs prapatti and a surrenderer also practices Bhakti. Why so ?

To practice Bhakti, one has to be cleansed of all his papa karmas. Since our papas are countless, the prayascittams are also countless, which is almost impossible considering our finite life and knowledge. So in lieu of prayascittams a bhakta performs prapatti. The fruit for this surrender is cleaning the karmas. Then on Bhakti is born and further leads to liberation. This is called anga prapatti (ancillary to Bhakti).

A surrenderer after performing prapatti has to spend his life time in the service of his master. To generate more interest, to sing His glory, to chant His divine names and to enjoy His nearness, the

surrenderer uses Bhakti as a medium. Bhakti here is used as a means to enjoy and experience the Lord. Not as a means for liberation.

For a bhakta, Bhakti is the means for liberation but prapatti is ancillary for clearing karmas. For a prapanna, Lord's feet is the means for liberation, but Bhakti helps in furtherance of his service.

Bhakti is a mixture of action and meditation. Prapatti is a pure state of mind. A prapanna possesses the following : makes up his mind to do what pleases His master, not to do what displeases His master, absolute faith that He would protect, to seek Him alone as the protector, reveal his inability and meekness, and lastly submit oneself. Bhakti is easy to conceive and understand but difficult to practice, prapatti is easy to do but difficult to conceive understand or digest as a concept.

A hagiology for prapatti : Once Swamy ParAsara bhatta along with his disciple was going through a forest . He had to stay that day at a hunter's place. In the evening the hunter returned and was looking very hungry. Bhattar enquired whether he could not hunt any animal or bird that day. Hunter replied : "O knowledgeable ! I caught a small rabbit and was returning home happily. The mother of that rabbit saw this and stood before me with pleading eyes. I felt pity and let the small rabbit go. So I am hungry". Bhattar on hearing this fell unconscious. After a while he got up and said "neither the mother rabbit knew saraNagati sastram, (it did not chant dvayam, it did not say nivEdayata mAm kshipram like vibhIshana), nor the hunter knew the characteristics of a protector, (does not know sarva dharman parityajya mAmEkam saraNamvraja or abhayam sarvabhUtEbhyO dadAmi). Nevertheless without a word being uttered a prapatti has borne fruit here. " So it is not words or actions that matter in prapatti, but the mental make up- the pleading gesture - feeling of a destitute - absolute faith on Him that is important.

### **Pariṇāmavāda (Theory of real transformation)**

Closely related to Bhedābheda Vedānta's ontology is its theory of causality. Bhedābheda Vedāntins subscribe to the theory of Pariṇāmavāda, which states that the phenomenal world is a real transformation (pariṇāma) of the material cause of the world. They share this theory with the Sāṅkhya school of philosophy, as well as with most other schools of Vedānta. The major difference between the Vedāntic theory of Pariṇāmavāda and the Sāṅkhya's Pariṇāmavāda is the understanding of what constitutes the material cause of the world. For Sāṅkhya, primordial nature (prakṛti) transforms itself into the phenomenal world. The principle of primordial nature is completely insentient, and the process of transformation that creates the world is a blind, automatic process. For Bhedābheda Vedāntins, Brahman is both the material and efficient cause of the universe. Brahman, unlike the Sāṅkhya's prakṛti, is sentient. Yet both the sentient (individual souls) and insentient (physical things) have their origin in Brahman, according to Bhedābheda Vedāntins. In spite of their apparent proximity to the Sāṅkhya school on the issue of causality, early Bhedābheda thinkers such as Bhāskara took pains to critique the Sāṅkhya notion of prakṛti, accusing it of being both contrary to scripture and contrary to logic. A few later Bhedābheda thinkers took a softer line on Sāṅkhya. The most notable of these was Vijñānabhikṣu (16thc.), who argued for the ultimate unity of Sāṅkhya and Bhedābheda Vedānta doctrines.

### **khyāti**

Though the word khyāti literally means knowledge, it is often used as a technical term indicating a theory that purports to explain erroneous perception or illusion. Such a perception, though a fact of experience, defies all attempts at explaining it. When the snake is seen in a rope in insufficient light, or silver in nacre in moonlight, it is difficult to say how exactly it happens.

The various schools of Indian philosophy have dealt with this problem and have given different explanations of it. These explanations naturally vary according to their epistemological and metaphysical views. Each school has also tried to defend its position and refute the theories of others.

The main points of controversy are concerned with the nature of the illusory object and how it is caused.

The seven such khyātis or theories will now be dealt with in the alphabetical order:

1. **Akhyāti** ('non-apprehension'): This is the theory propounded by the Mīmāṃsā school of Prabhākara. 'Viveka-akhyāti-vāda' is another name for the same. According to this view, it is the akhyāti or non-apprehension of the difference between the memory-image of silver and nacre the percept, that is responsible for the illusion of silver in the nacre.
2. **Anirvacanīyakhyāti** ('apprehension of the indefinable'): According to this theory advocated by the Advaita Vedānta, the illusory object like silver is an instantaneous and apparent creation of ajñāna or ignorance associated with the substratum like nacre. Since the silver is perceived, it is not *asat* or unreal like the son of the barren woman. Since it is sublated by the later, correct, perception of nacre, it is not *sat* or real either. Nor can it be both *sat* and *asat* simultaneously which is contradictory. Hence it should be described as *anirvacanīya*, indefinable. The theory itself which holds the illusory object as *anirvacanīya*, is known as *anirvacanīya-khyāti*.
3. **Anyathākhyāti** ('misapprehension'): This theory also called 'viparītakhyāti,' is put forward by the Nyāya school, the school of Indian logic. Nacre is apprehended as *anyathā*, as something else. This misapprehension is caused by defective eyesight or insufficient light. The reflection of the nacre in moonlight due to its similarity to silver, brings on the memories of silver perceived earlier. The silver of memory, of a past experience, is superimposed on the nacre, or the present experience. Though both objects are real, the mistake consists in superimposing one upon the other, forgetting the time and place factors.
4. **Asat-khyāti** ('apprehension of the non-existent'): The nihilistic school of Buddhism, called the Mādhyamika school, propounds the theory that nothing really exists. In illusory perception, an *asat* or a non-existent like silver is apprehended as existent. Hence the name 'asat-khyāti', apprehending what does not really exist. Really speaking, even the nacre is unreal or non-existent. Hence both—the object of illusion and its substratum—are non-existent!
5. **Ātma-khyāti** ('apprehension of the subjective cognition'): As against the nihilism of the Mādhyamika school, subjective idealism of the Yogācāra school of Buddhism affirms the existence of internal ideas but denies external objects. Externalization of the internal cognitions is the real mistake in all perceptions whether 'normal' or 'illusory'. The silver as well as nacre is an internal idea only. This theory of illusion is known as *ātma-khyāti*.
6. **Sadasat-khyāti** ('apprehension of the real-unreal'): This theory is propounded by the Sāṅkhya school of Kapila. In the illusory perception 'This is silver', the cognition of 'this' is real since the object nacre is present to the organ of vision. But, the cognition of 'silver' is unreal since it is not present to the organ of vision. Hence it is a case of apprehending the *sad-asat*, or real-unreal.
7. **Sat-khyāti** ('apprehension of the real'): What is perceived as real, must have its basis in a real object. If silver is perceived in the nacre, it must be present there, however small may be the quantity. This is possible since the fundamental components of both nacre and silver (viz., the five elements of earth, water and so on) are the same. The perception is false only in the sense that the silver does not serve any practical purpose. This is the view of the Viśiṣṭādvaita school

of Vedānta propagated by Rāmānuja, called sat- kyāti.

## **Dvaita**

**Dvaita**, (Sanskrit: “Dualism”) an important school in Vedanta, one of the six philosophical systems (darshans) of Indian philosophy. Its founder was Madhva, also called Anandatirtha (c. 1199–1278), who came from the area of modern Karnataka state, where he still has many followers. Already during his lifetime, Madhva was regarded by his followers as an incarnation of the wind god Vayu, who was sent to earth by the god Vishnu to save the good, after the powers of evil had sent the philosopher Shankara, an important proponent of the Advaita (“Nondualist”) school, whose teaching of monism ran counter to Madhva’s.

In his expositions, Madhva shows the influence of the Nyaya philosophical school. He maintains that Vishnu is the supreme God, thus identifying the brahman, or absolute reality, of the Upanishads with a personal god, as Ramanuja (c. 1050– 1137) had done before him. There are in Madhva’s system three eternal, ontological orders: that of God, that of soul, and that of inanimate nature. The existence of God is demonstrable by logical proof, though only scripture teaches his nature. He is the epitome of all perfections and possesses a nonmaterial body, which consists of saccidananda (being, spirit, and bliss). God is the efficient cause of the universe, but Madhva denies that he is the material cause, for God cannot have created the world by splitting himself nor in any other way, since that militates against the doctrine that God is unalterable; in addition, it is blasphemous to accept that a perfect God changes himself into an imperfect world.

The individual souls are countless in number and are of atomic proportions. They are a “portion” of God and exist completely by the grace of God; in their actions they are totally subject to God. It is God too that allows the soul, to a limited extent, freedom of action in a way commensurate with one’s past acts (karma).

Ignorance, which for Madhva as for many other Indian philosophers means mistaken knowledge (ajnana), can be removed or corrected by means of devotion (bhakti), the deep mutual emotional attachment between a devotee and a personal god. Devotion can be attained in various ways: by solitary study of the scriptures, by performing one’s duty without self-interest, or by practical acts. That devotion is accompanied by an intuitive insight into God’s nature, or it may be a special kind of knowledge. Bhakti may itself become a goal; the devotee’s adoration of Vishnu is more important than the release (moksha) that ensues from it.

The present-day following of Dvaita has as its centre a monastery at Udipi, in Karnataka state, which was founded by Madhva himself and has continued under an uninterrupted series of abbots.

## **Rejection of nirguṇa brahmaṇ and māya, bheda and sāksi, bhakti Nirguṇa**

**Nirguṇa**, (Sanskrit: “distinctionless”), concept of primary importance in the orthodox Hindu philosophy of Vedānta, raising the question of whether the supreme being, Brahman, is to be characterized as without qualities (nirguṇa) or as possessing qualities (saguṇa).

The Advaita (Nondualist) school of Vedānta assumes on the basis of selected passages of the Upaniṣads that Brahman is beyond all polarity and therefore cannot be characterized in the normal terms of human discursive thought. This being the case, Brahman cannot possess qualities that distinguish it from all other magnitudes, as Brahman is not a magnitude but is all.

The fundamental text of this tenet is the Bṛhadāraṇyaka Upaniṣad definition of Brahman as neti-neti (“not this! not that!” 2.3.6). The scriptural texts that ascribe qualities to Brahman, leading to the conception of a qualified Brahman (saguṇa) are, according to the Advaita school, merely preparatory aids to meditations.

Others, notably the theistic schools of Vedānta (for example, Viśiṣṭādvaita), argue that God (Brahman) is possessed of all perfections and that the scriptural passages denying qualities deny only imperfect ones.

## **Maya**

**Maya**, (Sanskrit: “magic” or “illusion”) a fundamental concept in Hindu philosophy, notably in the Advaita (Nondualist) school of Vedānta. Maya originally denoted the magic power with which a god can make human beings believe in what turns out to be an illusion. By extension, it later came to mean the powerful force that creates the cosmic illusion that the phenomenal world is real.

For the Nondualists, maya is thus that cosmic force that presents the infinite Brahman (the supreme being) as the finite phenomenal world. Maya is reflected on the individual level by human ignorance (ajñāna) of the real nature of the self, which is mistaken for the empirical ego but which is in reality identical with brahman.

The Dvaita or “dualist” school of Hindu Vedānta philosophy originated in 13th-century South India with Sri Madhvācārya (Madhva). Madhva, who considered himself an avatara of the wind-god Vāyu, argued that a body of canonical texts called the “Vedānta” or “end of the Veda” taught the fundamental difference between the individual self or atman and the ultimate reality, brahman.

According to Madhva there are two orders of reality: 1. svatantra, independent reality, which consists of Brahman alone and 2. paratantra, dependent reality, which consists of jivas (souls) and jada (lifeless objects). Although dependent reality would not exist apart from brahman’s will, this very dependence creates a fundamental distinction between brahman and all else, implying a dualist view. By interpreting the Vedānta materials (especially the Upaniṣads, the Bhagavadgīta and the Brahmasūtras) along these lines, Madhva deliberately challenged the non-dualist reading in which the atman was identified with brahman. Madhva argued that the scriptures could not teach the identity of all beings because this would contradict ordinary perception, which tells us that we are different both from one another and from God. Madhva and his followers call their system tattvavada, “the realist viewpoint”.

### **1. Madhva and Sankara**

The main tenet of Madhva’s Dvaita Vedānta is that the Vedic tradition teaches a fundamental difference between the human soul or atman and the ultimate reality, brahman. This is markedly different from the earlier Advaita Vedānta, which Madhva often vociferously attacked. Sankara’s Advaita or “non-dualist” Vedānta (9th century) argued that the atman is completely identical with brahman. According to Sankara, the atman experiences a false sense of plurality and individuality when under the influence of the delusive power of maya.

While maya has the ambiguous ontological status of being neither real nor unreal, the only true reality is brahman. A soul becomes liberated from the cycle of rebirth (punar-janma) by realizing that its very experience of samsara is an illusion; its true identity is the singular objectless consciousness that constitutes pure being or brahman.

## 2. Madhva and Ramanuja

While Ramanuja's system of Visistadvaita Vedanta or "qualified non-dualism" modifies Sankara's position on the soul's identity with brahman, Madhva also rejected it. Ramanuja assumes a plurality of individual souls whose identity remains intact even after liberation but maintains that the souls share the essential nature of brahma. The souls are eternal particles issuing from brahman, who as their source retains its transcendence. Ramanuja maintains Visnu's distinct difference from the human soul and his supremacy as creator and redeemer. Ramanuja identifies brahman with Visnu, holding that brahman is saguna, i.e. possesses attributes, in contrast to Sankara's attributeless or "nirguna" brahman.

## 3. Dvaita Vedanta

Like Ramanuja, Madhva identifies brahman with Visnu. However, he argues that any system that allows for any identification of the atman with brahman undermines Visnu's supremacy, compromises His status, and strips devotional acts of their meaning. Madhva's insistence on the modal distinction between the atman and brahman, wherein the former is inalterably dependent upon—and therefore, fundamentally different from—the latter, insures Visnu-as-brahman's complete and utter transcendence of the human soul. For Madhva, this view alone makes devotion [bhakti] an essential component of religious belief and practice. Attaining Visnu's grace is the soul's only hope of achieving liberation [moksa] from the cycle of rebirth (samsara).

Like Ramanuja, Madhva opposes Sankara's conception of Brahman as nirguna or without qualities and as a pure self-consciousness. Madhva views Visnu as preeminent above all other deities on the basis of His unique characteristics. This emphasis on Visnu's particular collocation of attributes that renders Him distinct from all other gods, human souls, and the material world reveals another critical component of Madhva's philosophy which is his acceptance of an ontological plurality as a fundamental facet of being. Indeed, Madhva rejects the notion that brahman is the only truly existent entity (tattva) and he maintains that, even though living beings and inert matter are dependent upon Brahman, such dependence differentiates them from Him and makes them discrete entities (tattvas). Thus, reality in Madhva's system consists of three basic elements: God, the souls (jivasi), and insentient matter (jada).

Madhva's pluralistic ontology is founded on his realist epistemology, which in turn affects his Vedic hermeneutics. He argues that God and the human soul are separate because our daily experience of separateness from God and of plurality in general is presented to us as an undeniable fact, fundamental to our knowledge of all things. Madhva's emphasis on the validity of experience as a means of knowledge is intended to refute the nondualist position that the differences we experience in daily life are ultimately a shared illusion with the ambiguous ontological status of being neither real nor unreal. In Madhva's view, Advaita's denial of the innate validity of knowledge acquired through sense perception completely undermines our ability to know anything since we must always question the content of our knowledge. This questioning would encompass our knowledge of the sacred canon, which is accessible to us only through our ability to perceive it and to draw inferences from it. Madhva argues that perception and inference must be innately valid and the reality they present us with must be actually and ultimately real since such a position is the only one that allows us to know the content of the Vedas. The Vedas alone are responsible for teaching us about the nature of the self and brahman.

This aspect of Madhva's realist epistemology is important not only because it bolsters Madhva's

claim that the atman and brahman are permanently distinct as revealed to us by experience, but because it means that the sacred texts must be read in consonance with the data we receive from our everyday experience, even though the Vedas present us with knowledge of a supra-sensible realm. Madhva argues that the Vedas cannot teach non-difference between the atman and brahman or a lack of true plurality since this would directly contradict our experience. In Madhva's view the sacred texts teach pancabheda, the five-fold difference between 1. Visnu and jivas 2. Visnu and jada 3. jiva and jada 4. one jiva and another and 5. one form of jada and another.

Madhva's belief in the innate difference of one soul from another led to some interesting doctrines in his system. He believed in a hierarchy of jivas, based upon their innate configurations of virtues (gunas) and faults (dosas). For example, Visnu is supreme because He possesses all qualities in their most fulfilled and perfect form. Furthermore, because Madhva believed that souls possess innate characteristics and capacities, he also maintained that they were predestined to achieve certain ends. This perspective put Madhva at odds with traditional Hindu views of the karma theory wherein differences in social and religious status are explained via past moral or immoral acts. For Madhva, each individual being possesses an innate moral propensity and karma is merely the mechanism by which a given soul is propelled towards his or her destiny.

#### **4. Canonical Sources**

Madhva's attempts to locate his controversial views in the canonical Vedanta texts often proved difficult. He is perhaps most famous for his idiosyncratic rendering of the Chandogya Upanisad's statement *tat tvam asi* or "you (the atman) are that (brahman)." By carrying over the 'a' from the preceding word, Madhva rendered the phrase *atat tvam asi* or "you are not that." Some scholars have speculated on "foreign," particularly Christian, influences on Madhva's thought but current scholarly consensus maintains that political and social changes in Madhva's region prompted a new approach to old religious convictions.

Madhva's Dvaita Vedanta is recognized as one of the three major schools of Vedanta (besides Sankara's Advaita and Ramanuja's Visistadvaita Vedanta). It has been further developed by such major figures as Jayatirtha (1356-1388) and Vyasaraya (1478-1589) and is kept alive by a still flourishing community [Madhvasampradaya] in India with its main center at Udipi (Karnataka).

### **Bhedabheda**

**Bhedabheda**, Sanskrit **Bhedābheda** ("Identity and Difference"), an important branch of Vedanta, a system of Indian philosophy. Its principal author was Bhaskara, probably a younger contemporary of the great 8th-century-CE thinker Shankara of the Advaita (nondualist) school. The mainstay of Bhaskara's philosophy was the conviction that acts and knowledge are not mutually exclusive but, rather, mutually reinforcing. In contrast, Shankara held that ultimately only total resignation and withdrawal from acts are necessary to attain release (moksha) from rebirth (samsara). Against that view, Bhaskara upheld the doctrine of the "cumulative effect of acts and knowledge" (jnana-karma-samuccaya) and declared that a person should withdraw only after an active life in which he fulfilled his obligations. On the important issue of the relationship between brahman (the Absolute) and the world, Bhaskara taught that the two are identical; if, he said, brahman is the substantial cause of the world, then the world itself is real. Difference occurs when certain limiting conditions (upadhis) are imposed on brahman.

### **Sākṣī**

In Hindu philosophy, **Sakshi**, also **Sākṣī** or **Shakshi**, "witness," refers to the 'Pure Awareness' that

witnesses the world but does not get affected or involved. Sakshi is beyond time, space and the triad of experiencer, experiencing and experienced; sakshi witnesses all thoughts, words and deeds without interfering with them or being affected by them, other than sakshi there is nothing else in the entire universe.

Sākṣī means 'observer', 'eyewitness' or the 'Supreme Being', is the Atman, the unchangeable eternal Reality, Pure Consciousness and knowledge. It is the timeless Being which witnesses all this ceaseless flow and change in the world of thought and things, the 'Witness' or the higher 'Ego', the faculty which perceives the individual personality.

It lends its shine (Chitchhaya) to the "ego" part of the subtle body, which consists of the everchanging Mind, the decision making Intellect, the Memory & the Illusory Ego. Mind (manas), Ego (ahankara) and Sakshi, all perform different functions but that difference of functions does not mean difference in nature or essence.

## **Bhakti**

**Bhakti**, (Sanskrit: "devotion") in Hinduism, a movement emphasizing the mutual intense emotional attachment and love of a devotee toward a personal god and of the god for the devotee. According to the Bhagavadgita, a Hindu religious text, the path of bhakti, or bhakti-marga, is superior to the two other religious approaches, the path of knowledge (jnana) and the path of ritual and good works (karma).

Bhakti arose in South India in the 7th to 10th centuries in poems that the Alvars and the Nayanars composed in Tamil to the gods Vishnu and Shiva, respectively. Drawing on earlier Tamil secular traditions of erotic poetry as well as royal traditions, bhakti poets applied to the god what would usually be said of an absent lover or of a king. Bhakti soon spread to North India, appearing most notably in the 10th-century Sanskrit text the Bhagavata-purana. Muslim ideas of surrender to God may have influenced Hindu ideas of bhakti from the start, and later poet-saints such as Kabir (1440–1518) introduced Sufi (mystical) elements from Islam.

Each of the major divinities of Hinduism—Vishnu, Shiva, and the various forms of the Goddess—have distinct devotional traditions. Vishnu-bhakti is based on Vishnu's avatars (incarnations), particularly Krishna and Rama. Devotion to Shiva is associated with his frequent manifestations on earth—in which he can appear as anyone, even a tribal hunter, a Dalit (formerly called an untouchable), or a Muslim. Devotion to the goddesses is more regional and local, expressed in temples and in festivals devoted to Durga, Kali, Shitala (goddess of smallpox), Lakshmi (goddess of good fortune), and many others.

Many, but not all, bhakti movements were open to people of both genders and all castes. Devotional practices included reciting the name of the god or goddess, singing hymns in praise of the deity, wearing or carrying identifying emblems, and undertaking pilgrimages to sacred places associated with the deity. Devotees also offered daily sacrifices—for some, animal sacrifices; for others, vegetarian sacrifices of fruit and flowers—in the home or temple. After the group ritual at the temple, the priest would distribute bits of the deity's leftover food (called prasada, the word for "grace"). Seeing—and being seen by—the god or goddess (darshan) was an essential part of the ritual.

During the medieval period (12th to mid-18th century), different local traditions explored the various possible relationships between the worshipper and the deity. In Bengal the love of God was

considered analogous to the sentiments involved in human relationships, such as those felt by a servant toward his master, a friend toward a friend, a parent toward a child, a child toward a parent, and a woman toward her beloved. In South India passionate, often erotic, poems to Shiva and Vishnu (particularly to Krishna) were composed in Tamil and other Dravidian languages, such as Kannada, Telugu, and Malayalam.

In the 16th century Tulsidas's Hindi retelling of the Rama legend in the Ramcharitmanas ("Sacred Lake of the Acts of Rama") focused on the sentiment of friendship and loyalty. Many of those poems continue to be recited and sung, often at all-night celebrations.

## **Dvaitadvaita**

Nimbarka lived shortly after Ramanuja. Nimbarka advocates the doctrine of dualistic monism (dvaitadvaitavada) He insists on difference as well as non-difference or identity (bheda-bheda) between Brahman and the individual souls and the world.

He advocates the relation of identity-in-difference between them. He, like Bhaskara, advocates the doctrine of transformation of Brahman into the world (brahmaparipamavada).

### **Brahman:**

Brahman is the greatest, Supreme Person (purusottama) possessed of infinite, inconceivable, natural essences, qualities, and powers. He is omniscient, omnipotent, and omnipresent.

He is possessed of infinite excellent qualities. He is free from all taint of imperfections. He is the creator, preserver, and destroyer of the world of conscious souls (cit) and unconscious matter (acit). He is absolutely free and independent controller of all finite agents, and dispenser of the fruits of their actions.

He has infinite knowledge, infinite bliss, and infinite will and power. He is infinite (bhuma). He is self-subsistent and absolute. He has transcendental bliss and immortality. He is imperishable (aksara). He is the ground of all effects in the past, the present, and the future. He is the support of the world. He is the cause of its stability and harmony. He is of the nature of eternal manifestation.

He is transcendent as well as immanent. He transcends the world. He is immanent in the world. He is knowable through the Vedas only. He is the final goal of human attainment. He is the supreme end of the individual souls. They share in the bliss of God. He is the inner controller (antaryamin) of the world and the souls. He is the knower and controller of all things and beings.

Brahman is the material cause and the efficient cause of the world. He transforms himself into the world by his own extraordinary power without any accessory conditions, even as milk is transformed into curd without any accessory conditions. God, who is omniscient and omnipotent, transforms himself into the world by his own power and will with his essential nature (svarupa) unmodified (avyakrta).

He is unmodified in his essential nature and modified in his inessential nature. It may be urged that if God be the material cause of the world, he, being devoid of parts, becomes entirely transformed into the world, and that if he partly transforms himself into the world, he ceases to be partless. But the Sruti says: "Brahman willed to become many; he created the world (sat) out of himself and yet remained transcendent (tyat), even as a spider spins out a web out of itself."

The omnipotent Supreme Lord can create the world out of himself, and yet remain transcendent. The inconceivable creative power in God is the cause of the world. It is real. It is the will of God. It is not indefinable Maya of Samkara, which is neither real nor unreal. The world which is the transformation of Brahman is real. It is not a false appearance as Samkara holds.

Effect is non-different from cause. It is not absolutely different from cause. When cause is perceived, effect is perceived. Effect is a transformation of cause. Hence, effect is non-different from cause. The effect that happens subsequently, pre-exists in the cause. If the effect were non-existent in the cause, then sprouts of barley would be produced from fire. The effect is the unfoldment of the cause, even as an unrolled cloth is the unfoldment of a folded cloth.

Vital airs are inhaled and exhaled. So the effect is implicit in the cause, and becomes explicit when it assumes the form of the effect. The world pre-exists in Brahman in an implicit condition, and becomes explicit after creation. Cause and effect are partly different and partly non-different from the world. Brahman is transformed into the world, which is non-different from him. Brahman is the inner controller of the world.

So there is no absolute identity between them. Brahman is both different and non-different from the world of unconscious matter and conscious souls, even as the sea is different and non-different from its waves, and the sun is different and non-different from its rays.

The world including formed and unformed existence, material things and spiritual beings, exists in its cause, Brahman, is the relation of identity-in-different. God is related to the world as a snake is related to its coiled form. God remains unmodified in his essential nature, and only undergoes modification through his conscious energy (cit-sakti) and unconscious energy (acit-sakti).

This doctrine resembles Vallabha's doctrine of immutable transformation (avikrtaparinama). God transcends his three natures as the world, souls, and even as God. In his pure and transcendent nature he is absolutely unaffected by changes and mutations of the world of phenomena. As noumenon he is immutable; as phenomenon he undergoes mutations. In his esoteric and essential nature he is immutable; in his exoteric and phenomenal nature he is mutable.

### **The Jiva:**

The individual soul (jiva) is not born. It is eternal. Its birth and death are due to its connection with and separation from its body. It is the knower or ego which possesses the essential quality of knowledge.

The relation of the soul to knowledge is that of the qualified (dharmin) to its quality (dharma). There is identity-in-difference between them. The soul and knowledge, though non-distinct from each other, are related to each other as substance and attribute. The soul is an enjoyer.

It feels pleasure and pain, which are the fruitions of merits and demerits. It is an active agent. It has the power of doing right and wrong actions. Its activity is controlled by God. It strives to share in the infinite bliss of God. It is atomic.

But it can experience pleasure and pain through its entire body. Its seat is in the heart. It has experience through its whole body, even as the light of a lamp illumines the whole room. It is a part of Brahman. It is both different and non-different from him.

There is great difference between a soul and Brahman. The soul is subject to joys and sorrows (bhoktr). It experiences the fruits of its actions. But Brahman does not experience fruits of actions (abhokt). Brahman is the worshipped while the soul is the worshipper.

Brahman is known by the soul which is the knower. The soul strives to receive the infinite bliss of God who is the giver of bliss. Brahman is the inner controller of the soul which is controlled by him. So Brahman and the soul are different from each other. But they are not absolutely different from each other. The soul is a part of Brahman. It is identical with him in-essence. Its natural knowledge and bliss are covered by nescience (avidya) which is removed by the grace of God.

The liberated soul acquires absolute equality with God, being purged of merits and demerits and becoming immaculate, But it does not lose its integrity in him.

Brahman is not defiled by the limitations and imperfections of the souls, though he regulates their different states, waking, dream, sleep, and intuitive state. Their natural will-power is eclipsed by the superior will of God who guides them in all matters according to their past deeds.

Their bondage and release are due to the will of God. He is absolutely pure in spite of his connection with their impurities. He is the inner controller of all; yet he does not undergo any limitation. Though he is omnipresent, he does not suffer from the limitations of the souls. Even as light reveals objects covered by darkness, so God reveals everything, but is not affected by it. He abides in the souls, but is not affected by their changes.

He is not infected with their impurities. Brahman is both different from and identical with souls, even as the sun is both different from and identical with its rays for the sun and its rays are both light.

### **Nimbarka and Bhaskara:**

Nimbarka, like Bhaskara, believes in the transformation of Brahman into the world (brahmaparinama). He recognizes, like him, the relation of identity-in-difference (bhedabheda) between Brahman and the individual souls.

But Bhaskara emphasizes identity between them, their difference being due to limiting conditions (upadhi). Nimbarka stresses both identity and difference between them. His doctrine is dualistic non-dualism (dvaitadvaitavada) which stresses identity-in-difference (bhedabheda) between God and the soul and the world.

Nimbarka condemns both monistic absolutism and dualism, and reconciles the identity texts with the difference texts in his doctrine of dualistic monism. The world and the souls are different from Brahman because they have real and distinct existence dependent upon him. They are non-different from Brahman because they cannot exist apart from him.

'Tat tvam asi', or 'That thou art' means that individual soul (tvam) is both different and non-different from Brahman (tat). There is non-difference or identity between them in their essential nature. There is difference between them because they are related to each other as part and whole, the controlled and the controller, and the worshipper and the worshipped.

### **Nimbarka and Ramanuja:**

Ramanuja recognizes internal difference (svagatabheda) within Brahman. He regards Brahman as the qualified (visejya) substance whose attributes (visejapa) or modes (prakara) are the unconscious world of matter (acit) and conscious souls (cit). Matter and soul are adjectives of the divine substance.

They co-inhere in Brahman. Their co-inherence in Brahman shows their substantial identity. They constitute the body of Brahman who is the soul. They are inseparably related to each other like body and soul. There is inseparable relation (aprthaksiddhi) between them.

Ramanuja stresses identity or unity more than difference. But Nimbarka emphasizes identity as well as difference. The world is the transformation of the conscious energies (cit-sakti) and the unconscious energies (acit-sakti) of Brahman.

The individual souls are parts of Brahman. The world and souls are real and substantial; they are not mere adjectives of Brahman. He is immanent in them as their inner controller. But he transcends them, and is not affected by their changes and mutations. He is immutable in his essential nature.

## **DvaitAdvaita**

Achaarya Nimbarka (14th century CE?) is said to be the founder of this school of Vedanta which presents another variation of the bhedaabheda. Nimbarka was a Brahmin from Andhra and his school is identified as the Sanakasampradhaya of Vaishnavism. The works attributed to him are Vedantapaarjatasaurabha - a short commentary on the Brahma Sutras, Dashashloki, Shri Krishna Stavaraaja and Madhvamukavardhana.

Shrinivasa comments on Nimbarka's bhashyam in his Vedantakaustubha, on which Keshava Kashmiri has written his Kaustubhaprabhaa. Purushottama has written commentaries on Dashashloki and Stavaraaja called Vedaantaratanmanjushaa and Shrutyantasuradruma respectively. Maadhava Mukunda's Para-paksha-giri-vajra engages in polemics against Advaita.

## **IDENTITY AND DIFFERENCE**

Nimbarka revives the bhedaabheda of earlier Vedantins like Ashmarathya, Bhartrprapancha, Bhaskara and Yadhava Prakasha. He is also heavily indebted to Ramanuja from whom he seems to have borrowed wholesale, making significant enhancements and modifications here and there.

Nimbarka rejects Ramanuja's conception of souls and matter as qualities of God. The function of quality is either to differentiate a thing from other things or to make the object better known. Matter and souls as the qualities of God serve no such purpose. As there's nothing other than God what can they distinguish him from? Nor can they throw light on his true nature as they do not form his essence. Nimbarka also disputes Ramanuja's view that matter and souls constitute the body of God. It is wrong to distinguish between the body and soul of God. If so, then God being the soul would experience all the miseries and imperfections of the body. One part of God cannot present eternity and perfection, while the other part presents transience and imperfection.

Matter and souls are therefore not the body of God, but his powers. So the truth is not identity qualified by difference, but identity and difference. Both identity and difference are separately and equally real.

God, souls and matter are all real, but the last two are absolutely dependent on God. The relation between God and universe is one of identity and difference. The universe cannot be absolutely

identical with God, for then God himself will be bound and experience all the imperfections and miseries of samsaara. The universe cannot be absolutely different from God either - for then it would constitute a limit to God and he could not be its all pervading inner ruler and controller. Matter and souls do not have an independent existence of God and hence are not different from him. But since there are dependent and limited, they are different from God who is independent and unlimited. Even as the rays of the Sun and the Sun are both distinct and non-distinct, so is the relationship between the soul and God. In "tat tvam asi", 'tat' refers to the all pervading Brahman, 'tvam' refers to the dependant soul and 'asi' refers to the relation of differencecum non-difference between them.

## **GOD, MATTER AND SOULS**

Krishna is the highest Brahman who by his very nature is free from all defects and is filled with all perfections. He manifests himself in the four Vyuhas and in incarnations. He is the ruler of the universe and Radha is his consort. Souls and matter are his powers. He is the material as well as the efficient cause of the universe. He is the efficient cause because as the Lord of karma and the inner ruler of souls, he brings about creation in order to enable the souls reap the fruits of their karma. He is the material cause because creation means the manifestation of his powers of chit and achit. Creation is a real transformation (parinaama) of his powers.

Souls are essentially of the nature of knowledge (jnanasvarupa) and also form the substratum of knowledge. Quite like the Sun which is of the nature of light as well as substratum of light which is its attribute, the relation between soul and knowledge is like the one between the qualified and qualification - identity as well as difference. The soul which is atomic in size is the real knower, agent and enjoyer. It is dependent on God who pervades, supports and controls it from within. Though the soul is eternal, still it suffers the misery of samsara due to its embodiment which itself is due to karma and avidhya. Bhakti to God results in knowledge which brings about liberation.

### **The Inanimate is of three kinds :**

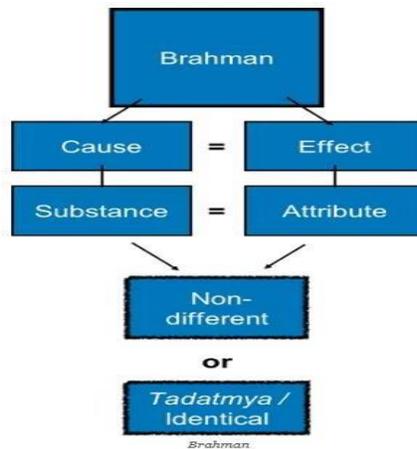

1. Apraakrta is the super matter out of which the divine body is made.
2. Praakrta which is derived from prakriti with its three gunas - sattva, rajas and tamas and
3. Kaala or time.

## **Shuddadvaita**

**Shuddadvaita** (Sanskrit: śuddhādvaita "pure non-dualism") is the "purely non-dual" philosophy propounded by Vallabhacharya (1479-1531 CE), the founding philosopher and guru of the Vallabha sampradāya ("tradition of Vallabha") or Puṣṭimārga ("The path of grace"), a Hindu Vaishnava tradition focused on the worship of Krishna. Vallabhacharya's pure form (nondualist) philosophy is different from Advaita. The Shrinathji temple at Nathdwara, and compositions of eight poets (aṣṭachap), including Sur, are central to the worship by the followers of the sect.

## The Concept of Avikṛta-Parinamavāda

- According to Vallabha, the universe is not a vivarta (or an appearance). The theory of universe being a vivarta is accepted by Sankara's Advaita Vedānta philosophy.
- Vallabha says, universe is a real manifestation and not an unreal manifestation of Brahman.
- At the same time, it is also not a Parinama. (The concept of Parinama-vāda is accepted by Nimbarka, Ramanuja, etc.)
- Vallabha says, it is not a parinama because the manifestation of universe does not bring out any change or transformation in Brahman.
- Therefore, the universe is a natural emanation from Brahman which does not cause any notion of change in him.
- This concept is called, Avikṛta-Parinamavāda.
- According to Vallabha, the cause and effect, the substance and its attributes are identical in nature. This relation is called the relation of Identity or *tadatmya*.
- Brahman is both the material cause or the inherent cause and the efficient cause.
- Hence, Brahman manifests himself as the universe without undergoing any change.

**Pariṇāmavāda** literally means 'the theory of change of state'.

### **Pariṇāmavāda as per Brahmasutras**

According to the Brahmasutras, this world has its origin in Brahman. It is sustained by It and is dissolved back into It. Evolution of this world from Brahman is explained by the different schools of Vedānta in different ways.

### **Pariṇāmavāda as per Advaita Vedānta**

Advaita Vedānta of Saṅkara considers this world as a 'vivarta,' a mere appearance, Viśiṣṭādvaita

Vedānta of Rāmānuja accepts 'pariṇaria' or change for Brahman. This change may be a change of form like that of clay being shaped into a pot or of state, like milk becoming curds. Rāmānuja accepts the latter and hence his view is known as 'pariṇāmavāda,' or 'Brahmapariṇāmavāda'.

## Vedanta

Vedanta in a literal sense is "End of the Vedas" which basically refers to the appendix to the Vedic hymns and in a deeper sense, mastering the end goal or purpose of the Vedas. While it was used to refer to Upanishads in the early period, later on during the medieval period, it came to mean the interpretation of the Upanishads. While there are many schools of the Vedanta, all of them seek to answer the basic question, the relation between the Atman (Inner Self or Soul) and Brahman and that between Brahman and the World. It is the various answers to these questions that have come to form some of the more well known schools.

These schools have certain basic concepts

- Brahman is the supreme cause of the entire universe and is eternal and all encompassing.
- All actions are subordinate to knowledge and devotion.
- Bondage is subject to Samsara, the eternal cycle of death and rebirth.
- And deliverance from the cycle of Samsara is true liberation.

Now going by the classification we have the following schools

**Advaita-** This is the oldest school of Vedanta, and it states that Brahman is the only reality and the world is illusory (Maya). Ignorance of the reality is what causes suffering, and liberation can be obtained only by true knowledge of Brahman. It states that both the individual self (Atman) and Brahman are the same, and knowing this difference causes liberation

**Dvaita-** This was propounded by Madhvacharya and is also called as Tatvavada-the Philosophy of Reality. It considers Brahman and Atman as two different entities, and Bhakti as the route to eternal salvation.

**Bhedabheda-** As the name suggests it looks at the concept of difference (Bheda) and non-difference (Abheda). This school states that the jivatma (individual self) is both different as well as similar to the ultimate reality Brahman. In a way this combines both the teachings of Dvaita (which states Individual Self and Brahman are different) and Advaita (which states that both Individual self and Brahman are one and the same). This school was particularly popular during the medieval era, with thinkers like Ramanuja (who pioneered Vishishtadvaita), Nimbarka (founded Dvaitadvaita), Vallabha (Shuddadvaita) and Chaitanya Mahaprabhu (founder of Gaudiya Vaishnavism).

**Vishishtadvaita-** Literally meaning the Unique Advaita, this was pioneered by Ramanuja during the 11th century. While it accepts Brahman as the unified whole, it states he is characterized by multiple forms. In a sense it believes that all diversity is subsumed to a unified whole. Its philosophy is summed up as Aśeṣa Chit-Achit Prakāram Brahmaikameva Tatvam meaning Brahman as qualified by sentient modes (the ability to feel and sense) and insentient modes (inability to feel or sense) is the only reality.

**Dvaitadvaita-** Propounded by Nimbarka, it states that the Brahman is the highest reality, the controller of all. And is also the cause of creation of the Universe. The Chit or Jiva, the individual soul is which possesses both the knowledge and is knowledge itself. In a way similar to the sun which is both light

as well as the source from which all light comes. Achit or Jagat is basically of 3 sorts- Prakrta (derived from basic matter), Apkarta is that which is non Prakrta and Kala. It states that Brahman or Isvara, is the highest reality and both Chit, Achit are dependent on him.

**Shuddadavaita-** Pure non dualistic form of philosophy, propounded by Vallabhacharya. As per this, both God and the individual self are the same, and not different. However it differs from Shankara's Advaita, in that considers the individual self as part of God who is the whole. It also states Maya is not unreal, unlike Advaita, but a manifestation of God's power.

**Achintya Bheda Abheda-** This was enunciated by Chaitanya Mahaprabhu, the founder of the Gaudinya Vaishnavism. It combines both the views points of the Advaita and Dvaita schools. It states that while the individual self is linked with Brahman, yet it is not the same as him. It states that the individual self is only a part of the Supreme Lord. In a sense it breaks away from the rather rigid definitions of Dvaita and Advaita.

# MCQs

1. The systems which accept the authority of Vedas are called
  - a. Orthodox
  - b. Heterodox
  - c. Theistic
  - d. Atheistic
2. Which among the following is a Heterodox System
  - a. Purvamimamsa
  - b. Nyaya
  - c. Charvaka
  - d. Yoga
3. Which among the following is a Heterodox System
  - a. Advaita Vedanta
  - b. Buddhism
  - c. Nyaya
  - d. Yoga
4. Which among the following is a Heterodox System
  - a. Yoga
  - b. Charvaka
  - c. Nyaya
  - d. Advaita Vedanta
5. Which among the following is an Orthodox System
  - a. Jainism
  - b. Nyaya
  - c. Buddhism
  - d. Charvaka
6. Which among the following is an Orthodox System
  - a. Advaita Vedanta
  - b. Buddhism
  - c. Jainism
  - d. Charvaka

7. Which among the following is a Orthodox System
- Jainism
  - Buddhism
  - Charvaka
  - Yoga
8. Which among the following is a Orthodox System
- Charvaka
  - Jainism
  - Vaiseshika
  - Buddhism
9. Which among the following is a Orthodox System
- Samkhya
  - Charvaka
  - Buddhism
  - Jainism
10. Which among the following is a Orthodox System
- Charvaka
  - Purvamimamsa
  - Buddhism
  - Jainism
11. 'SarvaDarsanaSamgraha' is written by
- Jaimini
  - Madhavacharya
  - Vatsyayanad.
  - Kanada
12. Charvaka Philosophy is
- Materialistic
  - Spiritualistic
  - Both
  - None
13. Charvaka believes----- as the only reality
- Self
  - God
  - Brahman
  - Matter
14. Which among the following is not accepted by Charvaka
- Earth

- b. Air
- c. Water
- d. Ether

15. The only pramana accepted by Charvaka is

- a. Perception
- b. Inference
- c. Comparison
- d. Verbal testimony

16. Which among the following is not come under purushartha

- a. Artha
- b. Kama
- c. Karma
- d. Moksha

17. Which among the following is a material goal in the social life of man

- a. Dharmab
- b. Karma
- c. Moksha
- d. Kama

18. Which among the following is a material goal in the social life of man

- a. Moksha
- b. Artha
- c. Satchitananda
- d. Dharma

19. Which among the following is a spiritual goal in the social life of man

- a. Artha
- b. Kama
- c. Moksha
- d. None of the above

20. Which among the following is a spiritual goal in the social life of man

- a. Kama
- b. Dharma
- c. Artha
- d. Karma

21. Which system of Indian Philosophy is considered as Indian Hedonism

- a. Nyaya
- b. Yoga
- c. Advaita Vedanta

d. Charvaka

22. According to Charvaka , the Ultimate goal in the life of man is

- a. Self-Realization
- b. Pleasure
- c. Dharma
- d. Moksha

23. 'Eat, Drink and be Merry' is the Slogan of

- a. Dvaita
- b. PurvaMimamsa
- c. Charvaka
- d. VisishtAdvaita

24. The founder of Buddhism is

- a. Kanada
- b. Vatsyayana
- c. Buddha
- d. Jaimini

25. Buddha's 'four noble truths' is known as

- a. Mahavrata
- b. Anuvrata
- c. Dukha Saha
- d. Arya Satya

26. According to Buddha the cause of suffering is

- a. Wisdom
- b. Ignorance
- c. Pleasure
- d. Courage

27. Which among the following is not come under 'Four Noble Truths' of Buddha

- a. SarvamDukha
- b. Dukha Karana
- c. DukhamSaha
- d. DukhaNirodha

28. According to Buddha, 'Dukha' leads man towards

- a. Moksha
- b. Pain & Rebirth
- c. Enjoyment
- d. Success

29. Buddha's theory of causation is known as

- a. Arambha vada
- b. PratityaSamutpada
- c. .Parinamavada
- d. Brahma parinamavada

30. Links in 'Bhava Chakra ' is called

- a. Nidhana
- b. Nirvana
- c. Skanda
- d. Kshanika

31. How many Nidhanas are there in 'Bhava Chakra according to Budha

- a. 10
- b. 15
- c. 13
- d. 12

32. Which among the following is nota Nidhana

- a. Vijnana
- b. Vedana
- c. Samjna
- d. Samskara

33. According to Buddha, Cessationfrom sufferings is

- a. Vedana
- b. Nirvana
- c. Jathi
- d. Upadana

34. Buddha illustrated 'Impermanency of the World andmomentary existence of objects'through his theory of

- a. Anatmavada
- b. Syadvada
- c. Anekandavada
- d. Kshanikavada

35. Path of Liberation according toBuddha is called

- a. Nishkama Karma
- b. Yoga
- c. Ashanga marga
- d. Saptabhanginaya

36. Which among the following is notcome under Ashtanga marga

- a. Right faith
- b. Right devotion

- c. Right thought
- d. Right concentration

37. 'Ashtanga marga' is also known as

- a. Madhamika marga
- b. Ashtanga Yoga
- c. Both
- d. None

38. Kshanikavada is put forwarded by

- a. Kanada
- b. Buddha
- c. Rishabha deva
- d. Jaimini

39. No- Soul theory is also known as

- a. Anatmavada
- b. Atmavada
- c. Syadvada
- d. Anekandavada

40. Which one of the following is nota skanda

- a. Vijnana
- b. Vedana.
- c. Upadana
- d. Samskara

41. Cluster of five factors whichconstitute Soul is called

- a. Nidhana
- b. Nirvana
- c. Upadana
- d. Skanda

42. The Scripture of Buddhism iscalled

- a. Skanda
- b. Triratna
- c. Tripitika
- d. Nidhana

43. Which one among the following isnot a scripture of Buddhism

- a. Vinaya pitika
- b. Buddha pitika
- c. Abhidamapitika
- d. Sutta pitika

44. Which one among the following is a sect of Buddhism
- Mahayana
  - Swethambhara
  - Digambhara
  - Avadhuta
45. The meaning of the term 'Hinayana' is
- Great vessel
  - Little vessel
  - Proximate vessel
  - Remote vessel
46. Poems written by Buddhist nuns are called
- Theragadha
  - Therigadha
  - Mahagadhad
  - Swarnagadha
47. In the 'Causal Wheel' Vedana arises out of
- Sparsa
  - Trishna
  - Upadana
  - Bhava
48. In the 'Causal Wheel' Trishna arises from
- Sparsa
  - Vedana
  - Upadana
  - Bhava
49. In the 'Causal Wheel' 'Samskara' arises from
- Sparsa
  - Vedana
  - Ajnana
  - Bhava
50. In the 'Causal Wheel', Consciousness arises from
- Sparsa
  - Vedana
  - Upadana
  - Samskara
51. In the 'Causal Wheel' Name and form arise from
- Ignorance
  - Desire

- c. Consciousness
- d. Sensation

52. In the 'Causal Wheel' 'Upadana' arises from

- a. Sparsa
- b. Vedana
- c. Ajnana
- d. Trishna

53. In the 'Causal Wheel' 'Bhava' arises from

- a. Upadana
- b. Vedana
- c. Ajnana
- d. Trishna

54. In the 'Causal Wheel' 'Jathi' arises from

- a. Upadana
- b. Vedana
- c. Ajnana
- d. Bhava

55. In Bhava Chakra, each Nidhana is

- a. Independent in origination
- b. Dependent in origination
- c. Both
- d. None

56. In the 'Causal Wheel' 'Old age and death' arises from

- a. Ignorance
- b. Desire
- c. Consciousness
- d. Birth & rebirth

57. Buddha's 'Eight Fold Path' is also known as

- a. Ashtanga marga
- b. Ashtanga Yoga
- c. Syadvada
- d. Nidhan

58. According to Buddha, Soul constitute a cluster of

- a. 10 factors
- b. 8 factors
- c. 5 factors
- d. 2 factors

59. Which one of the following is nota skanda

- a. Rupa
- b. Samjna
- c. Jathi
- d. Samskara

60. The founder of Jainism is

- a. Rishabha Deva
- b. Buddha
- c. Jaimini
- d. Vardhamana Mahaveera

61. The famous prophet who had propagated Jaina Philosophy is

- a. Rishabha Deva
- b. Buddha
- c. Jaimini
- d. Vardhamana Mahaveera

62. The word 'Jaina' came from the word

- a. Jiva
- b. Ajiva
- c. Jina
- d. Jathi

63. According to Jainism 'Jiva' is

- a. Matter
- b. Soul
- c. God
- d. None of the above

64. 'Jiva', in its purest form is called

- a. Jivanmukta
- b. Mukta
- c. Baddha
- d. Bandha

65. The Bounded Soul according to Jainism is called

- a. Mukta
- b. Bandha
- c. Baddha
- d. None of these

66. How many types of Ajivas are there according to Jaina Philosophy

- a. 3
- b. 5

- c. 7
- d. 9

67. Which among the following is not Ajiva

- a. Pudgala
- b. Dharma
- c. Karma
- d. Kala

68. Which among the following is Ajiva

- a. Pudgala
- b. Karma
- c. Abhava
- d. Samavaya

69. The substance which can undergo integration and disintegration is called

- a. Dharma
- b. Pudgala
- c. Adharma
- d. Kala

70. According to Jainism, Matter is made up of

- a. Light
- b. soul
- c. atom
- d. gas

71. The minutest particle of matter which can not be further divided is called

- a. Atom
- b. Soul
- c. Mind
- d. Space

72. Which among the following is not a feature of Time according to Jainism

- a. Eternal
- b. Infinite
- c. Immaterial
- d. Perceptible

73. The filled space according to Jainism is called

- a. Past
- b. Lokaakasa/Alokaakasa
- c. Present
- d. Future

74. The Empty space according to Jainism is called

- a. Lokaakasa
- b. Alokaakasa
- c. Present
- d. Future

75. In which space growing objects are present according to Jainism

- a. Lokaakasa
- b. Alokaakasa
- c. Both
- d. None of these

76. In which space movement of objects is not possible according to Jainism

- a. Lokaakasa
- b. Alokaakasa
- c. Both
- d. None of these

77. The principle of motion according to Jainism is

- a. Pudgala
- b. Kala
- c. Dharma
- d. Adharma

78. The principle of rest according to Jainism is

- a. Pudgala
- b. Kala
- c. Dharma
- d. Adharma

79. Jaina Philosophy is

- a. Realistic
- b. Idealistic
- c. Both
- d. None

80. Jaina theory of Reality is called

- a. Syad vada
- b. Kshanikavada
- c. Anekandavada
- d. Anatmavada

81. Jaina theory of knowledge is called

- a. Syad vada
- b. Kshanikavada

- c. Anekandavada
- d. Anatmavada

82. The word 'Syad' means

- a. Many
- b. One
- c. Complex
- d. Probable

83. According to Jainism how many probable judgements which leads to relative knowledge is

- a. 5
- b. 7
- c. 9
- d. 11

84. Probable judgements which lead to relative knowledge according to Jainism is called

- a. Pratiyasamutpada
- b. Saptabhanginaya
- c. Ashtanga marga
- d. Madhyamika marga

85. Which among the following is not come under Saptabhanginaya

- a. Syad Asti
- b. Syad Nasti
- c. Syad Asteya
- d. Syad Avakthavyam

86. The concept of 'Triratna' is the contribution of

- a. Charvaka
- b. Jainism
- c. Buddhism
- d. Nyaya

87. Which among the following is not a sect of Jainism

- a. Svetambara
- b. Hinayana
- c. Mahayana
- d. Bodhisatva

88. Which among the following is a sect of Jainism

- a. Svetambara
- b. Digambara
- c. Both
- d. None

89. The liberated Soul according to Jaina Philosophy is called

- a. Sarvajna
- b. Sarvatman
- c. Sarvasaktan
- d. Sarvavyapi

90. Which among the following is not a quality of Mukta

- a. Infinite Power
- b. Infinite Bliss
- c. Infinite Life
- d. Infinite Knowledge

91. Which among the following is not a way towards salvation according to Jainism

- a. Samyak Jnana
- b. Samyak Buddhi
- c. Samyak Darsana
- d. Samyak Charitra

92. Which among the following is not come under 'Triratna

- a. Samyak Jnana
- b. Samyak Dhyana
- c. Samyak Darsana
- d. Samyak Charitra

93. Nyaya System is

- a. Orthodox
- b. Heterodox
- c. Both
- d. None

94. Vaisesika System is

- a. Orthodox
- b. Heterodox
- c. Both
- d. None

95. The Term 'Nyaya' means

- a. Nayam
- b. Number
- c. Argumentation
- d. Particularity

96. The Term 'Vaisesika' means

- a. Vishayam
- b. Number
- c. Argumentation
- d. Particularity

97. Which one among the following is called 'Indian Logic'

- a. Nyaya
- b. Vaisesika
- c. Sankhya
- d. Yoga

98. Who among the following is the founder of Nyaya System

- a. Pathanjali
- b. Jaimini
- c. Gautama
- d. Kanada

99. Who among the following is the founder of Vaisesika System

- a. Pathanjali
- b. Jaimini
- c. Gautama
- d. Kanada

100. Who is the author of 'NyayaSutra'

- a. Vatsyayana
- b. Prasasthpada
- c. Kapila
- d. Gautama

101. Who wrote 'Nyaya Bhashya'

- a. Vatsyayana
- b. Prasasthpada
- c. Kapila
- d. Gautama

102. Who among the following is the author of 'VaisesikaSutra'

- a. Kanada
- b. Jaimini
- c. Vijnana Bhikshu
- d. Kapila

103. Who wrote 'VaisesikaBhashya'

- a. Iswara Krishna
- b. Vatsyayana
- c. Prabhakara

d. Prasasthapada

104. Which among the following is not a characteristic feature of NyayaVaiseshikasyste

- a. Realistic
- b. Pluralistic
- c. Both
- d. Dualistic

105. Means of Valid Knowledge is

- a. Prama
- b. Pramatha
- c. Prameya
- d. Pramana

106. Which among the following Pramanas is not accepted by Nyaya

- a. Prathyaksha
- b. Arthapatti
- c. Anumana
- d. Upamana

107. Direct and immediate knowledge obtained through the contact between object and sense organs is

- a. Perception
- b. Inference
- c. Verbal testimony
- d. Comparison

108. The first stage of Perception is called

- a. NirvikalpakaPrathyaksha
- b. SavikalpakaPrathyaksha
- c. LaukikaPrathyaksha
- d. AlukikaPrathyaksha

109. The second stage of Perception is called

- a. NirvikalpakaPrathyaksha
- b. SavikalpakaPrathyaksha
- c. LaukikaPrathyaksha
- d. AlukikaPrathyaksha

110. Perception within the limits of sense organs is called

- a. NirvikalpakaPrathyaksha
- b. SavikalpakaPrathyaksha
- c. LaukikaPrathyaksha
- d. AlukikaPrathyaksha

111. Perception beyond the limits of sense organs is called

- a. Nirvikalpaka Prathyaksha
- b. Savikalpaka Prathyaksha
- c. Laukika Prathyaksha
- d. Alaukika Prathyaksha

112. Mediate and indirect knowledge obtained through previous perception is called

- a. Perception
- b. Inference
- c. Verbal testimony
- d. Comparison

113. Establishment of Universal relation between two inseparable objects is called

- a. Hetu
- b. Udaharana
- c. Vyapti
- d. Nigamana

114. The first step in the Nyaya Syllogism is called

- a. Hetu
- b. Vyapti
- c. Nigamana
- d. Pratijna

115. Which among the following is not a step in Nyaya Syllogism

- a. Pratinjna
- b. Udaharana
- c. Samanya
- d. Nigamana

116. How many steps are there in Nyaya Syllogism

- a. 3
- b. 5
- c. 7
- d. 8

117. Valid knowledge obtained through the utterances of a trustworthy person is called

- a. Prathyaksha
- b. Anumana
- c. Sabda
- d. Upamana

118. Which among the following is regarded as Sabdapramana by Nyaya

- a. Bhagavad Gita
- b. Veda
- c. Mahabharata
- d. Purana

119. Mediate and indirect knowledge derived from the similarity between two objects is

- a. Perception
- b. Inference
- c. Verbal testimony
- d. Comparison

120. According to Vaiseshika objects of valid knowledge is called

- a. Pramana
- b. Padartha
- c. Prameya
- d. Pramatha

121. How many categories are there according to Vaiseshika

- a. 4
- b. 6
- c. 7
- d. 8

122. Which one among the following is not a category of Vaiseshika's System

- a. Samanya
- b. Samavaya
- c. Vishesha
- d. Samhita

123. According to Vaiseshika, material cause of this Universe is

- a. Guna
- b. Dravya
- c. Karma
- d. Abhava

124. How many substances are there according to Vaiseshika

- a. 9
- b. 5
- c. 7
- d. 10

125. Which among the following is not a substance

- a. Time
- b. Space
- c. Dharma

d. Mind

126. Which among the following is atomic in structure

- a. Self
- b. Mind
- c. Karma
- d. Guna

127. Which one among the following is not atomic in nature

- a. Earth
- b. Air
- c. Water
- d. Ether

128. Which among the following is a spiritual substance

- a. Karma
- b. Samanya
- c. Self
- d. Samavaya

129. According to Vaisesika, the seat of knowledge is

- a. Mind
- b. body
- c. Action
- d. Self

130. According to Vaisesika, there are \_\_\_\_\_ qualities

- a. 50
- b. 25
- c. 24
- d. 23

131. How many types of actions are there according to Vaisesika

- a. 5
- b. 6
- c. 7
- d. 8

132. Which among the following is not a type of action according to Vaisesika

- a. Upward movement
- b. Expansion
- c. Locomotion
- d. Forward movement

133. The generic feature commonly present in all members of a class is called

- a. Samavaya
- b. Samanya
- c. Vishesha
- d. Upadhana

134. The unique feature present in each object of a particular class is called

- a. Samavaya
- b. Samanya
- c. Vishesha
- d. Upadhana

135. The intimate and eternal relation between two objects is called

- a. Samavaya
- b. Samanya
- c. Vishesha
- d. Upadhana

136. Non-existence of an object in a particular time and space is called

- a. Upamana
- b. Sparsa
- c. Abhava
- d. Dravya

137. Which one of the following is not an Abhava

- a. PragAbhava
- b. AnyonyaAbhava
- c. AnatmaAbhava
- d. AtyanthaAbhava

138. Non-existence of an object before its construction is called

- a. PragAbhava
- b. AnnyonnyaAbhava
- c. PratvamsaAbhava
- d. Antynthaabhava

139. Non-existence of an object after its destruction is called

- a. PragAbhava
- b. PratvamsaAbhava
- c. AnnyonnyaAbhava
- d. Antynthaabhava

140. Non-existence of an object in another object is called

- a. PragAbhava
- b. AnyonyaAbhava
- c. PratvamsaAbhava

d. Antynthaabhava

141. Absolute non existence is called

- a. PragAbhava
- b. AnyonyaAbhava
- c. PratvamsaAbhava
- d. Antynthaabhava

142. Paramanuvada is the contribution of

- a. Vaiseshika
- b. Samkhya
- c. Yoga
- d. Charvaka

143. The founder of Paramanuvada is

- a. Gautama
- b. Kanada
- c. Pathanjali
- d. Jaimini

144. Which one of the following is not an element of 'Panchabhuta'

- a. Earth
- b. Ether
- c. Water
- d. Light

145. According to Vaiseshika , atoms are structures

- a. Circular
- b. Hexagonal
- c. Globular
- d. Cylindrical

146. Two atoms combined together to form

- a. Triratna
- b. Triad
- c. Diad
- d. Triangle

147. Three Diads combined together to form

- a. Triratna
- b. Triad
- c. Diad
- d. Triangle

148. How many atoms are there in a Triad

- a. 3
- b. 6
- c. 9
- d. 12

149. Asatkaryavada is the theory of causation of

- a. Nyaya Vaisesika
- b. Purvamimamsa
- c. Samkhya Yoga
- d. Uttara mimamsa

150. The founder of Samkhya system is

- a. Jaimini
- b. Kapila
- c. Madhva
- d. Ramanuja

151. The author of Samkhya Sutra is

- a. Kapila
- b. Gautama
- c. Kanada
- d. Vatsyayana

152. The commentary of Samkhya Sutra was written by

- a. Prasasthapada
- b. Vatsyayana
- c. Iswara Krishna
- d. Vijnana Bikshu

153. The term 'Yoga' means

- a. Calculation
- b. Argumentation
- c. Uniqueness
- d. Union with the Absolute

154. The founder of Yoga system is

- a. Gautama
- b. Pathanjali
- c. Kanada
- d. Kapila

155. The author of Yoga Sutra is

- a. Gautama
- b. Pathanjali
- c. Kanada

d. Kapila

156. The commentary of Yoga Sutrawas written by

- a. VijnanaBikshu
- b. Vatsyayana
- c. Iswara Krishna
- d. Jaimini

157. According to Samkhya , the material cause of this Universe is

- a. Prakriti
- b. Purusha
- c. Jiva
- d. Dharma

158. Prakriti is

- a. Many
- b. One
- c. Two
- d. Three

159. Prakriti is

- a. Passive
- b. Active
- c. Both
- d. None

160. Which among the following isnot a constituent of Prakriti

- a. Sattva
- b. Rajas
- c. Tamas
- d. Tejas

161. The disturbance in the equilibrium of gunasin Prakriti iscalled

- a. Samyoga
- b. Salokya
- c. Gunakshobha
- d. Gunakopa

162. Purusha is

- a. Matter
- b. Mind
- c. Self
- d. Man

163. How many Purushas are there according to Samkhya

- a. A. two
- b. Three
- c. Many
- d. Five

164. Which among the following is a characteristic feature of Purusha

- a. Unconscious
- b. Active
- c. Self - luminous
- d. Complex

165. What is the cause of evolution of Prakriti

- a. Presence of Purusha
- b. Presence of Karma
- c. Presence of Dravya
- d. Presence of Atmosphere

166. The first evolute of Prakriti is

- a. Jnanendriya
- b. Karmendriya
- c. Manas
- d. Mahat

167. Which among the following is not a Jnanendriya

- a. Sense of taste
- b. Sense of touch
- c. sense of Speech
- d. Sense of sight

168. Which among the following is not a Karmendriya

- a. Sense of speech
- b. Sense of prehension
- c. Sense of excretion
- d. Sense of smell

169. The evolutes formed from Ahamkara in Psychological branch are

- a. Mind
- b. 5 Sense organs
- c. 5 Motor organs
- d. All these

170. The evolutes formed from Ahamkara in Physical branch are

- a. 5 Subtle elements
- b. 5 Gross elements

- c. Both
- d. None of these

171. Which one among the following is not a Subtle element

- a. Essence of smell
- b. Essence of hearing
- c. Essence of colour
- d. Essence of taste

172. Which among the following is not a gross element

- a. Earth
- b. Air
- c. Water
- d. Colour

173. Five gross elements together known as

- a. PanchaBheta
- b. PanchaBhuta
- c. Pancha tantra
- d. Panchasarira

174. According to Samkhya theory of evolution, how many evolutes are formed from Prakriti

- a. 13
- b. 23
- c. 33
- d. 43

175. Ashtanga Yoga was prescribed by

- a. Jaimini
- b. Kapila
- c. Pathanjali
- d. Kumarila Bhatta

176. The first step of Ashtanga Yoga is

- a. Yama
- b. Niyama
- c. Asana
- d. Pranayama

177. Yama consists of

- a. 8 principles
- b. 5 principles
- c. 10 principles
- d. 7 principles

178. Niyama consists of

- a. 8 principles
- b. 5 principles
- c. 10 principles
- d. 7 principles

179. Which among the following is not a principle of Yama

- a. Saucha
- b. Asteya
- c. Satya
- d. Aparigraha

180. Which among the following is not a principle of Yama

- a. Saucha
- b. Asteya
- c. Santhosha
- d. Tapas

181. The skill to keep his body in a steady position for a long time is called

- a. Yama
- b. Pranayama
- c. Asana
- d. Dhyana

182. Control of breath is called

- a. Pranayama
- b. Dharana
- c. Dhyana
- d. Samadhi

183. The last step of Ashtanga Yoga is

- a. Asana
- b. Dharana
- c. Dhyana
- d. Samadhi

184. Samkhya theory of causation is called

- a. Arambhavada
- b. Parinamavada
- c. Syad vada
- d. Kshanikavada

185. The author of Mimamsa Sutra is

- a. Jaimini
- b. Kanada
- c. Kapila
- d. Sri Sankaracharya

186. Daily duties according to Purvamimamsa is called

- a. Nitya karma
- b. Naimittika Karma
- c. Kamy Karma
- d. None of these

187. Occasional duties according to Purvamimamsa is called

- a. Nitya karma
- b. Naimittika Karma
- c. Kamy Karma
- d. None of these

188. Optional duties according to Purvamimamsa is called

- a. Nitya karma
- b. Naimittika Karma
- c. Kamy Karma
- d. None of these

189. The unseen potency of Soul according to Purvamimamsa is called

- a. Apavarga
- b. Apurva
- c. Upadhana
- d. Sadyatana

190. Advaita Vedanta is the contribution of

- a. Jaimini
- b. Sri Sankaracharya
- c. Kanada
- d. Kapila

191. The power of Illusion is called

- a. Brahman
- b. Atman
- c. Maya
- d. Iswara

192. Prathibhasika level of Reality belongs to

- a. Waking stage
- b. Dreaming stage

- c. Both
- d. None of these

193. Vyavaharika level of reality belongs to

- a. Waking stage
- b. Dreaming stage
- c. both
- d. None of these

194. Visishtadvaita is the contribution of

- a. Kanada
- b. Ramanuja
- c. Sri Sankaracharya
- d. Kapila

195. The relation of Brahman with Jiva and Jagat is called

- a. Sayujya
- b. Salokya
- c. Samipiya
- d. Apradhah Siddhi

196. The founder of Dvaita is

- a. Madhva
- b. Ramanuja
- c. Sri Sankaracharya
- d. Jaimini

197. Which among the following is not come under Panchabheta

- a. Difference between God and Soul
- b. Difference between Soul and Matter
- c. Difference between God and Man
- d. Difference between God and Soul

198. Madhvacharya consider God as

- a. Brahman
- b. Narayana
- c. Siva
- d. Devi

199. Before creation, World is present in Brahman as

- a. Purusha
- b. Prakriti
- c. Soul

d. God

200. Cosmic view of Brahman is advocated by

- a. Madhva
- b. Sankara
- c. Ramanuja
- d. Pathanjali

201. Which of the following Vedic literature where the Varna system was discussed?

- a. Rigveda
- b. Samaveda
- c. Yajurveda
- d. Atharvaveda

Ans: A

Explanation: Ninth Mandal of Rigveda contains hymns called Purusha Sukta from where Varna system was discussed. Hence, A is the correct option.

202. Which of the following Vedic literature contains Gayatri Mantra?

- a. Rigveda
- b. Samaveda
- c. Yajurveda
- d. Atharvaveda

Ans: A

Explanation: Third Mandal of Rigveda contains the Gayatri Mantra which was compiled in the praise of sun god Savitri. Hence, A is the correct option.

203. Which of the following is incorrectly matched:

- a. Rigveda- Hotra or Hotri
- b. Samaveda - Udgatri
- c. Yajurveda - Adhvaryu
- d. All the above

Ans: D

Explanation: Rishi who were experts in Rigveda were called hotra or hotri. Udgatri was the experts of Samaveda. Adhvaryu was the experts of the knowledge of Yajurveda. Indian medicinal science i.e. Ayurveda has its origin from Atharvaveda. Hence, D is the correct option.

204. Which of the following Vedic literature is the collection of sacrificial formulae?

- a. Rigveda
- b. Samaveda
- c. Yajurveda
- d. Atharvaveda

Ans: D

Explanation: The Atharvaveda is composed in Vedic Sanskrit, and it is a collection of 730 hymns with about 6,000 mantras, divided into 20 books. It is the collection of sacrificial formulae which were written both in prose and poetry. Hence, D is the correct option.

205. Which of the following statement (s) is/are related to the Aranyakas?

- a. Written in forests for the hermits and students of the Vedas.
- b. Initiated a changeover from materialistic religion to spiritual religion. Hence, they formed a tradition that culminates in the Upanishads.
- c. Both A and B
- d. Neither A nor B

Ans: C

Explanation: The Aranyakas were written in forests and are concluding parts of the Brahmanas. They are like a bridge between Vedas cum Brahmanas and Upanishads. They don't lay much emphasis on rites, ritual and sacrifices, but have philosophy and mysticism. So they have moral science and philosophy. Hence, C is the correct option.

206. Which of the following are correctly matched

- a. Shiksha - Phonetics of Science of Pronunciation
- b. Kalpa - Rituals and ceremonies

c. Nirukta - Etymology (Origin of words)

d. All the above are correctly matched

Ans: D

Explanation: The Vedanga are six auxiliary disciplines in Vedic culture are as:

207. Which of the following Vedic literature refers to the 'to sit near the feet of'?

a. Vedangas

b. Upanishads

c. Aranyakas

d. Brahmanas

Ans: B

Explanation: The Upanishads are a collection of texts of religious and philosophical nature, written in India. Etymologically, the name Upanishad is composed of the terms upa (near) and shad (to sit), meaning something like "sitting down near". Hence, B is the correct option.

208. Which of the following Vedic literature contains details about the meanings of Vedic hymns, their applications, and stories of their origins?

a. Vedangas

b. Upanishads

c. Aranyakas

d. Brahmanas

Ans: D

Explanation: The Brahmanas are the prose texts which explain the hymns in the Vedas, give explanation and applications and related stories of their origin. Hence, D is the correct option.

209. Which of the following is not correctly matched?

a. Aitareya or Kaushitaki Brahmanas-Yajurveda

b. Tandya and Jaiminiya Brahmanas-Samveda

c. Taittiriya and Shatpatha Brahmanas- Yajurveda

d. Gopath Brahmanas- Atharvaveda

Ans: A

Explanation: The Brahmanas are the prose texts which explain the hymns in the Vedas, give explanation and applications and related stories of their origin. They also have some stories related to the certain persons related to the Vedic Text. Aitareya or Kaushitaki Brahmanas were allotted to the Rigveda for detailing. Tandya and Jaiminiya Brahmanas to Samveda for detailing. Taittiriya and Shatpatha Brahmanas to Yajurveda for detailing. Gopath Brahmanas to the Atharvaveda for detailing. Hence, A is the correct option.

210. Rama was

a. A prince

b. A priest

c. A sage

d. A philosopher

Answer: a. A prince.

211. The word karma refers to

a. Bad things that happen

- b. The fruit of action
- c. The result of previous mistakes
- d. Action

Answer: d. Action.

212. Brahman is

- a. The God of Time
- b. The God of Creation
- c. The all-pervasive one supreme consciousness
- d. A priest

Answer: c. The all-pervasive one supreme consciousness.

- a. Kant
- b. Hume
- c. Mill
- d. Bentham

Answer: (C)

273. Who among the following Philosophers has propounded the concept of 'Pure Being' ?

- a. Pythagoras
- b. Democritus
- c. Heraclitus
- d. Parmenides

Answer: (D)

274. Which one of the following theories of error is maintained by Rāmānuja ?

- a. Satkhyāti
- b. Asatkhyāti
- c. Atmakhyāti
- d. Anirvachniya khyāti

Answer: (A)

275. Which one of the following is known as moderate Bauddha (Pracchanna Bauddha) ?

- a. Mahāvira
- b. Sāmkhya

c.Shankara  
d Cārvāka  
Answer:(C)

276. 'Jin' is associated with

- a. Buddhism
- b. Jainism
- c. Sikhism
- d Islam

Answer:(B)

277. Prajñyā, Sila and Samādhi are the key concepts of

- a. Hinduism
- b. Jainism
- c. Buddhism
- d. None of the above

Answer:(C)

278. Who introduced internal sanction in morality ?

- a. Bentham
- b. Mill
- c. Sidgwick
- d Hume

Answer:(B)

279. A Hypothesis is scientifically valuable if it is

- a. opposed to established scientific law
- b. opposed to religious belief
- c. in agreement with a religious belief
- d. verifiable

Answer:(D)

280. What is meant by 'Pancalabdhi' ?

- a. Uplabdhi, Mahālabdhi, Kāranalabdhi, Mocanalabdhi, Anuplabdhi
- b. Kshyopśamlabdhi, Viśuddhilabdhi, Deśanālabdhi, Prāyogyalabdhi, Karanalabdhi
- c. Labhālabdhi, Deśanālabdhi, Krpālabdhi, Samvaralabdhi, Nirjarālabdhi
- d. None of these

Answer:(B)

Answer:(C)

283. Who takes into Consideration the length and breadth in Ethics ?

- a. Mill
- b. Spinoza
- c. Spencer
- d. Moore

Answer:(C)

284. What type of Sattā is ascribable to Brahman ?

- a. Vyāvaharika
- b. Paramārthika
- c. Both Vyāvaharika & Paramārthika
- d. Prātibhāsika

Answer:(B)

285. In which Āshrama Vyāvasthā, a person leaves for the jungle in order to pray to God and practice Yoga ?

- a. Brahmacharya
- b. Gārhastha
- c. Vānaprastha
- d. Sanyāsa

Answer:(C)

286. The two sentences labelled as Assertion (A) and Reason (R) are given below. Mark the correct code according to these :

Assertion (A) : According to Mimāmsā Vedas are eternal. Reason (R) : According to Mimāmsā words are eternal.

Codes :

- a. Both (A) and (R) are true and (R) provides correct explanation to (A).
- b. Both (A) and (R) are true, but (R) does not provide correct explanation to (A).
- c. (A) is true, (R) is false and (R) does not provide correct explanation to (A).
- d. (A) is false, (R) is true and (R) provides correct explanation to (A).

Answer:(A)

287. Match List – I with List – II and mark the correct option :

List – I

List – II

- a. Purusārtha                      i. Varna
- b. Brahmavihāra                ii. Musavādā

- c. Pancaśila                      iii. Mokśa  
 d. Vaiśya                          iv. Karunā

Codes :

a b c d

- a. i ii iii iv  
 b. iii iv ii i  
 c. iv ii i iii  
 d. iii i ii iv

Answer:(B)

288. Consider the following statements in the context of Bentham and mark the correct code :

1. Greatest happiness of the greatest number.
2. Nature has placed mankind under the governance of two sovereign masters pain and pleasure.
3. Community is a fictitious body composed of the individual persons.

Codes :

- a. 1 and 2 are true.  
 b. 1 and 3 are true.  
 c. only 1 is true.  
 d. 1, 2 and 3 are true.

Answer:(D)

289. 'Enlightened Anarchy' means

- a. Lawlessness  
 b. Non-existence of the state  
 c. Lawlessness of the intellectuals  
 d. Imperialism

Answer:(C)

- d. Rigveda

Answer:(B)

299. Religion according to Gandhi is :

- a. Justice
- b. Prayer
- c. Moral Principle
- d. Freedom

Answer:(C)

300. "We do not want mass production but we want production for the masses" advocated by

- a. Marx
- b. Gandhi
- c. Nehru
- d. Amartya Sen

Answer:(B)

301. Match List – I and List – II and select the code correctly matched :

List – I

List – II

- a. Advait Vedanta      i. Nimbark
- b. Vishista dvaitvada    ii. Shankar
- c. Dvaitvada            iii. Ramanuja
- d. Dvaitadvaitvada    iv. Madhva

Codes :

a b c d

- a.    iii ii i iv
- b.    ii iii iv i
- c.    iv ii iii i
- d.    i ii iii iv

Answer:(B)

302. Which of the following statements are associated with Gandhiji's concept of truth ?

- 1. Truth is an ontological category.
- 2. Truth is an ethical category.
- 3. Truth is only a property of statement.

Select the correct answer from the codes given below :

Codes :

- a. 1, 2 and 3
- b. 1 and 2
- c. 2 and 3
- d. 1 and 3

Answer:(B)

303. Samavāyikārana of the world according to the Vaiśeṣikas is

- a. Īśvara
- b. Paramānu-Sa yoga
- c. Dvyanuka .
- d. Paramānu

Answer:(D)

304. Pārmārthika Sattā may be refuted by

- a. Vyavahārika Sattā
- b. Prātibhasika Sattā
- c. Both (A) and (B)
- d. None of the above

Answer:(D)

305. Which one of the following pairs is not correctly matched ?

- a. The doctrine of Monads – Leibnitz
- b. The Doctrine of Modes – Spinoza
- c. Berkeley's Philosophy – Solipsism
- d. Distinction between 'Knowledge concerning relation of Ideas' and 'Knowledge concerning matter of fact' – Kant

Answer:(D)

- a. Identity, Negation, Co-existence
- b. Identity, Causality, Negation
- c. Causality, Negation, Co-existence
- d. Causality, Identity, Co-existence

Answer:(B)

316. In the following inference there is fallacy of : 'Sky flower is fragrant because it has floweriness in it'

- a. Anekāntika
- b. Satpratipak a
- c. Bādhita
- d. Aśsayāsiddhā

Answer:(D)

317. Read the following arguments and select the fallacy in it, using the code given below :

Argument : "All Hindus are Aryans. No Persians are Hindus. No Persians are Aryans". Codes :

- a. Fallacy of Illicit Major
- b. Fallacy of Illicit Minor
- c. Fallacy of Four Terms
- d. Fallacy of Undistributed Middle

Answer:(A)

318. In the context of laws of thought mark the best combination of the laws as given below :

Laws :

- I. Law of Identity
- II. Law of Contradiction
- III. Law of Excluded Middle
- IV. Law of Sufficient Reason

Combinations :

- a. I and II are correct.

- b. III and IV are correct.
- c. I, II and IV are correct.
- d. I, II, III and IV are correct.

Answer:(D)

319. Match List – I with List – II and select the right answer using the code, given below :

List – I    List – II

- a. AAA    i. Ferio
- b. All    ii. Celarent
- c. EAE    iii. Darii
- d. EIO    iv. Barbara

Codes :

a b c d

- a. iii v iv i
- b. iii iv i ii
- c. iv iii ii i
- d. v iv i iii

Answer:(C)

320. Which of the following statements are true with regard to phenomenology ?

- a. Phenomenologist's is not concerned with particular facts as such.
- b. The subject matter of Phenomenology is the ideal meanings and universal relations with which the ego is confronted in its experience.
- c. Only (A) (as above said) is true and (B) is false.
- d. Both (A) and (B) (as above said) are true.

Answer:(D)

321. The objects of phenomenological inquiry are

- a. External objects
- b. Intentional objects
- c. Extensional objects
- d. Ideal objects

Answer:(B)

322. Given below are two statements, one labelled as Assertion (A), and Reason

(R) : Assertion (A) : According to Quine, the verificationist theory has

taken language in a very piecemeal fashion.

Reason (R) : It therefore has resulted in a sort of reductionism.

In the context of the above two statements, which of the following is incorrect ?

Code :

- a. Both (A) and (R) are true and (R) is the correct explanation of (A).
- b. Both (A) and (R) are true but (R) is not the correct explanation of (A).
- c. (A) is true, but (R) is false.

d. (A) is false, but (R) is true

Answer:(A)

323. Match List – I with List – II and select the correct answer code from below :

List – I            List – II

- |                    |                    |                 |
|--------------------|--------------------|-----------------|
| a. On the logic of | i. Gadamer         | social sciences |
| b. Being and       | ii. Habermas       | time            |
| c. Philosophical   | iii. Heidegger     | Hermeneutics    |
| d. Hermeneutics    | iv. Schleiermacher | and Criticism   |

Codes :

a b c d

a. ii iii i iv

b. iv iii i ii

c. i iii iv ii

d. ii iii iv i

Answer:(A)

324. Match the List – I with List – II choose correct answer from the code given below :

List – I            List – II (Authors) (Books)

- |                 |   |
|-----------------|---|
| a. G.E. Moore   | i. Foundations of the metaphysics of Morals |
| b. Kant         | ii. Right and the good                      |
| c. F.H. Bradley | iii. Principia Ethica                       |
| d. W.D. Ross    | iv. Ethical studies                         |

Codes :

a b c d

a. iv i iii ii

b. iii i iv ii

c. i ii iv iii

d. ii i iii iv

Answer:(B)

325. When 'A' proposition is true, E and I propositions are

- a. False and true
- b. True and false
- c. False and doubtful
- d. True and doubtful

Answer:(A)

326. Social rights which form a part of Universal Declaration of Human Rights (1948) address covers which of the following aspects ?

- a. Education
- b. Food

- c. Employment
- d. All of the above

Answer:(D)

327. Which position is held by the Naiyāyikas regarding the relation between pada and padārtha (vrthi) ?

- a. Śakti and Laksanā
- b. Gauni and Vyañjanā
- c. Śakti, Laksanā and Vyañjanā
- d. Vyañjanā, Gauni and Laksana

Answer:(A)

328. Which of the following Vedic literature where the Varna system was discussed?

- a. Rigveda
- b. Samaveda
- c. Yajurveda
- d. Atharvaveda

Ans: A

Explanation: Ninth Mandal of Rigveda contains hymns called Purusha Sukta from where Varna system was discussed. Hence, A is the correct option.

329. Which of the following Vedic literature contains Gayatri Mantra?

- a. Rigveda
- b. Samaveda
- c. Yajurveda
- d. Atharvaveda

Ans: A

Explanation: Third Mandal of Rigveda contains the Gayatri Mantra which was compiled in the praise of sun god Savitri. Hence, A is the correct option.

330. Which of the following is incorrectly matched:

- a. Rigveda- Hotra or Hotri
- b. Samaveda - Udgatri
- c. Yajurveda - Adhvaryu
- d. All the above

Ans: D

Explanation: Rishi who were experts in Rigveda were called hotra or hotri. Udgatri was the experts of Samaveda. Adhvaryu was the experts of the knowledge of Yajurveda. Indian medicinal science i.e. Ayurveda has its origin from Atharvaveda. Hence, D is the correct option.

- c. Taittiriya and Shatpatha Brahamans- Yajurveda
- d. Gopath Brahamans- Atharvaveda

Ans: A

Explanation: The Brahamanas are the prose texts which explain the hymns in the Vedas, give explanation and applications and related stories of their origin. They also have some stories related to the certain persons related to the Vedic Text. Aitareya or Kaushitaki Brahamnas were allotted to the Rigveda for detailing. Tandya and Jaiminiya Brahamans to Samveda for detailing. Taittiriya and Shatpatha Brahamans to Yajurveda for detailing. Gopath Brahamans to the Atharvaveda for detailing. Hence, A is the correct option.

337. Rama was

- a. A prince
- b. A priest
- c. A sage
- d. A philosopher

Answer: a. A prince.

338. The word karma refers to

- a. Bad things that happen
- b. The fruit of action
- c. The result of previous mistakes
- d. Action

Answer: d. Action.

339. Brahman is

- a. The God of Time
- b. The God of Creation
- c. The all-pervasive one supreme consciousness
- d. A priest

Answer: c. The all-pervasive one supreme consciousness.

340. In the Purusha Sukta, from the head of the Cosmic man emerged

- a. The agriculturalists and artisans
- b. Brahmins

- c. Warriors and kings
- d. Servants

Answer: b. *Brahmins*.

341. The word Dalit means

- a. "the leaders"
- b. "the seers"
- c. "hairy ones"
- d. "the oppressed"

Answer: d. "the oppressed".

342. Which of the following is not one of the Four Ends of Life for Hindus?

- a. Renunciation
- b. Fulfillment of desire
- c. Acquiring wealth
- d. Fulfillment of duty In the Ramayana

Answer: a. Renunciation.

343. Rama went to the forest for fourteen years\_\_\_\_\_.

- a. To kill demons
- b. To protect sages
- c. Because he was banished
- d. To serve the gods Hindus will perform their own last rites while still living a.

Answer: c. Because he was banished.

**Classical Western: Ancient,  
Medieval, And Modern:  
Epistemology And Metaphysics**

## **Presocratic Philosophy INTRODUCTION**

The story of philosophy in Western civilization begins in ancient Greece, which produced three of the world's greatest thinkers, namely, Socrates, Plato and Aristotle. While it would be nice to start our study with Socrates, the first prominent figure in the history of philosophy, the fact is that Socrates did not create his views from thin air. Rather, he was the outgrowth of a remarkably fertile philosophical environment within Greece that had been germinating for a couple centuries. We call this early period Presocratic philosophy, that is, philosophy before Socrates, and well over 100 philosophers actively contributed to its accomplishments.

### **Beyond Mythology**

Even before the Presocratic philosophers came on the scene, religious mythology was already setting the conceptual stage for philosophical speculation. Religion, then as now, was a powerful social force in shaping views of human nature and the cosmos. According to the Greeks, the gods bring about natural disasters, make demands on human conduct, and determine our place in the afterlife. Two Greek mythologists in particular developed an especially sophisticated religious world-life view. The first is Homer (fl. c. 750 BCE), the famed author of the epic tales the Iliad and the Odyssey, which chronicle the adventures of a hero named Odysseus. Throughout his journeys to the underworld and other parts of the mythological universe, Odysseus regularly encounters gods and strange creatures, sometimes appeasing them, other times battling them. Second is Hesiod (fl. c. 700 BCE), author of the Theogony, a work that describes the origins of hundreds of deities from a common pair of ancestors at the beginning of the world.

Two aspects of their mythology deserves mention for their impact on early philosophy. First, their cosmologies do not attribute the creation of the world to the work of the gods. While Zeus is the supreme god, he is not described as the creator. Homer takes the universe as a given, and Hesiod describes its origins as follows:

First Chaos was created, then wide-bosomed Earth, the eternal unshaken foundation of the immortal gods who inhabit the snowy peaks of Olympus or the gloomy Tartarus within the depths of the wide-pathed Earth. Love then arose, most beautiful among the immortal gods, which who loosens the limbs and overcomes the mind and wise counsels of all gods and mortal men.

[Hesiod, Theogony]

According to Hesiod, first there is emptiness, then earth, and only then do the gods appear. And, when the gods do appear on the scene, they behave in a disorderly way, and often bend the operations of nature according to their whims. This all leaves much room for speculation about how the physical cosmos emerged, what it was composed of, and what gives it order. The explanations offered by the first philosophers were not only philosophical, but, by the standards of their time, they were also scientific. Thus, the first philosophers were also the first scientists, and, in fact, many had practical interests in mathematics, astronomy and biology. Second, Homer illustrates how the gods watch over human activity, judge our behavior and impose their wishes on us and the natural world as they saw fit, often in arbitrary ways. It is this aspect of mythology that the first philosophers most resisted and instead stressed the rational unity of things. In a sense, they attempted to move beyond mythology to offer a more scientific account of both physical nature and human nature.

## Issues of the Presocratics

Over a period of 200 years, the Presocratic philosophers focused on three key issues. First is the problem of the one and the many, that is, explaining how one basic thing can be the source of many varied things. The world contains an enormous variety of objects, some living, others inanimate; some solid, others liquid. It seems reasonable to suppose that all things come from a common source or type of stuff. Identifying that common source, though, is the challenge. Second is the problem of change and constancy, that is, explaining how things remain constant as they change over time. Not only are there many kinds of things in the world, but each one is subject to change. Living things like trees grow old and die; inanimate objects like rocks weather away and change their form. As things go through changes, there's still something about them that enables them to retain their identity. Third is the problem of relativism, namely, determining whether principles are absolute or created by people. Suppose that I arrive at some reasonable explanation of how the world operates. Is that explanation true just for me, or have I discovered something more universal that must be true for everyone? While some truths might appear to be independent of me, identifying those truths is a challenge.

The theories of the Presocratic philosophers were daring, sometimes to the point of being bizarre. Being the first ones to venture into the uncharted territories of both philosophy and science, they explored virtually any explanation of things that seemed reasonable, and because of this there is a richness and diversity to their views that we have not since seen. This makes it all the more unfortunate that none of the books authored by the Presocratic philosophers have survived intact. All that we have are some summaries and scattered sentences from their works that are quoted by later writers such as Plato and Aristotle. From these quotation fragments, we are left to reconstruct their original views. Sometimes a clear image emerges; other times, as we will see, it's a matter of guesswork.

## B. MILESIANS

The first known philosophers of ancient Greece were from a city-state called Miletus. Located on the west coast of what is now the peninsula of Turkey (then called Anatolia), Miletus was a thriving seaport, and part of a region of cities called Ionia. As a hub of sea trade, residents of Miletus were in contact with surrounding cultures and as such were influenced by many of their views, particularly theories of astronomy that came from civilizations to the east of Greece. The three first philosophers from Miletus were Thales, Anaximander and Anaximenes, all of whom attempted to answer the question "What is the common stuff from which everything is composed?"

### Thales: Water

The very first among the Milesian philosophers was Thales (c. 625-545 BCE) who held that water is the basic stuff of all things. Thales himself didn't write anything, and what we know of him comes from later sources. He was famed for his expertise in astronomy and geometry, and, according to one story, he successfully predicted an eclipse of the sun in the year 585 BCE. There are colorful stories about his life, such as the following which describes how he fell into a well: A witty maid-servant saw Thales tumbling into a well and said that he was so eager to know what was going on in heaven that he could not see what was before his feet. This is applicable to all philosophers. The philosopher is unacquainted with the world; he hardly knows whether his neighbor is a man or an animal. For he is always searching into the essence of man, and enquiring what such a nature ought to do or suffer different from any other. [Plato, Theaetetus]

The event very likely never took place, and, in fact, this story represents a common stereotype about philosophers both then and now: they are so absorbed in their speculations that they don't pay attention to where they're walking. Another common stereotype of philosophers is that their skills have very little realworld application, and such a criticism was also allegedly raised against Thales. As the story goes, though, Thales proves them wrong by making a bundle of money investing in olive oil: People detested Thales for his poverty, as if the study of philosophy was useless. However, it is reported that, through his skill in astronomy, he perceived that there would be a large harvest of olives that year. Then, while it was still winter, and having obtained a little money, he put deposits on all the olive oil businesses that were in Miletus and Chios. He obtained them at a low price, since there was no one to bid against him. When the season came for making oil, many people wanted the rights, and he sold them all at once for whatever terms he pleased.

Raising a large sum of money by that means, he convinced everyone that it was easy for philosophers to be rich if they chose it, but that that was not what they aimed at. In this manner is Thales said to have shown his wisdom. [Aristotle, Politics, 1.11] The details of Thales' philosophy are as sketchy as those of his life. The best account is from Aristotle, who notes that all of the first philosophers attempted to discover the underlying stuff of all things, but they disagreed about what that particular stuff was. The Greeks already held to the view that there were four basic elements, namely, earth, air, fire and water. From these, Thales selected water as the primary stuff of nature, and Aristotle speculates about why Thales chose water specifically: Thales, the founder of this type of philosophy, said the principle is water (for which reason he declared that the earth rests on water). Perhaps he got this notion from seeing that the nutrition of all things is moist, and that heat itself is generated from the moist and kept alive by it (and that from which they come to be is a principle of all things). Perhaps he also got his notion from the fact that the seeds of all things have a moist nature, and that water is the origin of the nature of moist things. [Ibid.]

As Aristotle explains, moisture seems to be an essential element in all living things. Water also seems like a reasonable choice since it's at a middle state between earth and air insofar as some moist substances can evaporate and turn into air, and others solidify and turn to slime or earth.

Even if we understand Thales' reasoning for why he selected water as the primary substance, there is still some haziness about what it means for water to be the source of all things. On the one hand, it could mean that the world originated from water, a view that had been around in mythology for a long time. On the other, it could mean that the world is still made of water, and things as they are now are composed of water as their primary stuff. This second interpretation of Thales is the more common one, and the one that constitutes Thales' legitimate claim to fame. It seems like an easy thing to identify a single element like water as the primary stuff of all things. But it is a very sophisticated move to abandoned mythological foundations of the natural world in favor of physical explanations, and this is precisely what Thales did.

### **Anaximenes: Air**

The third of the founding philosophers from Miletus was Anaximenes (c. 585-525 BCE), who held that condensed and expanded air is the source of everything. He was a student of Anaximander and, like his teacher, he wrote a book with only a sentence or two surviving. The most notable fragment is this, which stresses the central role of air in conception of reality: "Just as our soul, being air, holds us together, so do breath and air surround the whole world." We find a more

complete account of his view of air in the following summary from an early philosopher: Anaximenes of Miletus, who had been an associate of Anaximander, said, like him, that the underlying substance was one and infinite. He did not, however, say it was indeterminate, like Anaximander, but determinate; for he said it was Air. It differs in different substances in virtue of its rarefaction and condensation. In its thinnest state it comes to be. Being condensed it becomes wind, then cloud, and when still further condensed it becomes water, then earth, then stones, and the rest of things comes to be out of these. [Theophrastus]

On Anaximenes' view, then, physical objects differ only in how condensed the air is in a given space: stuff is airy when less compressed and solid when more compressed. When air begins to be compressed, it condenses into wind, then cloud, then water, then earth, then stones, and everything else that we see comes from these. The importance of this is that Anaximenes was the first to suggest that reality could be measured. We could at least in theory say that a certain amount of pressure exerted on an area of air will result in it attaining a specific level of solidity. This provides a more scientific account of reality, particularly in comparison to Anaximander's theory which removed ultimate reality from the realm of what we can perceive. Many philosophers after Anaximenes adopted this compression and expansion view of how elements change.

## **C. IONIANS**

Thales, Anaximander and Anaximenes started a philosophical trend in their geographical region of Ionia, and, from neighboring cities, they were joined by two other philosophers, namely, Heraclitus and Pythagoras. Together, these five philosophers are sometimes seen as forming a distinct Ionian school of philosophy.

### **Pythagoras: Numbers**

According to tradition, famed mathematician and philosopher Pythagoras (c.570– c.497 BCE) held that numbers and mathematical relations underlie reality. Born on the Greek island of Samos, part of the Ionian region along the Turkish peninsula, as a young man Pythagoras spent much time studying religious practices throughout the Mediterranean area, and in time formed a colony of followers. He himself wrote nothing, and it is difficult to isolate the historical Pythagoras from the more glorified account of him present by Pythagorean followers who flourished for almost 1,000 years after him. Plato and Aristotle credit him with establishing only a way of life, whereas later Pythagoreans present him as being the originator of ancient Greek philosophy as a whole.

The Pythagorean school itself was a remarkable institution, and the level of reverence that Pythagoras's followers had for him rose to a cult-like status, as we see here: Pythagoras is said to have been a man of the most dignified appearance, and his disciples adopted an opinion about him that he was Apollo who had come from [the mythical realm of] Hyperborea. It is said, that once when he was stripped naked, he was seen to have a golden thigh. There were many people who affirmed that, when he was crossing the river Nessus, the river called him by his name. [Diogenes, Lives, "Pythagoras"]

His students also believed that his teachings were prophecies of the gods. There were two groups of followers within the Pythagorean school. First there was the privileged inner circle of followers, called the "mathematicians," who could study with him in person. Second, there was an outer circle, called the "listeners", who couldn't see Pythagoras directly but only received summaries of

his views and listened to him from behind a curtain. The Pythagoreans also had a list of rules to follow, and some of the more metaphorical ones are these:

- Don't stir the fire with a knife (don't stir the passions or the pride of the powerful).
- Don't step over the beam of a balance (don't overstep the boundaries of justice).
- Don't sit down on your bushel (have the same concern for today and the future, where a bushel is the day's ration).
- Don't eat your heart (don't waste your life over troubles and pains).
- Don't turn around when you go abroad (when reaching death, look beyond the pleasures of this life).
- Don't urinate facing the sun (be modest).

Other sayings were intended literally, such as "abstain from eating beans", which Pythagoras believed were sacred. As Pythagoras' fame spread, legend has it that no fewer than 600 scholars would try to visit him each day, "and if any of them had ever been permitted to see him, they wrote about it to their friends as if they had gained some great advantage." Pythagoras died, as the story goes, while visiting a friend's home for dinner; the house was set fire by his enemies who feared that he would grow in power, take control of the city, and become a tyrant. He fled into a nearby field, but, stopped as soon as he saw beans growing there and refused to step on them. His pursuers thus caught and killed him.

Today Pythagoras's name is associated with the Pythagorean theorem, and, as legend has it, when he discovered it he sacrificed 100 cattle to the gods. Tradition also credits him with influencing the systematic approach to geometry that was later formalized by Euclid. For Pythagoras, though, mathematics was at the center of his philosophy insofar as he believed that mathematical relations govern all things. In fact, he considered numbers themselves to be sacred. Everything is related to mathematics and, through mathematics, everything can be predicted and measured in rhythmic patterns. Two types of mathematical ratios were especially important for Pythagoras: the Tetractys and musical harmony.

The Tetractys is a mystical symbol involving ten points arranged in four rows: one, two, three, and four points in each row respectively:

```
*  
**  
***  
****
```

The four rows represent earth, air, fire and water, and various combinations of the points generate important numbers and ratios. The Tetractys is similar to the aesthetic principle of the more well-known "Golden Ratio" that was developed later by Euclid and Renaissance artists. With both the Tetractys and the Golden Ratio, objects that contain special proportions have a natural beauty or balance to them such as, for example, a window opening that is three feet wide and four feet tall, where three and four are the bottom two rows of the Tetractys. The reverence that Pythagoras had for the Tetractys is seen in an oath uttered by his followers: "I swear by him who communicated the Tetractys, from which all our wisdom springs, and which contains perennial nature's fountain, cause, and root" (Iamblichus, Life of Pythagoras).

For Pythagoras, the cosmos itself is arranged in ratios connected to the Tetractys, and, as described below, music is a perfect example of how ratio and harmonious structure are interrelated:

The tetractys is a certain number, which being composed of the four first numbers produces the most perfect number, ten. For one and two and three and four come to ten. This number is the first tetractys, and is called the source of ever flowing nature. This is because, according to them, the entire cosmos is organized according to harmony, and harmony is a system of three intervals: the fourth, the fifth, and the octave. The proportions of these three intervals are found in the aforementioned four numbers. [Sextus Empiricus, *Against the Mathematicians*, 7.94-95]

Musicians, particularly players of stringed instruments, will instantly recognize the mathematical basis of the three harmonic intervals mentioned above. More precisely they are these: Musical 4th: interval of 4:3 (e.g., divide a string at the 1/4 mark) Musical 5th: interval of 3:2 (e.g. divide a string at the 1/3 mark) Musical octave: interval of 2:1 (e.g., divide a string at the 1/2 mark) Like other Presocratic philosophers, Pythagoras also had theories about most everything, including how the cosmos was originally formed and then developed. The following passage describes Pythagoras' view of the cyclical nature of the cosmos: Pythagoras declared that the soul is immortal, then that it changes into other kinds of animals. In addition, the things that happen recur at certain intervals, and nothing is absolutely new. Also, all things that come to be alive must be thought akin. Pythagoras seems to have been the first to introduce these opinions into Greece. [Porphyry, *Life of Pythagoras*, 19]

There are two cyclical aspects of the cosmos alluded to in the above. The first is what we now call reincarnation: upon the death of my body, my soul continues to live by migrating to the body of a newborn baby, and when that body dies I move on to another. The second is that the events in the cosmos itself repeat after certain periods of time. Both of these are ideas found in Hindu thought, which Pythagoras might have come in contact with during his travels.

Among his most notable pieces of wisdom is his comparison of life to what takes place at Olympic games. There are, he argues, three types of lives that we see among people at the games. The lowest is the merchant who seeks to make money by selling to the swarm of visitors. Next is the athlete who participates in the games to win a prize. The highest, though, is the spectator who observes the events, which is a metaphor for the philosopher who surveys the world and reflects on it.

## **Heraclitus: Change and the Logos**

Heraclitus (c. 540–c. 480 BCE) argued that an ever-changing world around us is held together through a unifying principle that he called the logos. Heraclitus was born into an aristocratic family from the Ionian city of Ephesus, not far from the city of Miletus where Greek philosophy first began. As he grew in fame, he also became disliked by his fellow citizens for his superior tone and gained the nickname "the obscure" for his use of riddles. Self-taught, he claimed that he investigated everything there was to know and learned everything by himself. His book *On Nature* was supposedly composed in an intentionally obscure style so that only those who were wise would understand it, thereby protecting himself from ridicule by the common people. Legend has it that the great Persian king Darius requested that Heraclitus travel to his palace to clarify the obscurities within the book. Heraclitus refused, saying that he had no interest in receiving such a

royal honor and was content to live modestly. Progressively withdrawing from society, he spent his last years living in the mountains, eating grasses and plants. Becoming sick with edema, he returned to the city to find a cure. But when he approached physicians with his problem, he presented it in the form of a riddle, which they couldn't understand. Attempting to cure himself, he covered his body with cow dung which brought on his death.

The traditional understanding of Heraclitus's obscure philosophy is that it has two main themes, one of which is a problem that he poses, and the other is his solution to the problem. The problem is that everything in the world is continually changing. Things grow then decay, they are created but then disintegrate. The most permanent things we see like mountains or stone monuments wear down with time. As things change, they exhibit opposing tendencies: "Cold things become warm, and what is warm cools; what is wet dries, and the dry is moistened." He famously makes this point with the analogy of stepping into a river: "You cannot step twice into the same rivers; for fresh waters are ever flowing in upon you. It scatters and it gathers; it advances and retires."

Constant change, then, is the problem. What, though, is the solution? According to Heraclitus, there is a unifying plan that underlies the coherence of all natural changes and harmonizes their opposing tendencies. He dubbed this the logos, the Greek word meaning "plan" or "formula". In this passage he describes the difficulty people have in recognizing and understanding the logos: Though this Logos is true always, yet people are as unable to understand it both when they hear it for the first time and when they have heard it at all again. For, though all things come into being in accordance with the Logos, people seem as if they had no experience of it. [Sextus Empiricus, Against the Mathematicians]

For Heraclitus, then, as things in the world go through change, exhibiting their opposing characteristics, the logos gives them their unity. Even though the flowing river is constantly changing by scattering and gathering, the logos gives it structure so that we can recognize it as a river, rather than merely a series of haphazard and opposing events.

Heraclitus identified the ordering structure of the logos with one of the four elements, namely fire. He describes the cosmic role of fire here:

The ordered universe, which is the same for all, was not made by one of the gods or by humans. Rather, it always was, is now, and forever will be an ever-living fire, ignited in measure, and extinguished in measure. [Clement, Miscellanies]

Fire not only gives structure to the world, but it is also the primary stuff from which everything is made. In this way he follows in the footsteps of Thales and his fellow philosophers from Ionia who grounded the unity of things in a specific element. Similar to Anaximenes' theory, Heraclitus held that things take on a different form based on how expanded or compressed fire is. When more compressed, it becomes water, and, when even more compressed, earth.

## **D.ELEATICS**

The most radical philosophical theory among the early Greeks was proposed by a group of philosophers from the city of Elea, a Greek colony on the south-west coast of Italy. They are thus referred to as Eleatic philosophers in honor of their hometown. The leader among the Eleatic

philosophers was a man named Parmenides, who argued that our everyday perceptions of the world are completely wrong, and all reality is the One, that is, a single, undifferentiated and unchanging thing. We will look at three Eleatic philosophers who are associated with this view: Xenophanes who first suggested it, Parmenides who developed it, and Zeno who defended it.

## **Parmenides: The One**

Parmenides (b. 510 BCE) was born into a wealthy family in the city of Elea, and his only known writing is a book titled *On Nature* that he composed in poetic verse as allegedly conveyed to him by the goddess Persephone. In a nutshell, Parmenides argues that only one unchanging thing exists, and it is an indivisible spherical-shaped thing, like a toy marble, which he calls “the One”. It might appear that the world consists of countless different things—me, you, the chair I’m sitting on, the dog barking down the street. According to Parmenides, though, this is all just an illusion, and I can’t trust my common sense; the truth is that only the One exists.

Why would he offer an account of the world that is so contrary to commonsense? The answer is not entirely clear. While Parmenides and his followers were the only major thinkers in Western civilization at that time to offer this view, it has close similarities with some Eastern philosophical views, particularly within Hinduism. Within Eastern philosophical traditions the proof of “the One” is based on mystical experience. When you enter a mystical state of enlightenment through meditation, you will experience the oneness of everything and see that the world of multiplicity and change around us is an illusion. Maybe Parmenides was inspired by this kind of a mystical experience, but we know so little about his life and background that there is no way of telling.

Regardless of what inspired him, he offers a proof of his theory of “the One,” which requires serious attention. He begins arguing that there are just two paths of inquiry: the path of assertion in which you maintain that something is, and the path of denial in which you maintain that something is not. If we think about these two paths, we’ll see that the path of denial is nonsense: you cannot know what is not, and you can’t even express it. He makes this point here: There are only two ways of inquiry that can be thought of. [Proclus, *Commentary on Plato’s Timaeus*]

The first, namely, that it is (and that it is impossible for it not to be), is the way of belief, for truth is its companion. The other way of inquiry, namely, that it is not (and cannot be), is a path that none can learn at all. For you cannot know what is not, nor can you express it. [Simplicius, *Commentary on Aristotle’s Physics*]

That leaves us with the remaining path of assertion: the only meaningful way of inquiry is to assert that something is, as he maintains as follows: It is the same thing that can be thought and that can be. What can be spoken and thought must be; for it is possible for it to be, but impossible for nothing to be. . . . One path only is left for us to speak of, namely, that it is. In this path are very many signs that “what is” is uncreated and indestructible; it is complete, immovable, and without end. [Simplicius, *Commentary on Aristotle’s Physics*]

His point is that we can say anything that we want about reality, so long as we don’t use the word “not”, since that would involve the path of denial. Establishing the path of assertion is only preliminary. The next step is to draw out the implications of asserting only that something is. The result is that we arrive at the qualities of the One, namely, that it is eternal, indivisible, unmoving,

and round.

The first implication of the path of assertion, then, is that whatever exists must be eternal, that is, uncreated and indestructible. If we say that a thing came into existence or will go out of existence, like a bicycle, then this would require saying that the bicycle “is not” before it was manufactured and “is not” after it is melted down for scrap metal. But that would take us down the path of denial since we’d be using the term “not” twice, and thus uttering nonsense. He writes, [The One is eternal], for how can “what is” be going to be in the future? Or how could it come into being? If it came into being, then it is not. Nor is it, if it is going to be in the future. Thus is becoming extinguished and passing away not to be heard of. [Simplicius, Commentary on Aristotle’s Physics] The second implication of the path of assertion is that whatever exists is indivisible. For, if we say that a bicycle has parts, then we maintain one of its parts are here where the handlebar is, but not there where the seat is. Again, we use the word “not” which takes us down the impossible path of denial. Parmenides writes, [The One] is not divisible, since it is all alike, and there is no more of it in one place than in another, to hinder it from holding together, nor less of it, but everything is full of what is. For this reason it is wholly continuous; for what is, is in contact with what is. [Ibid]

Third, whatever exists is unmoving, since movement requires us to say, for example, that the bicycle is now in this location, but not in that location. Again this takes us down the path of denial. He writes, It is immovable in the bonds of mighty chains, without beginning and without end; since coming into being and passing away have been driven afar, and true belief has cast them away. It is the same, and it rests in the self-same place, abiding in itself. And thus it remains constant in its place; for hard necessity keeps it in the bonds of the limit that holds it fast on every side. For this reason it is not permitted to “what is” to be infinite; for it is in need of nothing; while, if it were infinite, it would stand in need of everything. [Ibid]

Finally, whatever exists is round. If it had any other shape, then one part would be greater, and another part smaller, for example, the wheel of a bicycle is larger than the pedal. This, though, would require us to say that one part is not like the other part, yet again taking us down the path of denial. Compare that to a perfect sphere where any place you point to on it will be identical in shape to any other. He writes, “Since it has a furthest limit, it is complete on every side, like the mass of a rounded sphere, equally poised from the center in every direction; for it cannot be greater or smaller in one place than in another.”

According to Parmenides, then, what we can say about reality is that it is an eternal, single, unmoving, and round thing, which is the One. This strangely means that no other object exists, like a bicycle, which comes into existence, or has parts, or moves, or is non-spherical. That is, there are no bicycles, rocks, trees or people: the entirety of the cosmos consists of the One.

### **Anaxagoras: Mind and the Divisibility of Material Ingredients**

Anaxagoras (500–428 BCE) held that the world is comprised of infinitely divisible portions of ingredients (seeds) that are set in motion by a cosmic Mind. Anaxagoras was born into a wealthy family from the Ionian city Clazomenae (near Miletus), and eventually abandoned his inheritance to devote himself to philosophy. He was a student of Anaximenes (the third of the founding philosophers from Miletus). For around 20 years he lived and taught in the city of Athens. While there, he stated that the sun was just a mass of burning iron, and not a divine being as mythologists claimed. For this act of irreligion he was sentenced to death, although he was

ultimately punished with exile. When he first heard of his sentence by the Athenian court, he said "Nature has long since condemned both them and me." After relocating to a new city, the citizens there held him in high regard and upon his death put the following inscription on his tomb: "Here lies Anaxagoras, who reached for truth, the farthest bounds in heavenly speculations."

Being a pluralist like Empedocles, Anaxagoras also held that the cosmos is composed of many material ingredients, and not just a single one. Also like Empedocles, he held that all of the ingredients swirl around in a cosmic blender, and create individual things like rocks and trees as they move around. Here, though, is where his similarities with Empedocles end. There are five major themes to Anaxagoras's philosophy, the first of which is that the material ingredients of the cosmos exist in a completely vacuumless environment (that is, a plenum—a term that means the opposite of vacuum). While today we assume that material things float in empty space, Anaxagoras denied this, maintaining that all the material stuff swirling around in the cosmic blender is packed solid, with no empty areas. The second feature of his theory is that things are infinitely divisible. That is, if you take a material thing and divide it in half, then that part in half, you can keep doing this on to infinity. He makes his point here: All things were together, infinite both in amount and in smallness, for the small, too, was infinite. And because all things were together, nothing was distinguishable on account of its smallness; for air and aether covered all things, both being infinite, for these are the most important [ingredients] in the total mixture both in number and in size. [Simplicius, Commentary on Aristotle's Physics]

Related to this is the third feature of his theory that there are worlds within worlds. Deep within the tiny elements of our world, there are miniature worlds composed of even tinier elements. These worlds are much like ours and contain animals people, farms and cities.

The fourth feature of this view is encapsulated in his statement that "A portion of everything is in everything". For the sake of clarity, let's suppose that there are four main material ingredients in the cosmic mix, namely earth, air, fire and water (Anaxagoras' surviving writings do not contain a clear list of elements). Let's say that the rock in my front yard is composed of 97% earth, 1% air, 1% fire, and 1% water. No matter how small of a piece of the rock I examine, it will contain the same portions of these four material ingredients. In each piece I examine, earth will predominate, and thus give it its characteristic of rock-like solidity. Similarly, a glass of wine might contain 97% water, 1% earth, 1% air, and 1% fire, and so too with every microscopic drop of wine that I examine. Anaxagoras describes his view of portions here: Since the portions of the great and of the small are equal in amount, for this reason, too, all things will be in everything. Nor is it possible for them to be apart, but all things have a portion of everything. Since it is impossible for there to be a least thing, they cannot be separated, nor come to be by themselves. They must be now, just as they were in the beginning, all together. In all things many things are contained, and an equal number both in the greater and in the smaller of the things that are separated off. [Ibid]

Thus, within the giant cosmic blender, portions of all the material ingredients are spread throughout the mix, and the variety of things that we see in the world around us is already contained within the primordial mix. This, according to Anaxagoras, helps explain how things change. When a piece of wood disintegrates into earth, the elements of earth were already embedded within it. When the wood ignites into fire, the fire was already embedded within it. In some passages, Anaxagoras uses the term "seeds" to express this notion of the ingredient portions that are within everything.

The fifth main feature of his theory is that Mind is the external force that accounts for all the motion, growth and change that occurs within the material ingredients. Mind is the motor that causes the giant blender to churn the mixture of stuff. He writes, "All things were mixed up together; then Mind came and arranged them all in distinct order." Mind for Anaxagoras performs much the same function that Love and Strife perform for Empedocles. He describes its function in the following: Mind has power over all things, both greater and smaller, that have life. Mind had power over the whole revolution, so that it began to revolve in the beginning. It began to revolve first from a small beginning; but the revolution now extends over a larger space, and will extend over a larger still. All the things that are mingled together and separated off and distinguished are all known by Mind. [Ibid]

In the above, Anaxagoras maintains that Mind begins by making swirls within small areas of the mix, and this slowly passes to larger areas.

In short, the primary function of Mind is to initiate motion within the cosmic mix of material ingredients. To that extent, it functions as a force of physics. But is it anything more than this? Anaxagoras also seems to suggest that Mind has a partly divine function; but to the extent that it is divine, it is not an anthropomorphized god like Zeus or some other divine being of religious devotion. While we may like to know more about the kind of thing this Mind is, Anaxagoras does not provide the details. In fact, Aristotle criticizes Anaxagoras for inventing the notion of Mind as an artificial crutch to prop up his theory. Aristotle writes, "When Anaxagoras cannot explain why something is necessarily as it is, he drags in Mind, but otherwise he will use anything rather than Mind to explain a particular phenomenon" (Aristotle, *Metaphysics*, 985a18).

In any case, with his two-pronged theory of (1) material stuff and (2) Mind, Anaxagoras holds the honor of being the first matter/spirit dualist in Western philosophy. That is, according to Anaxagoras's dualism, there are two radically distinct types of things in the cosmos, matter and Mind, each of which performs its unique role in creating the universe and all that it contains.

## **F. ATOMISTS**

The next important advance in Presocratic philosophy was a theory called Atomism. While most of the previous theories about the universe that we've examined so far have been rather strange, Atomism is different in that its essential features are the ones that we hold today. Its central thesis is that the world is composed of indivisible particles called atoms that exist within empty space. Everything contained in the universe, then, results from the clumping together of these atomic particles. It is tempting to think that the originators of this theory had a special insight into the nature of the physical world, but the reality is that it was just a lucky guess. There was no scientific equipment at the time that could prove or disprove any proposed theory of the cosmos. The Presocratic philosophers were all insatiably curious about the nature of things and stretched their imaginations to the farthest limits, proposing every conceivable explanation. With such a diversity of ideas being explored, one was bound to get it right, and it turned out to be Atomism. However, it took over 2,000 years for civilization to realize this, and when physicists of the twentieth-century finally discovered what they believed was the tiniest particle of matter, they named it the atom, in honor of this Presocratic theory.

Two Presocratic philosophers are associated with the theory of Atomism: Leucippus, who proposed the theory, and his student Democritus who systematized it. Very little is known about

Leucippus' life, but he is reported to have been a student of Zeno, and may have come from the city of Elea, home of both Parmenides and Zeno. He wrote a work called *The Great World System*, none of which survives in itself, although its contents may have been incorporated into the writings of Democritus, who we do know much more about. Democritus (460-350 BCE) was from the Greek coastal city of Abdera (now in modern-day Greece). Born into a wealthy family, he was tutored by Persian astronomers, and, after his father's death, traveled extensively learning what he could. At some point he became a student of Leucippus as well as the Pythagoreans and perhaps also of Anaxagoras. He secluded himself from the public, but nonetheless became famous for his knowledge of natural phenomena and the ability to predict the weather. One story reports that he met with Socrates in Athens, without revealing to Socrates who he was. A prolific writer, he composed dozens of works in the areas of ethics, physics, astronomy, mathematics, and music, none of which, unfortunately, survive. His lasting fame in philosophy, though, is his development of Leucippus' atomism.

### **Atoms in the Void**

The central notion of atomism is that the universe is composed of an infinite number of atoms that are dispersed throughout an infinite vacuum of empty space (or "void"), with no beginning in time. This is the exact opposite of Anaxagoras's position in two important ways. First, Anaxagoras argued that matter was infinitely divisible. That is, if you take a rock, break it in half, then that in half, and so on, you will never arrive at a smallest piece. You could in theory keep splitting that thing in half forever. Atomism denies this: if you keep breaking apart the rock, eventually you'll arrive at a tiny component, an atom, that cannot be broken down any further into smaller pieces. Second, Anaxagoras argued that the cosmos is a vacuumless plenum: it contains no empty space and even the tiniest area is jam-packed with material stuff. Atomism also denies this: atoms exist in a vacuum of empty space. Their reasoning is that if there was no empty space, then things would be so squeezed together they couldn't move.

According to Leucippus and Democritus, the atoms themselves have several features. Each atom is of the same substance, colorless, uncreated, indestructible, unalterable, homogeneous, solid, and indivisible. Their shapes and sizes have infinite variations, and they are spread throughout the universe. They are also continually moving, or at least vibrating, within the vacuum of empty space. While in motion, they collide with each other, and, when they do, sometimes they rebound, other times they join together and form compound bodies that we are able to perceive through our senses. An early philosopher describes this view of the atomists here: Substances are unlimited in multitude and atomic ... and scattered in the void. When they approach one another or collide or become entangled, the compounds appear as water or fire or as a plant or a human. But all things are atoms, which he calls forms; there is nothing else. [Plutarch, *Against Colotes*]

Differences in objects result from changes in the shape, arrangement, density, and position of the atoms.

### **The Mind as Material**

It's one thing to account for the composition of rocks and other inanimate objects in terms of material atoms clumped together. However, Leucippus and Democritus argue that everything in the universe is composed of the material stuff of atoms, including conscious human beings; there are no non-physical spirits or souls, or gods. In philosophy this is a position called materialism, that is, only material things exist, and the challenge of materialism is to explain how conscious

thought in humans can be a purely material thing. Throughout much of history, philosophers argued that this was impossible, and that human thought could only take place in a non-physical soul or spirit. After all, conscious thoughts do not seem to be the kinds of things that take up physical space. They are not like three-dimensional rocks and trees. But the atomists argued that conscious thoughts are indeed material, very much like rocks and trees.

While minds are material, they are rather unique material things, and the Atomists explained them with two special kinds of atoms: fire-atoms and image-particles. First, human minds are composed of fire-atoms that are distributed throughout the human body; think of them as a type of perceptual tissue, sort of like the role that today we give neurons. Second, all visible objects emit tiny image-particles which fly off in all directions. (The concept of the image-particle is often translated "idols" from the Greek word *eidola* which Democritus used). With the thickness of only one atom, the image-particles preserve the shape of the original object. A rock, for example, continually sheds image-particles, which have the shape of the rock itself. I mentally perceive the rock, then, when the image-particles strike my eye and excite my fire-atoms. One early philosopher describes this aspect of the atomist theory here: [Leucippus and Democritus] attributed sight to certain image-particles, of the same shape as the object, which were continually streaming off from the objects of sight and impacting the eye. [Alexander, *On the Senses*]

The mental act of thinking is a more focused form of perception. Some places in my body that contain fire-atoms are so densely compressed that image-particles excite motion in them as they pass through them; hence, thought arises.

In addition to explaining human thought, another challenge of materialism is explaining the nature of divine beings such as God that are traditionally thought to be non-material spirits. The atomists had a physical explanation of these too. Some image-particles are very large, and appear in the shape of humans, which we perceive in our dreams. An early philosopher provides this summary of Democritus's view of the gods: Democritus says that certain image-particles of atoms approach humans, and of them some cause good and others evil... These are large and immense, and difficult to destroy though not indestructible. They indicate the future in advance to people when they are seen to emit voices. As a result people of ancient times, upon perceiving the appearances of these things, supposed that they are a god, though there is no other god aside from these having an indestructible nature. [Sextus Empiricus, *Against the Mathematicians*, 9.19]

The gods, then, are not spiritual beings that reside on Mount Olympus: they are only strange image-particles that excite our imaginations. This essentially amounts to a denial of the existence of God, which is a rather controversial side effect of atomism's materialism.

Another controversial side effect of materialism is a view called determinism: all events are determined according to the strict laws that govern the operations of material things. Since, according to materialism, human beings are composed only of material stuff, then all human actions are also determined, hence there is no free will. We see this in the following statements about Democritus by two early philosophers, [Democritus held that] everything that happens, happens of necessity. Motion is the cause of the production of everything, and he calls this necessity. [Diogenes Laertius, *Lives*, "Democritus"]

Democritus, the author of the Atomic Philosophy, preferred admitting the necessity of fate to depriving indivisible bodies of their natural motions. [Cicero, *On Fate*, 10]

According to atomism, then, all human actions are determined by the laws that govern the movement of atoms. We noted already how atomism foreshadowed the general makeup of the universe held by modern physicists. Similarly, their commitment to materialism and determinism foreshadows views that dominate contemporary philosophy of mind. Nevertheless, in its time it was just one of many Presocratic theories battling with its rivals for attention.

## The Ionian Philosophers

Ionia was the name given to the island realm in the Aegean Sea between Greece and Turkey. It has the distinction of being the birthplace of Western science and philosophy. Rather than relying on supernatural explanations for the appearance of the **Sun, Moon, planets** and **stars**, the philosophers attempted to understand nature and looked for laws that described its behaviour. The recorded history of Greek philosophy actually began in Miletus, on the coast of Turkey (Asia Minor). Here, in the 6th century BC, **Thales, Anaximander** and **Anaximenes** developed their ideas about the **Universe**. This trio of early scientists were materialists: they believed that the Earth and everything else in the Universe was made from a material (rather than spiritual) substance. However, their opinions differed as to what this substance was. Thales believed it was water, Anaximander asserted it was 'the Infinite' and Anaximenes proposed that it was air.

Pythagoras (560-480 BC) studied under Thales before traveling to Egypt and Mesopotamia, ultimately establishing his own school of philosophy in Croton(southern Italy).

Following on from the Milesian school were 5th century BC philosophers such as the Eleatic School (**Xenophanes**, Parmenides, Zeno), the later Ionians (**Heraclitus**, Empedocles and Anaxagoras) and the Atomists (Leucippus and Democritus). The **Ionian philosophers** are also referred to as pre-Socratic philosophers, as much of their work was completed before the time of Socrates (469-399 BC).

**Note:** most of what we know about the Presocratics in general and so the Ionians comes from Aristotle. Although Plato frequently mentions them, it is usually in passing. Aristotle is the first source to attempt systematic exposition of their doctrines. One Aristotelian account is that contained in METAPHYSICS I, Chs. 4ff. Aristotle's primary aim here was to provide a background for his own solution to the problems the Presocratics discussed. Hence his treatment is given from a different standpoint than that of pure historical exposition. [Are his expositions slanted?] [Many of the other sources Kirk, Raven, and Schofield cite depend directly or indirectly on Aristotle--for example, Theophrastus, Aristotle's nephew and disciple, and Simplicius, whose information, according to KRS, comes from Theophrastus. The attempt to get "behind" Aristotle on the understanding of these philosophers is a natural reaction to the sheer bulk of writings which have survived from Plato and Aristotle compared to that of the writings of their predecessors.

## General features of the Ionian philosophy:

1. Designation of a ruling element, either earth, air, fire, or water, which Aristotle interprets as having been for them the basic substance, or (Greek) 'ousia' of everything. There is implied here according to Aristotle a conservation principle: substance is conserved--it can be neither created nor destroyed.
2. Preoccupation with the cyclic changes in nature (birth-death, day- night, summer-winter) and

how to explain them.

3. Departure from mythological patterns of explanation (i. e., by means of stories of personal divinities and their actions) for natural occurrences, although some mythological language remains.
4. Seeing these cycles as changes in element- dominance (i. e., at night, light recedes and darkness becomes dominant), interpreted by some of the Ionians as eternal warfare of the elements (seemingly Anaximander and Heraclitus).
5. Perhaps ascribing immanent Mind or Intelligence to one or more of the elements.

## Democritus

**Democritus** (c. 460 - 370 B.C.), sometimes known as the "**Laughing Philosopher**", was a Pre-Socratic Greek philosopher from **Thrace** in northern Greece. Along with his teacher, **Leucippus**, he was the founder of the Greek philosophical school of Atomism and developed a Materialist account of the natural world.

Although he was a contemporary of Socrates, he usually considered Pre-Socratic in that his philosophy and his approach were more similar to other Pre-Socratic thinkers than to Socrates and Plato.

## Life

Democritus was born in **Abdera**, a town in Thrace in northern Greece, which had originally been settled by Greek colonists from the **Ionian** city of Teos in present-day Turkey). His date of birth is usually given as 460 B.C., although some authorities argue for up to ten years earlier, and some for a few years later.

His father was very wealthy, and had even received the Persian king **Xerxes** on his march through Abdera. According to some accounts, Democritus studied **astronomy** and **theology** from some of the **magi** (wise men) Xerxes left in Abdera in gratitude.

On his father's death, Democritus spent his inheritance on extensive travels to distant countries, to satisfy his thirst for knowledge. He is reputed to have traveled to **Persia**, **Babylon** (modern-day Iraq), **Asia** (as far as India), **Ethiopia** and **Egypt** (where he lived for five years, being particularly impressed by the Egyptian mathematicians). He also traveled throughout **Greece** to acquire a knowledge of its culture and meet Greek philosophers (he may have met the physician **Hippocrates** (c. 460 B.C.) and Socrates, and possibly also Anaxagoras, whom he praises in his own work), and his wealth enabled him to purchase their writings. He was known as one of the most traveled scholars of his time.

On returning to his native land, (now with no means of subsistence), he settled with his brother **Damosis**, and occupied himself with natural philosophy and gave public lectures in order to pay his way. His greatest influence was certainly **Leucippus**, with whom he is credited as co-founding Atomism. In around 440 B.C. or 430 B.C., Leucippus had founded a school at Abdera, and Democritus became his star pupil. There are no existing writings which can be **positively** attributed to Leucippus, and so it is virtually impossible to identify which ideas were unique to Democritus and which are Leucippus', or any views about which they disagreed.

From anecdotal evidence, Democritus was known for his disinterestedness, modesty and

simplicity, and appeared to live solely for his studies, declining the public honors he was offered. One story has him deliberately blinding himself in order to be less disturbed in his pursuits, although it is more likely that he lost his sight in old age. He was always cheerful and ready to see the comical side of life, and he was affectionately known as the "Laughing Philosopher" (although some writers maintain that he laughed at the foolishness of other people and was also known as "The Mocker"). His knowledge of natural phenomena (such as diagnosing illnesses and predicting the weather) gave him the reputation of being something of a prophet or soothsayer.

It is believed that he died at the age of 90, in about 370 B.C., although some writers have him living to over a hundred years of age.

## Work

**Diogenes Laertius**, the 3rd Century historian of the early Greek philosophers, lists a large number of works by Democritus, covering Ethics, physics, mathematics, music and cosmology, including two works called the "**Great World System**" and the "**Little World System**". However, his works have survived only in secondhand reports, sometimes unreliable or conflicting. Much of the best evidence comes from Aristotle, who was perhaps the chief critic of Atomism, although he nevertheless praised Democritus for arguing from sound considerations, and considered Democritus an important rival in natural philosophy.

Like many other Pre-Socratic philosophies, the Atomism of Leucippus and Democritus was largely a response to the unacceptable claim of Parmenides that change was impossible without something coming from nothing (which is itself impossible), and thus any perceived change or movement was merely illusory.

In the Atomist version, there are multiple unchanging material principles which constantly rearrange themselves in order to affect what we see as changes. These principles are very small, indivisible and indestructible building blocks known as atoms (from the Greek "atomos", meaning "uncuttable"). All of reality and all the objects in the universe are composed of different arrangements of these eternal atoms and an infinite void, in which they form different combinations and shapes.

There is no room in this theory for the concept of a God, and essentially Atomism is a type of Materialism or Physicalism, as well as being atheistic and deterministic in its outlook. However, Democritus did allow for the existence of the human soul, which he saw as composed of a special kind of spherical atom, in constant motion, and he explained the senses in a similar manner.

In Epistemology, Democritus distinguished two types of knowledge: "**bastard**" (subjective and insufficient knowledge, obtained by perception through the senses), and "**legitimate**" (genuine knowledge obtained by the processing of this unreliable "bastard" knowledge using inductive reasoning).

In the field of Ethics, Democritus pursued a type of early Hedonism or Epicureanism. He was one of the earliest thinkers to explicitly posit a supreme good or goal, which he called cheerfulness or well-being and identified with the untroubled enjoyment of life. He saw this as achievable through moderation in the pursuit of pleasure, through distinguishing useful pleasures from harmful ones,

and through conforming to conventional morality. He is quoted as saying, "The brave man is he who overcomes not only his enemies but his pleasures".

Democritus was also a pioneer of mathematics and geometry, and produced works entitled "**On Numbers**", "**On Geometrics**", "**On Tangencies**", "**On Mapping**" and "**On Irrationals**", although these works have not survived. We do know that he was among the first to observe that a **cone** or pyramid has one-third the volume of a cylinder or prism respectively with the same base and height.

He was also the first philosopher we know who realized that the celestial body we call the **Milky Way** is actually formed from the light of distant stars, even though many later philosophers (including Aristotle) argued against this. He was also among the first to propose that the universe contains many worlds, some of which may be inhabited. He devoted many of the later years of his life to researches into the properties of minerals and plants, although we have no record of any **conclusions** he may have drawn.

## **The Sophists**

The term sophist (sophistēs) derives from the Greek words for wisdom (sophia) and wise (sophos). Since Homer at least, these terms had a wide range of application, extending from practical know-how and prudence in public affairs to poetic ability and theoretical knowledge. Notably, the term sophia could be used to describe disingenuous cleverness long before the rise of the sophistic movement. Theognis, for example, writing in the sixth century B.C.E., counsels Cynos to accommodate his discourse to different companions, because such cleverness (sophiē) is superior to even a great excellence (Elegiac Poems, 1072, 213).

In the fifth century B.C.E. the term sophistēs was still broadly applied to 'wise men', including poets such as Homer and Hesiod, the Seven Sages, the Ionian 'physicists' and a variety of seers and prophets. The narrower use of the term to refer to professional teachers of virtue or excellence (aretē) became prevalent in the second half of the fifth century B.C.E., although this should not be taken to imply the presence of a clear distinction between philosophers, such as Socrates, and sophists, such as Protagoras, Gorgias and Prodicus. This much is evident from Aristophanes' play *The Clouds* (423 B.C.E.), in which Socrates is depicted as a sophist and Prodicus praised for his wisdom.

Aristophanes' play is a good starting point for understanding Athenian attitudes towards sophists. *The Clouds* depicts the tribulations of Strepsiades, an elderly Athenian citizen with significant debts. Deciding that the best way to discharge his debts is to defeat his creditors in court, he attends *The Thinkery*, an institute of higher education headed up by the sophist Socrates. When he fails to learn the art of speaking in *The Thinkery*, Strepsiades persuades his initially reluctant son, Pheidippides, to accompany him. Here they encounter two associates of Socrates, the Stronger and the Weaker Arguments, who represent lives of justice and self-discipline and injustice and self-indulgence respectively. On the basis of a popular vote, the Weaker Argument prevails and leads Pheidippides into *The Thinkery* for an education in how to make the weaker argument defeat the stronger. Strepsiades later revisits *The Thinkery* and finds that Socrates has turned his son into a pale and useless intellectual. When Pheidippides graduates, he subsequently prevails not only over Strepsiades' creditors, but also beats his father and offers a persuasive rhetorical justification for the act. As Pheidippides prepares to beat his mother, Strepsiades' indignation motivates him to

lead a violent mob attack on The Thinkery.

Aristophanes' depiction of Socrates the sophist is revealing on at least three levels. In the first instance, it demonstrates that the distinction between Socrates and his sophistic counterparts was far from clear to their contemporaries. Although Socrates did not charge fees and frequently asserted that all he knew was that he was ignorant of most matters, his association with the sophists reflects both the indeterminacy of the term sophist and the difficulty, at least for the everyday Athenian citizen, of distinguishing his methods from theirs. Secondly, Aristophanes' depiction suggests that the sophistic education reflected a decline from the heroic Athens of earlier generations. Thirdly, the attribution to the sophists of intellectual deviousness and moral dubiousness predates Plato and Aristotle.

Hostility towards sophists was a significant factor in the decision of the Athenian *dēmos* to condemn Socrates to the death penalty for impiety. Anytus, who was one of Socrates' accusers at his trial, was clearly unconcerned with details such as that the man he accused did not claim to teach *aretē* or extract fees for so doing. He is depicted by Plato as suggesting that sophists are the ruin of all those who come into contact with them and as advocating their expulsion from the city (*Meno*, 91c-92c). Equally as revealing, in terms of attitudes towards the sophists, is Socrates' discussion with Hippocrates, a wealthy young Athenian keen to become a pupil of Protagoras (*Protagoras*, 312a). Hippocrates is so eager to meet Protagoras that he wakes Socrates in the early hours of the morning, yet later concedes that he himself would be ashamed to be known as a sophist by his fellow citizens.

Plato depicts Protagoras as well aware of the hostility and resentment engendered by his profession (*Protagoras*, 316c-e). It is not surprising, Protagoras suggests, that foreigners who profess to be wise and persuade the wealthy youth of powerful cities to forsake their family and friends and consort with them would arouse suspicion. Indeed, Protagoras claims that the sophistic art is an ancient one, but that sophists of old, including poets such as Homer, Hesiod and Simonides, prophets, seers and even physical trainers, deliberately did not adopt the name for fear of persecution. Protagoras says that while he has adopted a strategy of openly professing to be a sophist, he has taken other precautions – perhaps including his association with the Athenian general Pericles – in order to secure his safety.

The low standing of the sophists in Athenian public opinion does not stem from a single source. No doubt suspicion of intellectuals among the many was a factor. New money and democratic decision-making, however, also constituted a threat to the conservative Athenian aristocratic establishment. This threatening social change is reflected in the attitudes towards the concept of excellence or virtue (*aretē*) alluded to in the summary above. Whereas in the Homeric epics *aretē* generally denotes the strength and courage of a real man, in the second half of the fifth century B.C.E. it increasingly became associated with success in public affairs through rhetorical persuasion.

In the context of Athenian political life of the late fifth century B.C.E. the importance of skill in persuasive speech, or rhetoric, cannot be underestimated. The development of democracy made mastery of the spoken word not only a precondition of political success but also indispensable as a form of self-defence in the event that one was subject to a lawsuit. The sophists accordingly answered a growing need among the young and ambitious. *Meno*, an ambitious pupil of Gorgias, says that the *aretē* – and hence function – of a man is to rule over people, that is, manage his

public affairs so as to benefit his friends and harm his enemies (73c-d). This is a long-standing ideal, but one best realised in democratic Athens through rhetoric. Rhetoric was thus the core of the sophistic education (Protagoras, 318e), even if most sophists professed to teach a broader range of subjects.

Suspicion towards the sophists was also informed by their departure from the aristocratic model of education (*paideia*). Since Homeric Greece, *paideia* had been the preoccupation of the ruling nobles and was based around a set of moral precepts befitting an aristocratic warrior class. The business model of the sophists presupposed that *aretē* could be taught to all free citizens, a claim that Protagoras implicitly defends in his great speech regarding the origins of justice. The sophists were thus a threat to the status quo because they made an indiscriminate promise – assuming capacity to pay fees – to provide the young and ambitious with the power to prevail in public life. One could therefore loosely define sophists as paid teachers of *aretē*, where the latter is understood in terms of the capacity to attain and exercise political power through persuasive speech. This is only a starting point, however, and the broad and significant intellectual achievement of the sophists, which we will consider in the following two sections, has led some to ask whether it is possible or desirable to attribute them with a unique method or outlook that would serve as a unifying characteristic while also differentiating them from philosophers.

Scholarship in the nineteenth century and beyond has often fastened on method as a way of differentiating Socrates from the sophists. For Henry Sidgwick (1872, 288-307), for example, whereas Socrates employed a question-and-answer method in search of the truth, the sophists gave long epideictic or display speeches for the purposes of persuasion. It seems difficult to maintain a clear methodical differentiation on this basis, given that Gorgias and Protagoras both claimed proficiency in short speeches and that Socrates engages in long eloquent speeches – many in mythical form – throughout the Platonic dialogues. It is moreover simply misleading to say that the sophists were in all cases unconcerned with truth, as to assert the relativity of truth is itself to make a truth claim. A further consideration is that Socrates is guilty of fallacious reasoning in many of the Platonic dialogues, although this point is less relevant if we assume that Socrates' logical errors are unintentional.

G.B. Kerferd (1981a) has proposed a more nuanced set of methodological criteria to differentiate Socrates from the sophists. According to Kerferd, the sophists employed eristic and antilogical methods of argument, whereas Socrates disdained the former and saw the latter as a necessary but incomplete step on the way towards dialectic. Plato uses the term eristic to denote the practice – it is not strictly speaking a method – of seeking victory in argument without regard for the truth. We find a representation of eristic techniques in Plato's dialogue *Euthydemus*, where the brothers Euthydemus and Dionysiodorus deliberately use egregiously fallacious arguments for the purpose of contradicting and prevailing over their opponent. Antilogic is the method of proceeding from a given argument, usually that offered by an opponent, towards the establishment of a contrary or contradictory argument in such a way that the opponent must either abandon his first position or accept both positions. This method of argumentation was employed by most of the sophists, and examples are found in the works of Protagoras and Antiphon.

Kerferd's claim that we can distinguish between philosophy and sophistry by appealing to dialectic remains problematic, however. In what are usually taken to be the "early" Platonic dialogues, we find Socrates' employing a dialectical method of refutation referred to as the *elenchus*. As Nehamas has argued (1990), while the *elenchus* is distinguishable from eristic because of its

concern with the truth, it is harder to differentiate from antilogic because its success is always dependent upon the capacity of interlocutors to defend themselves against refutation in a particular case. In Plato's "middle" and "later" dialogues, on the other hand, according to Nehamas' interpretation, Plato associates dialectic with knowledge of the forms, but this seemingly involves an epistemological and metaphysical commitment to a transcendent ontology that most philosophers, then and now, would be reluctant to uphold.

More recent attempts to explain what differentiates philosophy from sophistry have accordingly tended to focus on a difference in moral purpose or in terms of choices for different ways of life, as Aristotle elegantly puts it (*Metaphysics* IV, 2, 1004b24-5). Section 4 will return to the question of whether this is the best way to think about the distinction between philosophy and sophistry. Before this, however, it is useful to sketch the biographies and interests of the most prominent sophists and also consider some common themes in their thought.

## 2. The Sophists

### a. Protagoras

Protagoras of Abdera (c. 490-420 B.C.E.) was the most prominent member of the sophistic movement and Plato reports he was the first to charge fees using that title (*Protagoras*, 349a). Despite his animus towards the sophists, Plato depicts Protagoras as quite a sympathetic and dignified figure.

One of the more intriguing aspects of Protagoras' life and work is his association with the great Athenian general and statesman Pericles (c. 495-429 B.C.E.). Pericles, who was the most influential statesman in Athens for more than 30 years, including the first two years of the Peloponnesian War, seems to have held a high regard for philosophers and sophists, and Protagoras in particular, entrusting him with the role of drafting laws for the Athenian foundation city of Thurii in 444 B.C.E.

From a philosophical perspective, Protagoras is most famous for his relativistic account of truth – in particular the claim that 'man is the measure of all things' – and his agnosticism concerning the Gods. The first topic will be discussed in section 3b. Protagoras' agnosticism is famously articulated in the claim that 'concerning the gods I am not in a position to know either that (or how) they are or that (or how) they are not, or what they are like in appearance; for there are many things that prevent knowledge, the obscurity of the matter and the brevity of human life' (*DK*, 80B4). This seems to express a form of religious agnosticism not completely foreign to educated Athenian opinion. Despite this, according to tradition, Protagoras was convicted of impiety towards the end of his life. As a consequence, so the story goes, his books were burnt and he drowned at sea while departing Athens. It is perhaps significant in this context that Protagoras seems to have been the source of the sophistic claim to 'make the weaker argument defeat the stronger' parodied by Aristophanes.

Plato suggests that Protagoras sought to differ his educational offering from that of other sophists, such as Hippias, by concentrating upon instruction in *aretē* in the sense of political virtue rather than specialised studies such as astronomy and mathematics (*Protagoras*, 318e).

Apart from his works *Truth* and *On the Gods*, which deal with his relativistic account of truth and

agnosticism respectively, Diogenes Laertius says that Protagoras wrote the following books: Antilogies, Art of Eristics, Imperative, On Ambition, On Incorrect Human Actions, On those in Hades, On Sciences, On Virtues, On Wrestling, On the Original State of Things and Trial over a Fee.

### **b. Gorgias**

Gorgias of Leontini (c.485 – c.390 B.C.E.) is generally considered as a member of the sophistic movement, despite his disavowal of the capacity to teach aretē (Meno, 96c). The major focus of Gorgias was rhetoric and given the importance of persuasive speaking to the sophistic education, and his acceptance of fees, it is appropriate to consider him alongside other famous sophists for present purposes.

Gorgias visited Athens in 427 B.C.E. as the leader of an embassy from Leontini with the successful intention of persuading the Athenians to make an alliance against Syracuse. He travelled extensively around Greece, earning large sums of money by giving lessons in rhetoric and epideictic speeches.

Plato's Gorgias depicts the rhetorician as something of a celebrity, who either does not have well thought out views on the implications of his expertise, or is reluctant to share them, and who denies his responsibility for the unjust use of rhetorical skill by errant students. Although Gorgias presents himself as moderately upstanding, the dramatic structure of Plato's dialogue suggests that the defence of injustice by Polus and the appeal to the natural right of the stronger by Callicles are partly grounded in the conceptual presuppositions of Gorgianic rhetoric.

Gorgias' original contribution to philosophy is sometimes disputed, but the fragments of his works On Not Being or Nature and Helen – discussed in detail in section 3c – feature intriguing claims concerning the power of rhetorical speech and a style of argumentation reminiscent of Parmenides and Zeno. Gorgias is also credited with other orations and encomia and a technical treatise on rhetoric titled At the Right Moment in Time.

### **c. Antiphon**

The biographical details surrounding Antiphon the sophist (c. 470-411 B.C.) are unclear – one unresolved issue is whether he should be identified with Antiphon of Rhamnus (a statesman and teacher of rhetoric who was a member of the oligarchy which held power in Athens briefly in 411 B.C.E.). However, since the publication of fragments from his On Truth in the early twentieth century he has been regarded as a major representative of the sophistic movement.

On Truth, which features a range of positions and counterpositions on the relationship between nature and convention (see section 3a below), is sometimes considered an important text in the history of political thought because of its alleged advocacy of egalitarianism: Those born of illustrious fathers we respect and honour, whereas those who come from an undistinguished house we neither respect nor honour. In this we behave like barbarians towards one another. For by nature we all equally, both barbarians and Greeks, have an entirely similar origin: for it is fitting to fulfil the natural satisfactions which are necessary to all men: all have the ability to fulfil these in the same way, and in all this none of us is different either as barbarian or as Greek; for we all breathe into the air with mouth and nostrils and we all eat with the hands (quoted in Untersteiner, 1954).

Whether this statement should be taken as expressing the actual views of Antiphon, or rather as

part of an antilogical presentation of opposing views on justice remains an open question, as does whether such a position rules out the identification of Antiphon the sophist with the oligarchical Antiphon of Rhamnus.

#### **d. Hippias**

The exact dates for Hippias of Elis are unknown, but scholars generally assume that he lived during the same period as Protagoras. Whereas Plato's depictions of Protagoras – and to a lesser extent Gorgias – indicate a modicum of respect, he presents Hippias as a comic figure who is obsessed with money, pompous and confused.

Hippias is best known for his polymathy (DK 86A14). His areas of expertise seem to have included astronomy, grammar, history, mathematics, music, poetry, prose, rhetoric, painting and sculpture. Like Gorgias and Prodicus, he served as an ambassador for his home city. His work as a historian, which included compiling lists of Olympic victors, was invaluable to Thucydides and subsequent historians as it allowed for a more precise dating of past events. In mathematics he is attributed with the discovery of a curve – the quadratrix – used to trisect an angle.

In terms of his philosophical contribution, Kerferd has suggested, on the basis of Plato's *Hippias Major* (301d-302b), that Hippias advocated a theory that classes or kinds of thing are dependent on a being that traverses them. It is hard to make much sense of this alleged doctrine on the basis of available evidence. As suggested above, Plato depicts Hippias as philosophically shallow and unable to keep up with Socrates in dialectical discussion.

#### **e. Prodicus**

Prodicus of Ceos, who lived during roughly the same period as Protagoras and Hippias, is best known for his subtle distinctions between the meanings of words. He is thought to have written a treatise titled *On the Correctness of Names*.

Plato gives an amusing account of Prodicus' method in the following passage of the *Protagoras*: Prodicus spoke up next: ... 'those who attend discussions such as this ought to listen impartially, but not equally, to both interlocutors. There is a distinction here. We ought to listen impartially but not divide our attention equally: More should go to the wiser speaker and less to the more unlearned ... In this way our meeting would take a most attractive turn, for you, the speakers, would then most surely earn the respect, rather than the praise, of those listening to you. For respect is guilelessly inherent in the souls of listeners, but praise is all too often merely a deceitful verbal expression. And then, too, we, your audience, would be most cheered, but not pleased, for to be cheered is to learn something, to participate in some intellectual activity; but to be pleased has to do with eating or experiencing some other pleasure in the body' (337a-c).

Prodicus' epideictic speech, *The Choice of Heracles*, was singled out for praise by Xenophon (*Memorabilia*, II.1.21-34) and in addition to his private teaching he seems to have served as an ambassador for Ceos (the birthplace of Simonides) on several occasions.

Socrates, although perhaps with some degree of irony, was fond of calling himself a pupil of Prodicus (*Protagoras*, 341a; *Meno*, 96d).

## **f. Thrasymachus**

Thrasymachus was a well-known rhetorician in Athens in the latter part of the fifth century B.C.E., but our only surviving record of his views is contained in Plato's Cleitophon and Book One of The Republic. He is depicted as brash and aggressive, with views on the nature of justice that will be examined in section 3a.

## **3. Major Themes of Sophistic Thought**

### **a. Nature and Convention**

The distinction between *physis* (nature) and *nomos* (custom, law, convention) was a central theme in Greek thought in the second half of the fifth century B.C.E. and is especially important for understanding the work of the sophists. Before turning to sophistic considerations of these concepts and the distinction between them, it is worth sketching the meaning of the Greek terms. Aristotle defines *physis* as 'the substance of things which have in themselves as such a source of movement' (Metaphysics, 1015a13-15). The term *physis* is closely connected with the Greek verb to grow (*phuō*) and the dynamic aspect of *physis* reflects the view that the nature of things is found in their origins and internal principles of change. Some of the Ionian thinkers now referred to as presocratics, including Thales and Heraclitus, used the term *physis* for reality as a whole, or at least its underlying material constituents, referring to the investigation of nature in this context as *historia* (inquiry) rather than philosophy.

The term *nomos* refers to a wide range of normative concepts extending from customs and conventions to positive law. It would be misleading to regard the term as referring only to arbitrary human conventions, as Heraclitus' appeal to the distinction between human *nomoi* and the one divine *nomos* (DK 22B2 and 114) makes clear. Nonetheless, increased travel, as exemplified by the histories of Herodotus, led to a greater understanding of the wide array of customs, conventions and laws among communities in the ancient world. This recognition sets up the possibility of a dichotomy between what is unchanging and according to nature and what is merely a product of arbitrary human convention.

The dichotomy between *physis* and *nomos* seems to have been something of a commonplace of sophistic thought and was appealed to by Protagoras and Hippias among others. Perhaps the most instructive sophistic account of the distinction, however, is found in Antiphon's fragment On Truth.

Antiphon applies the distinction to notions of justice and injustice, arguing that the majority of things which are considered just according to *nomos* are in direct conflict with nature and hence not truly or naturally just (DK 87 A44). The basic thrust of Antiphon's argument is that laws and conventions are designed as a constraint upon our natural pursuit of pleasure. In a passage suggestive of the discussion on justice early in Plato's Republic, Antiphon also asserts that one should employ justice to one's advantage by regarding the laws as important when witnesses are present, but disregarding them when one can get away with it. Although these arguments may be construed as part of an antilogical exercise on nature and convention rather than prescriptions for a life of prudent immorality, they are consistent with views on the relation between human nature and justice suggested by Plato's depiction of Callicles and Thrasymachus in the Gorgias and Republic respectively.

Callicles, a young Athenian aristocrat who may be a real historical figure or a creation of Plato's imagination, was not a sophist; indeed he expresses disdain for them (Gorgias, 520a). His account of the relation between *physis* and *nomos* nonetheless owes a debt to sophistic thought. According to Callicles, Socrates' arguments in favour of the claim that it is better to suffer injustice than to commit injustice trade on a deliberate ambiguity in the term justice. Callicles argues that conventional justice is a kind of slave morality imposed by the many to constrain the desires of the superior few. What is just according to nature, by contrast, is seen by observing animals in nature and relations between political communities where it can be seen that the strong prevail over the weak. Callicles himself takes this argument in the direction of a vulgar sensual hedonism motivated by the desire to have more than others (*pleonexia*), but sensual hedonism as such does not seem to be a necessary consequence of his account of natural justice.

Although the sophist Thrasymachus does not employ the *physis/nomos* distinction in Book One of the Republic, his account of justice (338d-354c) belongs within a similar conceptual framework. Like Callicles, Thrasymachus accuses Socrates of deliberate deception in his arguments, particularly in the claim the art of justice consists in a ruler looking after their subjects. According to Thrasymachus, we do better to think of the ruler/ruled relation in terms of a shepherd looking after his flock with a view to its eventual demise. Justice in conventional terms is simply a naive concern for the advantage of another. From another more natural perspective, justice is the rule of the stronger, insofar as rulers establish laws which persuade the multitude that it is just for them to obey what is to the advantage of the ruling few. An alternative, and more edifying, account of the relation between *physis* and *nomos* is found in Protagoras' great speech (Protagoras, 320c-328d). According to Protagoras' myth, man was originally set forth by the gods into a violent state of nature reminiscent of that later described by Hobbes. Our condition improved when Zeus bestowed us with shame and justice; these enabled us to develop the skill of politics and hence civilized communal relations and virtue. Apart from supporting his argument that *aretē* can be taught, this account suggests a defence of *nomos* on the grounds that nature by itself is insufficient for the flourishing of man considered as a political animal.

## **b. Relativism**

The primary source on sophistic relativism about knowledge and/or truth is Protagoras' famous 'man is the measure' statement. Interpretation of Protagoras' thesis has always been a matter of controversy. Caution is needed in particular against the temptation to read modern epistemological concerns into Protagoras' account and sophistic teaching on the relativity of truth more generally.

Protagoras measure thesis is as follows: A human being is the measure of all things, of those things that are, that they are, and of those things that are not, that they are not (DK, 80B1). There is near scholarly consensus that Protagoras is referring here to each human being as the measure of what is rather than 'humankind' as such, although the Greek term for 'human' – *hōanthrōpos* – certainly does not rule out the second interpretation. Plato's Theaetetus (152a), however, suggests the first reading and I will assume its correctness here. On this reading we can regard Protagoras as asserting that if the wind, for example, feels (or seems) cold to me and feels (or seems) warm to you, then the wind is cold for me and is warm for you.

Another interpretative issue concerns whether we should construe Protagoras' statement as primarily ontological or epistemological in intent. Scholarship by Kahn, Owen and Kerferd among

others suggests that, while the Greeks lacked a clear distinction between existential and predicative uses of 'to be', they tended to treat existential uses as short for predicative uses. Having sketched some of the interpretative difficulties surrounding Protagoras' statement, we are still left with at least three possible readings (Kerferd, 1981a, 86). Protagoras could be asserting that (i) there is no mind-independent wind at all, but merely private subjective winds (ii) there is a wind that exists independently of my perception of it, but it is in itself neither cold nor warm as these qualities are private (iii) there is a wind that exists independently of my perception of it and this is both cold and warm insofar as two qualities can inhere in the same mind-independent 'entity'.

All three interpretations are live options, with (i) perhaps the least plausible. Whatever the exact import of Protagoras' relativism, however, the following passage from the Theaetetus suggests that it was also extended to the political and ethical realm:

Whatever in any particular city is considered just and admirable is just and admirable in that city, for so long as the convention remains in place (167c).

One difficulty this passage raises is that while Protagoras asserted that all beliefs are equally true, he also maintained that some are superior to others because they are more subjectively fulfilling for those who hold them. Protagoras thus seems to want it both ways, insofar as he removes an objective criterion of truth while also asserting that some subjective states are better than others. His appeal to better and worse beliefs could, however, be taken to refer to the persuasiveness and pleasure induced by certain beliefs and speeches rather than their objective truth.

The other major source for sophistic relativism is the *Dissoi Logoi*, an undated and anonymous example of Protagorean antilogic. In the *Dissoi Logoi* we find competing arguments on five theses, including whether the good and the bad are the same or different, and a series of examples of the relativity of different cultural practices and laws. Overall the *Dissoi Logoi* can be taken to uphold not only the relativity of truth but also what Barney (2006, 89) has called the variability thesis: whatever is good in some qualified way is also bad in another respect and the same is the case for a wide range of contrary predicates.

### **c. Language and Reality**

Understandably given their educational program, the sophists placed great emphasis upon the power of speech (*logos*). *Logos* is a notoriously difficult term to translate and can refer to thought and that about which we speak and think as well as rational speech or language. The sophists were interested in particular with the role of human discourse in the shaping of reality. Rhetoric was the centrepiece of the curriculum, but literary interpretation of the work of poets was also a staple of sophistic education. Some philosophical implications of the sophistic concern with speech are considered in section 4, but in the current section it is instructive to concentrate on Gorgias' account of the power of rhetorical *logos*.

The extant fragments attributed to the historical Gorgias indicate not only scepticism towards essential being and our epistemic access to this putative realm, but an assertion of the omnipotence of persuasive *logos* to make the natural and practical world conform to human desires. Reporting upon Gorgias' speech *About the Nonexistent or on Nature*, Sextus says that the rhetorician, while adopting a different approach from that of Protagoras, also eliminated the

criterion (DK, 82B3). The elimination of the criterion refers to the rejection of a standard that would enable us to distinguish clearly between knowledge and opinion about being and nature. Whereas Protagoras asserted that man is the measure of all things, Gorgias concentrated upon the status of truth about being and nature as a discursive construction.

About the Nonexistent or on Nature transgresses the injunction of Parmenides that one cannot say of what is that it is not. Employing a series of conditional arguments in the manner of Zeno, Gorgias asserts that nothing exists, that if it did exist it could not be apprehended, and if it was apprehended it could not be articulated in logos. The elaborate parody displays the paradoxical character of attempts to disclose the true nature of beings through logos: For that by which we reveal is logos, but logos is not substances and existing things. Therefore we do not reveal existing things to our comrades, but logos, which is something other than substances (DK, 82B3) Even if knowledge of beings was possible, its transmission in logos would always be distorted by the rift between substances and our apprehension and communication of them. Gorgias also suggests, even more provocatively, that insofar as speech is the medium by which humans articulate their experience of the world, logos is not evocative of the external, but rather the external is what reveals logos. An understanding of logos about nature as constitutive rather than descriptive here supports the assertion of the omnipotence of rhetorical expertise. Gorgias' account suggests there is no knowledge of nature sub specie aeternitatis and our grasp of reality is always mediated by discursive interpretations, which, in turn, implies that truth cannot be separated from human interests and power claims.

In the Encomium to Helen Gorgias refers to logos as a powerful master (DK, 82B11). If humans had knowledge of the past, present or future they would not be compelled to adopt unpredictable opinion as their counsellor. The endless contention of astronomers, politicians and philosophers is taken to demonstrate that no logos is definitive. Human ignorance about non-existent truth can thus be exploited by rhetorical persuasion insofar as humans desire the illusion of certainty imparted by the spoken word: The effect of logos upon the condition of the soul is comparable to the power of drugs over the nature of bodies. For just as different drugs dispel different secretions from the body, and some bring an end to disease and others to life, so also in the case of logoi, some distress, others delight, some cause fear, others make hearers bold, and some drug and bewitch the soul with a kind of evil persuasion (DK, 82B11).

All who have persuaded people, Gorgias says, do so by moulding a false logos. While other forms of power require force, logos makes all its willing slave.

This account of the relation between persuasive speech, knowledge, opinion and reality is broadly consistent with Plato's depiction of the rhetorician in the Gorgias. Both Protagoras' relativism and Gorgias' account of the omnipotence of logos are suggestive of what we moderns might call a deflationary epistemic anti-realism.

#### **4. The Distinction Between Philosophy and Sophistry**

The distinction between philosophy and sophistry is in itself a difficult philosophical problem. This closing section examines the attempt of Plato to establish a clear line of demarcation between philosophy and sophistry.

As alluded to above, the terms 'philosopher' and 'sophist' were disputed in the fifth and fourth

century B.C.E., the subject of contention between rival schools of thought. Histories of philosophy tend to begin with the Ionian 'physicist' Thales, but the presocratics referred to the activity they were engaged in as *historia* (inquiry) rather than *philosophia* and although it may have some validity as a historical projection, the notion that philosophy begins with Thales derives from the mid nineteenth century. It was Plato who first clearly and consistently refers to the activity of *philosophia* and much of what he has to say is best understood in terms of an explicit or implicit contrast with the rival schools of the sophists and Isocrates (who also claimed the title *philosophia* for his rhetorical educational program).

The related questions as to what a sophist is and how we can distinguish the philosopher from the sophist were taken very seriously by Plato. He also acknowledges the difficulty inherent in the pursuit of these questions and it is perhaps revealing that the dialogue dedicated to the task, *Sophist*, culminates in a discussion about the being of non-being. Socrates converses with sophists in *Euthydemus*, *Hippias Major*, *Hippias Minor*, *Gorgias*, *Protagoras* and the *Republic* and discusses sophists at length in the *Apology*, *Sophist*, *Statesman* and *Theaetetus*. It can thus be argued that the search for the sophist and distinction between philosophy and sophistry are not only central themes in the Platonic dialogues, but constitutive of the very idea and practice of philosophy, at least in its original sense as articulated by Plato.

This point has been recognised by recent poststructuralist thinkers such as Jacques Derrida and Jean Francois-Lyotard in the context of their project to place in question central presuppositions of the Western philosophical tradition deriving from Plato. Derrida attacks the interminable trial prosecuted by Plato against the sophists with a view to exhuming 'the conceptual monuments marking out the battle lines between philosophy and sophistry' (1981, 106). Lyotard views the sophists as in possession of unique insight into the sense in which discourses about what is just cannot transcend the realm of opinion and pragmatic language games (1985, 73-83).

The prospects for establishing a clear methodological divide between philosophy and sophistry are poor. Apart from the considerations mentioned in section 1, it would be misleading to say that the sophists were unconcerned with truth or genuine theoretical investigation and Socrates is clearly guilty of fallacious reasoning in many of the Platonic dialogues. In the *Sophist*, in fact, Plato implies that the Socratic technique of dialectical refutation represents a kind of 'noble sophistry' (*Sophist*, 231b).

This in large part explains why contemporary scholarship on the distinction between philosophy and sophistry has tended to focus on a difference in moral character. Nehamas, for example, has argued that 'Socrates did not differ from the sophists in method but in overall purpose' (1990, 13). Nehamas relates this overall purpose to the Socratic *elenchus*, suggesting that Socrates' disavowal of knowledge and of the capacity to teach *aretē* distances him from the sophists. However, this way of demarcating Socrates' practice from that of his sophistic counterparts, Nehamas argues, cannot justify the later Platonic distinction between philosophy and sophistry, insofar as Plato forfeited the right to uphold the distinction once he developed a substantive philosophical teaching, that is, the theory of forms.

There is no doubt much truth in the claim that Plato and Aristotle depict the philosopher as pursuing a different way of life than the sophist, but to say that Plato defines the philosopher either through a difference in moral purpose, as in the case of Socrates, or a metaphysical presumption regarding the existence of transcendent forms, as in his later work, does not in itself adequately

characterise Plato's critique of his sophistic contemporaries. Once we attend to Plato's own treatment of the distinction between philosophy and sophistry two themes quickly become clear: the mercenary character of the sophists and their overestimation of the power of speech. For Plato, at least, these two aspects of the sophistic education tell us something about the persona of the sophist as the embodiment of a distinctive attitude towards knowledge.

The fact that the sophists taught for profit may not seem objectionable to modern readers; most present-day university professors would be reluctant to teach pro bono. It is clearly a major issue for Plato, however. Plato can barely mention the sophists without contemptuous reference to the mercenary aspect of their trade: particularly revealing examples of Plato's disdain for sophistic money-making and avarice are found at Apology 19d, Euthydemus 304b-c, Hippias Major 282b-

e, Protagoras 312c-d and Sophist 222d-224d, and this is not an exhaustive list. Part of the issue here is no doubt Plato's commitment to a way of life dedicated to knowledge and contemplation. It is significant that students in the Academy, arguably the first higher education institution, were not required to pay fees. This is only part of the story, however.

A good starting point is to consider the etymology of the term *philosophia* as suggested by the Phaedrus and Symposium. After completing his palinode in the Phaedrus, Socrates expresses the hope that he never be deprived of his 'erotic' art. Whereas the speechwriter Lysias presents *erōs* (desire, love) as an unseemly waste of expenditure (Phaedrus, 257a), in his later speech Socrates demonstrates how *erōs* impels the soul to rise towards the forms. The followers of Zeus, or philosophy, Socrates suggests, educate the object of their *erōs* to imitate and partake in the ways of the God. Similarly, in the Symposium, Socrates refers to an exception to his ignorance. Approving of the suggestion by Phaedrus that the drinking party eulogise *erōs*, Socrates states that *ta erōtika* (the erotic things) are the only subject concerning which he would claim to possess rigorous knowledge (Symposium, 177 d-e). When it is his turn to deliver a speech, Socrates laments his incapacity to compete with the Gorgias-influenced rhetoric of Agathon before delivering Diotima's lessons on *erōs*, represented as a daimonion or semi-divine intermediary between the mortal and the divine. *Erōs* is thus presented as analogous to philosophy in its etymological sense, a striving after wisdom or completion that can only be temporarily fulfilled in this life by contemplation of the forms of the beautiful and the good (204a-b). The philosopher is someone who strives after wisdom – a friend or lover of wisdom – not someone who possesses wisdom as a finished product, as the sophists claimed to do and as their name suggests.

Plato's emphasis upon philosophy as an 'erotic' activity of striving for wisdom, rather than as a finished state of completed wisdom, largely explains his distaste for sophistic money-making. The sophists, according to Plato, considered knowledge to be a ready-made product that could be sold without discrimination to all comers. The Theages, a Socratic dialogue whose authorship some scholars have disputed, but which expresses sentiments consistent with other Platonic dialogues, makes this point with particular clarity. The farmer Demodokos has brought his son, Theages, who is desirous of wisdom, to Socrates. As Socrates questions his potential pupil regarding what sort of wisdom he seeks, it becomes evident that Theages seeks power in the city and influence over other men. Since Theages is looking for political wisdom, Socrates refers him to the statesmen and the sophists. Disavowing his ability to compete with the expertise of Gorgias and Prodicus in this respect, Socrates nonetheless admits his knowledge of the erotic things, a subject about which he claims to know more than any man who has come before or indeed any of those to come

(Theages, 128b). In response to the suggestion that he study with a sophist, Theages reveals his intention to become a pupil of Socrates. Perhaps reluctant to take on an unpromising pupil, Socrates insists that he must follow the commands of his daimonion, which will determine whether those associating with him are capable of making any progress (Theages, 129c). The dialogue ends with an agreement that all parties make trial of the daimonion to see whether it permits of the association.

One need only follow the suggestion of the Symposium that *erōs* is a daimonion to see that Socratic education, as presented by Plato, is concomitant with a kind of 'erotic' concern with the beautiful and the good, considered as natural in contrast to the purely conventional. Whereas the sophists accept pupils indiscriminately, provided they have the money to pay, Socrates is oriented by his desire to cultivate the beautiful and the good in promising natures. In short, the difference between Socrates and his sophistic contemporaries, as Xenophon suggests, is the difference between a lover and a prostitute. The sophists, for Xenophon's Socrates, are prostitutes of wisdom because they sell their wares to anyone with the capacity to pay (*Memorabilia*, I.6.13). This – somewhat paradoxically – accounts for Socrates' shamelessness in comparison with his sophistic contemporaries, his preparedness to follow the argument wherever it leads. By contrast, Protagoras and Gorgias are shown, in the dialogues that bear their names, as vulnerable to the conventional opinions of the paying fathers of their pupils, a weakness contributing to their refutation. The sophists are thus characterised by Plato as subordinating the pursuit of truth to worldly success, in a way that perhaps calls to mind the activities of contemporary advertising executives or management consultants.

The overestimation of the power of human speech is the other theme that emerges clearly from Plato's (and Aristotle's) critique of the sophists. In the *Sophist*, Plato says that dialectic – division and collection according to kinds – is the knowledge possessed by the free man or philosopher (*Sophist*, 253c). Here Plato reintroduces the difference between true and false rhetoric, alluded to in the *Phaedrus*, according to which the former presupposes the capacity to see the one in the many (*Phaedrus*, 266b). Plato's claim is that the capacity to divide and synthesise in accordance with one form is required for the true expertise of *logos*. Whatever else one makes of Plato's account of our knowledge of the forms, it clearly involves the apprehension of a higher level of being than sensory perception and speech. The philosopher, then, considers rational speech as oriented by a genuine understanding of being or nature. The sophist, by contrast, is said by Plato to occupy the realm of falsity, exploiting the difficulty of dialectic by producing discursive semblances, or phantasms, of true being (*Sophist*, 234c). The sophist uses the power of persuasive speech to construct or create images of the world and is thus a kind of 'enchanter' and imitator.

This aspect of Plato's critique of sophistry seems particularly apposite in regard to Gorgias' rhetoric, both as found in the Platonic dialogue and the extant fragments attributed to the historical Gorgias. In response to Socratic questioning, Gorgias asserts that rhetoric is an all-comprehending power that holds under itself all of the other activities and occupations (*Gorgias*, 456a). He later claims that it is concerned with the greatest good for man, namely those speeches that allow one to attain freedom and rule over others, especially, but not exclusively, in political settings (452d). As suggested above, in the context of Athenian public life the capacity to persuade was a precondition of political success. For present purposes, however, the key point is that freedom and rule over others are both forms of power: respectively power in the sense of liberty or capacity to do something, which suggests the absence of relevant constraints, and power in the sense of

dominion over others. Gorgias is suggesting that rhetoric, as the expertise of persuasive speech, is the source of power in a quite comprehensive sense and that power is 'the good'. What we have here is an assertion of the omnipotence of speech, at the very least in relation to the determination of human affairs.

The Socratic position, as becomes clear later in the discussion with Polus (466d-e), and is also suggested in Meno (88c-d) and Euthydemus (281d-e), is that power without knowledge of the good is not genuinely good. Without such knowledge not only 'external' goods, such as wealth and health, not only the areas of expertise that enable one to attain such so-called goods, but the very capacity to attain them is either of no value or harmful. This in large part explains the so-called Socratic paradox that virtue is knowledge.

Plato's critique of the sophists' overestimation of the power of speech should not be conflated with his commitment to the theory of the forms. For Plato, the sophist reduces thinking to a kind of making: by asserting the omnipotence of human speech the sophist pays insufficient regard to the natural limits upon human knowledge and our status as seekers rather than possessors of knowledge (Sophist, 233d). This critique of the sophists does perhaps require a minimal commitment to a distinction between appearance and reality, but it is an oversimplification to suggest that Plato's distinction between philosophy and sophistry rests upon a substantive metaphysical theory, in large part because our knowledge of the forms for Plato is itself inherently ethical. Plato, like his Socrates, differentiates the philosopher from the sophist primarily through the virtues of the philosopher's soul (McKoy, 2008). Socrates is an embodiment of the moral virtues, but love of the forms also has consequences for the philosopher's character.

There is a further ethical and political aspect to the Platonic and Aristotelian critique of the sophists' overestimation of the power of speech. In Book Ten of Nicomachean Ethics, Aristotle suggests that the sophists tended to reduce politics to rhetoric (1181a12-15) and overemphasised the role that could be played by rational persuasion in the political realm. Part of Aristotle's point is that there is an element to living well that transcends speech. As Hadot eloquently puts it, citing Greek and Roman sources, 'traditionally people who developed an apparently philosophical discourse without trying to live their lives in accordance with their discourse, and without their discourse emanating from their life experience, were called sophists' (2004, 174).

The testimony of Xenophon, a Greek general and man of action, is instructive here. In his treatise on hunting, (*Cynēgeticus*, 13.1-9), Xenophon commends Socratic over sophistic education in *aretē*, not only on the grounds that the sophists hunt the young and rich and are deceptive, but also because they are men of words rather than action. The importance of consistency between one's words and actions if one is to be truly virtuous is a commonplace of Greek thought, and this is one important respect in which the sophists, at least from the Platonic-Aristotelian perspective, fell short.

One might think that a denial of Plato's demarcation between philosophy and sophistry remains well-motivated simply because the historical sophists made genuine contributions to philosophy. But this does not entail the illegitimacy of Plato's distinction. Once we recognise that Plato is pointing primarily to a fundamental ethical orientation relating to the respective personas of the philosopher and sophist, rather than a methodological or purely theoretical distinction, the tension dissolves. This is not to deny that the ethical orientation of the sophist is likely to lead to a certain kind of philosophising, namely one which attempts to master nature, human and external, rather

than understand it as it is.

Sophistry for Socrates, Plato and Aristotle represents a choice for a certain way of life, embodied in a particular attitude towards knowledge which views it as a finished product to be transmitted to all comers. Plato's distinction between philosophy and sophistry is not simply an arbitrary viewpoint in a dispute over naming rights, but is rather based upon a fundamental difference in ethical orientation. Neither is this orientation reducible to concern with truth or the cogency of one's theoretical constructs, although it is not unrelated to these.

Where the philosopher differs from the sophist is in terms of the choice for a way of life that is oriented by the pursuit of knowledge as a good in itself while remaining cognisant of the necessarily provisional nature of this pursuit.

## **Socrates**

Socrates was an ancient Greek philosopher considered to be the main source of Western thought. He was condemned to death for his Socratic method of questioning. Socrates was a scholar, teacher and philosopher born in ancient Greece. His Socratic method laid the groundwork for Western systems of logic and philosophy.

When the political climate of Greece turned against him, Socrates was sentenced to death by hemlock poisoning in 399 B.C. He accepted this judgment rather than fleeing into exile.

## **Early Years**

Born circa 470 B.C. in Athens, Greece, Socrates's life is chronicled through only a few sources: the dialogues of Plato and Xenophon and the plays of Aristophanes.

Because these writings had other purposes than reporting his life, it is likely none present a completely accurate picture. However, collectively, they provide a unique and vivid portrayal of Socrates's philosophy and personality.

Socrates was the son of Sophroniscus, an Athenian stonemason and sculptor, and Phaenarete, a midwife. Because he wasn't from a noble family, he probably received a basic Greek education and learned his father's craft at a young age. It's believed Socrates worked as mason for many years before he devoted his life to philosophy.

Contemporaries differ in their account of how Socrates supported himself as a philosopher. Both Xenophon and Aristophanes state Socrates received payment for teaching, while Plato writes Socrates explicitly denied accepting payment, citing his poverty as proof.

Socrates married Xanthippe, a younger woman, who bore him three sons: Lamprocles, Sophroniscus and Menexenus. There is little known about her except for Xenophon's characterization of Xanthippe as "undesirable."

He writes she was not happy with Socrates's second profession and complained that he wasn't supporting family as a philosopher. By his own words, Socrates had little to do with his sons' upbringing and expressed far more interest in the intellectual development of Athens' other young boys.

## **Life in Athens**

Athenian law required all able-bodied males serve as citizen soldiers, on call for duty from ages 18 until 60. According to Plato, Socrates served in the armored infantry – known as the hoplite – with shield, long spear and face mask.

He participated in three military campaigns during the Peloponnesian War, at Delium, Amphipolis and Potidaea, where he saved the life of Alcibiades, a popular Athenian general.

Socrates was known for his fortitude in battle and his fearlessness, a trait that stayed with him throughout his life. After his trial, he compared his refusal to retreat from his legal troubles to a soldier's refusal to retreat from battle when threatened with death.

Plato's Symposium provides the best details of Socrates' physical appearance. He was not the ideal of Athenian masculinity. Short and stocky, with a snub nose and bulging eyes, Socrates always seemed to appear to be staring.

However, Plato pointed out that in the eyes of his students, Socrates possessed a different kind of attractiveness, not based on a physical ideal but on his brilliant debates and penetrating thought.

Socrates always emphasized the importance of the mind over the relative unimportance of the human body. This credo inspired Plato's philosophy of dividing reality into two separate realms, the world of the senses and the world of ideas, declaring that the latter was the only important one.

## **Philosophy**

Socrates believed that philosophy should achieve practical results for the greater well-being of society. He attempted to establish an ethical system based on human reason rather than theological doctrine.

Socrates pointed out that human choice was motivated by the desire for happiness. Ultimate wisdom comes from knowing oneself. The more a person knows, the greater his or her ability to reason and make choices that will bring true happiness.

Socrates believed that this translated into politics with the best form of government being neither a tyranny nor a democracy. Instead, government worked best when ruled by individuals who had the greatest ability, knowledge and virtue, and possessed a complete understanding of themselves.

## **Plato's Life and Times**

Born into an aristocratic and influential Athenian family, and raised during the Peloponnesian War, Plato's family expected him to go into politics, but he fell in love with philosophy. After his mentor, Socrates, was executed in 399 bce, a disgusted Plato left Athens. He returned in 387 to found the Academy, often considered the first university.

His Academy developed thinkers such as Aristotle. Plato spent time writing dialogues, typically divided into stages: early, middle, and late. These reflect developments in his thinking; he extended and effectively completed Socrates's interest in ethics to a systematic philosophy encompassing

ideas in metaphysics and epistemology.

## **Plato's Theory of Knowledge**

Plato's rationalism marks him out from other ancient thinkers such as Heraclitus in his rejection of the ever-changing physical world as a source of knowledge. Instead, he proposed that knowledge is to be found in a transcendent realm of the Forms. The Forms, however, do not provide a convincing theory of knowledge. Instead, Aristotle's account of knowledge gained through experience is more convincing and supported by the philosophy of Locke in the 17<sup>th</sup> century and later A.J Ayer in the 20<sup>th</sup> century. While Ayer's verificationism raises the problem of relativism, I shall argue that these problems must be solved by an empiricist approach, rather than Plato's mysterious realm of the Forms.

Heraclitus observed that 'No man can step in the same river twice', which acknowledged that the physical world is constantly changing. Plato insists, however, that there exists an eternal, perfect and immaterial form of physical objects; the properties of physical objects and values, such as justice, beauty and truth. This can be seen as part of a convincing theory of knowledge to the extent that it explains how a person can recognise particular things as belonging to a universal idea, even if those particular things are imperfect reflections of their universal form; for example, one can recognise different dogs as dogs because they have an innate memory of the form of a dog, according to Plato. This innate memory, Plato explains, comes from before birth when the soul belonged in the realm of the forms.

The problem with this theory of knowledge, however, is that there is no evidence that there actually exists a realm of the forms. John Locke was an empiricist who argued that we gain knowledge from experience. We understand the concept of a dog not because we recollect the Form of a dog that exists independently of any particular dog, but because we are able to compare a particular dog to other dogs that we have experienced. Using our imagination, we can then abstract the concept of a dog from those experiences of the things that all dogs have in common. Aristotle, also an empiricist, argued that 'goodness', rather than existing in a mysterious realm of the forms as the source of all perfection and existence, is only meaningful as a judgment about whether or not something fulfils its function in practice, e.g. a knife is 'good' if it cuts well.

One may argue that not all knowledge is based on experience, for example, the idea of a unicorn. Some knowledge, therefore must be innate in a way similar to how Plato describes. John Locke, however, in his 'Essay concerning Human Understanding', argues that even ideas in our imagination are based on a combination of things drawn from experience. He suggests that if certain ideas were innate, like the law of non-contradiction, then 'children and idiots' would understand them, but there is no evidence that they do.

Iris Murdoch, in the 20<sup>th</sup> century, argued that Plato's theory of knowledge is convincing. She argued that there must exist a Platonic form of 'goodness' that guides us to become better people and rise to an external standard of morality. This may be convincing if we consider that without this, when we judge something as good or beautiful, we are just expressing an opinion based on popular opinion. This would mean that values are relative and we would be unable to judge others for acts or views that we intuitively perceive as absolutely wrong, e.g. rape or genocide. Plato was warning against relativism in his allegory of the cave when he describes those who are bound by popular opinion as being prisoners who merely see shadows on a wall as oppose to the real

objects of knowledge, the forms. Plato further explains this idea with the analogy of the divided line that shows that the forms are more real than physical objects by a ratio of 2:1, an idea that was influenced by Pythagoras.

Ayer, however, would argue that Plato's theory of knowledge is unconvincing because the Forms cannot be verified. He denied the existence of any "reality transcending the limits of all possible sense-experience" and argued that any statement that cannot be directly or indirectly verified is meaningless. This implies that statements about goodness and beauty (both of which Plato believes to be Forms of absolute truth) are relative and simply expressions of emotion. Ayer's approach to knowledge is more convincing than Plato's because it is based on what can be scientifically proven, however, the problems of relativism that have just been raised are unavoidable on Ayer's understanding of knowledge.

Aristotle and Locke's common sense empiricism more convincingly explains how we have knowledge of concepts derived from physical things. While there may be problems with relativism on Ayer's understanding of concepts like goodness and beauty, Plato's Forms are unverifiable. There must be a solution to the problems of relativism that are based on a scientific, verifiable view of the world.

**Knowledge and Reality** Plato believed that there are truths to be discovered; that knowledge is possible. Moreover, he held that truth is not, as the Sophists thought, relative. Instead, it is objective; it is that which our reason, used rightly, apprehends. Through his systematic philosophy, he developed a formidable rejection of skepticism, the view that we lack knowledge in some fundamental way.

**Believing and Knowing** For Plato, there is a distinction between believing and knowing. Since there are objective truths to be known, we may believe X, but belief alone does not guarantee we are correct. There are three necessary and sufficient conditions, according to Plato, for one to have knowledge: (1) the proposition must be believed; (2) the proposition must be true; and (3) the proposition must be supported by good reasons, which is to say, you must be justified in believing it. Thus, for Plato, knowledge is justified, true belief.

**Reason and the Forms** Since truth is objective, our knowledge of true propositions must be about real things. According to Plato, these real things are Forms. Their nature is such that the only mode by which we can know them is rationality. Forms are the eternal and immutable blueprints or models for everything that is. Consequently, they are more real than their particulars.

Because the Forms make particulars possible, they explain what is—we can understand what is by understanding the Forms. We can also extrapolate from particulars to get closer to contemplating the Forms. This extrapolation process is made possible by the way that reason works.

Unlike the senses, which can only tell us about this or that sensation, reason can think both about particulars and general concepts. Since the Forms are the most general things there are, the only way we can consider them is by way of our rationality. Moreover, Plato holds that our souls learned about the Forms before we were born, so we already know them—we have innate knowledge that needs to be elicited through the Socratic method.

## Plato's Rationalism

Following Parmenides, Plato privileges rationalism over empiricism, or reason over the senses, as the way we know. Unaided by the senses, reason will come to contemplate the Forms.

**Allegory of the Cave** Plato's Allegory of the Cave explains, among other things, how we come to the proper use of our reason to know the Forms.

## Immortality, Morality, and the Soul

### The Immortal Soul

The soul is immortal, according to Plato. In various dialogues, specifically the *Phaedo*, Plato articulates the relation between philosophy and the soul, where the activity of philosophy prepares the soul for a good death and afterlife. In this dialogue, Plato offers several arguments in support of the claim that the soul is immortal, one of which harkens back to the theory of recollection demonstrated in the *Meno*. (See Ch. 3.) Another argument involves the idea that there are two types of being, one of which is associated with perishable things, like human bodies, and another that is associated with imperishable things, like the soul.

**The Three-Part Soul** The soul consists of three parts: appetitive (appetites or urges), spirited (emotional), and rational. When one of the first two is not in control, the soul is in a state of disarray. In such a condition, individuals make poor choices and live unhappy lives.

**The Moral Soul** The moral soul is the harmonious and just soul guided by reason. This is the soul in which each of the two lower parts, appetite and spirit, are kept in alignment by reason.

**The Individual and the State** The individual is a microcosm of the state. The harmonious state is one in which each person performs his or her role according to his or her most prominent part of the soul or our nature: appetitive, spirited, or rational. The person driven most by his or her appetitive side is a producer, while the auxiliary is the spirited person, and the guardian is most rational. The producers are the laborers, carpenters, artists, and farmers of society; the auxiliaries are the soldiers, warriors, and police; and the guardians are the leaders, rulers, or philosopher-kings.

This arrangement lends itself to an aristocracy, a society ruled by a privileged class, rather than a democracy. This privilege is, however, practically speaking a burden. Doing what's best for society means thinking always and only about the right way to govern, the right way to achieve a unified state. The society Plato envisions is one he thinks can alone ensure people get their due. This, he thinks, is a meritocracy, or system of rule whereby people are distinguished by their abilities and achievements.

## Outline of Plato's contrast of knowledge and opinion:

1. Knowledge is a mental faculty/power that allows us to apprehend "being" (i.e., reality).
2. Ignorance is the opposite of knowledge.
3. Opinion is subject to error, but knowledge is not.
4. Opinion differs from knowledge
5. Different faculties involve different "spheres" (areas they govern). Opinion involves a different faculty, and has a different subject-matter.

6. Particular objects are subject to "opposite names." For example: The same house is beautiful to one person, ugly to another, and the same person is at one time young, at another time old.
7. Particulars are in the region between being and not-being.
8. Particulars are the subject-matter of opinion
9. Particulars are the subject-matter of opinion.
10. Eternal and immutable natures are the subject-matter of knowledge.

Opinion can possibly be true, in which case it serves as a successful guide to action (and this explains how Athens' heroes were good, they had correct opinions). But even true opinion, because it is only opinion, cannot be defended, and thus "like a runaway slave" flees when attacked. However, knowledge differs from mere opinion in that it can be defended by a logos, a rational explanation of why that opinion is true. Thus emerges the formula that knowledge is true opinion accompanied by a logos, or as it came to be expressed in the Western tradition, as "justified true belief."

This means that the real difference between opinion and knowledge lies in the "justification" (the logos). An opinion can become justified by showing how it can be deduced from other premises, if those premises are true. But no matter how validly we reason, Socrates saw that we cannot justify any opinion unless we start from premises known to be true, rather than just assumed as "hypotheses" in the way the mathematician assumes certain axioms. The series of justifications would seem to be infinite unless some "first" premises can be known directly and not inferred from "higher" premises. How can we attain knowledge of such premises which are not merely possibly true, like a mere hypothesis, but are necessarily true?

Thus, we can assume that, there are three minimum conditions for knowledge. They are, 1. **True** (it must be true) 2. **Believe** (we must actually believe it. Belief must be consciously held), 3. **Justification** is present (there must be sufficient evidence for it). Therefore, what is known has to be fact and thus true must come from the regard of the person acknowledging it as truth. The person must have an adequate basis for believing it, that is, have sufficient justification for believing it.

The purpose of belief is to represent the world accurately. Therefore, belief serves its role only if the formation, retention and revision of belief are sensitive to what one takes to be one's evidence. In the definition of belief, "Belief is a species of propositional attitude distinguished by their having the mind-to-world direction of fit". Most philosophers have assumed that belief is an inner state of mind, directly accessible to introspection and distinct from, though casually related to, the believer's behavior. Thus, belief plays a central role in theoretical reasoning (reason about what is so) and hence in practical reasoning (reason about what to do). We, therefore, need to know what we can do and how we can do is related to what we want. When seeking knowledge of these things we seek true belief about them. Thus, what we do is conditioned by what we believe. Belief issues in behavior only in conjunction with appropriate other propositional attitudes. In support of this theory, is the fact that not only can others check our claims to believe by considering whether we behave appropriately, but we ourselves may also take the results of such a test to overrule claims to believe that which we have sincerely made. Knowledge and belief are not only distinct attitudes but they also have a distinct and proprietary objectives. Whereas, belief can be true or false, knowledge is neither. But belief is a necessary condition for knowledge. Knowledge is acquired by deriving beliefs from other beliefs (foundation beliefs). Therefore, we accept belief(s) as a foundational principle because;

1. They are innate,
2. they are beliefs about present conscious experience,
3. They are beliefs that belong to our sense of experience.
4. They are self-evident.

## **Plato Theory Of Ideas**

Platonic theory of ideas is an answer to a fundamental question of metaphysics What is the ultimate reality of the world? As per the great thinker and Philosopher Plato, Ideas are the ultimate realities. In this world, there are lots of particular things but if we take these things in a particular way only, nothing general can be extracted. Thus, on the basis of some common qualities of things, Plato divides particular things into different classes. Ideas are nothing but essential features common to all members of these classes.

As an example, there is a class man, and every member of this class possesses a quality called manness. Thus, there exists an idea of manness. Likewise, there are several ideas including an idea of tree, idea of horseness etc. Throwing light on the importance of ideas, Plato says that the concept is important to understand a sentence. As an example, there is a sentence say, India is a democratic world. To understand it properly, we should have an idea of democracy. Here comes the necessity of ideas to plato Features of Ideas, as explained by Plato: . Ideas are substances as they are the ultimate realities of the world . Ideas are eternal because they exist beyond space and time . Ideas exist prior to particular things and apart from them . Ideas are many in number. Thus, Plato is a pluralist as he considers the reality to be more than one in number. However, bridging the gap between atomists and Parmenides, Plato says that ideas are unity in plurality.

There are many trees but idea of tree is one. . Ideas are perfect. For example, idea of beauty is a perfect idea. No other thing in the world exists that carries the same level of perfection. Discussing the origin and status of ideas, Plato says that there is a different world of ideas, also called heaven of ideas. It can be comprehended by our reason but this world of ideas does not depend on us for its existence. Plato, here, lays the foundation of Rationalism by saying that in human reason , there exist some universal principles which act as starting point of knowledge. On the other hand, by accentuating that ideas do not depend on us for their existence, Plato advocates Objective Idealism. Ideas have been presented in a scale as per the degree of comprehensiveness. Idea of Good is at the top that imparts axiological dimension to Platonic theory( Zeller).

Plato considers the reality to be good and beautiful. In views of Zeller, the theory also carries ontological dimensions because ideas are not mere mental constructions, they are the substances. W.C. states that ideas are epistemological because they have been considered as the starting point of knowledge. In addition, they are mystical because they have their own world ,different from our world. Succinctly put, ideas are the realities of the world. However, this consideration has left big questions: How this real world has been derived from the world of ideas? What is the relation between this world and the world of ideas? In answer to these questions, Plato has come up with two concepts:

- 1) Relation of appearance and reality
- 2) Concept of participation

According to Plato, world of ideas is a reality and our physical world is just a copy of it. In his book Republic, Plato takes an example of allegory of caves to prove his point. In this example, a man is considered to be fully chained, can't move from his place. Sunlight coming from behind makes his shadow on the wall in front of him. As the man can't move from his place, he is only able to see the shadow and nothing except that. Thus, he considers the shadow to be real. However, shadow is just an appearance. Reality is the sunlight coming from behind. Same is the case with our world. As we continuously see this world, we start considering it a reality. In actuality, reality is the ideas and this world is a mere shadow of ideas. Plato also provides second argument and opines that things and beings of the world participate in ideas. A particular thing may participate simultaneously in plurality of forms and assumes new forms when it undergoes any change. Ideas exist prior to things and apart from them. We can't think of man without having an idea of manness but not vice versa. Thus, ideas are necessary for this physical world to exist. Secondly, things of the physical world exist only to the extent that they participate in the world of ideas. Thus, ideas explain the physical world. Platonic theory draws praises from Whitehead but at the same time has been criticized on the basis of inconsistencies.

Successor, Aristotle, makes a severe attack by saying that ideas are posterior, not prior to things. He further says that ideas are abstract entities and they can not explain the existence of this concrete physical world. Plato considers two worlds in his theory, world of ideas and physical world. Because of this, he has been attacked by Aristotle of keeping this distinction between form (ideas) and matter. He says that Plato could not reconcile between form and matter. Plato stated that world of ideas is the only reality and this physical world a mere shadow, on the other hand he said that physical things are real to the extent they participate in the world of ideas. This seems illogical.

## **Dialectic**

Plato uses the term dialectic throughout his works to refer to whatever method he happens to be recommending as the vehicle of philosophy. The term, from *dialogesthai*, meaning to converse or talk through, gives insight into his core conception of the project. Yet it is also evident that he stresses different aspects of the conversational method in different dialogues.

The form of dialectic featured in the Socratic works became the basis of subsequent practice in the Academy—where it was taught by Aristotle—and in the teachings of the Skeptics during the Hellenistic Age. While the conversation in a Socratic dialogue unfolds naturally, it features a process by which even someone who lacks knowledge of a given subject (as Socrates in these works claims to do) may test the understanding of a putative expert. The testing consists of a series of questions posed in connection with a position the interlocutor is trying to uphold. The method presupposes that one cannot have knowledge of any fact in isolation; what is known must be embedded in a larger explanatory structure. Thus, in order to know if a certain act is pious, one must know what piety is. This requirement licenses the questioner to ask the respondent about issues suitably related to his original claim. If, in the course of this process, a contradiction emerges, the supposed expert is revealed not to command knowledge after all: if he did, his grasp of the truth would have enabled him to avoid contradiction. While both Socrates and the Skeptics hoped to find the truth (a *skeptikos* is after all a “seeker”), the method all too often reveals only the inadequacy of the respondent. Since he has fallen into contradiction, it follows that he is not an expert, but this does not automatically reveal what the truth is.

By the time of the composition of the Republic, Plato's focus had shifted to developing positive views, and thus "dialectic" was now thought of not as a technique of testing but as a means of "saying of each thing what it is." The Republic stresses that true dialectic is performed by thinking solely of the abstract and nonsensible realm of forms; it requires that reason secure an unhypothetical first principle (the Good) and then derive other results in light of it. Since this part of the dialogue is merely a programmatic sketch, however, no actual examples of the activity are provided, and indeed some readers have wondered whether it is really possible.

In the later dialogue Parmenides, dialectic is introduced as an exercise that the young Socrates must undertake if he is to understand the forms properly. The exercise, which Parmenides demonstrates in the second part of the work, is extremely laborious: a single instance involves the construction of eight sections of argument; the demonstration then takes up some three-quarters of the dialogue. The exercise challenges the reader to make a distinction associated with a sophisticated development of the theory of Platonic forms. Even after a general understanding has been achieved, repeating the exercise with different subjects allows one to grasp each subject's role in the world.

This understanding of dialectic gives a central place to specifying each subject's account in terms of genus and differentiae (and so, relatedly, to mapping its position in a genus-species tree). The Phaedrus calls the dialectician the person who can specify these relations—and thereby "carve reality at the joints." Continuity among all the kinds of dialectic in Plato comes from the fact that the genus-species divisions of the late works are a way of providing the accounts that dialectic sought in all the previous works.

## Plato's Theory of Soul

The intellectual world is teleological. That is to say nothing is written without purpose and each intellectual responds to; reflects upon; provides intellectual explanation and justification or critique and alternative to the issues and circumstances prevailing in his contemporary time-space. Plato's **Republic** is not an utopia addressed to no-one but a passionate appeal to fellow Athenians to overthrow the existing democratic governance that is in his opinion, the government of fools, which he "vows" to overthrow and replace it with the ideal state. Though he could not overthrow it, Roman aggressors did, couple of centuries later.

As the state is the institution of managing the common affairs of humans, Plato, like the modern liberal political theorists, begins with the dissection of human psychology with tripartite assumption of human soul. Plato's assumptions and views regarding the soul constitute the foundation and basis of his theory of Justice and thereby of Ideal State, which shall be elaborated in subsequent sections. Like the Idea of the Good, Plato avoids defining soul in terms of empirically verifiable facts but explores the world of desirable philosophical abstractions in the search of perfection. Plato's theory of Soul not only lays the foundation of his theory of justice to be attained in Ideal State ruled by the philosopher king/queen but is intimately related to his theory of Idea or Form. In fact soul is the means for the acquisition and comprehension of the Idea or the Form of good.

Plato considers soul to be above and beyond the visible, bodily person, just the appearance, the essence lies in the its immortal, eternal, infinite in the soul, not part of the visible phenomenal world but of invisible world of Ideas or Form, which Plato uses interchangeably, in an acknowledgment of the spiritualism and the super-naturalism. Soul and conscience, as human

attributes do not exist outside but inside human person and dies with the death of person. Plato, like Pythagoras believed in the eternity and transcendence of soul, that is also one of the key messages of Gita.

According to him the soul is divine and eternal that roams in the world of Ideas and not in the visible phenomenal world. Theorists of the eternity of soul and its transcendence from one to another body do not explain the source surplus souls required for the bodies of the increased population! To quote him from Phaedo, "The soul is infinitely like unchangeable; even the most stupid person would not deny that." He further adds, "What is the definition of that which is named soul? Can we imagine any other definition than The motion that moves by itself".

The motion of soul is first in origin and power that moves by itself." He reaffirms in his last work, the Laws, "Motion of the soul is the first in origin and power." And, "the soul is most ancient and divine of all things whose motion is an ever flowing source of real existence."

A detailed discussion on the theory of soul is beyond the scope of our present needs. Plato uses his tripartite assumption of the soul as consisting of the reason; spirit and appetite and their respective as philosophical tool for his division of society into 3 classes.

### **The Elements of Soul**

Plato divides the soul into 3, hierarchical faculties – reason, spirit and appetite, in descending order. In fact this trilogy of the soul provides the philosophical foundation of his hierarchal order of the Ideal State, the abode of justice, his central concern in the Republic. The abode of the lowest faculty, the appetite is stomach and those of spirit and the reason are chest and the mind respectively. The appetite is identified in both the Republic as well as Phaedo with desires; greed; economic gains; physical comforts and sensuous pleasure. The spirit is identified with fearlessness, valor and warrior like qualities. The highest faculty of the soul is the reason – simple and indivisible, eternal and immortal. The reason is beyond the time and space, whereas spirit and appetite are within the time and space. The reason is, according to him, immortal and divine whereas spirit and appetite are mortal and mundane.

### **The Virtues of Soul**

After defining the soul in terms of its constituent elements, delves into their respective virtues and thence derives the virtue of soul by integrating them together. Every particular object has its particular nature and realizing that nature is its virtue. The nature of teacher is to induce students into critical thinking and help them in molding themselves into fearless, responsible citizen and in his/her attempts to invent newer knowledge. If a teacher satisfactorily does that he is a virtuous teacher. Virtue of a student is to study and discourse to acquire knowledge and expand in the same way as the virtue of the eyes is clear vision and of mind is clear thinking and reasoning. A soul is virtuous if its elements realize their nature, i.e. be virtuous. He first discusses the particular virtues of particular elements and combines them to construct a new virtue, superior to them and their coordinating force – the justice, Plato's central concern in the Republic. The virtue of reason is wisdom, that of spirit and appetite are courage and temperance respectively. A soul is just or virtuous that has the virtuous faculties and the inferior elements are regulated and directed by the superior ones. In other words, the spirit and appetite must take directions from, and obey the dictates of, the reason.

## **Wisdom or Knowledge**

There corresponds a particular virtue to each faculty. The virtue corresponding to the faculty of reason is knowledge or wisdom. Plato conceptualizes wisdom or knowledge in specific terms. The knowledge of mundane affairs or the knowledge of particular skill falls outside its ambit. Knowledge of varieties of soil fit for cultivation of particular crops or knowledge of medicine for particular disease is not wisdom. Plato calls them the opinions or technical knowledge. Even the knowledge of mathematics (arithmetic), geometry, astronomy or any other science disciplines, which Plato places in the realm of intelligible world, too is not knowledge, as they too use assumptions based on the objects of the visible world. He explains it through his, oft-quoted, line diagram. Wisdom does not come from the study of the objects of the visible world, as if the ideas come from some vacuum, in opposition to the fact that ideas are abstractions from the objects and have been historically emanating from them. According to him wisdom comes from ability to reason and analyze; discuss and debate; deliberate and discourse. Plato's pessimism does not allow him to accord these potentialities to anyone but to 'gifted' few 'endowed' with immanently innate qualities of excellence in the realm of reason. Plato's theory of knowledge shall be discussed below as an independent subtitle.

## **The Courage**

Courage is the cardinal virtue of the spirit. It finds frequent mentions in Republic. Traditionally, the courage meant manliness. For early Greeks, courage meant fearlessness, even of the death; patience in difficult situation; valour etc. For Plato courage is not just warrior like bravery but also firmly defend correct stand.

## **Temperance**

The third particular virtue is temperance of restraint that has been elaborately described in books III & IV of the Republic. It simply means control of the desires. "To be stronger than one-self"; "To be master of oneself"; doing not as one wishes but what one ought to.

## **Justice**

Apart from the above 3 particular virtue there is 4<sup>th</sup> virtue, a superior virtue that harmoniously coordinates them and is the central concern of the **Republic**, as is evident from its subtitle, Concerning Justice.

## **Plato's Theory of God Western Concepts of God**

Western concepts of God have ranged from the detached transcendent demiurge of Aristotle to the pantheism of Spinoza. Nevertheless, much of western thought about God has fallen within some broad form of theism. Theism is the view that there is a God which is the creator and sustainer of the universe and is unlimited with regard to knowledge (omniscience), power (omnipotence), extension (omnipresence), and moral perfection. Though regarded as sexless, God has traditionally been referred to by the masculine pronoun.

Concepts of God in philosophy are entwined with concepts of God in religion. This is most obvious in figures like Augustine and Aquinas, who sought to bring more rigor and consistency to concepts found in religion. Others, like Leibniz and Hegel, interacted constructively and deeply with religious concepts. Even those like Hume and Nietzsche, who criticized the concept of God, dealt with religious concepts. While Western philosophy has interfaced most obviously with Christianity, Judaism and Islam have had some influence. The orthodox forms of all three religions have

embraced theism, though each religion has also yielded a wide array of other views. Philosophy has shown a similar variety. For example, with regard to the initiating cause of the world, Plato and Aristotle held God to be the crafter of uncreated matter. Plotinus regarded matter as emanating from God. Spinoza, departing from his judaistic roots, held God to be identical with the universe, while Hegel came to a similar view by reinterpreting Christianity.

Issues related to Western concepts of God include the nature of divine attributes and how they can be known, if or how that knowledge can be communicated, the relation between such knowledge and logic, the nature of divine causality, and the relation between the divine and the human will.

## **Sources of Western Concepts of God**

Sources of western concepts of the divine have been threefold: experience, revelation, and reason. Reported experiences of God are remarkably varied and have produced equally varied concepts of the divine being. Experiences can be occasioned by something external and universally available, such as the starry sky, or by something external and private, such as a burning bush. Experiences can be internal and effable, such as a vision, or internal and ineffable, as is claimed by some mystics. Revelation can be linked to religious experience or a type of it, both for the person originally receiving it and the one merely accepting it as authoritative. Those who accept its authority typically regard it as a source of concepts of the divine that are more detailed and more accurate than could be obtained by other means. Increasingly, the modern focus has been on the complexities of the process of interpretation (philosophical hermeneutics) and the extent to which it is necessarily subjective. Revelation can be intentionally unconnected to reason such that it is accepted on bare faith (fideism; compare Kierkegaard), or at the other extreme, can be grounded in reason in that it is accepted because and only insofar as it is reasonable (compare Locke). Reason has been taken as ancillary to religious experience and revelation, or on other accounts, as independent and the sole reliable source of concepts of God.

Each of the three sources of concepts of God has had those who regard it as the sole reliable basis of our idea of the divine. By contrast, others have regarded two or three of the sources as interdependent and mutually reinforcing. Regardless of these differing approaches, theism broadly construed has been a dominant theme for much of the history of Western thought.

- Historical Overview

- a. Greeks

- At the dawn of philosophy, the Ionian Greeks sought to understand the true nature of the cosmos and its manifestations of both change and permanence. To Heraclitus, all was change and nothing endured, whereas to Parmenides, all change was apparent. The Pythagoreans found order and permanence in mathematics, giving it religious significance as ultimate being. The Stoics identified order with divine reason.

To Plato, God is transcendent—the highest and most perfect being—and one who uses eternal forms, or archetypes, to fashion a universe that is eternal and uncreated. The order and purpose he gives the universe is limited by the imperfections inherent in material. Flaws are therefore real and exist in the universe; they are not merely higher divine purposes misunderstood by humans. God is not the author of everything because some things are evil. We can infer that God is the author of the punishments of the wicked because those punishments benefit the wicked. God,

being good, is also unchangeable since any change would be for the worse. For Plato, this does not mean (as some later Christian thought held) that God is the ground of moral goodness; rather, whatever is good is good in an of itself. God must be a first cause and a self- moved mover otherwise there will be an infinite regress to causes of causes. Plato is not committed to monotheism, but suggests for example that since planetary motion is uniform and circular, and since such motion is the motion of reason, then a planet must be driven by a rational soul. These souls that drive the planets could be called gods.

Aristotle made God passively responsible for change in the world in the sense that all things seek divine perfection. God imbues all things with order and purpose, both of which can be discovered and point to his (or its) divine existence. From those contingent things we come to know universals, whereas God knows universals prior to their existence in things. God, the highest being (though not a loving being), engages in perfect contemplation of the most worthy object, which is himself. He is thus unaware of the world and cares nothing for it, being an unmoved mover. God as pure form is wholly immaterial, and as perfect he is unchanging since he cannot become more perfect. This perfect and immutable God is therefore the apex of being and knowledge. God must be eternal. That is because time is eternal, and since there can be no time without change, change must be eternal. And for change to be eternal the cause of change-the unmoved mover-must also be eternal. To be eternal God must also be immaterial since only immaterial things are immune from change. Additionally, as an immaterial being, God is not extended in space.

The Neo-Platonic God of Plotinus (204/5-270 A.D.) is the source of the universe, which is the inevitable overflow of divinity. In that overflow, the universe comes out of God (ex deo) in a timeless process. It does not come by creation because that would entail consciousness and will, which Plotinus claimed would limit God. The first emanation out of God (nous) is the highest, successive emanations being less and less real. Finally, evil is matter with no form at all, and as such has no positive existence. God is an impersonal It who can be described only in terms of what he is not. This negative way of describing God (the via negativa) survived well into the middle ages. Though God is beyond description, Plotinus (perhaps paradoxically) asserted a number of things, such as that virtue and truth inhere in God. Because for Plotinus God cannot be reached intellectually, union with the divine is ecstatic and mystical. His thought influenced a number of Christian mystics, such as Meister Eckhart (1260-1327).

## **Aristotle – Classification of the sciences**

In one of his monumental works, *Physics*, Aristotle sets out to investigate the appropriate divisions of science. According to Aristotle, a science is possible if and only if there are knowable objects. There cannot be a science of dragons, for example, because dragons do not exist and hence a 'science' of dragons would lack knowable objects and thus would not be a 'science'. Furthermore, he thought the aim of scientific knowledge was the attainment of universal and necessary truths; that is, truths that apply everywhere, at all times, and of necessity must apply.

The first division of science, according to Aristotle, was **Theoretical science**. Those who engage in theoretical science seek knowledge for its own sake. For Aristotle theoretical science in turn was divided into three sub-categories. The first sub- category studies natural objects which generate movement and growth internally; that is, living objects as well as the the 'heavenly bodies' and geological phenomena. The second sub-category of theoretical science studies objects in abstraction from their motion. In other words, it studies the quantitative aspect of objects. This

second division of theoretical science is the domain of mathematics. The third and final sub-category of theoretical science is the study of objects that are not in motion, or are immovable. This is the study of “first causes”, so to speak, and is the domain of theology.

The second division of science for Aristotle was **Productive science**. Such a science aims at the creation of a product. A science of computers, for example, aims at the production of computers. For Aristotle only human beings, who alone have rationality, are capable of engaging in productive science. A bird which builds a nest is merely acting according to its instincts, and not at all according to reason and scientific knowledge. Thus, only human beings can engage in productive science, and create a product through the utilization of theoretical knowledge.

The third and final division of science for Aristotle was **Practical science**. Such a science aims at knowledge of action, or praxis. The science of action underlies the ability to act well, or to live the good life, which according to Aristotle was a life guided by reason.

These three divisions, according to Aristotle, encompass every conceivable object or phenomena which science can investigate. And up until today, over 2000 years after Aristotle proposed these three divisions of science, no one has been able to think of an object of science which does not fall into one of these three categories.

## **Aristotelian logic**

Aristotelian logic, after a great and early triumph, consolidated its position of influence to rule over the philosophical world throughout the Middle Ages up until the 19<sup>th</sup> Century. All that changed in a hurry when modern logicians embraced a new kind of mathematical logic and pushed out what they regarded as the antiquated and clunky method of syllogisms. Although Aristotle’s very rich and expansive account of logic differs in key ways from modern approaches, it is more than a historical curiosity. It provides an alternative way of approaching logic and continues to provide critical insights into contemporary issues and concerns. The main thrust of this article is to explain Aristotle’s logical system as a whole while correcting some prominent misconceptions that persist in the popular understanding and even in some of the specialized literature. Before getting down to business, it is important to point out that Aristotle is a synoptic thinker with an overarching theory that ties together all aspects and fields of philosophy. He does not view logic as a separate, self-sufficient subject-matter, to be considered in isolation from other aspects of disciplined inquiry. Although we cannot consider all the details of his encyclopedic approach, we can sketch out the larger picture in a way that illuminates the general thrust of his system. For the purposes of this entry, let us define logic as that field of inquiry which investigates how we reason correctly (and, by extension, how we reason incorrectly). Aristotle does not believe that the purpose of logic is to prove that human beings can have knowledge. (He dismisses excessive scepticism.) The aim of logic is the elaboration of a coherent system that allows us to investigate, classify, and evaluate good and bad forms of reasoning.

## **The Organon**

To those used to the silver tones of an accomplished writer like Plato, Aristotle’s prose will seem, at first glance, a difficult read. What we have are largely notes, written at various points in his career, for different purposes, edited and cobbled together by later followers. The style of the resulting collection is often rambling, repetitious, obscure, and disjointed. There are many arcane, puzzling, and perhaps contradictory passages. This problem is compounded by the abstract,

technical vocabulary logic sometimes requires and by the wide-ranging scope and the scattered nature of Aristotle's observations. Some familiarity with Greek terminology is required if one hopes to capture the nuances in his thought. Classicists and scholars do argue, of course, about the precise Greek meaning of key words or phrases but many of these debates involve minor points of interpretation that cannot concern us here. Aristotle's logical vocabulary needs to be understood within the larger context of his system as a whole. Many good translations of Aristotle are available. (Parenthetical citations below include the approximate Bekker number (the scholarly notation for referring to Aristotelian passages according to page, column, and line number of a standard edition), the English title of the work, and the name of the translator.)

Ancient commentators regarded logic as a widely-applicable instrument or method for careful thinking. They grouped Aristotle's six logical treatises into a sort of manual they called the *Organon* (Greek for "tool"). The *Organon* included the *Categories*, *On Interpretation*, the *Prior Analytics*, the *Posterior Analytics*, the *Topics*, and *On Sophistical Refutations*. These books touch on many issues: the logical structure of propositions, the proper structure of arguments (syllogisms), the difference between induction and deduction, the nature of scientific knowledge, basic fallacies (forms of specious reasoning), debating techniques, and so on. But we cannot confine our present investigations to the *Organon*. Aristotle comments on the principle of non-contradiction in the *Metaphysics*, on less rigorous forms of argument in the *Rhetoric*, on the intellectual virtues in the *Nicomachean Ethics*, on the difference between truth and falsity in *On the Soul*, and so on. We cannot overlook such important passages if we wish to gain an adequate understanding of Aristotelian logic.

### • **Categories**

The world, as Aristotle describes it in his *Categories*, is composed of substances— separate, individual things—to which various characterizations or properties can be ascribed. Each substance is a unified whole composed of interlocking parts. There are two kinds of substances. A primary substance is (in the simplest instance) an independent (or detachable) object, composed of matter, characterized by form. Individual living organisms—a man, a rainbow trout, an oak tree—provide the most unambiguous examples of primary substances. Secondary substances are the larger groups, the species or genera, to which these individual organisms belong. So man, horse, mammals, animals (and so on) would be examples of secondary substances. As we shall see, Aristotle's logic is about correctly attributing specific properties to secondary substances (and therefore, indirectly, about attributing these properties to primary substances or individual things).

Aristotle elaborates a logic that is designed to describe what exists in the world. We may well wonder then, how many different ways can we describe something? In his *Categories* (4.1b25-2a4), Aristotle enumerates ten different ways of describing something. These categories (Greek=*kategoria*, deriving from the verb to indicate, signify) include (1) substance, (2) quantity, (3) quality, (4) relation, (5) where, (6) when, (7) being-in-a-position, (8) possessing, (9) doing or (10) undergoing something or being affected by something. In the *Topics* (I.9, 103b20-25), he includes the same list, replacing "substance" (*ousia*) with "essence" (*ti esti*). We can, along with Aristotle, give an example of each kind of description: (1) to designate something as a "horse" or a "man" is to identify it as a substance or to attribute an essence to it; (2) to say that the wall is four feet long is to describe it in terms of quantity; (3) to say that the roof is "white" is to ascribe a quality to it; (4) to say that your weight is "double" mine is to describe a relation between the two;

(5) to say something happened in the market-place isto explain where; (6) to say it happened last year is to explain when; (7) to say an old man is sitting is to describe his position; (8) to say the girl has shoes on is to describe what she possesses; (9) to say the head chef is cutting a carrot with a knife is to describe what he is doing; and finally, (10) to say wood is being burned in the fireplace is to describe what it means for the wood to undergo burning or to be affected by fire. Commentators claim that these ten categories represent either different descriptions of being or different kinds of being. (To be a substance is to be in a certain way; to possess quantity is to be in a certain way; to possess a quality is to be in a certain way, and so on.) There is nothing magical about the number ten. Aristotle gives shorter lists elsewhere. (Compare Posterior Analytics, I.22.83a22-24, where he lists seven predications, for example). Whether Aristotle intends the longer lists as a complete enumeration of all conceivable types of descriptions is an open question. Scholars have noticed that the first category, substance or essence, seems to be fundamentally different than the others; it is what something is in the most complete and perfect way.

### ● From Words into Propositions

Aristotle does not believe that all reasoning deals with words. (Moral decision-making is, for Aristotle, a form of reasoning that can occur without words.) Still, words are a good place to begin our study of his logic. Logic, as we now understand it, chiefly has to do with how we evaluate arguments. But arguments are made of statements, which are, in turn, made of words. In Aristotelian logic, the most basic statement is a proposition, a complete sentence that asserts something. (There are other kinds of sentences—prayers, questions, commands—that do not assert anything true or false about the world and which, therefore, exist outside the purview of logic.) A proposition is ideally composed of at least three words: a subject (a word naming a substance), a predicate (a word naming a property), and a connecting verb, what logicians call a copula (Latin, for “bond” or “connection”). Consider the simple statement: “Socrates is wise.” Socrates is the subject; the property of being wise is the predicate, and the verb “is” (the copula) links Socrates and wisdom together in a single affirmation. We can express all this symbolically as “S is P” where “S” stands for the subject “Socrates” and “P” stands for the predicate “being wise.” The sentence “Socrates is wise” (or symbolically, “S is P”) qualifies as a proposition; it is a statement that claims that something is true about the world. Paradigmatically, the subject would be a (secondary) substance (a natural division of primary substances) and the predicate would be a necessary or essential property as in: “birds are feathered,” or “triangles have interior angles equal to two right angles,” or “fire is upward-moving.” But any overly restrictive metaphysical idea about what terms in a proposition mean seems to unnecessarily restrict intelligent discourse. Suppose someone were to claim that “anger is unethical.” But anger is not a substance; it is a property of a substance (an organism). Still, it makes perfect sense to predicate properties of anger. We can say that anger is unethical, hard to control, an excess of passion, familiar enough, and so on. Aristotle himself exhibits some flexibility here. Still, there is something to Aristotle’s view that the closer a proposition is to the metaphysical structure of the world, the more it counts as knowledge. Aristotle has an all-embracing view of logic and yet believes that, what we could call “metaphysical correctness” produces a more rigorous, scientific form of logical expression.

Of course, it is not enough to produce propositions; what we are after is true propositions. Aristotle believes that only propositions are true or false.

Truth or falsity (at least with respect to linguistic expression) is a matter of combining words into complete propositions that purport to assert something about the world. Individual words or incomplete phrases, considered by themselves, are neither true or false. To say, "Socrates," or "jumping up and down," or "brilliant red" is not to assert anything true or false about the world. It is to repeat words without making any claim about the way things are. In the *Metaphysics*, Aristotle provides his own definition of true and false: "to say of what is that it is, and of what is not that it is not, is true"; and "to say of what is that it is not, or of what is not that it is, is false." (IV.7.1011b25, Ross.) In other words, a true proposition corresponds to way things are. But Aristotle is not proposing a correspondence theory of truth as an expert would understand it. He is operating at a more basic level. Consider the statement: "Spiders have eight legs." (Symbolically, "All S is P," where S, the subject, is "spiders"; P, the predicate, is "the state of being eight-legged," and the verb "is" functions as the copula.) What does it mean to say that this claim is true? If we observe spiders to discover how many legs they have, we will find that (except in a few odd cases) spiders do have eight legs, so the proposition will be true because what it says matches reality. As we shall see, Aristotle's logic is designed to produce just this kind of general statement.

### ● Kinds of Propositions

Aristotle suggests that all propositions must either affirm or deny something. Every proposition must be either an affirmation or a negation; it cannot be both. He also points out that propositions can make claims about what necessarily is the case, about what possibly is the case, or even about what is impossible. His modal logic, which deals with these further qualifications about possibility or necessity, presents difficulties of interpretation. We will focus on his assertoric (or non-modal) logic here. Still, many of Aristotle's points about necessity and possibility seem highly intuitive. In one famous example about a hypothetical sea battle, he observes that the necessary truth of a mere proposition does not trump the uncertainty of future events. Because it is necessarily true that there will be or will not be a sea battle tomorrow, we cannot conclude that either alternative is necessarily true. (De Interpretatione, 9.19a30ff.) So the necessity that attaches to the proposition "there will or will not be a sea battle tomorrow" does not transfer over to the claim "that there will be a sea battle tomorrow" or to the claim "there will not be a sea battle tomorrow." Aristotle goes out of his way to emphasize the point that our personal beliefs about what will happen in the future do not determine whether the individual propositions are true. (Note that we must not confuse the necessary truth of a proposition with the necessity that precipitates the conclusion of a deductively-valid argument. The former is sometimes called "material," "non-logical," or "metaphysical" necessity; the later, "formal," "deductive," or "logical" necessity." We discuss these issues further below.)

Aristotle claims that all propositions can be expressed using the "Subject copula Predicate" formula and that complex propositions are, on closer inspection, collections of simpler claims that display, in turn, this fundamental structure. Having fixed the proper logical form of a proposition, he goes on to classify different kinds of propositions. He begins by distinguishing between particular terms and universal terms. (The term he uses for "universal" is the Greek "katholou.") Particular terms refer to individual things; universal terms refer to groups of things. The name "Socrates" is a particular term because it refers to a single human being; the word "spiders" is a universal term for it universally applies to all members of the group "spiders." Aristotle realizes, of course, that universal terms may be used to refer to parts of a group as well as to entire groups. We may claim that all spiders have eight legs or that only some spiders have book-lungs. In the first case, a property, eight-leggedness, is predicated of the entire group referred to by the

universal term; in the second case, the property of having book-lungs is predicated of only part of the group. So, to use Aristotelian language, one may predicate a property universally or not universally of the group referred to by a universal term.

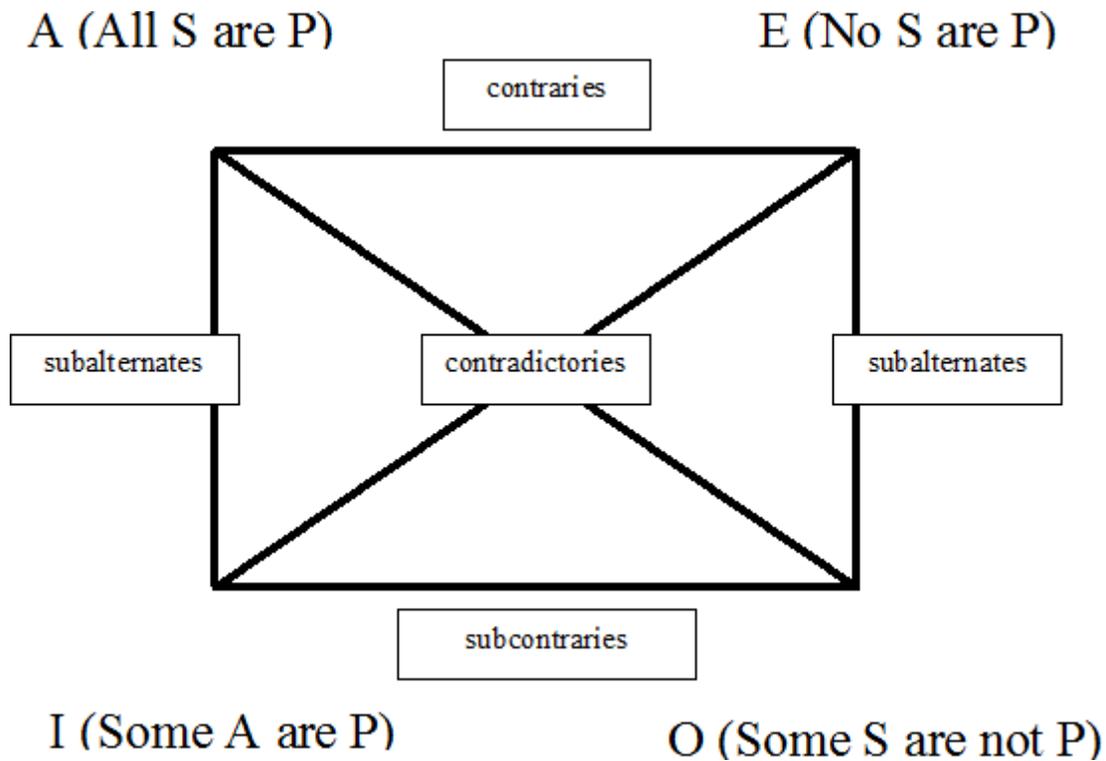

This brings us to Aristotle's classification of the four different kinds of categorical propositions (called "categorical propositions" because they assert a relationship between two categories or kinds). Each different categorical proposition possesses quantity inasmuch as it represents a universal or a particular predication (referring to all or only some members of the subject class). It also possesses a definite quality (positive or negative) inasmuch as it affirms or denies the specified predication. The adjectives "all," "no," and "some" (which is understood as meaning "at least one") determine the quantity of the proposition; the quality is determined by whether the verb is in the affirmative or the negative. Rather than going into the details of Aristotle's original texts, suffice it to say that contemporary logicians generally distinguish between four logical possibilities:

- Universal Affirmation: All S are P (called A statements from the Latin, "AFFIRMO": I affirm).
- Universal Negation: No S are P (called E statements from "NEGO": I deny).
- Particular Affirmation: Some S are P (called I statements from AFFIRMO).
- Particular Negation: Some S are not P (called O statements from NEGO).

Note that these four possibilities are not, in every instance, mutually exclusive. As mentioned above, particular statements using the modifier "some" refer to at least one member of a group. To say that "some S are P" is to say that "at least one S is P"; to say that "some S are not P" is to say that "at least one S is not P." It must follow then (at least on Aristotle's system) that universal statements require the corresponding particular statement. If "All S are P," at least one S must be P; that is, the particular statement "Some S are P" must be true. Again, if "No S are P," at least one S must not be P; that is, the particular statement "Some S are not P" must be true. (More on this, with qualifications, below.) Note also that Aristotle treats propositions with an individual subject such as "Socrates is wise" as universal propositions (as if the proposition was saying something like "all instances of Socrates" are wise.) One caveat: Although we cannot linger on further complications here, keep in mind that this is not the only way to divide up logical possibility.

#### • **Square of Opposition**

Aristotle examines the way in which these four different categorical propositions are related to one another. His views have come down to us as "the square of opposition," a mnemonic diagram that captures, systematizes, and slightly extends what Aristotle says in *De Interpretatione*. (Cf. 6.17a25ff.)

**Figure 1**

### **The Traditional Square of Opposition**

As it turns out, we can use a square with crossed interior diagonals (Fig. 1 above) to identify four kinds of relationships that hold between different pairs of categorical propositions. Consider each relationship in turn.

1) Contradictory propositions possess opposite truth-values. In the diagram, they are linked by a diagonal line. If one of two contradictories is true, the other must be false, and vice versa. So the A proposition (All S are P) and the O proposition (Some S are not P) are contradictories. Clearly, if it is true that “all S are P,” then the O statement that “some S are not P” must be false. And if it is true that “some S are not P,” then the A statement that “all S are P” must be false. The same relationship holds between E (No S are P) and I (Some S are P) propositions. To use a simple example: If it is true that “all birds lay eggs,” then it must be false that “some birds do not lay eggs.” And if it is true that “some birds do not fly,” then it must be false that “all birds fly.”

2) Contrary propositions cannot both be true. The top horizontal line in the square joining the A proposition (All S are P) to the E proposition (No S are P) represents this logical relationship. Clearly, it cannot be true that “all S are P” and that “no S are P.” The truth of one of these contrary propositions excludes the truth of the other. It is possible, however, that both statements are false as in the case where some S are P and some (other) S are not P. So, for example, the statements “all politicians tell lies” and “no politicians tell lies” cannot both be true. They will, however, both be false if it is indeed the case that some politicians tell lies whereas some do not.

3) The relationship of subalternation results when the truth of a universal proposition, “the superaltern,” requires the truth of a second particular proposition, “the subaltern.” The vertical lines

moving downward from the top to the bottom of the square in the diagram represent this condition. Clearly, if all members of an existent group possess (or do not possess) a specific characteristic, it must follow that any smaller subset of that group must possess (or not possess) that specific characteristic. If the A proposition (All S are P) is true, it must follow that the I proposition ("Some S are P") must be true. Again, if the E proposition (No S are P) is true, it must follow that the O proposition (Some S are not P) must be true. Consider, for example, the statement, "all cheetahs are fast." If every member of the whole group of cheetahs is fast, then it must be the case that at least one member of the group of cheetahs is fast; that is, the statement "some cheetahs are fast" must be true. And, to reformulate the same example as a negation, if it is true that "no cheetahs are slow," then it must be the case that at least one member of the group of cheetahs is not slow; that is, the statement "some cheetahs are not slow" must be true.

Note that subalternation does not work in the opposite direction. If "Some S are P," it need not follow that "All S are P." And if "Some S are not P," it need not follow that "No S are P." We should also point out that if the subaltern is false, it must follow that the superaltern is false. If it is false to say that "Some S are P," it must be false to say that "All S are P." And if it is false to say that "Some S are not P," it must be false to say that "No S are P."

4) Subcontrary propositions cannot both be false. The bottom horizontal line in the square joining the I proposition (Some S are P) to the O proposition (Some S are not P) represents this kind of subcontrary relationship. Keeping to the assumptions implicit in Aristotle's system, there are only three possibilities: (1) All S have property P; in which case, it must also be true (by subalternation) that "some S are P." (2) No S have property P; in which case it must also be true (by subalternation) that "some S are not P." (3) Some S have and some S do not have property P; in which case it will be true that "some S are P" and that "some S are not P." It follows that at least one of a pair of subcontrary propositions must be true and that both will be true in cases where P is partially predicated of S. So, for example, both members of the subcontrary pair "some men have beards" and "some men do not have beards" are true. They are both true because having a beard is a contingent or variable male attribute. In contrast, only one member of the subcontrary pair "some snakes are legless" and "some snakes are not legless" is true. As all snakes are legless, the proposition "some snakes are not legless" must be false.

Traditional logicians, inspired by Aristotle's wide-ranging comments, identified a series of "immediate inferences" as a way of deriving new propositions through a routine rearrangement of terms. Subalternation is an obvious example of immediate inference. From "All S are P" we can immediately infer—that is, without argument—that "some S are P." They also recognized conversion, obversion, and contraposition as immediate inferences.

In conversion, one interchanges the S and P terms. If, for example, we know that "No S is P," we can immediately infer that "No P is S." (Once we know that "no circles are triangles," we know right away that "no triangles are circles.")

In obversion, one negates the predicate term while replacing it with the predicate term of opposite quality. If, for example, we know that "Some S are P," we can immediately infer the obverse, "Some S are not non-P." (Once we know that "some students are happy," we know right away that "some students are not unhappy.")

Finally, in contraposition, one negates both terms and reverses their order. If, for example, we know that “All S are P,” we can infer the contrapositive “All non-P are non-S.” (Once we know that “all voters are adults,” we know right away that “all children are unable to vote.”) More specific rules, restrictions, and details are readily available elsewhere.

### • **Laws of Thought**

During the 18th, 19th, and early 20th Century, scholars who saw themselves as carrying on the Aristotelian and Medieval tradition in logic, often pointed to the “laws of thought” as the basis of all logic. One still encounters this approach in textbook accounts of informal logic. The usual list of logical laws (or logical first principles) includes three axioms: the law of identity, the law of non-contradiction, and the law of excluded middle. (Some authors include a law of sufficient reason, that every event or claim must have a sufficient reason or explanation, and so forth.) It would be a gross simplification to argue that these ideas derive exclusively from Aristotle or to suggest (as some authors seem to imply) that he self-consciously presented a theory uniquely derived from these three laws. The idea is rather that Aristotle’s theory presupposes these principles and/or that he discusses or alludes to them somewhere in his work. Traditional logicians did not regard them as abstruse or esoteric doctrines but as manifestly obvious principles that require assent for logical discourse to be possible.

The law of identity could be summarized as the patently unremarkable but seemingly inescapable notion that things must be, of course, identical with themselves. Expressed symbolically: “A is A,” where A is an individual, a species, or a genus. Although Aristotle never explicitly enunciates this law, he does observe, in the *Metaphysics*, that “the fact that a thing is itself is [the only] answer to all such questions as why the man is man, or the musician musical.” (VII.17.1041a16-18, Ross.) This suggests that he does accept, unsurprisingly, the perfectly obvious idea that things are themselves. If, however, identical things must possess identical attributes, this opens the door to various logical maneuvers. One can, for example, substitute equivalent terms for one another and, even more portentously, one can arrive at some conception of analogy and induction. Aristotle writes, “all water is said to be . . . the same as all water . . . because of a certain likeness.” (*Topics*, I.7.103a19-20, Pickard-Cambridge.) If water is water, then by the law of identity, anything we discover to be water must possess the same water-properties.

Aristotle provides several formulations of the law of non-contradiction, the idea that logically correct propositions cannot affirm and deny the same thing:

“It is impossible for anyone to believe the same thing to be and not be.” (*Metaphysics*, IV.3.1005b23-24, Ross.)

“The same attribute cannot at the same time belong and not belong to the same subject in the same respect.” (*Ibid.*, IV.3.1005b19-20.)

“The most indisputable of all beliefs is that contradictory statements are not at the same time true.” (*Ibid.*, IV.6.1011b13-14.) Symbolically, the law of non-contradiction is sometimes represented as “not (A and not A).”

The law of excluded middle can be summarized as the idea that every proposition must be either true or false, not both and not neither. In Aristotle’s words, “It is necessary for the affirmation or

the negation to be true or false.” (De Interpretatione, 9.18a28-29, Ackrill.) Symbolically, we can represent the law of excluded middle as an exclusive disjunction: “A is true or A is false,” where only one alternative holds. Because every proposition must be true or false, it does not follow, of course, that we can know if a particular proposition is true or false.

Despite perennial challenges to these so-called laws (by intuitionists, dialetheists, and others), Aristotelians inevitably claim that such counterarguments hinge on some unresolved ambiguity (equivocation), on a conflation of what we know with what is actually the case, on a false or static account of identity, or on some other failure to fully grasp the implications of what one is saying.

- **Existential Assumptions**

Before we move on to consider Aristotle’s account of the syllogism, we need to clear up some widespread misconceptions and explain a few things about Aristotle’s project as a whole. Criticisms of Aristotle’s logic often assume that what Aristotle was trying to do coincides with the basic project of modern logic. Begin with the usual criticism brought against the traditional square of opposition. For reasons we will not explore, modern logicians assume that universal claims about non-existent objects (or empty sets) are true but that particular claims about them are false. On this reading, the claim that “all fairy-god mothers are beautiful” is true, whereas the claim that “some fairy-god mothers are beautiful” is false. Clearly, this clashes with the traditional square of opposition. By simple subalternation, the truth of the proposition “all fairy-god mothers are beautiful” requires the truth of the proposition “some fairy-god mothers are beautiful.” If the first claim is true, the second claim must also be true. For this and similar reasons, some modern logicians dismiss the traditional square as inadequate, claiming that Aristotle made a mistake or overlooked relevant issues. Aristotle, however, is involved in a specialized project. He elaborates an alternative logic, specifically adapted to the problems he is trying to solve.

Aristotle devises a companion-logic for science. He relegates fictions like fairy godmothers and mermaids and unicorns to the realms of poetry and literature. In his mind, they exist outside the ambit of science. This is why he leaves no room for such non-existent entities in his logic. This is a thoughtful choice, not an inadvertent omission. Technically, Aristotelian science is a search for definitions, where a definition is “a phrase signifying a thing’s essence.” (Topics, I.5.102a37, Pickard-Cambridge.) To possess an essence—is literally to possess a “what-it-is-to-be” something (to ti ēn einai). Because non-existent entities cannot be anything, they do not, in Aristotle’s mind, possess an essence. They cannot be defined. Aristotle makes this point explicitly in the Posterior Analytics. He points out that a definition of a goat-stag, a cross between a goat and a deer (the ancient equivalent of a unicorn), is impossible.

He writes, “no one knows the nature of what does not exist—[we] can know the meaning of the phrase or name ‘goat-stag’ but not what the essential nature of a goat-stag is.” (II.7.92b6-8, Mure.) Because we cannot know what the essential nature of a goat-stag is—indeed, it has no essential nature—we cannot provide a proper definition of a goat-stag. So the study of goat-stags (or unicorns) is not open to scientific investigation. Aristotle sets about designing a logic that is intended to display relations between scientific propositions, where science is understood as a search for essential definitions. This is why he leaves no place for fictional entities like goat-stags (or unicorns). Hence, the assumed validity of a logical maneuver like subalternation.

- **Form versus Content**

However, this is not the only way Aristotle's approach parts ways with more modern assumptions. Some modern logicians might define logic as that philosophical inquiry which considers the form not the content of propositions. Aristotle's logic is unapologetically metaphysical. We cannot properly understand what Aristotle is about by separating form from content. Suppose, for example, I was to claim that (1) all birds have feathers and (2) that everyone in the Tremblay family wears a red hat. These two claims possess the same very same propositional form, A.

We can represent the first claim as: "All S are P," where S=birds, and P=being feathered. And we can also represent the second claim as "All S are P," where S=members of the Tremblay family, and P=wearing a red hat. Considered from an Aristotelian point of view, however, these two "All S are P" propositions possess a very different logical status. Aristotle would view the relationship between birds and feathers expressed in the first proposition as a necessary link, for it is of the essence of birds to be feathered.

Something cannot be a bird and lack feathers. The link between membership in the Tremblay family and the practice of wearing a red hat described in the second proposition is, in sharp contrast, a contingent fact about the world. A member of the Tremblay family who wore a green hat would still be a member of the Tremblay family. The fact that the Tremblays only wear red hats (because it is presently the fashion in Quebec) is an accidental (or surface) feature of what a Tremblay is. So this second relationship holds in a much weaker sense. In Aristotle's mind, this has important consequences not just for metaphysics, but for logic.

It is hard to capture in modern English the underlying metaphysical force in Aristotle's categorical statements. In the *Prior Analytics* Aristotle renders the phrase "S is P" as "P belongs to S." The sense of belonging here is crucial. Aristotle wants a logic that tells us what belongs to what.

But there are different levels of belonging. My billfold belongs to me but this is a very tenuous sort of belonging. The way my billfold belongs to me pales in significance to, say, the way a bill belongs to a duck-billed platypus. It is not simply that the bill is physically attached to the platypus. Even if you were to cut off the bill of a platypus, this would just create a deformed platypus; it would not change the sense of necessary belonging that connects platypuses and bills. The deep nature of a platypus requires—it necessitates—a bill. In so much as logic is about discovering necessary relationships, it is not the mere arrangement of terms and symbols but their substantive meaning that is at issue.

As only one consequence of this "metaphysical attitude," consider Aristotle's attitude towards inductive generalizations. Aristotle would have no patience for the modern penchant for purely statistical interpretations of inductive generalizations. It is not the number of times something happens that matters. It is the deep nature of the thing that counts. If the wicked boy (or girl) next door pulls three legs off a spider, this is just happenstance. This five-legged spider does not (for Aristotle) present a serious counterexample to the claim that "all spiders are eight-legged." The fact that someone can pull legs off a spider does not change the fact that there is a necessary connection between spiders and having eight legs.

Aristotle is too keen a biologist not to recognize that there are accidents and monstrosities in the world, but the existence of these individual imperfections does not change the deep nature of

things. Aristotle recognizes then that some types of belonging are more substantial—that is, more real—than others. But this has repercussions for the ways in which we evaluate arguments. In Aristotle’s mind, the strength of the logical connection that ties a conclusion to the premises in an argument depends, decisively, on the metaphysical status of the claims we are making.

Another example may help. Suppose I were to argue, first: “Ostriches are birds; all birds have feathers, therefore, ostriches have feathers.” Then, second, “Hélène is the youngest daughter of the Tremblay family; all members of the Tremblay family wear red hats; therefore, Hélène wears a red hat.” These arguments possess the same form. (We will worry about formal details later.) But, to Aristotle’s way of thinking, the first argument is, logically, more rigorous than the second. Its conclusion follows from the essential and therefore necessary features of birds. In the second argument, the conclusion only follows from the contingent state of fashion in Quebec. In Aristotelian logic, the strength of an argument depends, in some important way, on metaphysical issues. We can’t simply say “All S are P; and so forth” and be done with it. We have to know what “S” and “P” stand for. This is very different than modern symbolic logic. Although Aristotle does use letters to take the place of variable terms in a logical relation, we should not be misled into thinking that the substantive content of what is being discussed does not matter.

- **The Syllogism**

We are now in a position to consider Aristotle’s theory of the syllogism. Although one senses that Aristotle took great pride in these accomplishments, we could complain that the persistent focus on the mechanics of the valid syllogism has obscured his larger project. We will only cover the most basic points here, largely ignoring hypothetical syllogisms, modal syllogisms, extended syllogisms (sorites), inter alia. The syllogistic now taught in undergraduate philosophy departments represents a later development of Aristotle’s ideas, after they were reworked at the hands of Medieval and modern logicians. We will begin with a brief account of the way syllogisms are presented in modern logic and then move on to discussion of Aristotle’s somewhat different account.

We can define a syllogism, in relation to its logical form, as an argument made up of three categorical propositions, two premises (which set out the evidence), and a conclusion (that follows logically from the premises). In the standard account, the propositions are composed of three terms, a subject term, a predicate term, and a middle term: the subject term is the (grammatical) subject of the conclusion; the predicate term modifies the subject in the conclusion, and the middle term links the subject and predicate terms in the premises. The subject and predicate terms appear in different premises; the middle term appears once in each premise. The premise with the predicate term and the middle term is called the major premise; the premise with the subject term and the middle term is called the minor premise.

Because syllogisms depend on the precise arrangement of terms, syllogistic logic is sometimes referred to as term logic. Most readers of this piece are already familiar with some version of a proverbial (non-Aristotelian) example: “All men are mortal; (all) Socrates, Plato, and Aristotle are men; therefore, Socrates, Plato and Aristotle are mortal.” If we symbolize the three terms in this syllogism such that Middle Term, M=man; Subject Term, S=Socrates, Plato, Aristotle; Predicate Term, P=mortal; we can represent the argument as: Major Premise: All M is P; Minor Premise: All S is M; Conclusion: So, All S is P. In the Middle Ages, scholars came up with Latin names for valid syllogisms, using vowels to represent the position of each categorical proposition. (Their list

is readily available elsewhere.) The precise arrangement of propositions in this syllogism goes by the Latin moniker “Barbara” because the syllogism is composed of three A propositions: hence, **BARbArA**: A syllogism in Barbara is clearly valid where validity can be understood (in modern terms) as the requirement that if the premises of the argument are true, then the conclusion must be true. Modern textbook authors generally prove the validity of syllogisms in two ways. First, they use a number of different rules.

For example: “when major and minor terms are universal in the conclusion they must be universal in the premises”; “if one premise is negative, the conclusion must be negative”; “the middle term in the premises must be distributed (include every member of a class) at least once,” and so on. Second, they use Venn diagrams, intersecting circles marked to indicate the extension (or range) of different terms, to determine if the information contained in the conclusion is also included in the premises.

Modern logicians, who still hold to traditional conventions, classify syllogisms according to figure and mood. The four figure classification derives from Aristotle; the mood classification, from Medieval logicians. One determines the figure of a syllogism by recording the positions the middle term takes in the two premises. So, for Barbara above, the figure is MP-SM, generally referred to as Figure 1. One determines the mood of a syllogism by recording the precise arrangement of categorical propositions.

So, for Barbara, the mood is AAA. By tabulating figures and moods, we can make an inventory of valid syllogisms. (Medieval philosophers devised a mnemonic poem for such purposes that begins with the line “Barbara, Celarent, Darii, Ferioque prioris.”) Although traditional classroom treatments prefer to stick to this time-honoured approach, Fred Sommers and George Englebretsen have devised a more up-to-date term logic that uses equations with “+” and “-” operators and is more attuned to natural language reasoning than the usual predicate logic. Turn then to a brief discussion of Aristotle’s own account of the syllogism.

As already mentioned, we need to distinguish between two kinds of necessity. Aristotle believes in metaphysical or natural necessity. Birds must have feathers because that is their nature. So the proposition “All birds have feathers” is necessarily true.” But Aristotle identifies the syllogistic form with the logical necessity that obtains when two separate propositions necessitate a third.

He defines a *sullogismos* as “a discourse [logos] in which, certain things being stated, something other than what is stated follows of necessity from them.” (Prior Analytics, I.1.24b18-20, Jenkinson.) The emphasis here is on the sense of inevitable consequence that precipitates a conclusion when certain forms of propositions are added together. Indeed, the original Greek term for syllogism is more rigorously translated as “deduction.” In the Prior Analytics, Aristotle’s method is exploratory. He searches for pairs of propositions that combine to produce a necessary conclusion. He begins by accepting that a few syllogisms are self-evidently (or transparently) true. Barbara, AAA-Fig.1, discussed above, is the best example of this kind of “perfect syllogism.” Another example of a perfect syllogism is Celarent: EAE-Fig.1. On seeing the arrangement of terms in such cases, one immediately understands that the conclusion follows necessarily from the premises. In the case of imperfect syllogisms Aristotle relies on a method of proof that translates them, step-by-step, into perfect syllogisms through a careful rearrangement of terms. He does this directly, through conversion, or indirectly, through the relationships of contradiction and contrariety outlined in the square of opposition. To cite only one very simple example, consider a brief

passage in the *Prior Analytics* (I.5.27a5ff) where Aristotle demonstrates that the propositions “No P are M,” and “All S are M” can be combined to produce a syllogism with the conclusion, “No S are P.” If “No P are M,” it must follow that “No M are P” (conversion); but “No M are P” combined with the second premise, “All S are M” proves that “No S are P.” (This is to reduce the imperfect syllogism Cesare to the perfect syllogism Celarent.) This conversion of an imperfect syllogism into a perfect syllogism demonstrates that the original arrangement of terms is a genuine deduction. In other cases, Aristotle proves that particular arrangements of terms cannot yield proper syllogisms by showing that, in these instances, true premises lead to obviously false or contradictory conclusions. Alongside these proofs of logical necessity, Aristotle derives general rules for syllogisms, classifies them according to figure, and so on.

It is important to reiterate that Aristotelian syllogisms are not (primarily) about hypothetical sets, imaginary classes, or purely abstract mathematical entities. Aristotle believes there are natural groups in the world—species and genera—made up of individual members that share a similar nature, and hence similar properties. It is this sharing of individual things in a similar nature that makes universal statements possible. Once we have universal terms, we can make over-arching statements that, when combined, lead inescapably to specific results. In the most rigorous syllogistic, metaphysical necessity is added to logical necessity to produce an unassailable inference. Seen in this Aristotelian light, syllogisms can be construed as a vehicle for identifying the deep, immutable natures that make things what they are.

Medieval logicians summarized their understanding of the rationale underlying the syllogism in the so-called *dictum de omni et nullo* (the maxim of all and none), the principle that whatever is affirmed or denied of a whole must be affirmed or denied of a part (which they alleged derived from a reading of *Prior Analytics* I.1.24b27-30). Some contemporary authors have claimed that Aristotelian syllogistic is at least compatible with a deflationary theory of truth, the modern idea that truth-claims about propositions amount to little more than an assertion of the statement itself. (To say that “S is P” is true, is just to assert “S is P.”) Perhaps it would be better to say that one can trace the modern preoccupation with validity in formal logic to the distinction between issues of logical necessity and propositional truth implicit in Aristotle. In Aristotle’s logic, arguments do not take the form: “this state of affairs is true/false,” “this state of affairs is true/false,” therefore this state of affairs is true/false.” We do not argue “All S is M is true” but merely, “All S is M.” When it comes to determining validity—that is, when it comes to determining whether we have discovered a true syllogism—the question of the truth or falsity of propositions is pushed aside and attention is focused on an evaluation of the logical connection between premises and conclusion. Obviously, Aristotle recognizes that ascertaining the material truth of premises is an important part of argument evaluation, but he does not present a “truth-functional” logic. The concept of a “truth value” does not play any explicit role in his formal analysis the way it does, for example, with modern truth tables. Mostly, Aristotle wants to know what we can confidently conclude from two presumably true premises; that is, what kind of knowledge can be produced or demonstrated if two given premises are true.

### • Inductive Syllogism

Understanding what Aristotle means by inductive syllogism is a matter of serious scholarly dispute. Although there is only abbreviated textual evidence to go by, his account of inductive argument can be supplemented by his ampler account of its rhetorical analogues, argument from analogy and argument from example. What is clear is that Aristotle thinks of induction (*epagoge*)

as a form of reasoning that begins in the sense perception of particulars and ends in a understanding that can be expressed in a universal proposition (or even a concept). We pick up mental momentum through a familiarity with particular cases that allows us to arrive at a general understanding of an entire species or genus. As we discuss below, there are indications that Aristotle views induction, in the first instance, as a manifestation of immediate understanding and not as an argument form. Nonetheless, in the *Prior Analytics* II.23 (and 24), he casts inductive reasoning in syllogistic form, illustrating the “syllogism that springs out of induction” (ho ex epagoges sullogismos) by an argument about the longevity of bileless animals.

Relying on old biological ideas, Aristotle argues that we can move from observations about the longevity of individual species of bileless animals (that is, animals with clean-blood) to the universal conclusion that bilelessness is a cause of longevity. His argument can be paraphrased in modern English: All men, horses, mules, and so forth, are long-lived; all men, horses, mules, and so forth, are bileless animals; therefore, all bileless animals are long-lived. Although this argument seems, by modern standards, invalid, Aristotle apparently claims that it is a valid deduction. (Remember that the word “syllogism” means “deduction,” so an “inductive syllogism” is, literally, an “inductive deduction.”) He uses a technical notion of “convertibility” to formally secure the validity of the argument. According to this logical rule, terms that cover the same range of cases (because they refer to the same nature) are interchangeable (antistrophe). They can be substituted for one another. Aristotle believes that because the logical terms “men, horses, mules, etc” and “bileless animals” refer to the same genus, they are convertible. If, however, we invert the terms in the proposition “all men, horses, mules, and so forth, are bileless animals” to “all bileless animals are men, horses, mules, and so forth,” we can then rephrase the original argument: All men, horses, mules, and so forth, are long-lived; all bileless animals are men, horses, mules, and so forth; therefore, all bileless animals are long-lived. This revised induction possesses an obviously valid form (Barbara, discussed above). Note that Aristotle does not view this inversion of terms as a formal gimmick or trick; he believes that it reflects something metaphysically true about shared natures in the world. (One could argue that inductive syllogism operates by means of the quantification of the predicate term as well as the subject term of a categorical proposition, but we will not investigate that issue here.)

These passages pose multiple problems of interpretation. We can only advance a general overview of the most important disagreements here. We might identify four different interpretations of Aristotle’s account of the inductive syllogism.

(1) The fact that Aristotle seems to view this as a valid syllogism has led many commentators (such as Ross, McKirahan, Peters) to assume that he is referring to what is known as “perfect induction,” a generalization that is built up from a complete enumeration of particular cases. The main problem here is that it seems to involve a physical impossibility. No one could empirically inspect every bileless animal (and/or species) to ascertain that the connection between bilelessness and longevity obtains in every case.

(2) Some commentators combine this first explanation with the further suggestion that the bileless example is a rare case and that Aristotle believes, in line with modern accounts, that most inductions only produce probable belief. (Cf. Govier’s claim that there is a “tradition going back to Aristotle, which maintains that there are . . . only two broad types of argument: deductive arguments which are conclusive, and inductive arguments, which are not.” (*Problems in Argument Analysis*, 52.)) One problem with such claims is that they overlook the clear distinction that

Aristotle makes between rigorous inductions and rhetorical inductions (which we discuss below).

(3) Some commentators claim that Aristotle (and the ancients generally) overlooked the inherent tenuousness of the inductive reasoning. On this account, Empiricists such as Locke and Hume discovered something seriously wrong about induction that escaped the notice of an ancient author like Aristotle. Philosophers in the modern Anglo-American tradition largely favor this interpretation. (Cf. Garrett's and Barbanell's insistence that "Hume was the first to raise skeptical doubts about inductive reasoning, leaving a puzzle as to why the concerns he highlighted had earlier been so completely overlooked." ("Induction," 172.) Such allegations do not depend, however, on any close reading of a wealth of relevant passages in the Aristotelian corpus and in ancient philosophy generally.

(4) Finally, a minority contemporary view, growing in prominence, has argued that Aristotle did not conceive of induction as an enumerative process but as a matter of intelligent insight into natures. (Cf. McCaskey, Biondi, Rijk, Groarke.) On this account, Aristotle does not mean to suggest that inductive syllogism depends on an empirical inspection of every member of a group but on a universal act of understanding that operates through sense perception. Aristotelian induction can best be compared to modern notions of abduction or inference to the best explanation. This non-mathematical account has historical precedents in neo-Platonism, Thomism, Idealism, and in the textbook literature of traditionalist modern logicians that opposed the new formal logic. This view has been criticized, however, as a form of mere intuitionism dependent on an antiquated metaphysics.

The basic idea that induction is valid will raise eyebrows, no doubt. It is important to stave off some inevitable criticism before continuing. Modern accounts of induction, deriving, in large part, from Hume and Locke, display a mania for prediction. (Hence Hume's question: how can we know that the future bread we eat will nourish us based on past experience of eating bread?) But this is not primarily how Aristotle views the problem. For Aristotle, induction is about understanding natural kinds. Once we comprehend the nature of something, we will, of course, be able to make predictions about its future properties, but understanding its nature is the key. In Aristotle's mind, rigorous induction is valid because it picks out those necessary and essential traits that make something what it is. To use a very simple example, understanding that all spiders have eight legs—that is, that all undamaged spiders have eight legs—is a matter of knowing something deep about the biological nature that constitutes a spider. Something that does not have eight legs is not a spider. (Fruitful analogies might be drawn here to the notion of "a posteriori necessity" countenanced by contemporary logicians such as Hilary Putnam and Saul Kripke or to the "revised" concept of a "natural kind" advanced by authors such as Hilary Kornblith or Brian Ellis.) It is commonly said that Aristotle sees syllogisms as a device for explaining relationships between groups. This is, in the main, true. Still, there has to be some room for a consideration of individuals in logic if we hope to include induction as an essential aspect of reasoning. As Aristotle explains, induction begins in sense perception and sense perception only has individuals as its object. Some commentators would limit inductive syllogism to a movement from smaller groups (what Aristotle calls "primitive universals") to larger groups, but one can only induce a generalization about a smaller group on the basis of a prior observation of individuals that compose that group. A close reading reveals that Aristotle himself mentions syllogisms dealing with individuals (about the moon, *Topics*; about the wall; about the eclipse, *Posterior Analytics*, and so on.) If we treat individuals as universal terms or as representative of universal classes, this poses no problem for formal analysis. Collecting observations about one individual or about

individuals who belong to a larger group can lead to an accurate generalization.

### • Deduction versus Induction

We cannot fully understand the nature or role of inductive syllogism in Aristotle without situating it with respect to ordinary, “deductive” syllogism. Aristotle’s distinction between deductive and inductive argument is not precisely equivalent to the modern distinction. Contemporary authors differentiate between deduction and induction in terms of validity. (A small group of informal logicians called “Deductivists” dispute this account.) According a well-worn formula, deductive arguments are valid; inductive arguments are invalid. The premises in a deductive argument guarantee the truth of the conclusion: if the premises are true, the conclusion must be true. The premises in an inductive argument provide some degree of support for the conclusion, but it is possible to have true premises and a false conclusion. Although some commentators attribute such views to Aristotle, this distinction between strict logical necessity and merely probable or plausible reasoning more easily maps onto the distinction Aristotle makes between scientific and rhetorical reasoning (both of which we discuss below). Aristotle views inductive syllogism as scientific (as opposed to rhetorical) induction and therefore as a more rigorous form of inductive argument.

We can best understand what this amounts to by a careful comparison of a deductive and an inductive syllogism on the same topic. If we reconstruct, along Aristotelian lines, a deduction on the longevity of bileless animals, the argument would presumably run: All bileless animals are long-lived; all men, horses, mules, and so forth, are bileless animals; therefore, all men, horses, mules, and so forth, are long-lived. Defining the terms in this syllogism as: Subject Term, S=men, horses, mules, and so forth; Predicate Term, P=long-lived animals; Middle Term, M=bileless animals, we can represent this metaphysically correct inference as: Major Premise: All M are P. Minor Premise: All S are M.

Conclusion: Therefore all S are P. (Barbara.) As we already have seen, the corresponding induction runs: All men, horses, mules, and so forth, are long-lived; all men, horses, mules, and so forth, are bileless animals; therefore, all bileless animals are long-lived. Using the same definition of terms, we are left with: Major Premise: All S are P. Minor Premise: All S are M (convertible to All M are S).

Conclusion: Therefore, all M are P. (Converted to Barbara.) The difference between these two inferences is the difference between deductive and inductive argument in Aristotle. Clearly, Aristotelian and modern treatments of these issues diverge. As we have already indicated, in the modern formalism, one automatically defines subject, predicate, and middle terms of a syllogism according to their placement in the argument. For Aristotle, the terms in a rigorous syllogism have a metaphysical significance as well. In our correctly formulated deductive-inductive pair, S represents individual species and/or the individuals that make up those species (men, horses, mules, and so forth); M represents the deep nature of these things (bilelessness), and P represents the property that necessarily attaches to that nature (longevity). Here then is the fundamental difference between Aristotelian deduction and induction in a nutshell. In deduction, we prove that a property (P) belongs to individual species (S) because it possesses a certain nature (M); in induction, we prove that a property (P) belongs to a nature (M) because it belongs to individual species (S). Expressed formally, deduction proves that the subject term (S) is associated with a predicate term (P) by means of the middle term (M); induction proves that the middle term (M) is

associated with the predicate term (P) by means of the subject term (S). (Cf. Prior Analytics, II.23.68b31-35.)

Aristotle does not claim that inductive syllogism is invalid but that the terms in an induction have been rearranged. In deduction, the middle term joins the two extremes (the subject and predicate terms); in induction, one extreme, the subject term, acts as the middle term, joining the true middle term with the other extreme. This is what Aristotle means when he maintains that in induction one uses a subject term to argue to a middle term. Formally, with respect to the arrangement of terms, the subject term becomes the “middle term” in the argument.

Aristotle distinguishes then between induction and deduction in three different ways. First, induction moves from particulars to a universal, whereas deduction moves from a universal to particulars. The bileless induction moves from particular species to a universal nature; the bileless deduction moves from a universal nature to particular species. Second, induction moves from observation to language (that is, from sense perception to propositions), whereas deduction moves from language to language (from propositions to a new proposition). The bileless induction is really a way of demonstrating how observations of bileless animals lead to (propositional) knowledge about longevity; the bileless deduction demonstrates how (propositional) knowledge of a universal nature leads (propositional) knowledge about particular species. Third, induction identifies or explains a nature, whereas deduction applies or demonstrates a nature. The bileless induction provides an explanation of the nature of particular species: it is of the nature of bileless organisms to possess a long life. The bileless deduction applies that finding to particular species; once we know that it is of the nature of bileless organisms to possess a long life, we can demonstrate or put on display the property of longevity as it pertains to particular species.

One final point needs clarification. The logical form of the inductive syllogism, after the convertibility maneuver, is the same as the deductive syllogism. In this sense, induction and deduction possess the same (final) logical form. But, of course, in order to successfully perform an induction, one has to know that convertibility is possible, and this requires an act of intelligence which is able to discern the metaphysical realities between things out in the world. We discuss this issue under non-discursive reasoning below.

#### • **Science**

Aristotle wants to construct a logic that provides a working language for rigorous science as he understands it. Whereas we have been talking of syllogisms as arguments, Aristotelian science is about explanation. Admittedly, informal logicians generally distinguish between explanation and argument. An argument is intended to persuade about a debatable point; an explanation is not intended to persuade so much as to promote understanding. Aristotle views science as involving logical inferences that move beyond what is disputable to a consideration of what is the case. Still, the “explanatory” syllogisms used in science possess precisely the same formal structures as “argumentative” syllogisms. So we might consider them arguments in a wider sense. For his part, Aristotle relegates eristic reason to the broad field of rhetoric. He views science, perhaps naively, as a domain of established fact. The syllogisms used in science are about establishing an explanation from specific cases (induction) and then applying or illustrating this explanation to specific cases (deduction).

The ancient Greek term for science, “episteme,” is not precisely equivalent to its modern

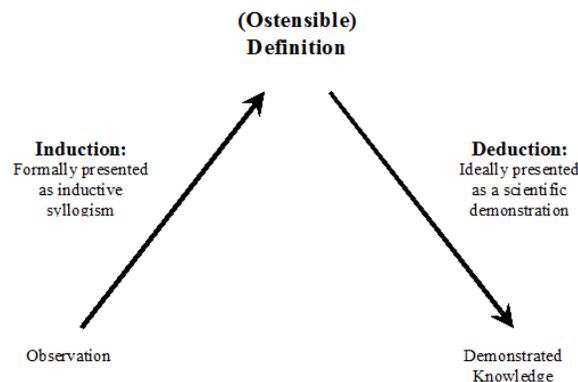

counterpart. In Aristotle's worldview, science, as the most rigorous sort of discursive knowledge, is opposed to mere opinion (*doxa*); it is about what is universal and necessary as opposed to what is particular and contingent, and it is theoretical as opposed to practical. Aristotle believes that knowledge, understood as justified true belief, is most perfectly expressed in a scientific demonstration (*apodeixis*), also known as an *apodeitic* or scientific syllogism. He posits a number of specific requirements for this most rigorous of all deductions. In order to qualify as a scientific demonstration, a syllogism must possess premises that are "true, primary, immediate, better known than, prior to, and causative of the conclusion." (*Posterior Analytics*, I.2.71b20ff, Tredennick.) It must yield information about a natural kind or a group of individual things. And it must produce universal knowledge (*episteme*). Specialists have disputed the meaning of these individual requirements, but the main message is clear. Aristotle accepts, as a general rule, that a conclusion in an argument cannot be more authoritative than the premises that led to that conclusion. We cannot derive better (or more reliable) knowledge from worse (or less reliable) knowledge. Given that a scientific demonstration is the most rigorous form of knowledge possible, we must start with premises that are utterly basic and as certain as possible, which are "immediately" induced from observation, and which confirm to the necessary structure of the world in a way that is authoritative and absolutely incontrovertible. This requires a reliance on first principles which we discuss below.

In the best case scenario, Aristotelian science is about finding definitions of species that, according to a somewhat bald formula, identify the genus (the larger natural group) and the differentia (that unique feature that sets the species apart from the larger group). As Aristotle's focus on definitions is a bit cramped and less than consistent (he himself spends a great deal of time talking about necessary rather than essential properties), let us broaden his approach to science to focus on ostensible definitions, where an ostensible definition is either a rigorous definition or, more broadly, any properly-formulated phrase that identifies the unique properties of something. On this looser approach, which is more consistent with Aristotle's actual practice, to define an entity is to identify the nature, the essential and necessary properties, that make it uniquely what it is. Suffice it to say that Aristotle's idealized account of what science entails needs to be expanded to cover a wide range of activities and that fall under what is now known as scientific practice. What follows is a general sketch of his overall orientation. (We should point out that Aristotle himself resorts to whatever informal methods seem appropriate when reporting on his own biological investigations without too much concern for any fixed ideal of formal correctness. He makes no attempt to cast his own scientific conclusions in metaphysically-correct syllogisms. One could perhaps insist that he uses enthymemes (syllogisms with unstated premises), but mostly, he just seems to record what seems appropriate without any deliberate attempt at correct formalization. Note that most of Aristotle's scientific work is "historia," an earlier stage of observing, fact-collecting, and opinion-reporting that proceeds the principled theorizing of advanced science.)

For Aristotle, even theology is a science inasmuch as it deals with universal and necessary principles. Still, in line with modern attitudes (and in opposition to Plato), Aristotle views sense-perception as the proper route to scientific knowledge. Our empirical experience of the world yields knowledge through induction. Aristotle elaborates then an inductive-deductive model of science. Through careful observation of particular species, the scientist induces an ostensible definition to explain a nature and then demonstrates the consequences of that nature for particular species. Consider a specific case. In the *Posterior Analytics* (II.16-17.98b32ff, 99a24ff), Aristotle mentions an explanation about why deciduous plants lose their leaves in the winter. The ancients apparently

believed this happens because sap coagulates at the base of the leaf (which is not entirely off the mark). We can use this ancient example of a botanical explanation to illustrate how the business of Aristotelian science is supposed to operate. Suppose we are a group of ancient botanists who discover, through empirical inspection, why deciduous plants such as vines and figs lose their leaves. Following Aristotle's lead, we can cast our discovery in the form of the following inductive syllogism: "Vine, fig, and so forth, are deciduous. Vine, fig, and so forth, coagulate sap. Therefore, all sap-coagulators are deciduous." This induction produces the definition of "deciduous." ("Deciduous" is the definiendum; sap-coagulation, the definiens; the point being that everything that is a sap-coagulator is deciduous, which might not be the case if we turned it around and said "All deciduous plants are sap-coagulators.") But once we have a definition of "deciduous," we can use it as the first premise in a deduction to demonstrate something about say, the genus "broad-leaved trees." We can apply, in other words, what we have learned about deciduous plants in general to the more specific genus of broad-leaved trees. Our deduction will read: "All sap-coagulators are deciduous. All broad-leaved trees are sap-coagulators. Therefore, all broad-leaved trees are deciduous." We can express all this symbolically. For the induction, where S=vine, fig, and so forth, P=deciduous, M= being a sap-coagulator, the argument is: "All S is P; all S is M (convertible to all M is S); therefore, all M are P (converted to Barbara). For the deduction, where S=broad-leaved trees, M=being a sap-coagulator, P=deciduous, the argument can be represented: "All M are P; all S is M; therefore, all S is P" (Barbara). This is then the basic logic of Aristotelian science.

A simple diagram of how science operates follows (Figure 2).

**Figure 2**

### **The Inductive-Deductive Method of Aristotelian Science**

Aristotle views science as a search for causes (aitia). In a well-known example about planets not twinkling because they are close to the earth (Posterior Analytics, I.13), he makes an important distinction between knowledge of the fact and knowledge of the reasoned fact. The rigorous scientist aims at knowledge of the reasoned fact which explains why something is the way it is. In our example, sap-coagulation is the cause of deciduous; deciduous is not the cause of sap-coagulation. That is why "sap-coagulation" is featured here as the middle term, because it is the cause of the phenomenon being investigated. The deduction "All sap-coagulators are deciduous; all broad-leaved trees are sap-coagulators; therefore, all broad-leaved trees are deciduous" counts as knowledge of the reasoned fact because it reveals the cause of broad-leaved deciduousness.

Aristotle makes a further distinction between what is more knowable relative to us and what is more knowable by nature (or in itself). He remarks in the *Physics*, “The natural way of [inquiry] is to start from the things which are more knowable and obvious to us and proceed towards those which are clearer and more knowable by nature; for the same things are not ‘knowable relatively to us’ and ‘knowable’ without qualification.” (I.184a15, Hardie, Gaye.) In science we generally move from the effect to the cause, from what we see and observe around us to the hidden origins of things. The outward manifestation of the phenomenon of “deciduousness” is more accessible to us because we can see the trees shedding their leaves, but sap-coagulation as an explanatory principle is more knowable in itself because it embodies the cause. To know about sap-coagulation counts as an advance in knowledge; someone who knows this knows more than someone who only knows that trees shed their leaves in the fall. Aristotle believes that the job of science is to put on display what best counts as knowledge, even if the resulting theory strays from our immediate perceptions and first concerns.

Jan Lukasiewicz, a modern-day pioneer in term logic, comments that “some queer philosophical prejudices which cannot be explained rationally” made early commentators claim that the major premise in a syllogism (the one with the middle and predicate terms) must be first. (Aristotle’s *Syllogistic*, 32.) But once we view the syllogism within the larger context of Aristotelian logic, it becomes perfectly obvious why these early commentators put the major premise first: because it constitutes the (ostensible) definition; because it contains an explanation of the nature of the thing upon which everything else depends. The major premise in a scientific deduction is the most important part of the syllogism; it is scientifically prior in that it reveals the cause that motivates the phenomenon. So it makes sense to place it first. This was not an irrational prejudice.

#### • **Non-Discursive Reasoning**

The distinction Aristotle draws between discursive knowledge (that is, knowledge through argument) and non-discursive knowledge (that is, knowledge through nous) is akin to the medieval distinction between ratio (argument) and intellectus (direct intellection). In Aristotelian logic, non-discursive knowledge comes first and provides the starting points upon which discursive or argumentative knowledge depends. It is hard to know what to call the mental power that gives rise to this type of knowledge in English. The traditional term “intuition” invites misunderstanding. When Aristotle claims that there is an immediate sort of knowledge that comes directly from the mind (nous) without discursive argument, he is not suggesting that knowledge can be accessed through vague feelings or hunches. He is referring to a capacity for intelligent appraisal that might be better described as discernment, comprehension, or insight. Like his later medieval followers, he views “intuition” as a species of reason; it is not prior to reason or outside of reason, it is—in the highest degree—the activity of reason itself. (Cf. *Posterior Analytics*, II. 19; *Nicomachean Ethics*, IV.6.)

For Aristotle, science is only one manifestation of human intelligence. He includes, for example, intuition, craft, philosophical wisdom, and moral decision-making along with science in his account of the five intellectual virtues. (*Nicomachean Ethics*, VI.3-8.) When it comes to knowledge-acquisition, however, intuition is primary. It includes the most basic operations of intelligence, providing the ultimate ground of understanding and inference upon which everything else depends. Aristotle is a firm empiricist. He believes that knowledge begins in perception, but he also believes that we need intuition to make sense of perception. In the *Posterior Analytics*

(II.19.100a3-10), Aristotle posits a sequence of steps in mental development: sense perception produces memory which (in combination with intuition) produces human experience (*empeiria*), which produces art and science. Through a widening movement of understanding (really, a non-discursive form of induction), intuition transforms observation and memory so as to produce knowledge (without argument). This intuitive knowledge is even more reliable than science. As Aristotle writes in key passages at the end of the *Posterior Analytics*, “no other kind of thought except intuition is more accurate than scientific knowledge,” and “nothing except intuition can be truer than scientific knowledge.” (100b8ff, Mure, slightly emended.)

Aristotelian intuition supplies the first principles (*archai*) of human knowledge: concepts, universal propositions, definitions, the laws of logic, the primary principles of the specialized science, and even moral concepts such as the various virtues. This is why, according to Aristotle, intuition must be viewed as infallible. We cannot claim that the first principles of human intelligence are dubious and then turn around and use those principles to make authoritative claims about the possibility (or impossibility) of knowledge. If we begin to doubt intuition, that is, human intelligence at its most fundamental level of operation, we will have to doubt everything else that is built upon this universal foundation: science, philosophy, knowledge, logic, inference, and so forth. Aristotle never tries to prove first principles. He acknowledges that when it comes to the origins of human thought, there is a point when one must simply stop asking questions. As he points out, any attempt at absolute proof would lead to an infinite regress. In his own words: “It is impossible that there should be demonstration of absolutely everything; there would be an infinite regress, so that there would still be no demonstration.” (*Metaphysics*, 1006a6ff, Ross.) Aristotle does make arguments, for example, that meaningful speech presupposes a logical axiom like the principle of non-contradiction, but that is not, strictly speaking, a proof of the principle.

Needless to say, Aristotle’s reliance on intuition has provoked a good deal of scholarly disagreement. Contemporary commentators such as Joseph Owens, G. L. Owen, and Terrence Irwin have argued that Aristotelian first principles begin in dialectic. On their influential account, we arrive at first principles through a weaker form of argument that revolves around a consideration of “*endoxa*,” the proverbial opinions of the many and/or the wise. Robin Smith (and others) severely criticize their account. The idea that mere opinion could somehow give rise to rigorous scientific knowledge conflicts with Aristotle’s settled view that less reliable knowledge cannot provide sufficient logical support for the more reliable knowledge. As we discuss below, *endoxa* do provide a starting point for dialectical (and ethical) arguments in Aristotle’s system. They are, in his mind, a potent intellectual resource, a library of stored wisdom and right opinion. They may include potent expressions of first principles already discovered by other thinkers and previous generations. But as Aristotle makes clear at the end of the *Posterior Analytics* and elsewhere, the recognition that something is a first principle depends directly on intuition. As he reaffirms in the *Nicomachean Ethics*, “it is intuitive reason that grasps the first principles.” (VI.6.1141a7, Ross.) If Irwin and his colleagues seek to limit the role of intuition in Aristotle, authors such as Lambertus Marie de Rijk and D. W. Hamlyn go to an opposite extreme, denying the importance of the inductive syllogism and identifying induction (*epagoge*) exclusively with intuition. De Rijk claims that Aristotelian induction is “a pre-argumentation procedure consisting in . . . [a] disclosure [that] does not take place by a formal, discursive inference, but is, as it were, jumped upon by an intuitive act of knowledge.” (*Semantics and Ontology*, I.2.53, 141-2.) Although this position seems extreme, it seems indisputable that inductive syllogism depends on intuition, for without intuition (understood as intelligent discernment), one could not recognize the convertibility of subject and middle terms (discussed above). Aristotle also points out that one needs intuition to recognize the

(ostensible) definitions so crucial to the practice of Aristotelian science. We must be able to discern the difference between accidental and necessary or essential properties before coming up with a definition. This can only come about through some kind of direct (non-discursive) discernment. Aristotle proposes a method for discovering definitions called division—we are to divide things into smaller and smaller sub-groups—but this method depends wholly on nous. (Cf. *Posterior Analytics*, II.13.) Some modern Empiricist commentators, embarrassed by such mystical-sounding doctrines, warn that this emphasis on non-discursive reasoning collapses into pure rationalism (or Platonism), but this is a caricature. What Aristotle means by rational “intuition” is not a matter of pure, disembodied thought. One does not arrive at first principles by closing one’s eyes and retreating from the world (as with Cartesian introspection). For Aristotle, first principles arise through a vigorous interaction of the empirical with the rational; a combination of rationality and sense experience produces the first seeds of human understanding.

Note that Aristotle believes that there are first principles (*koinai archai*) that are common to all fields of inquiry, such as the principle of non-contradiction or the law of excluded middle, and that each specialized science has its own first principles. We may recover these first principles second-hand by a (dialectical) review of authorities. Or, we can derive them first hand by analysis, by dividing the subject matter we are concerned with into its constituent parts. At the beginning of the *Physics*, Aristotle explains, “What is to us plain and obvious at first is rather confused masses, the elements and principles of which become known to us later by analysis. Thus we must advance from generalities to particulars; for it is a whole that is best known to sense-perception, and a generality is a kind of whole, comprehending many things within it, like parts. . . . Similarly a child begins by calling all men ‘father,’ and all women ‘mother,’ but later on distinguishes each of them.” (I.1.184a22-184b14, Hardie, Gaye.) Just as children learn to distinguish their parents from other human beings, those who successfully study a science learn to distinguish the different natural kinds that make up the whole of a scientific phenomenon. This precedes the work of induction and deduction already discussed. Once we have the parts (or the aspects), we can reason about them scientifically.

#### • Rhetoric

Argumentation theorists (less aptly characterized as informal logicians) have critiqued the ascendancy of formal logic, complaining that the contemporary penchant for symbolic logic leaves one with an abstract mathematics of empty signs that cannot be applied in any useful way to larger issues. Proponents of formal logic counter that their specialized formalism allows for a degree of precision otherwise not available and that any focus on the substantive meaning or truth of propositions is a distraction from logical issues per se. We cannot readily fit Aristotle into one camp or the other. Although he does provide a formal analysis of the syllogism, he intends logic primarily as a means of acquiring true statements about the world. He also engages in an enthusiastic investigation of less rigorous forms of reasoning included in the study of dialectic and rhetoric.

Understanding precisely what Aristotle means by the term “dialectics” (*dialektike*) is no easy task. He seems to view it as the technical study of argument in general or perhaps as a more specialized investigation into argumentative dialogue. He intends his rhetoric (*rhetorike*), which he describes as the counterpart to dialectic, as an expansive study of the art of persuasion, particularly as it is directed towards a non-academic public. Suffice it to say, for our purposes, that Aristotle reserves a place in his logic for a general examination of all arguments, for scientific

reasoning, for rhetoric, for debating techniques of various sorts, for jurisprudential pleading, for cross-examination, for moral reasoning, for analysis, and for non-discursive intuition.

Aristotle distinguishes between what I will call, for convenience, rigorous logic and persuasive logic. Rigorous logic aims at *epistēmē*, true belief about what is eternal, necessary, universal, and unchanging. (Aristotle sometimes qualifies this to include “for the most part” scientific knowledge.) Persuasive logic aims at acceptable, probable, or convincing belief (what we might call “opinion” instead of knowledge.) It deals with approximate truth, with *endoxa* (popular or proverbial opinions), with reasoning that is acceptable to a particular audience, or with claims about accidental properties and contingent events. Persuasive syllogisms have the same form as rigorous syllogisms but are understood as establishing their conclusions in a weaker manner. As we have already seen, rigorous logic produces deductive and inductive syllogisms; Aristotle indicates that persuasive logic produces, in a parallel manner, enthymemes, analogies, and examples. He defines an enthymeme as a deduction “concerned with things which may, generally speaking, be other than they are,” with matters that are “for the most part only generally true,” or with “probabilities and signs” (*Rhetoric*, I.2.1357a, Roberts). He also mentions that the term “enthymeme” may refer to arguments with missing premises. (*Rhetoric*, I.2.1357a16-22.) When it comes to induction, Aristotle’s presentation is more complicated, but we can reconstruct what he means in a more straightforward manner.

The persuasive counterpart to the inductive syllogism is the analogy and the example, but the example is really a composite argument formed from first, an analogy and second, an enthymeme. Some initial confusion is to be expected as Aristotle’s understanding of analogies differs somewhat from contemporary accounts. In contemporary treatments, analogies depend on a direct object(s)-to-object(s) comparison. Aristotelian analogy, on the other hand, involves reasoning up to a general principle. We are to conclude (1) that because individual things of a certain nature X have property z, everything that possesses nature X has property z. But once we know that every X possesses property z, we can make a deduction (2) that some new example of nature X will also have property z. Aristotle calls (1), the inductive movement up to the generalization, an analogy (literally, an argument from likeness=*ton homoion*); he calls (2), the deductive movement down to a new case, an enthymeme; and he considers (1) + (2), the combination of the analogy and the enthymeme together, an example (*paradeigma*). He presents the following argument from example in the *Rhetoric* (I.2.1357b31-1358a1). Suppose we wish to argue that Dionysius, the ruler, is asking for a bodyguard in order to set himself up as despot. We can establish this by a two-step process. First, we can draw a damning analogy between previous cases where rulers asked for a bodyguard and induce a general rule about such practices. We can insist that Peisistratus, Theagenes, and other known tyrants, were scheming to make themselves despots, that Peisistratus, Theagenes, and other known tyrants also asked for a bodyguard, and that therefore, everyone who asks for a bodyguard is scheming to make themselves dictators. But once we have established this general rule, we can move on to the second step in our argument, using this conclusion as a premise in an enthymeme. We can argue that all people asking for a bodyguard are scheming to make themselves despots, that Dionysius is someone asking for a bodyguard, and that therefore, Dionysius must be scheming to make himself despot. This is not, in Aristotle’s mind, rigorous reasoning. Nonetheless, we can, in this way, induce probable conclusions and then use them to deduce probable consequences. Although these arguments are intended to be persuasive or plausible rather than scientific, but the reasoning strategy mimics the inductive-deductive movement of science (without compelling, of course, the same degree of belief).

We should point out that Aristotle does not restrict himself to a consideration of purely formal issues in his discussion of rhetoric. He famously distinguishes, for example, between three means of persuasion: ethos, pathos, and logos. As we read, at the beginning of his *Rhetoric*: “Of the modes of persuasion furnished by the spoken word there are three kinds. . . . [Firstly,] persuasion is achieved by the speaker’s personal character when the speech is so spoken as to make us think him credible. . . . Secondly, persuasion may come through the hearers, when the speech stirs their emotions. Thirdly, persuasion is effected through the speech itself when we have proved [the point] by means of the persuasive arguments suitable to the case in question.” (*Rhetoric*, I.2.1356a2-21, Roberts.) Aristotle concludes that effective arguers must (1) understand morality and be able to convince an audience that they themselves are good, trustworthy people worth listening to (ethos); (2) know the general causes of emotion and be able to elicit them from specific audience (pathos); and (3) be able to use logical techniques to make convincing (not necessarily sound) arguments (logos). Aristotle broaches many other issues we cannot enter into here. He acknowledges that the goal of rhetoric is persuasion, not truth. Such techniques may be bent to immoral or dishonest ends. Nonetheless, he insists that it is in the public interest to provide a comprehensive and systematic survey of the field.

We might mention two other logical devices that have a place in Aristotle’s work: the *topos* and the *aporia*. Unfortunately, Aristotle never explicitly explains what a *topos* is. The English word “topic” does not do justice to the original notion, for although Aristotelian *topoi* may be organized around subject matter, they focus more precisely on recommended strategies for successful arguing. (The technical term derives from a Greek word referring to a physical location. Some scholars suggest a link to ancient mnemonic techniques that superimposed lists on familiar physical locations as a memory aid.) In relevant discussions (in the *Topics* and the *Rhetoric*) Aristotle offers helpful advice about finding (or remembering) suitable premises, about verbally out-manoeuvring an opponent, about finding forceful analogies, and so on. Examples of specific *topoi* would include discussions about how to argue which is the better of two alternatives, how to substitute terms effectively, how to address issues about genus and property, how to argue about cause and effect, how to conceive of sameness and difference, and so on. Some commentators suggest that different *topoi* may have been used in a classroom situation in conjunction with student exercises and standardized texts, or with written lists of *endoxa*, or even with ready-made arguments that students were expected to memorize.

An *aporia* is a common device in Greek philosophy. The Greek word *aporia* (plural, *aporiai*) refers to a physical location blocked off by obstacles where there is no way out; by extension, it means, in philosophy, a mental perplexity, an impasse, a paradox or puzzle that stoutly resists solution. Aristotle famously suggests that philosophers begin with *aporiai* and complete their task by resolving the apparent paradoxes. An attentive reader will uncover many *aporiai* in Aristotle who begins many of his treatises with a *diaporia*, a survey of the puzzles that occupied previous thinkers. Note that *aporiai* cannot be solved through some mechanical rearrangement of symbolic terms. Solving puzzles requires intelligence and discernment; it requires some creative insight into what is at stake.

#### • Fallacies

In a short work entitled *Sophistical Refutations*, Aristotle introduces a theory of logical fallacies that has been remarkably influential. His treatment is abbreviated and somewhat obscure, and

there is inevitably scholarly disagreement about precise exegesis. Aristotle thinks of fallacies as instances of specious reasoning; they are not merely errors but hidden errors. A fallacy is an incorrect reasoning strategy that gives the illusion of being sound or somehow conceals the underlying problem. Aristotle divides fallacies into two broad categories: those which depend on language (sometimes called verbal fallacies) and those that are independent of language (sometimes called material fallacies). There is some scholarly disagreement about particular fallacies, but traditional English names and familiar descriptions follow. Linguistic fallacies include: homonymy (verbal equivocation), ambiguity (amphiboly or grammatical equivocation), composition (confusing parts with a whole), division (confusing a whole with parts), accent (equivocation that arises out of mispronunciation or misplaced emphasis) and figure of speech (ambiguity resulting from the form of an expression). Independent fallacies include accident (overlooking exceptions), converse accident (hasty generalization or improper qualification), irrelevant conclusion, affirming the consequent (assuming an effect guarantees the presence of one possible cause), begging the question (assuming the point), false cause, and complex question (disguising two or more questions as one). Logicians, influenced by scholastic logic, often gave these characteristic mistakes Latin names: *compositio* for composition, *divisio* for division, *secundum quid et simpliciter* for converse accident, *ignoranti enlenchi* for nonrelevant conclusion, and *petitio principii* for begging the question.

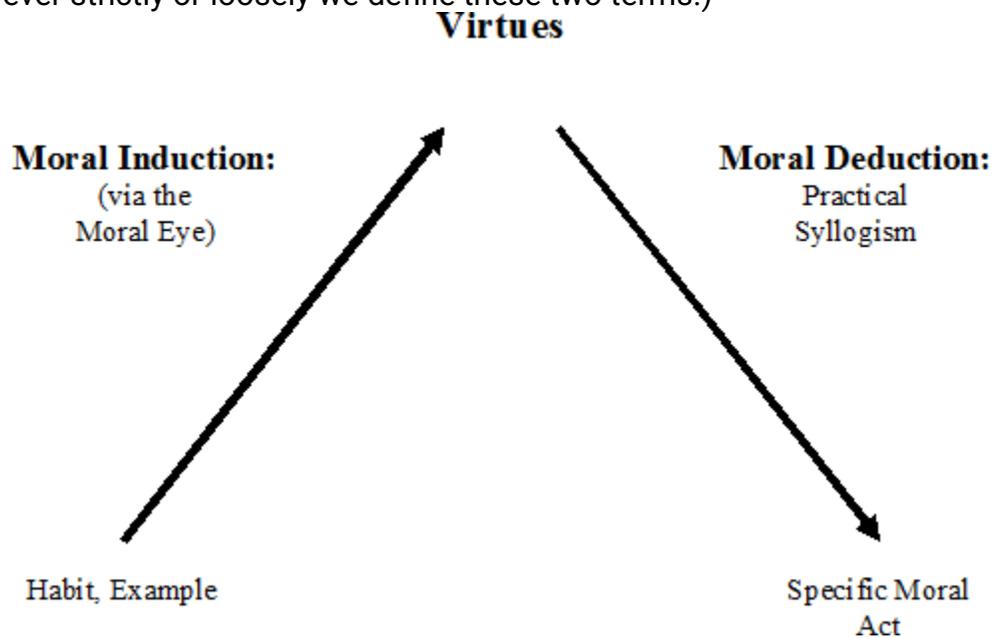

Consider three brief examples of fallacies from Aristotle's original text. Aristotle formulates the following amphiboly (which admittedly sounds awkward in English): "I wish that you the enemy may capture." (Sophistical Refutations, 4.166a7-8, Pickard-Cambridge.) Clearly, the grammatical structure of the statement leaves it ambiguous as to whether the speaker is hoping that the enemy or "you" be captured. In discussing complex question, he supplies the following perplexing example: "Ought one to obey the wise or one's father?"

(Ibid., 12.173a21.) Obviously, from a Greek perspective, one ought to obey both. The problem is that the question has been worded in such a way that anyone who answers will be forced to reject one moral duty in order to embrace the other. In fact, there are two separate questions here—Should one obey the wise? Should one obey one's father?—that have been illegitimately combined to produce a single question with a single answer. Finally, Aristotle provides the following time-honoured example of affirming the consequent: "Since after the rain the ground is wet, we suppose that if the ground is wet, it has been raining; whereas that does not necessarily follow" (Ibid., 5.167b5-8.) Aristotle's point is that assuming that the same effect never has more than one cause misconstrues the true nature of the world. The same effect may have several causes. Many of Aristotle's examples have to do with verbal tricks which are entirely unconvincing—for example, the person who commits the fallacy of division by arguing that the number "5" is both even and odd because it can be divided into an even and an odd number: "2" and "3." (Ibid., 4.166a32-33.) But the interest here is theoretical: figuring out where an obviously-incorrect argument or proposition went wrong. We should note that much of this text, which deals with natural language argumentation, does not presuppose the syllogistic form. Aristotle does spend a good bit of time considering how fallacies are related to one another. Fallacy theory, it is worth adding, is a thriving area of research in contemporary argumentation theory. Some of these issues are hotly debated.

#### • Moral Reasoning

In the modern world, many philosophers have argued that morality is a matter of feelings, not reason. Although Aristotle recognizes the connative (or emotional) side of morality, he takes a

decidedly different tack. As a virtue ethicist, he does not focus on moral law but views morality through the lens of character. An ethical person develops a capacity for habitual decision-making that aims at good, reliable traits such as honesty, generosity, high-mindedness, and courage. To modern ears, this may not sound like reason-at-work, but Aristotle argues that only human beings—that is, rational animals—are able to tell the difference between right and wrong. He widens his account of rationality to include a notion of practical wisdom (phronesis), which he defines as “a true and reasoned state of capacity to act with regard to the things that are good or bad for man.” (Nicomachean Ethics, VI.5.1140b4-5, Ross, Urmsen). The operation of practical wisdom, which is more about doing than thinking, displays an inductive-deductive pattern similar to science as represented in Figure 3. It depends crucially on intuition or nous. One induces the idea of specific virtues (largely, through an exercise of non-discursive reason) and then deduces how to apply these ideas to particular circumstances. (Some scholars make a strict distinction between “virtue” (areté) understood as the mental capacity which induces moral ideas and “phronesis” understood as the mental capacity which applies these ideas, but the basic structure of moral thinking remains the same however strictly or loosely we define these two terms.)

**Figure 3**

### **The Inductive-Deductive Method of Aristotelian Ethics**

We can distinguish then between moral induction and moral deduction. In moral induction, we induce an idea of courage, honesty, loyalty, and so on. We do this over time, beginning in our childhood, through habit and upbringing. Aristotle writes that the successful moral agent “must be born with an eye, as it were, by which to judge rightly and choose what is truly good.” (Ibid., VI.7.1114b6ff.) Once this intuitive capacity for moral discernment has been sufficiently developed—once the moral eye is able to see the difference between right and wrong,—we can apply moral norms to the concrete circumstances of our own lives. In moral deduction, we go on to apply the idea of a specific virtue to a particular situation. We do not do this by formulating moral arguments inside our heads, but by making reasonable decisions, by doing what is morally required given the circumstances. Aristotle refers, in this connection, to the practical syllogism which results “in a conclusion which is an action.” (Movement of Animals,

701a10ff, Farquharson.) Consider a (somewhat simplified) example. Suppose I induce the idea of promise-keeping as a virtue and then apply it to question of whether I should pay back the money I borrowed from my brother. The corresponding theoretical syllogism would be: Promise-keeping is good; giving back the money I owe my brother is an instance of promise-keeping; so giving the back the money I owe my brother is good." In the corresponding practical syllogism, I do not conclude with a statement: "this act is good." I go out and pay back the money I owe my brother. The physical exchange of money counts as the conclusion. In Aristotle's moral system, general moral principles play the role of an ostensible definition in science. One induces a general principle and deduces a corresponding action. Aristotle does believe that moral reasoning is a less rigorous form of reasoning than science, but chiefly because scientific demonstrations deal with universals whereas the practical syllogism ends a single act that must be fitted to contingent circumstances. There is never any suggestion that morality is somehow arbitrary or subjective. One could set out the moral reasoning process using the moral equivalent of an inductive syllogism and a scientific demonstration.

Although Aristotle provides a logical blueprint for the kind of reasoning that is going on in ethical decision-making, he obviously does not view moral decision-making as any kind of mechanical or algorithmic procedure. Moral induction and deduction represent, in simplified form, what is going on. Throughout his ethics, Aristotle emphasizes the importance of context. The practice of morality depends then on a faculty of keen discernment that notices, distinguishes, analyzes, appreciates, generalizes, evaluates, and ultimately decides. In the *Nicomachean Ethics*, he includes practical wisdom in his list of five intellectual virtues. (Scholarly commentators variously explicate the relationship between the moral and the intellectual virtues.) Aristotle also discusses minor moral virtues such as good deliberation (*eubulia*), theoretical moral understanding (*sunesis*), and experienced moral judgement (*gnome*). And he equates moral failure with chronic ignorance or, in the case of weakness of will (*akrasia*), with intermittent ignorance.

### **Aristotle Critique of Plato's theory of Ideas**

Plato (c. 428–c. 348 BCE) and Aristotle (384–322 BCE) are generally regarded as the two greatest figures of Western philosophy. For some 20 years Aristotle was Plato's student and colleague at the Academy in Athens, an institution for philosophical, scientific, and mathematical research and teaching founded by Plato in the 380s. Although Aristotle revered his teacher, his philosophy eventually departed from Plato's in important respects. Aristotle also investigated areas of philosophy and fields of science that Plato did not seriously consider. According to a conventional view, Plato's philosophy is abstract and utopian, whereas Aristotle's is empirical, practical, and commonsensical. Such contrasts are famously suggested in the fresco *School of Athens* (1510–11) by the Italian Renaissance painter Raphael, which depicts Plato and Aristotle together in conversation, surrounded by philosophers, scientists, and artists of earlier and later ages. Plato, holding a copy of his dialogue *Timeo* (*Timaeus*), points upward to the heavens; Aristotle, holding his *Etica* (*Ethics*), points outward to the world.

Although this view is generally accurate, it is not very illuminating, and it obscures what Plato and Aristotle have in common and the continuities between them, suggesting wrongly that their philosophies are polar opposites.

So how exactly does Plato's philosophy differ from Aristotle's? Here are three main differences.

**Forms.** The most fundamental difference between Plato and Aristotle concerns their theories of

forms. (When used to refer to forms as Plato conceived them, the term “Form” is conventionally capitalized, as are the names of individual Platonic Forms. The term is lowercased when used to refer to forms as Aristotle conceived them.) For Plato, the Forms are perfect exemplars, or ideal types, of the properties and kinds that are found in the world. Corresponding to every such property or kind is a Form that is its perfect exemplar or ideal type. Thus the properties “beautiful” and “black” correspond to the Forms the Beautiful and the Black; the kinds “horse” and “triangle” correspond to the Forms the Horse and the Triangle; and so on.

A thing has the properties it has, or belongs to the kind it belongs to, because it “participates” in the Forms that correspond to those properties or kinds. A thing is a beautiful black horse because it participates in the Beautiful, the Black, and the Horse; a thing is a large red triangle because it participates in the Large, the Red, and the Triangle; a person is courageous and generous because he or she participates in the Forms of Courage and Generosity; and so on.

For Plato, Forms are abstract objects, existing completely outside space and time. Thus they are knowable only through the mind, not through sense experience. Moreover, because they are changeless, the Forms possess a higher degree of reality than do things in the world, which are changeable and always coming into or going out of existence. The task of philosophy, for Plato, is to discover through reason (“dialectic”) the nature of the Forms, the only true reality, and their interrelations, culminating in an understanding of the most fundamental Form, the Good or the One.

Aristotle rejected Plato’s theory of Forms but not the notion of form itself. For Aristotle, forms do not exist independently of things—every form is the form of some thing. A “substantial” form is a kind that is attributed to a thing, without which that thing would be of a different kind or would cease to exist altogether. “Black Beauty is a horse” attributes a substantial form, horse, to a certain thing, the animal Black Beauty, and without that form Black Beauty would not exist. Unlike substantial forms, “accidental” forms may be lost or gained by a thing without changing its essential nature. “Black Beauty is black” attributes an accidental form, blackness, to a certain animal, who could change color (someone might paint him) without ceasing to be himself.

Substantial and accidental forms are not created, but neither are they eternal. They are introduced into a thing when it is made, or they may be acquired later, as in the case of some accidental forms.

**Ethics.** For both Plato and Aristotle, as for most ancient ethicists, the central problem of ethics was the achievement of happiness. By “happiness” (the usual English translation of the Greek term *eudaimonia*), they did not mean a pleasant state of mind but rather a good human life, or a life of human flourishing. The means by which happiness was acquired was through virtue. Thus ancient ethicists typically addressed themselves to three related questions: (1) What does a good or flourishing human life consist of?, (2) What virtues are necessary to achieve it?, and (3) How does one acquire those virtues?

Plato’s early dialogues encompass explorations of the nature of various conventional virtues, such as courage, piety, and temperance, as well as more general questions, such as whether virtue can be taught. Socrates (Plato’s teacher) is portrayed in conversation with presumed experts and the occasional celebrity; invariably, Socrates exposes their definitions as inadequate. Although Socrates does not offer his own definitions, claiming to be ignorant, he suggests that virtue is a

kind of knowledge, and that virtuous action (or the desire to act virtuously) follows necessarily from having such knowledge—a view held by the historical Socrates, according to Aristotle.

In Plato's later dialogue *Republic*, which is understood to convey his own views, the character Socrates develops a theory of "justice" as a condition of the soul. As described in that work, the just or completely virtuous person is the one whose soul is in harmony, because each of its three parts—Reason, Spirit, and Appetite—desires what is good and proper for it and acts within proper limits. In particular, Reason understands and desires the good of the individual (the human good) and the Good in general. Such understanding of the Form of the Good, however, can be acquired only through years of training in dialectic and other disciplines, an educational program that the *Republic* also describes. Ultimately, only philosophers can be completely virtuous.

Characteristically, for Aristotle, happiness is not merely a condition of the soul but a kind of right activity. The good human life, he held, must consist primarily of whatever activity is characteristically human, and that is reasoning. The good life is therefore the rational activity of the soul, as guided by the virtues. Aristotle recognized both intellectual virtues, chiefly wisdom and understanding, and practical or moral virtues, including courage and temperance. The latter kinds of virtue typically can be conceived as a mean between two extremes (a temperate person avoids eating or drinking too much but also eating or drinking too little). In his *Nicomachean Ethics*, Aristotle held that happiness is the practice of philosophical contemplation in a person who has cultivated all of the intellectual and moral virtues over much of a lifetime. In the *Eudemian Ethics*, happiness is the exercise of the moral virtues specifically in the political realm, though again the other intellectual and moral virtues are presupposed.

**Politics.** The account of justice presented in Plato's *Republic* is not only a theory of virtue but also a theory of politics. Indeed, the character Socrates there develops a theory of political justice as a means of advancing the ethical discussion, drawing an analogy between the three parts of the soul—Reason, Spirit, and Appetite—and the three classes of an ideal state (i.e., city-state)—Rulers, Soldiers, and Producers (e.g., artisans and farmers). In the just state as in the just individual, the three parts perform the functions proper to them and in harmony with the other parts. In particular, the Rulers understand not only the good of the state but, necessarily, the Good itself, the result of years of rigorous training to prepare them for their leadership role. Plato envisioned that the Rulers would live simply and communally, having no private property and even sharing sexual partners (notably, the rulers would include women). All children born from the Rulers and the other classes would be tested, those showing the most ability and virtue being admitted to training for rulership.

The political theory of Plato's *Republic* is notorious for its assertion that only philosophers should rule and for its hostility toward democracy, or rule by the many. In the latter respect it broadly reflects the views of the historical Socrates, whose criticisms of the democracy of Athens may have played a role in his trial and execution for impiety and other crimes in 399. In one of his last works, the *Laws*, Plato outlined in great detail a mixed constitution incorporating elements of both monarchy and democracy. Scholars are divided over the question of whether the *Laws* indicates that Plato changed his mind about the value of democracy or was simply making practical concessions in light of the limitations of human nature. According to the latter view, the state of the *Republic* remained Plato's ideal, or utopia, while that of the *Laws* represented the best that could be achieved in realistic circumstances, according to him.

In political theory, Aristotle is famous for observing that “man is a political animal,” meaning that human beings naturally form political communities. Indeed, it is impossible for human beings to thrive outside a community, and the basic purpose of communities is to promote human flourishing. Aristotle is also known for having devised a classification of forms of government and for introducing an unusual definition of democracy that was never widely accepted.

According to Aristotle, states may be classified according to the number of their rulers and the interests in which they govern. Rule by one person in the interest of all is monarchy; rule by one person in his own interest is tyranny. Rule by a minority in the interest of all is aristocracy; rule by a minority in the interest of itself is oligarchy. Rule by a majority in the interest of all is “polity”; rule by a majority in its own interest—i.e., mob rule—is “democracy.” In theory, the best form of government is monarchy, and the next best is aristocracy. However, because monarchy and aristocracy frequently devolve into tyranny and oligarchy, respectively, in practice the best form is polity.

### **Aristotle’s Criticism**

Aristotle’s Criticism of Plato Aristotle has stated that, “Wisdom will never die with Plato”, and on another occasion he said, Plato is dear, but truth is dearer. As mentioned above, while Academy was dedicated to speculative and political philosophy, Lyceum took biology and natural sciences seriously. But metaphysics or first philosophy occupies a central role in his scheme of things as well. According to him, mathematical and physical sciences treat of the quantity, quality, and relations of things.

On the other hand, the first philosophy deals with the category of substance and also studies the causes of things. It enquires into the nature of being without considering the conditions imposed by space and time. The absolute and necessary being, as understood by Aristotle, is the eternal essence of things as opposed to the relative, contingent, and accidental. In this regard he agrees with Plato to a great deal.

Aristotle’s major criticism of Plato’s philosophy targeted the latter’s idea of universal essences. For Plato they are universal and objective realities and they exist independent of objects. They are eternal and imperishable and the objects in the world are fundamentally unreal and are mere copies of these eternal essences.

Aristotle agrees with Plato on many counts. But he opposes the latter’s transcendentalism, which maintains that the essences are apart from the things. According to Aristotle, essences or forms are immanent to things.

As Russell says, Aristotle considered them as common nouns and not as objective realities and things. Any name capable of universal application to the members of a class represents a universal. Opposing Plato’s theory, which posits them as abstract original forms to which objects “participate”, Aristotle initiates the third man argument.

### **Third Man Argument**

This argument aims at criticizing Plato’s theory of ideas, which according to Aristotle states that, “a man is a man because he resembles or participates in the idea of man in the world of essences.” Aristotle states that, if a man is a man because he resembles the ideal man, there must

be a still more ideal man to whom both ordinary men and the ideal man are similar.

Aristotle intends to demonstrate that the notion of imitation or copying used in the theory of forms runs into logical difficulties. In order to explain the similarity between a man and the form of man, one needs to construe a third form of man, and this always requires another form and hence the theory of ideas leads to ad infinitum.

Aristotle further asks whether the ideal man is an ideal animal. If he is, there must be as many ideal animals as there are species of animals. Again, how does the perfect and the eternal world be held responsible for the imperfect and perishable world of material objects? Plato's transcendentalism conceived Ideas as real beings existing apart from the individuals, which express them. Aristotle finds this position objectionable. He asks, if the general Idea is the substance of the particulars or the essence of the things, how can it exist apart from that of which it is the substance and the essence? He affirms that the general cannot exist outside of and along side of the particular.

According to him ideas considered as such and apart from the things, are not real beings or substances. Opposing Plato he maintains that the phenomenal world is not unreal and argues that both form and matter coexist in the world of objects. Their coexistence is responsible for the existence of the world we live. Since he considers this world as real he finds it worthwhile in pursuing knowledge about it. This makes natural scientific investigations meaningful and important. He maintains that genuine scientific knowledge is not a mere acquaintance with facts as knowledge consists in knowing the reasons and causes of things and it should explain why they cannot be other than what they are. The theory of form-matter coexistence answers these fundamental questions.

Aristotle asserts that ideas do not and cannot exist apart from things. On the other hand, they are inherent or immanent in things. The idea is the form of the thing, and cannot be separated from it except by abstraction. It is the essence of the particular and with it constitutes an indivisible whole. For example, Aristotle would hold that there is manness because there are actual men in this world. There is parenthood, because there are parents. Russell elucidates Aristotle's argument of immanence with an interesting simile. He says that, when we say "there is such a thing as the game of football," it will be nonsensical to assume that football could exist without football-players. Russell in his usual style of language analysis explains Aristotle's position in the following way.

And this dependence is thought to be not reciprocal: the men who play football would still exist even if they never played football; things which are usually sweet may turn sour; and my face, which is usually red, may turn pale without ceasing to be my face. In this way we are led to conclude that what is meant by an adjective is dependent for its being on what is meant by a proper name, but not vice versa. This is, I think, what Aristotle means. His doctrine on this point, as on many others, is a common-sense prejudice pedantically expressed.

Aristotle's concept of matter is unique. According to him matter is coexistent with form and different forms design matter differently in the process of evolution of objects. It is something that changes and Aristotle believed that each concrete instance of matter has an inner purpose. It is destined to become something. But Aristotle also maintains that matter has no reality apart from the form, as matter without the Idea is also an abstraction like Idea apart from particular object. We shall take a concrete example of a pen in order to understand the concept of matter and

matter-form relationship.

Consider the form and matter of a ball pen. The form of the ball point pen is constituted by the properties of the pen, it has a ball point, it has ink in it, it can be used to write and can be held by the hand. Matter on the other hand is the material stuff to which these properties are attached to, the material by which the pen is made up of etc.

The form of the pen, he affirms, is inherent in the material stuff. The former does not have an existence apart from and independent of the latter or many such pens. But in a unique manner, the form is independent, as it does not depend on any particular pen in this world. At the same time, Aristotle is not prepared to separate the form completely from the actual pens in the world.

Aristotle's philosophical perspective advocates avoiding the extremes and adopting a middle path. His metaphysical theory thus adopts a position, which avoids the extremes of Platonism and Atomism. He rejects Plato's view, which considers essences alone as real and the material world as illusion. As a consequence of his idealism, Plato also affirmed that all change is an illusion. The Atomists, on the other hand, advocated a unique form of materialism, which holds that everything is made up of atoms.

According to them, the ultimate reality is constitutive of atoms and they try to explain the nature of reality and world in quantitative terms. They hold that atoms have no natural properties and all qualities and nature of objects result from a combination of atoms. Atoms themselves have no natural qualities. To this Aristotle responds by arguing that, if qualities and properties are not actually there but are only illusions, then the sensible world cannot be trusted. Aristotle holds that everything that exists has a definite nature and hence is potential to become something. Aristotle explains matter in terms of substantial material elements:

- 1) earth,
- 2) water,
- 3) fire,
- 4) air and
- 5) ether.

These five basic elements have qualities and each is distinguished from the other in terms of their unique quality and hence things have definite nature. Hence the Atomists' doctrine is unacceptable for him. Aristotle says that these qualities can transfer through matter. One important aspect of Aristotle's metaphysics is his conception that all change is evolution. He maintains that all change is evolution. Form and matter, according to him, eternally coexist as they cannot be separated from one another. The form of an object changes when it evolves into another thing. For example, seed into tree. Here matter remains more or less the same and different forms design the matter differently. In this process of evolution, the seed becomes a tree; it realizes its purpose.

Aristotle here provides a teleological explanation of the universe in terms of the matter-form relationship. Though the forms are eternal and non-perishable—and here Aristotle subscribes to the Platonic view—he maintains that they are nevertheless not transcendent. It is often stated that Aristotle has brought forms from heaven to earth. According to him, they are not apart from things but in them. They are not transcendent, but immanent.

On the other hand, matter too is equally real and eternal. It is not non-being, but dynamic and is in the process of change. Matter realizes the form or idea of the thing in the process of evolution. Aristotle explains the problem of change in the world with this dualism of form and matter and their constant coexistence. Here Aristotle significantly deviates from Plato's position, which held that all change is illusion.

According to Plato the material world is a copy and hence no knowledge is possible about it. We can form only opinions about it. Aristotle, on the other hand considers the material world as real and explains it in terms of the above described form-matter coexistence. His conception of change becomes relevant in this context. His theory of change is different from most of his predecessors. Unlike Plato and Parmenides, he never treated change as unreal and an illusion. But he does not agree with Heraclitus and others who find nothing but blind change as real. Aristotle adopts a middle path and affirms that all change is not illusion. Change is not blind, but purposeful and meaningful.

Every entity in nature is actually something and has the potential to become something else. For example, the seed is actually a seed but it has the potential to become a tree. According to Aristotle, in the seed state, the form of seed fashions or shapes in order to make it an actual seed. But as the seed progresses to the tree, it gets shaped and designed by different other forms. Finally the seed actualizes its potentials and becomes a tree.

Aristotle thus considers both change and permanence are real. In change it is the form that changes while the matter remains the same. Change occurs when the arrangement of the matter changes. Even though the form of an object can change, it is form, not matter, that provides the order and permanence in the world. The matter of all things is ultimately the same. Underlying this conception of change is his idea that all change is purposeful, because, according to him all change is evolution. He further explains this theory with a teleological explanation. He contends that the essential form of a thing determines what an object is and it guides the changes and development of that thing. Hence changes are not blind or illusory, but are intelligible. During evolution an organism realizes its purpose. Hence, there is no concept of complete change.

Only some aspects of the form of a thing changes and as long as a thing remains in existence, its essential form remains the same. An apple seed will evolve into an apple tree and not to anything else. The form of the matter changes in those ways that are necessary for it to become an apple tree. Again, while Plato rejected the world as illusion, for Aristotle it is real. The world is not just an imitation or a shadow, but a reality and hence it is possible to have knowledge about it. Consequently, Aristotle believes that studying the processes of the natural world is not worthless. This approach to the physical world and knowledge about it had encouraged the growth of natural sciences. We can see that the systematic study of natural sciences began with Aristotle's systematic approach to the knowledge about the natural world. It was he who initiated the classification of the living universe as species and genera, which even today lies at the foundation of elementary scientific enquiries.

### **Aristotle's Ethical Theory**

As mentioned above, Aristotle adopts a teleological approach and attempts to explain everything, including human reality with the assumption that the nature of reality, including the human world, can be explained teleologically; as the actualization of a purpose. According to him, the purpose of

human life is eudemonia. Before we explain what this constitutes, let us examine his conception of human reality.

Aristotle conceived ethics as a very important science and according to him it deals with actual human behavior. Unlike Plato, he affirmed that the empirical world and life in it are valuable. But unlike the materialists, he adopts a teleological conception of human life and hence conceived that there is a higher purpose to life, which needs to be realized in our present life in this world. Russell comments that, Aristotle's metaphysics, roughly speaking, may be described as Plato diluted by common sense. He is difficult because Plato and common sense do not mix easily.

## Theory of causation

Each Aristotelian science consists in the causal investigation of a specific department of reality. If successful, such an investigation results in causal knowledge; that is, knowledge of the relevant or appropriate causes. The emphasis on the concept of cause explains why Aristotle developed a theory of causality which is commonly known as the doctrine of the four causes. For Aristotle, a firm grasp of what a cause is, and how many kinds of causes there are, is essential for a successful investigation of the world around us.

As will become clear in due course, Aristotle is committed to a form of causal pluralism. For Aristotle, there are four distinct and irreducible kinds of causes. The focus of this entry is on the systematic interrelations among these four kinds of causes.

## The Four Causes

In the Posterior Analytics, Aristotle places the following crucial condition on proper knowledge: we think we have knowledge of a thing only when we have grasped its cause. That proper knowledge is knowledge of the cause is repeated in the Physics: we think we do not have knowledge of a thing until we have grasped its why, that is to say, its cause. Since Aristotle obviously conceives of a causal investigation as the search for an answer to the question "why?", and a why- question is a request for an explanation, it can be useful to think of a cause as a certain type of explanation.

Needless to say, not all why-questions are requests for an explanation that identifies a cause, let alone a cause in the particular sense envisioned by Aristotle. Still, Aristotle is clearly committed to the view that giving the relevant cause (or causes) is necessary and sufficient for offering a scientific explanation. His conception of a cause has both a metaphysical and an epistemological component. Part of the challenge for us is to do justice to both components. Following a recent suggestion, we may say that "causes are not ways in which we explain things, except derivatively, in virtue of the fact that they are ways in which some elements of the natural world explain others".

In Physics II 3 and Metaphysics V 2, Aristotle offers his general account of the four causes. This account is general in the sense that it applies to everything that requires an explanation, including artistic production and human action. Here Aristotle recognizes four kinds of things that can be given in answer to a why- question:

- **The material cause:** "that out of which", e.g., the bronze of a statue.
- **The formal cause:** "the form", "the account of what-it-is-to-be", e.g., the shape of a statue.
- **The efficient cause:** "the primary source of the change or rest", e.g., the artisan, the art of bronze-casting the statue, the man who gives advice, the father of the child.

- **The final cause:** “the end, that for the sake of which a thing is done”, e.g., health is the end of walking, losing weight, purging, drugs, and surgical tools.

All the four (kinds of) causes may enter in the explanation of something. Consider the production of an artifact like a bronze statue. The bronze enters in the explanation of the production of the statue as the material cause. Note that the bronze is not only the material out of which the statue is made; it is also the subject of change, that is, the thing that undergoes the change and results in a statue. The bronze is melted and poured in order to acquire a new shape, the shape of the statue. This shape enters in the explanation of the production of the statue as the formal cause. However, an adequate explanation of the production of a statue requires also a reference to the efficient cause or the principle that produces the statue.

This result is mildly surprising and requires a few words of elaboration. There is no doubt that the art of bronze-casting resides in an individual artisan who is responsible for the production of the statue. According to Aristotle, however, all the artisan does in the production of the statue is the manifestation of specific knowledge. This knowledge, not the artisan who has mastered it, is the salient explanatory factor that one should pick as the most accurate specification of the efficient cause. By picking the art, not the artisan, Aristotle is not just trying to provide an explanation of the production of the statue that is not dependent upon the desires, beliefs and intentions of the individual artisan; he is trying to offer an entirely different type of explanation—namely, an explanation that does not make a reference (implicit or explicit) to these desires, beliefs and intentions. More directly, the art of bronze-casting the statue enters in the explanation as the efficient cause because it helps us to understand what it takes to produce the statue; that is to say, what steps are required to produce the statue. But can an explanation of this type be given without a reference to the final outcome of the production, the statue? The answer is emphatically “no”. A model is made for producing the statue. A mold is prepared for producing the statue. The bronze is melted and poured for producing the statue. Both the prior and the subsequent stage are for the sake of a certain end, the production of the statue. Clearly, the statue enters in the explanation of each step of the artistic production as the final cause or that for the sake of which everything in the production process is done.

In thinking about the four causes, we have come to understand that Aristotle offers a teleological explanation of the production of a bronze statue; that is to say, an explanation that makes a reference to the telos or end of the process. Moreover, a teleological explanation of the type sketched above does not crucially depend upon the application of psychological concepts such as desires, beliefs and intentions. This is important because artistic production provides Aristotle with a teleological model for the study of natural processes, whose explanation does not involve beliefs, desires, intentions or anything of this sort. Some have objected that Aristotle explains natural process on the basis of an inappropriately psychological teleological model; that is to say, a teleological model that involves a purposive agent who is somehow sensitive to the end. This objection can be met if the artistic model is understood in non-psychological terms. In other words, Aristotle does not psychologize nature because his study of the natural world is based on a teleological model that is consciously free from psychological factors.

One final clarification is in order. By insisting on the art of bronze-casting as the most accurate efficient cause of the production of the statue, Aristotle does not mean to preclude an appeal to the beliefs and desires of the individual artisan. On the contrary, there are cases where the individual realization of the art obviously enters in the explanation of the bronze statue. For

example, one may be interested in a particular bronze statue because that statue is the great achievement of an artisan who has not only mastered the art but has also applied it with a distinctive style. In this case it is perfectly appropriate to make reference to the beliefs and desires of the artisan. Aristotle seems to make room for this case when he says that we should look “for general causes of general things and for particular causes of particular things”. Note, however, that the idiosyncrasies that may be important in studying a particular bronze statue as the great achievement of an individual artisan may be extraneous to a more central (and more interesting) case. To understand why let us focus on the study of nature. When the student of nature is concerned with the explanation of a natural phenomenon like the formation of sharp teeth in the front and broad molars in the back of the mouth, the student of nature is concerned with what is typical about that phenomenon. In other words, the student of nature is expected to provide an explanation of why certain animals typically have a certain dental arrangement. We shall return to this example in due course. For the time being, it is important to emphasize this important feature of the explanatory project attempted by Aristotle; a feature that we must keep in mind in trying to understand his theory of causality. This theory has in fact been developed primarily (but not exclusively) for the study of nature.

### **3. The Four Causes and the Science of Nature**

In the *Physics*, Aristotle builds on his general account of the four causes by developing explanatory principles that are specific to the study of nature. Here Aristotle insists that all four causes are involved in the explanation of natural phenomena, and that the job of “the student of nature is to bring the why- question back to them all in the way appropriate to the science of nature”. The best way to understand this methodological recommendation is the following: the science of nature is concerned with natural bodies insofar as they are subject to change, and the job of the student of nature is to provide the explanation of their natural change. The factors that are involved in the explanation of natural change turn out to be matter, form, that which produces the change, and the end of this change. Note that Aristotle does not say that all four explanatory factors are involved in the explanation of each and every instance of natural change. Rather, he says that an adequate explanation of natural change may involve a reference to all of them.

Aristotle goes on by adding a specification on his doctrine of the four causes: the form and the end often coincide, and they are formally the same as that which produces the change. This is one of the several times where Aristotle offers the slogan “it takes a human being to generate a human being”. This slogan is designed to point at the fundamental fact that the generation of a human being can be understood only in the light of the end of the process; that is to say, the fully developed human being. The question thus arises as to what it takes for a human being to be fully developed. Aristotle frames his answer in terms of the human form, maintaining that a human form is fully realized at the end of generation. But this does not explain why it takes a human being to generate a human being. Note, however, that a fully developed human being is not only the end of generation; it is also what initiates the entire process. For Aristotle, the ultimate moving principle responsible for the generation of a human being is a fully developed living creature of the same kind; that is, a human being who is formally the same as the end of generation. (A final clarification is in order here: Aristotle is committed to a hylomorphic explanation of animal generation. His considered view is that the father supplies the form whereas the mother provides the matter.)

Thus, the student of nature is often left with three types of causes: the formal/final cause, the efficient cause, and the material cause. However, the view that there are in nature causes besides

material and efficient causes was controversial in antiquity. According to Aristotle, most of his predecessors recognized only the material and the efficient cause. This explains why Aristotle cannot be content with saying that formal and final causes often coincide, but he also has to defend his thesis against an opponent who denies that final causality is a genuine mode of causality.

#### **4. Final Causes Defended**

Physics II 8 contains Aristotle's most general defense of final causality. Here Aristotle establishes that explaining nature requires final causality by discussing a difficulty that may be advanced by an opponent who denies that there are final causes in nature. Aristotle shows that an opponent who claims that material and efficient causes alone suffice to explain natural change fails to account for their characteristic regularity. Before considering how the defense is attempted, however, it is important to clarify that this defense does not perform the function of a proof. By showing that an approach to the study of nature that ignores final causality cannot account for a crucial aspect of nature, Aristotle does not thereby prove that there are final causes in nature. Strictly speaking, the only way to prove that nature exhibits final causality is to establish it on independent grounds. But this is not what Aristotle does in Physics II 8. Final causality is here introduced as the best explanation for an aspect of nature which otherwise would remain unexplained.

The difficulty that Aristotle discusses is introduced by considering the way in which rain works. It rains because of material processes which can be specified as follows: when the warm air that has been drawn up is cooled off and becomes water, then this water comes down as rain. It may happen that the corn in the field is nourished or the harvest is spoiled as a result of the rain, but it does not rain for the sake of any good or bad result. The good or bad result is just a coincidence. So, why cannot all natural change work in the same way? For example, why cannot it be merely a coincidence that the front teeth grow sharp and suitable for tearing the food and the molars grow broad and useful for grinding the food? When the teeth grow in just this way, then the animal survives. When they do not, then the animal dies. More directly, and more explicitly, the way the teeth grow is not for the sake of the animal, and its survival or its death is just a coincidence.

Aristotle's reply is that the opponent is expected to explain why the teeth regularly grow in the way they do: sharp teeth in the front and broad molars in the back of the mouth. Moreover, since this dental arrangement is suitable for biting and chewing the food that the animal takes in, the opponent is expected to explain the regular connection between the needs of the animal and the formation of its teeth. Either there is a real causal connection between the formation of the teeth and the needs of the animal, or there is no real causal connection and it just so happens that the way the teeth grow is good for the animal. In this second case it is just a coincidence that the teeth grow in a way that it is good for the animal. But this does not explain the regularity of the connection. Where there is regularity there is also a call for an explanation, and coincidence is no explanation at all. In other words, to say that the teeth grow as they do by material necessity and this is good for the animal by coincidence is to leave unexplained the regular connection between the growth of the teeth and the needs of the animal. Aristotle offers final causality as his explanation for this regular connection: the teeth grow in the way they do for biting and chewing food and this is good for the animal.

One thing to be appreciated about Aristotle's reply is that the final cause enters in the explanation of the formation of the parts of an organism like an animal as something that is good either for the existence or the flourishing of the animal. In the first case, something is good for the animal

because the animal cannot survive without it; in the second case, something is good for the animal because the animal is better off with it. This helps us to understand why in introducing the concept of end (telos) that is relevant to the study of natural processes Aristotle insists on its goodness: "not everything that is last claims to be an end (telos), but only that which is best".

Once his defense of the use of final causes is firmly in place, Aristotle can make a step further by focusing on the role that matter plays in his explanatory project. Let us return to the example chosen by Aristotle, the regular growth of sharp teeth in the front and broad molars in the back of the mouth. What explanatory role is left for the material processes involved in the natural process? Aristotle does not seem to be able to specify what material processes are involved in the growth of the teeth, but he is willing to recognize that certain material processes have to take place for the teeth to grow in the particular way they do. In other words, there is more to the formation of the teeth than these material processes, but this formation does not occur unless the relevant material processes take place. For Aristotle, these material processes are that which is necessary to the realization of a specific goal; that which is necessary on the hypothesis that the end is to be obtained.

Hypothetical necessity is often equated to conditional necessity. But this equation can be a first approximation at best. Stating the conditions under which something is the case is not yet giving a successful explanation. In other words, conditional necessity is a wider, and indeed weaker, notion than hypothetical necessity.

Physics II 9 is entirely devoted to the introduction of the concept of hypothetical necessity and its relevance for the explanatory ambition of Aristotle's science of nature. In this chapter, matter is reconfigured as hypothetical necessity. By so doing Aristotle acknowledges the explanatory relevance of the material processes, while at the same time he emphasizes their dependency upon a specific end.

## **5. The Explanatory Priority of Final Causes**

In the *Physics*, Aristotle builds on his general account of the four causes in order to provide the student of nature with the explanatory resources indispensable for a successful investigation of the natural world. However, the *Physics* does not provide all the explanatory resources for all natural investigations. Aristotle returns to the topic of causality in the first book of the *Parts of Animals*. This is a relatively independent and self-contained treatise entirely devoted to developing the explanatory resources required for a successful study of animals and animal life. Here Aristotle completes his theory of causality by arguing for the explanatory priority of the final cause over the efficient cause.

Significantly enough, there is no attempt to argue for the existence of four fundamental modes of causality in the first book of the *Parts of Animals*. Evidently, Aristotle expects his reader to be already familiar with his general account of the four causes as well as his defense of final causality. The problem that here concerns Aristotle is presented in the following way: since both the final and the efficient cause are involved in the explanation of natural generation, we have to establish what is first and what is second. Aristotle argues that there is no other way to explain natural generation than by reference to what lies at the end of the process. This has explanatory priority over the principle that is responsible for initiating the process of generation. Aristotle relies on the analogy between artistic production and natural generation, and the teleological model that he has developed for the explanation of artistic production. Consider, for example, house-building.

There is no other way to explain how a house is built, or is being built, than by reference to the final result of the process, the house. More directly, the bricks and the beams are put together in the particular way they are for the sake of achieving a certain end: the production of the house. This is true also in the case of natural generation. In this context Aristotle's slogan is "generation is for the sake of substance, not substance for the sake of generation". This means that the proper way to explain the generation of an organism like an animal, or the formation of its parts, is by reference to the product that lies at the end of the process; that is to say, a substance of a certain type.

From Aristotle we learn that Empedocles explained the articulation of the human spine into vertebrae as the result of the twisting and turning that takes place when the fetus is in the womb of the mother. Aristotle finds this explanation unacceptable. To begin with, the fetus must have the power to twist and turn in the way it does, and Empedocles does not have an explanation for this fact. Secondly, and more importantly, Empedocles overlooks the fact that it takes a human being to generate a human being. That is to say, the originating principle of the generation is a fully developed human being which is formally the same as the final outcome of the process of generation. It is only by looking at the fully developed human being that we can understand why our spine is articulated into vertebrae and why the vertebrae are arranged in the particular way they are. This amounts to finding the role that the spine has in the life of a fully developed human being. Moreover, it is only by looking at the fully developed human being that we can explain why the formation of the vertebrae takes place in the particular way it does.

Perhaps we are now in the position to understand how Aristotle argues that there are four kinds of causes and at the same time says that proper knowledge is knowledge of the cause or knowledge of the why. Admittedly, at least at first sight, this is a bit confusing. Confusion dissolves when we realize that Aristotle recognizes the explanatory primacy of the final/formal cause over the efficient and material cause. Of course this does not mean that the other causes can be eliminated. Quite the contrary: Aristotle is adamant that, for a full range of cases, all four causes must be given in order to give an explanation. More explicitly, for a full range of cases, an explanation which fails to invoke all four causes is no explanation at all. At the same time, however, the final/formal cause is the primary cause and knowledge of this cause amounts to knowledge of the why.

## **6. The Explanation of a Lunar Eclipse**

We have already seen that Aristotle is not committed to the view that everything has all four kinds of causes. Rather, his view is that a scientific explanation requires up to four kinds of causes. We may illustrate this point with the help of an example. Consider, in particular, the case of a lunar eclipse. In the *Metaphysics*, Aristotle says that an eclipse of the moon does not have a final cause. He also says that, strictly speaking, a lunar eclipse does not have matter. Rather, it has a cause that plays a role analogous to matter. This second claim can be inferred from what Aristotle says about the things that exist by nature but are not substances. With respect to these things, Aristotle says that they do not have matter but rather something that underlies. In the case of a lunar eclipse, that which underlies is the subject affected by the eclipse, that is, the moon. The moon is not strictly speaking the matter of the eclipse but rather the subject that undergoes an eclipse when the earth comes in the middle between the moon and the sun. Should we give the earth as the efficient cause of a lunar eclipse? We have to be careful here. By saying that the moon is a deprivation of light caused by the earth, we distinguish this particular deprivation of light from other kinds of deprivation of light. Still, by citing the earth as the efficient cause of a lunar eclipse, we are not yet giving the most precise description of the efficient cause. More directly, we are not

yet saying what the earth is doing to cause a lunar eclipse. A lunar eclipse is a deprivation of light caused by the interposition of the earth between the sun and the moon. By coming in the middle of the moon and the sun the earth blocks the light and causes the moon to suffer an eclipse. Hence, it is the interposition of the earth between the sun and the moon is the proximate efficient cause of a lunar eclipse. Citing the proximate efficient cause is also giving the most accurate description, and indeed the full explanation, of a lunar eclipse.

This brief discussion of the explanation of eclipse of the moon brings us back to a point that was already made in connection with Aristotle's explanation of the production of an artifact such as a bronze statue. There too we are required to look for the most accurate description of the efficient cause, which is to be identified with the art of bronze-casting a statue rather than the artisan. It is possible to build on both examples to conclude that Aristotle is concerned not only with finding the relevant kinds of causes but also with giving the most accurate description of those causes. By his lights, it is only the most accurate description of all the relevant causes that gives us the full explanation, and thereby scientific knowledge, of something.

### **Aristotle: the body and soul**

According to Aristotle a living creature is 'substance'. Body=matter Soul = form The soul (psyche) is the structure of the body - its function and organization. This was the word Greeks gave to the animator, the living force in a living being. For Aristotle the psyche controlled reproduction, movement and perception.

In contrast Aristotle regarded reason (nous) as the highest form of rationality. He believed that the 'unmoved mover' of the universe was a cosmic nous. Aristotle thought that the soul is the Form of the body. The soul is simply the sum total of the operations of a human being. Aristotle believed that there exists a hierarchy of living things – plants only have a vegetative soul, animals are above plants because they have appetites, humans are above animals because it has the power of reason.

Aristotle tries to explain his understanding of the distinction between the body and the soul using the analogy of an axe. If an axe were a living thing then its body would be made of wood and metal. However, its soul would be the thing which made it an axe i.e. its capacity to chop. If it lost its ability to chop it would cease to be an axe – it would simply be wood and metal.

Another illustration he uses is the eye. If the eye were an animal, sight would have to be its soul. When the eye no longer sees then it is an eye in name only.

Likewise, a dead animal is only an animal in name only – it has the same body but it has lost its soul.

What is important for Aristotle is the end purpose of something – an axe chops, an eye sees, an animal is animated...etc. This is what is meant by 'teleology' from the Greek teleo meaning end. For Aristotle, the body and soul are not two separate elements but are one thing. The body and the soul are not, as Plato would have it, two distinct entities, but are different parts or aspects of the same thing.

Aristotle does not allow for the possibility of the immortality of the soul. The soul is simply the

Form of the body, and is not capable of existing without the body. The soul is that which makes a person a person rather than just a lump of meat! Without the body the soul cannot exist. The soul dies along with the body.

Aristotle appears to make one exception – reason (nous). However, he is not clear about how this reason survives death or whether or not it is personal.

### **Criticisms of Aristotle**

Aristotle dismisses Plato's Realms saying there is no clear evidence for them. Instead he appeals to our senses, claiming that it through them that we experience reality. However, we are still left with the problem that there is no clear evidence that our senses are reliable. A religious person might argue that we know the world through faith and revelation.

There is no clear evidence that everything does have a final cause. Some philosophers deny that there is any purpose to the universe. Such philosophers claim that the universe has no intrinsic purpose other than existing.

The concept of the an Unmoved Mover - or Prime Mover depends upon the argument that everything must have a cause. The argument then contradicts itself by claiming that God does exactly what it claims is impossible.

Aristotle does not adequately explain how God as a thinking force could be responsible for causing movement. On the one hand he stresses that real knowledge beings with the senses but the concept of something being moved just through thought is not what most of us experience.

### **Aristotle's Influence on Christian Thought**

Aristotle's philosophy found new found interest in the writings of Thomas Aquinas in the thirteenth century. Just like Plato, theologians tend to pick and choose the bits that they like. Christian theologians have adopted:

- God is eternal, beyond space and time, immutable
- The universe has a purpose
- God is the Final Cause – the Unmoved Mover – the Christian cosmological argument for the existence of God
- Aristotle's teleology supports Aquinas' Natural Law

### **Aristotle's Concept of Matter and Form**

Aristotle was interested in the material world which he saw about him. He was interested in the nature of things and their substance. However, Aristotle was still interested in questions such as 'what is it about a table that gives it its tableness?' However, unlike his teacher Plato, Aristotle believed that the form of an object was not some kind of abstract ideal. He believed that the form of an object was contained within the object itself. To put it another way, its form was within the structure itself. This meant that the form of an object could be perceived using ones senses.

Aristotle uses the word substance in many ways which often makes it difficult to grasp his concept. Let us look at the example of a table. The substance of a table is the wood and the nails and the glue. However, the form of the table is that it has four legs...etc.

To confuse things further, Aristotle also used the word matter to mean the stuff of which something was made. A chair's matter is wood! Its form is the structure of the chair itself – i.e. that particular chair NOT some abstract universal.

This allowed Aristotle to also wonder whether it was possible that something could have matter but no form. He concluded that there could be prime matter or stuff that has no particular form and not arranged in any particular structure. Likewise, Aristotle wondered whether something could have form and structure without having matter. He proposed that something that has form and structure without matter is God.

## **Aristotle's Four Causes**

Aristotle wanted to ask 'what causes something to be what it is, to have the characteristics that it has, or to change in the way that it does?' This sort of questioning is often found in small children. Sometimes they go through a phase of asking 'why?' about anything and everything. Perhaps small children are the best philosophers!

For each answer they are given, they want to know the reason for this answer, and the cause of something can be traced back, showing not just one reason but a whole chain, going from the immediate to a final 'because it just is', or 'because I say so' or 'because it's just made that way'. Someone once commented that this is the reason we send children to school – to make them stop asking annoying questions. By the time children enter into the sixth form they think they know it all and have definitely stopped asking questions.

Aristotle thought about this; he concluded that the explanation of things could be seen in the four different ways, at four different levels: the four causes. 'Causes' is the best translation we have of the word he used – 'aition' (Gk - aition - meaning cause or fault) , which is a responsible, explanatory factor.

### **Aristotle's four causes can be summarised:**

1. Material cause – what is something made of?
2. Efficient cause – what brings something about?
3. Formal cause – what characteristics does an object have?
4. Final cause – what is the reason for something's existence?

For Aristotle the essence of an object was not just its material component parts, or its particular shape or characteristics; it also had a purpose, a function to perform.

When Aristotle looked at the world about him he not only asked questions such as what is such and such made of, or how can it be classified but also what is its purpose.

The fourth, final cause is the most important, and which in Aristotle's view gives the best explanation of an object. The final end, or purpose, or 'teleology' of a thing, when realised, gives that thing its full perfection and reality.

When something is doing what it was meant to do, or has developed into whatever it was

supposed to develop into, it has achieved goodness. The purpose of an object, for Aristotle, is part of the object itself, and not something which we might choose to impose on it – it is intrinsic.

All the different elements of nature have a purpose, according to Aristotle, and nothing is superfluous. We might not know what a slug is for but nevertheless it still has its own intrinsic purpose. But that is not all; the universe as a whole has a purpose too.

## **St. Augustine: Problem of Evil.**

### **The Theodicy of Augustine of Hippo**

Augustine of Hippo (354-430) based his theodicy on his reading of key Biblical passages: Genesis 3 and Romans 5. Genesis 3 is the story of Adam and Eve and their 'Fall' in the Garden of Eden. In it the snake convinces the woman to eat the forbidden fruit from the tree of the knowledge of good and evil. The woman picks the fruit, and passes some to Adam. Because of their disobedience God has them evicted from the garden. In Romans 5 Paul describes the Christian belief that Jesus' sacrifice on the cross cancels out the disobedience of Adam and Eve. In his self-sacrifice Jesus has made available the gift of righteousness.

### **Augustine's theodicy can be summarised:**

- God is perfect. The world he created reflects that perfection.
- Humans were created with free will.
- Sin and death entered the world through Adam and Eve, and their disobedience.
- Adam and Eve's disobedience brought about 'disharmony' in both humanity and Creation.
- The whole of humanity experiences this disharmony because we were all 'seminally' present in the loins of Adam.
- Natural evil is consequence of this disharmony of nature brought about by the Fall.
- God is justified in not intervening because the suffering is a consequence of human action.

Central to Augustine's theory is that of 'privation' – evil is not a substance it is a deprivation i.e. an absence of something. Augustine uses the analogy of blindness – blindness is not an entity but the absence of sight. For Augustine, evil came about as a direct result of the misuse of free will. All suffering is therefore a consequence of this abuse of free will. This includes natural evil as well as moral evil. Natural evil has come about through an imbalance in nature brought about by the Fall.

God's love for the world is demonstrated through the reconciliation made possible through Jesus Christ.

For God so loved the world that he gave his one and only Son, that whoever believes in him shall not perish but have eternal life. For God did not send his Son into the world to condemn the world, but to save the world through him.

A modern advocate of Augustine's view can be found in Alvin Plantinga (God, Freedom and Evil, 1974) who claimed that for God to have created a being who could only have performed good actions would have been logically impossible. This view was later criticised by Anthony Flew and J.L. Mackie, who both argue that God could have chosen to create "good robots" who still

possessed free-will.

### **Criticism of Augustine's Theodicy**

Augustine held that there was a state of ignorant bliss in the Garden of Eden which was unbalanced by the Fall. This is at odds with Darwin's theory of evolution by natural selection. If God can be held responsible for the system by which the natural world works, he should be held responsible for the suffering that his system causes. Augustine's theodicy puts all the blame on the first humans yet all suffer. Why should people suffer for the misdemeanours of past generations. Augustine makes much of the idea of hell – as part of Creation. Therefore God must be directly responsible for its creation, and therefore must have foreseen the need for punishment.

### **The Ontological Argument for the Existence of God Anselm of Canterbury**

The ontological argument for the existence of God, as it is found in its classical form, was first formulated by the eleventh century Benedictine monk, Archbishop and theologian, St Anselm of Canterbury (1033-1109). Anselm had prayed for a single, short argument by which to prove almost everything about God. The result was a simple deductive argument.

### **Deductive Arguments**

A deductive argument is one where the conclusion necessarily follows from the premises – if the premises are true then the conclusion must follow. For example we could put forward the premise that:

1. A bachelor is an unmarried man
2. George is an unmarried man
3. Therefore, it can be deduced that George is a bachelor

Providing premises (1) and (2) are correct then the conclusion (3) must necessarily follow. The validity of a deductive argument depends upon its internal logic – i.e. the very definition of words determines whether or not the argument can hold to be true.

### **Inductive Arguments**

The opposite of a deductive argument is an inductive argument. Inductive arguments are based on observation.

1. Jo, Charmaine, Kate, Lauren and Sarah wear skirts
2. Jo, Charmaine, Kate, Lauren and Sarah are women
3. Therefore, all women wear skirts

The validity of inductive arguments can vary from 0% to 100% as they are based on empirical observation and not internal logic. Premise (1) and (2) may well be true but the conclusion (3) may well be a massive assumption.

### **A priori vs. a posteriori**

A deductive argument can be said to be 'a priori' as it does not depend upon external validation. The validity of a deductive argument can be ascertained before empirical validation. Because of their internal logic deductive arguments appeal to many philosophers c.f. Immanuel Kant's 'Categorical Imperative'.

## **Ontological**

The term 'ontological' is derived from the Greek 'onto' meaning 'being' and 'logos' meaning 'the study of'. In philosophy ontology is a branch of metaphysics. The ontological argument is so called because it deals with the very being of God.

## **Anselm's Argument**

Anselm's first form of his argument follows:

1. God is the greatest possible being (nothing greater can be conceived)
2. If God exists in the mind alone (only as an idea), then a greater being could be imagined to exist both in the mind and in reality
3. This being would then be greater than God
4. Thus God cannot exist only as an idea in the mind
5. Therefore, God exists both in the mind (as an idea) and in reality.

The first premise (1) that God is the greatest possible being stems from the classical attributes of God i.e. omnipotence, omnipresent, omniscience...etc. It naturally follows that there cannot be two rival omnipotent beings...etc. For Anselm (and most theistic thinkers) this understanding of God goes without saying. It is axiomatic to say that God is omnipotent...etc. Any other definition of God would not be God.

The second and third premises (2 and 3) argue that something that exists in reality is better than something that exists only in one's imagination. For example, which is better imagining that you have £1 million, or actually having £1 million in your bank account?

The conclusion (4) follows from the first three premises (1,2 and 3). Anselm's final conclusion (5) is that if all the previous premises are true (1,2,3 and 4) then God must exist.

## **Gaunilo of Marmoutiers' objection to Anselm's Argument**

One problem with Anselm's ontological argument for the existence of God is that it invites parody. Parallel arguments purporting to prove the existence of any perfect thing at all can be constructed. This objection was first raised by one of Anselm's contemporaries, the monk Gaunilo of Marmoutiers, who constructed an ontological argument for the existence of the perfect island in his *On Behalf of the Fool*.

1. Gaunilo invited his readers to think of the greatest, or most perfect, conceivable island.
2. As a matter of fact, it is likely that no such island actually exists.
3. However, his argument would then say that we aren't thinking of the greatest conceivable island, because the greatest conceivable island would exist, as well as having all those other desirable properties.
4. Since we can conceive of this greatest or most perfect conceivable island, then it must exist.

Gaunilo argued that this line of argument was no less absurd than Anselm's original argument. Similar arguments for the existence of the perfect baseball pitcher, or the perfect husband or dragons or even unicorns—for the existence of any perfect thing at all—can be constructed. If any of these arguments is sound, it seems, then they must all be sound.

Clearly, though, these arguments are not all sound; the perfect baseball pitcher does not exist, and neither does the perfect husband. There is something wrong with the logic of these arguments. Each of these ontological arguments, though, uses the same logic. They must therefore all be unsound.

The fact that there is no perfect island, and no perfect baseball pitcher, then, shows that the logic of the ontological argument for God's existence is flawed.

Such objections are known as "Overload Objections"; they don't claim to show where or how the ontological argument goes wrong, they simply argue that if it is sound, then so are many other arguments of the same logical form which we don't want to accept, arguments which would overload the world with an indefinitely large number of things like perfect islands, perfect pizzas, perfect pencils, etc.

Such objections always depend upon the accuracy of the analogy. That is, we must be able to show that the objector's argument is sufficiently like the ontological argument for us to be able to conclude that if one works so must the other.

### **Criticisms of Gaunilo's Objection – Anselm's Reply**

The main problem with Gaunilo's objection is the definition of 'perfect'. There will be disagreements as to what makes an island perfect i.e. tropical, deserted, inhabited...etc. When we analyse it any definition here of 'perfect' in the case of an island would be subjective. Your idea of a perfect island might not be my idea of a perfect island.

Another problem is the use of the term 'perfect' in the case of islands. By definition any piece of land surrounded by water is an island. Any piece of land perfectly (i.e. – completely) surrounded by water is a 'perfect island'. In this case all islands are perfect islands.

Anselm would argue that this line of argument does not work for everyday objects. Anselm is concerned with a being and a necessary being at that – the greatest being one can conceive. Anselm argued that he was not talking about temporal contingent things such as islands which are rooted in time and space. Such things are dependent upon other things for their existence. Anselm is talking about the greatest thing that can be thought. God is not contingent or temporal. God's existence is necessary i.e. not dependent upon other things for his existence.

### **Definitions**

Necessary – inevitably resulting from or produced by the nature of things...etc., so that the contrary is impossible.

Contingent – that which need not be, that which could have been different; something that has dependency.

### **Anselm's second ontological argument**

Anselm's first argument left himself open to criticism from Gaunilo and his perfect island. Anselm only real reply to Gaunilo was to point him to chapter 3 of his Proslogion.

Gaulino's main objection to Anselm was that he thought no mere mortal could conceive (or understand) God's nature.

Anselm would have agreed with Gaulino – it is impossible to understand God in the same way one might understand geometry. However, this does not rule out the possibility to understand the concept that God is 'that which nothing greater can be conceived'.

At the heart of Anselm's argument is the philosophical understanding of 'necessary existence':

- necessary – cannot not be
- contingent – can cease to exist

### **Anselm's second argument follows:**

1. Either God exists or He does not exist
2. If God exists, God's existence must be necessary
3. If God does not exist, then his existence is logically impossible
4. God is not a logically impossible thing
5. Therefore, God's existence is necessary
6. Therefore, God exists

Either God exists or He does not exist Anselm is on solid ground here with a black and white statement If God exists, God's existence must be necessary It would be inconceivable to think of God in terms of Him being contingent – i.e. dependent upon something else. If we are going to think of God in terms of Him being omnipotent...etc. then by definition God must be necessary.

If God does not exist, then his existence is logically impossible There are two kinds of things which cannot exist:

- contingent things e.g. Superman, unicorns or Queen Victoria
- logically impossible things e.g. square circles, male sisters

God cannot be contingent. If we are going to reject the notion of God then it must be because he is illogical.

God is not a logically impossible thing There is no logical contradiction in the notion of God. It is logically possible for him to exist.

Therefore, God's existence is necessary and therefore, God exists As God is not logically impossible and also is not a contingent non-existence thing, then there is only one possible state left: that of a necessary being. It, therefore, follows that God's existence is necessary and God does exist.

## Anselm is arguing God's existence as a process of eliminations:

- God cannot be an existing contingent being (e.g. like you and me!)
- God cannot be a non-existent contingent being (e.g. a unicorn)
- God cannot be a logically impossible being (e.g. an omnipotent God who is impotent)
- God cannot be a necessary non-existent being (it is logically impossible)
- God must be a necessary existent being.

Anselm's second argument unlike his first is not dependent upon existence as being a perfection of a matter of greatness. Rather than saying that God must exist because existence is a perfection, Anselm is arguing that God must exist because God is a necessary being.

	<b>Non-existent</b>	<b>Existent</b>
<b>Contingent</b>	God cannot be a non-existent contingent being e.g. unicorns, dragons...etc.	God cannot be an existent contingent being e.g. like me and you!
<b>Necessary</b>	It would be logically impossible for God to be a non-existent necessary being i.e. how can something which cannot not be not exist!	Only available option! God must be a necessary existent being.

## Descartes' Support for the Ontological Argument

Rene Descartes (1596-1650) is generally regarded the founder of modern western philosophy. Descartes was instrumental in bringing about the Age of the Enlightenment in Western Europe. His writings challenged conventional beliefs which were still based upon Church teachings.

Descartes imagines the entire universe to be the work of a malevolent demon who creates the illusion that things exist. This is known as Cartesian Doubt. Descartes asked the question, 'How can I be sure that what I am experiencing through my senses is true?' After speculating that he is being deceived by a demon he concludes that the only thing he can be sure of is the fact that he is thinking. This gives rise to probably the most famous quote in western philosophy, "I think, therefore I am." >p> Having established that at least he exists, Descartes begins to look at things in the universe which can be established independently of empirical investigation i.e. a priori things e.g. mathematics. Anselm's deductive ontological argument became a powerful tool in Descartes hands.

Like Anselm, Descartes thought of God in terms of a perfect being. Following Anselm's first argument, Descartes was in agreement that existence was more perfect than non-existence. For Descartes, God's existence was part of His essence. For Descartes, there are some qualities that an object necessarily has or else it would not be that object. To illustrate this Descartes argued that the essence of a triangle is a 'three sided plane figure'. To say that God does not exist is rather like saying 'a triangle does not have three sides' or that the internal angles don't add up to 180°. In the same way, existence cannot be separated from the concept of God.

Descartes took on board Gaunilo's criticism of Anselm's first argument. Like Anselm before him, Descartes points to the distinction between a necessary being and a contingent being. The argument applies only to an absolutely perfect and necessary being. The argument cannot be applied to islands, dragons, unicorns or even pizzas! For Descartes, God alone is the being whose essence entails His existence. There cannot be more than one such being.

God then becomes the guarantor of the certainty that the external world exists. There is no longer the fear that there might be a malevolent demon out to deceive you. God is both omnipotent and omnibenevolent, He would not permit such a thing. God becomes the basis of Descartes' epistemology.

### **Criticism of Descartes' Ontological Argument**

A priest called Caterus responded to Descartes' argument. Caterus argued that the statement 'If God exists then he is highest being' was a tautology (the truth of the statement is self evident). But Caterus emphasised the word 'if'. It was not illogical to say, 'God does not exist therefore there is no highest being'. To use Descartes' analogy of a triangle it is possible to say, 'If a triangle exists it has three sides'. However, all this really tells us is something about triangles. It is equally coherent to say, 'triangles do not exist therefore three sided things do not exist.' Likewise, we might say, 'unicorns have one horn' but this does not prove there are any unicorns.

### **Kant's Objection to the Ontological Argument Kant's Background to the Ontological Argument**

Immanuel Kant (1724-1804) does not seem to show familiarity with Anselm's version of the ontological argument, and it appears that he is responding to its less impressive forms found in the writings of René Descartes (1596-1650) and Christian Wolff (1679-1754). Nonetheless, his objection has historical significance and is often cited by contemporary philosophers as good reason to reject the ontological argument.

Kant thought the ontological argument was flawed. Any argument for the existence of God based on the proposition that a God that exists in reality is greater than a God that only in the imagination is based on a confusion.

### **Predicates**

According to Kant the confusion lies in the fact that existence is not a predicate. The predicate is that part of a sentence which is not the subject but which gives information about the subject. A predicate might be a single word like 'John laughed' where John is the subject and 'laughed' is the predicate. Or a string of words as in the sentence Clare went to school, 'Clare' is the subject and 'went to school' is the predicate. A predicate is a property that a thing can either possess or lack.

### **Predicates and the Existence of God**

When people assert that God exists they are not saying that there is a God and he possesses the property of existence. If that were the case, then when people assert that God does not exist they would be saying that there is a God and he lacks the property of existence, i.e. they would be both affirming and denying God's existence at the same time. Kant suggests that to say that something exists is to say that the concept of that thing is exemplified in the world. For Kant, existence is not a matter of a thing possessing a property i.e. existence. Existence is a concept corresponding to

something in the world.

Kant's objection to the ontological argument is that existence is not a property that can be attributed to beings like we can attribute other properties such as being blue, hard, or round. When we talk about entities existing, Kant contends that we do not mean to add existence as a property to their beings. In other words, the objection seems to be that one cannot go around adding existence as a property to God (or anything else for that matter) in order to define God (or anything else) into existence. Unfortunately, defining my bank account as such a place that contains millions of pounds would not mean that a careful understanding of that definition of 'my bank account' would really make it so. In order to see if that definition were true, we would have to go to an ATM and check the balance of my account and see if it is accurate. Similarly, a definition of God must be checked with reality to see if it is correct.

### **Kant's Objection to Descartes' Ontological Argument**

Descartes had argued that God had existence in the same way as a triangle has three sides. Kant would agree, if you had a triangle then you did indeed have an object with three sides. But if you do not have the triangle, you have neither its three angles or its three sides. If you accept that there is a God, it is logical to accept also that His existence is necessary. But you don't have to accept that there is a God.

### **Contemporary Views of the Ontological Argument**

Kant's objection has been very influential in the ontological argument debate. Philosophers are still divided as to whether or not existence is a predicate. Some thinkers controversially believe that existence can be thought of as a unique property. A modern advocate of the ontological argument is Alvin Plantinga (b.1932) Professor of Philosophy at Notre Dame University, USA. He has forcefully argued that Kant's objection does not conflict with anything in Anselm's argument. For Anselm does not contingently add existence as a property to God and define him into existence. Naturally these objections are contentious, which adds to the intrigue of the ontological argument.

### **Aquinas' Cosmological Argument for the Existence of God**

St. Thomas Aquinas (1224-1274) was a Dominican priest, theologian, and philosopher. Called the Doctor Angelicus (the Angelic Doctor,) Aquinas is considered one of the greatest Christian philosophers to have ever lived. Two of his most famous works, the Summa Theologiae and the Summa Contra Gentiles, are the finest examples of his work on Christian philosophy.

In his Summa Theologiae Aquinas put forward five proofs (or five ways) for the existence of God:  
First Way – Argument from Motion  
Second Way – Causation of Existence  
Third Way – Contingent and Necessary Objects  
Fourth Way – The Argument from Degrees and Perfection  
Fifth Way – The Argument from Intelligent Design

#### **First Way - The Argument From Motion**

St. Thomas Aquinas, studying the works of the Greek philosopher Aristotle, concluded from common observation that an object that is in motion (e.g. the planets, a rolling stone) is put in motion by some other object or force. From this, Aquinas believes that ultimately there must have been an UNMOVED MOVER (GOD) who first put things in motion. Follow the argument this way:

1. Nothing can move itself.

2. If every object in motion had a mover, then the first object in motion needed a mover.
3. Movement cannot go on for infinity.
4. This first mover is the Unmoved Mover, called God.

Aquinas is starting from an a posteriori position. For Aquinas motion includes any kind of change e.g. growth. Aquinas argues that the natural condition is for things to be at rest. Something which is moving is therefore unnatural and must have been put into that state by some external supernatural power.

### **Second Way - Causation of Existence**

This Way deals with the issue of existence. Aquinas concluded that common sense observation tells us that no object creates itself. In other words, some previous object had to create it. Aquinas believed that ultimately there must have been an UNCAUSED FIRST CAUSE (GOD) who began the chain of existence for all things. Follow the argument this way:

1. There exist things that are caused (created) by other things.
2. Nothing can be the cause of itself (nothing can create itself.)
3. There cannot be an endless string of objects causing other objects to exist.
4. Therefore, there must be an uncaused first cause called God.

### **Third Way - Contingent and Necessary Objects**

This Way is sometimes referred to as the modal cosmological argument. Modal is a reference to contingency and necessary. This Way defines two types of objects in the universe: contingent beings and necessary beings. A contingent being is an object that cannot exist without a necessary being causing its existence. Aquinas believed that the existence of contingent beings would ultimately necessitate a being which must exist for all of the contingent beings to exist. This being, called a necessary being, is what we call God. Follow the argument this way:

1. Contingent beings are caused.
2. Not every being can be contingent.
3. There must exist a being which is necessary to cause contingent beings.
4. This necessary being is God.

### **Fourth Way - The Argument From Degrees And Perfection**

St. Thomas formulated this Way from a very interesting observation about the qualities of things. For example one may say that of two marble sculptures one is more beautiful than the other. So for these two objects, one has a greater degree of beauty than the other. This is referred to as degrees or gradation of a quality. From this fact Aquinas concluded that for any given quality (e.g. goodness, beauty, knowledge) there must be a perfect standard by which all such qualities are measured. These perfections are contained in God.

### **Fifth Way - The Argument From Intelligent Design**

The final Way that St. Thomas Aquinas speaks of has to do with the observable universe and the order of nature. Aquinas states that common sense tells us that the universe works in such a way, that one can conclude that it was designed by an intelligent designer, God. In other words, all physical laws and the order of nature and life were designed and ordered by God, the intelligent designer.

## **Faith and Reason**

Aquinas sees reason and faith as two ways of knowing. "Reason" covers what we can know by experience and logic alone. From reason, we can know that there is a God and that there is only one God; these truths about God are accessible to anyone by experience and logic alone, apart from any special revelation from God.

"Faith" covers what we can know by God's special revelation to us (which comes through the Bible and Christian Tradition). By faith, we can know that God came into the world through Jesus Christ and that God is triune (Father, Son, and Holy Spirit). These truths about God cannot be known by reason alone.

Faith builds on reason. Since faith and reason are both ways of arriving at truth -- and since all truths are harmonious with each other -- faith is consistent with reason. If we understand faith and reason correctly, there will be no conflict between what faith tells us and what reason tells us.

## **St. Thomas Aquinas: Essence and Existence**

Metaphysics is the study of the basic structure of reality. It is, in Aristotle's words, the study of being as being, rather than the study of any particular being per se. Metaphysics is the framework by which we understand reality. We can't avoid metaphysics -- every act of understanding entails a metaphysical framework, a perspective. One might say that our metaphysical perspective is that by which we understand, contrasted to nature itself, which is that which we understand.

Our own metaphysical framework is often opaque to us. We use it, like we might use an intuitive political bias, without really examining the framework we are using. We each have a metaphysical bias -- it's unavoidable, and the important question is: does our bias lead us toward or away from the truth? Gaining metaphysical insight is not easy, but it pays big dividends. It helps us to know the truth -- indeed, it is that by which we know the truth.

## **A Rigorous and Consistent System**

St. Thomas Aquinas developed a rigorous and consistent system of metaphysics. He was the first Christian philosopher to insist that faith and reason, properly understood, are never in conflict. Belief in God is not contrary to knowledge of the natural world. St. Thomas' doctrine was controversial in his day, but it was accepted by the Church in the centuries after his death, and it became the intellectual foundation of the modern world, including the cornerstone of modern science.

Ironically, the correspondence of faith and reason is controversial today, especially in the atheist community. The denial of the compatibility between faith and reason is a lynchpin of atheist arguments for naturalism: atheists insist that science tells us the real truth about the world, and faith in God is superstition. The Thomistic reply is that genuine faith and reason both point to the same truth. The Thomistic understanding of reason and its correspondence with faith offer a powerful reply to atheistic naturalism. For readers who are interested in metaphysics and in these modernist controversies (which readers of Evolution News are likely to be), it's worthwhile taking a closer look at the principle that is the cornerstone of Thomistic metaphysics.

## Essence and Existence

The cornerstone of Thomistic metaphysics is the doctrine of essence and existence. It is this: essence is absolutely distinct from existence. This doctrine, which St. Thomas was the first philosopher to assert unequivocally and demonstrate with rigor, has profound implications for our understanding of reality, of nature, of science and of God. What does St. Thomas mean in saying “essence is absolutely distinct from existence”?

First, definitions. **Essence** is that which makes something the sort of thing it is. It is, succinctly, all the characteristics that are knowable about something. The essence of a cat is everything about the cat that makes it a cat. Its cat-shape, its furriness, its meow, its animality, etc. Some things about the cat – the fact, for instance, that at (unfortunate) times it can be a projectile launcher or a meal – are not parts of the essence of a cat. They are extraneous to it, although in rare circumstances, they may be true of it. You can see here where that modern notion of “essence” comes from. Essence is what’s important about something, what tells us what something really is.

## And Now for Existence

**Existence** is that a thing is, rather than what a thing is. The existence of a thing is different from the essence of a thing. I can know the essence of a rock, but it is the rock’s existence by which I stub my toe. I can’t stub my toe on essence, no matter how hard it is.

Prior to St. Thomas, many philosophers considered existence to be a property of something, part of its essence. We might say that my cat Fluffy’s essence is that she is shaped like a cat, purrs and meows, likes to play with yarn, and exists.

## Descartes

The first great philosopher of the modern era was René Descartes, whose new approach won him recognition as the progenitor of modern philosophy. Descartes’s pursuit of mathematical and scientific truth soon led to a profound rejection of the scholastic tradition in which he had been educated. Much of his work was concerned with the provision of a secure foundation for the advancement of human knowledge through the natural sciences. Fearing the condemnation of the church, however, Descartes was rightly cautious about publicly expressing the full measure of his radical views. The philosophical writings for which he is remembered are therefore extremely circumspect in their treatment of controversial issues.

After years of work in private, Descartes finally published a preliminary statement of his views in the *Discourse on the Method of Rightly Conducting the Reason* (1637). Since mathematics has genuinely achieved the certainty for which human thinkers yearn, he argued, we rightly turn to mathematical reasoning as a model for progress in human knowledge more generally. Expressing perfect confidence in the capacity of human reason to achieve knowledge, Descartes proposed an intellectual process no less unsettling than the architectural destruction and rebuilding of an entire town. In order to be absolutely sure that we accept only what is genuinely certain, we must first deliberately renounce all of the firmly held but questionable beliefs we have previously acquired by experience and education.

The progress and certainty of mathematical knowledge, Descartes supposed, provide an emulable model for a similarly productive philosophical method, characterized by four simple rules:

1. Accept as true only what is indubitable.
2. Divide every question into manageable parts.
3. Begin with the simplest issues and ascend to the more complex.
4. Review frequently enough to retain the whole argument at once.

This quasi-mathematical procedure for the achievement of knowledge is typical of a rationalistic approach to epistemology.

While engaged in such a comprehensive revision of our beliefs, Descartes supposed it prudent to adhere to a modest, conventional way of life that provides a secure and comfortable environment in which to pursue serious study. The stoic underpinnings of this "provisional morality" are evident in the emphasis on changing oneself to fit the world. Its general importance as an avenue to the contemplative life, however, is more general. Great intellectual upheavals can best be undertaken during relatively calm and stable periods of life.

### **Anticipated Results**

In this context, Descartes offered a brief description of his own experience with the proper approach to knowledge. Begin by renouncing any belief that can be doubted, including especially the testimony of the senses; then use the perfect certainty of one's own existence, which survives this doubt, as the foundation for a demonstration of the providential reliability of one's faculties generally. Significant knowledge of the world, Descartes supposed, can be achieved only by following this epistemological method, the rationalism of relying on a mathematical model and eliminating the distraction of sensory information in order to pursue the demonstrations of pure reason.

Later sections of the Discourse (along with the supplementary scientific essays with which it was published) trace some of the more significant consequences of following the Cartesian method in philosophy. His mechanistic inclinations emerge clearly in these sections, with frequent reminders of the success of physical explanations of complex phenomena. Non-human animals, on Descartes's view, are complex organic machines, all of whose actions can be fully explained without any reference to the operation of mind in thinking.

In fact, Descartes declared, most of human behavior, like that of animals, is susceptible to simple mechanistic explanation. Cleverly designed automata could successfully mimic nearly all of what we do. Thus, Descartes argued, it is only the general ability to adapt to widely varying circumstances—and, in particular, the capacity to respond creatively in the use of language—that provides a sure test for the presence of an immaterial soul associated with the normal human body.

But Descartes supposed that no matter how human-like an animal or machine could be made to appear in its form or operations, it would always be possible to distinguish it from a real human being by two functional criteria. Although an animal or machine may be capable of performing any one activity as well as (or even better than) we can, he argued, each human being is capable of a greater variety of different activities than could be performed by anything lacking a soul. In a special instance of this general point, Descartes held that although an animal or machine might be made to utter sounds resembling human speech in response to specific stimuli, only an immaterial thinking substance could engage in the creative use of language required for responding

appropriately to any unexpected circumstances. My puppy is a loyal companion, and my computer is a powerful instrument, but neither of them can engage in a decent conversation. (This criterion anticipated the more formal requirements of the Turing test.)

## **The Method of Doubt**

The basic strategy of Descartes's method of doubt is to defeat skepticism on its own ground. Begin by doubting the truth of everything—not only the evidence of the senses and the more extravagant cultural presuppositions, but even the fundamental process of reasoning itself. If any particular truth about the world can survive this extreme skeptical challenge, then it must be truly indubitable and therefore a perfectly certain foundation for knowledge. The First Meditation, then, is an extended exercise in learning to doubt everything that I believe, considered at three distinct levels:

### **1. Perceptual Illusion**

First, Descartes noted that the testimony of the senses with respect to any particular judgment about the external world may turn out to be mistaken. Things are not always just as they seem at first glance (or at first hearing, etc.) to be. But then, Descartes argues, it is prudent never wholly to trust in the truth of what we perceive. In ordinary life, of course, we adjust for mistaken perceptions by reference to correct perceptions. But since we cannot be sure at first which cases are veridical and which are not, it is possible (if not always feasible) to doubt any particular bit of apparent sensory knowledge.

### **2. The Dream Problem**

Second, Descartes raised a more systematic method for doubting the legitimacy of all sensory perception. Since my most vivid dreams are internally indistinguishable from waking experience, he argued, it is possible that everything I now "perceive" to be part of the physical world outside me is in fact nothing more than a fanciful fabrication of my own imagination. On this supposition, it is possible to doubt that any physical thing really exists, that there is an external world at all.

Severe as it is, this level of doubt is not utterly comprehensive, since the truths of mathematics and the content of simple natures remain unaffected. Even if there is no material world (and thus, even in my dreams) two plus three makes five and red looks red to me. In order to doubt the veracity of such fundamental beliefs, I must extend the method of doubting even more hyperbolically.

### **3. A Deceiving God**

Finally, then, Descartes raises even more comprehensive doubts by inviting us to consider a radical hypothesis derived from one of our most treasured traditional beliefs. What if (as religion teaches) there is an omnipotent god, but that deity devotes its full attention to deceiving me? The problem here is not merely that I might be forced by god to believe what something which is in fact false. Descartes means to raise the far more devastating possibility that whenever I believe anything, even if it has always been true up until now, a truly omnipotent deceiver could at that very moment choose to change the world so as to render my belief false. On this supposition, it seems possible to doubt the truth of absolutely anything I might come to believe.

Although the hypothesis of a deceiving god best serves the logical structure of the Meditations as a whole, Descartes offered two alternative versions of the hypothetical doubt for the benefit of

those who might take offense at even a counter-factual suggestion of impiety. It may seem more palatable to the devout to consider the possibility that I systematically deceive myself or that there is some evil demon who perpetually tortures me with my own error. The point in each case is that it is possible for every belief I entertain to be false.

Remember that the point of the entire exercise is to out-do the skeptics at their own game, to raise the broadest possible grounds for doubt, so that whatever we come to believe in the face of such challenges will indeed be that which cannot be doubted. It is worthwhile to pause here, wallowing in the depths of Cartesian doubt at the end of the First Meditation, the better to appreciate the escape he offers at the outset of Meditation Two.

## **I Am, I Exist**

The Second Meditation begins with a review of the First. Remember that I am committed to suspending judgment with respect to anything about which I can conceive any doubt, and my doubts are extensive. I mistrust every report of my senses, I regard the material world as nothing more than a dream, and I suppose that an omnipotent god renders false each proposition that I am even inclined to believe. Since everything therefore seems to be dubitable, does it follow that I can be certain of nothing at all?

It does not. Descartes claimed that one thing emerges as true even under the strict conditions imposed by the otherwise universal doubt: "I am, I exist" is necessarily true whenever the thought occurs to me. This truth neither derives from sensory information nor depends upon the reality of an external world, and I would have to exist even if I were systematically deceived. For even an omnipotent god could not cause it to be true, at one and the same time, **both** that I am deceived **and** that I do not exist. If I am deceived, then at least I am.

Although Descartes's reasoning here is best known in the Latin translation of its expression in the Discourse, "cogito, ergo sum" ("I think, therefore I am"), it is not merely an inference from the activity of thinking to the existence of an agent which performs that activity. It is intended rather as an intuition of one's own reality, an expression of the indubitability of first-person experience, the logical self-certification of self-conscious awareness in any form.

Skepticism is thereby defeated, according to Descartes. No matter how many skeptical challenges are raised—indeed, even if things are much worse than the most extravagant skeptic ever claimed—there is at least one fragment of genuine human knowledge: my perfect certainty of my own existence. From this starting-point, Descartes supposed, it is possible to achieve indubitable knowledge of many other propositions as well.

## **I Am a Thinking Thing**

An initial consequence may be drawn directly from the intuitive certainty of the cogito itself. If I know that I am, Descartes argued, I must also know what I am; an understanding of my true nature must be contained implicitly in the content of my awareness.

What then, is this "I" that doubts, that may be deceived, that thinks? Since I became certain of my existence while entertaining serious doubts about sensory information and the existence of a material world, none of the apparent features of my human body can have been crucial for my understanding of myself. But all that is left is my thought itself, so Descartes concluded that "sum

res cogitans" ("I am a thing that thinks"). In Descartes's terms, I am a substance whose inseparable attribute (or entire essence) is thought, with all its modes: doubting, willing, conceiving, believing, etc. What I really am is a mind or soul. So completely am I identified with my conscious awareness, Descartes claimed, that if I were to stop thinking altogether, it would follow that I no longer existed at all. At this point, nothing else about human nature can be determined with such perfect certainty.

### **Descartes: God and Human Nature Clear and Distinct Ideas**

At the outset of the Third Meditation, Descartes tried to use this first truth as the paradigm for his general account of the possibilities for achieving human knowledge. In the cogito, awareness of myself, of thinking, and of existence are somehow combined in such a way as to result in an intuitive grasp of a truth that cannot be doubted. Perhaps we can find in other cases the same grounds for indubitable truth. But what is it? The answer lies in Descartes's theory of ideas. Considered formally, as the content of my thinking activity, the ideas involved in the cogito are unusually clear and distinct. But ideas may also be considered objectively, as the mental representatives of things that really exist. According to a representative realist like Descartes, then, the connections among our ideas yield truth only when they correspond to the way the world really is. But it is not obvious that our clear and distinct ideas do correspond to the reality of things, since we suppose that there may be an omnipotent deceiver.

In some measure, the reliability of our ideas may depend on the source from which they are derived. Descartes held that there are only three possibilities: all of our ideas are either **adventitious** (entering the mind from the outside world) or **factitious** (manufactured by the mind itself) or **innate** (inscribed on the mind by god). But I don't yet know that there is an outside world, and I can imagine almost anything, so everything depends on whether god exists and deceives me.

### **God Exists**

The next step in the pursuit of knowledge, then, is to prove that god does indeed exist. Descartes's starting point for such a proof is the principle that the cause of any idea must have at least as much reality as the content of the idea itself. But since my idea of god has an absolutely unlimited content, the cause of this idea must itself be infinite, and only the truly existing god is that. In other words, my idea of god cannot be either adventitious or factitious (since I could neither experience god directly nor discover the concept of perfection in myself), so it must be innately provided by god. Therefore, god exists.

As a backup to this argument, Descartes offered a traditional version of the cosmological argument for god's existence. From the cogito I know that I exist, and since I am not perfect in every way, I cannot have caused myself. So something else must have caused my existence, and no matter what that something is (my parents?), we could ask what caused it to exist. The chain of causes must end eventually, and that will be with the ultimate, perfect, self-caused being, or god.

As Antoine Arnauld pointed out in an Objection published along with the Meditations themselves, there is a problem with this reasoning. Since Descartes will use the existence (and veracity) of god to prove the reliability of clear and distinct ideas in Meditation Four, his use of clear and distinct ideas to prove the existence of god in Meditation Three is an example of circular reasoning. Descartes replied that his argument is not circular because intuitive reasoning—in the proof of god as in the cogito—requires no further support in the moment of its conception. We must rely on a non-deceiving god only as the guarantor of veridical memory, when a demonstrative argument involves too many steps to be held in the mind at once. But this response is not entirely

convincing.

The problem is a significant one, since the proof of god's existence is not only the first attempt to establish the reality of something outside the self but also the foundation for every further attempt to do so. If this proof fails, then Descartes's hopes for human knowledge are severely curtailed, and I am stuck in solipsism, unable to be perfectly certain of anything more than my own existence as a thinking thing. With this reservation in mind, we'll continue through the Meditations, seeing how Descartes tried to dismantle his own reasons for doubt.

### **Deception and Error**

The proof of god's existence actually makes the hypothetical doubt of the First Meditation a little worse: I now know that there really is a being powerful enough to deceive me at every turn. But Descartes argued that since all perfections naturally go together, and since deception is invariably the product of imperfection, it follows that the truly omnipotent being has no reason or motive for deception. God does not deceive, and doubt of the deepest sort may be abandoned forever. It follows that the simple natures and the truths of mathematics are now secure. In fact, Descartes maintained, I can now live in perfect confidence that my intellectual faculties, bestowed on me by a veracious god, are properly designed for the apprehension of truth.

But this seems to imply too much: if I have a divinely-endowed capacity for discovering the truth, then why don't I always achieve it? The problem is not that I lack knowledge of some things; that only means that I am limited. Rather, the question is why I so often make mistakes, believing what is false despite my possession of god-given mental abilities. Descartes's answer derives from an analysis of the nature of human cognition generally.

Every mental act of judgment, Descartes held, is the product of two distinct faculties: the understanding, which merely observes or perceives, and the will, which assents to the belief in question. Considered separately, the understanding (although limited in scope) is adequate for human needs, since it comprehends completely everything for which it has clear and distinct ideas. Similarly, the will as an independent faculty is perfect, since it (like the will of god) is perfectly free in every respect. Thus, god has benevolently provided me with two faculties, neither of which is designed to produce error instead of true belief. Yet I do make mistakes, by misusing my free will to assent on occasions for which my understanding does not have clear and distinct ideas. For Descartes, error is virtually a moral failing, the willful exercise of my powers of believing in excess of my ability to perceive the truth.

### **The Essence of Matter**

Since the truths of reason have been restored by the demonstration of god's veracity, Descartes employed mathematical reasoning to discover the essence of bodies in the Fifth Meditation. We do not yet know whether there are any material objects, because the dream problem remains in force, but Descartes supposed that we can determine what they would be like if there were any by relying upon reason alone, since mathematics achieves certainty without supposing the reality of its objects.

According to Descartes, the essence of material substance is simply extension, the property of filling up space. So solid geometry, which describes the possibility of dividing an otherwise uniform space into distinct parts, is a complete guide to the essence of body. It follows that there

can be in reality only one extended substance, comprising all matter in a single spatial whole. From this, Descartes concluded that individual bodies are merely modes of the one extended being, that there can be no space void of extension, and that all motion must proceed by circular vortex. Thus, again, the true nature of bodies is understood by pure thought, without any information from the senses.

By the way, this explanation of essences suggested to Descartes another proof of god's existence, a modern variation on the Ontological Argument. Just as the essence of a triangle includes its having interior angles that add up to a straight line, Descartes argued, so the essence of god, understood as a being in whom all perfections are united, includes necessary existence in reality. As Descartes himself noted, this argument is no more certain than the truths of mathematics, so it also rests on the reliability of clear and distinct ideas, secured in turn by the proofs of god's existence and veracity in the Third and Fourth Meditations.

### **The Existence of Bodies**

In the Sixth Meditation, Descartes finally tried to eliminate the dream problem by proving that there is a material world and that bodies do really exist. His argument derives from the supposition that divinely-bestowed human faculties of cognition must always be regarded as adequately designed for some specific purpose. Since three of our faculties involve representation of physical things, the argument proceeds in three distinct stages.

First, since the understanding conceives of extended things through its comprehension of geometrical form, it must at least be possible for things of this sort to exist. Second, since the imagination is directed exclusively toward the ideas of bodies and of the ways in which they might be purposefully altered, it is probable that there really are such things. Finally, since the faculty of sense perception is an entirely passive ability to receive ideas of physical objects produced in me by some external source outside my control, it is certain that such objects must truly exist.

The only alternative explanation for perception, Descartes noted, is that god directly puts the ideas of bodies into my mind without there actually being anything real that corresponds to them. (This is precisely the possibility that Malebranche would later accept as the correct account of the material world.) But Descartes supposed that a non-deceiving god would never maliciously give me so complete a set of ideas without also causing their natural objects to exist in fact. Hence, the bodies I perceive do really exist.

### **Mind-Body Dualism**

Among the physical objects I perceive are the organic bodies of animals, other human beings, and myself. So it is finally appropriate to consider human nature as a whole: how am I, considered as a thinking thing, concerned with the organism I see in the mirror? What is the true relation between the mind and the body of any human being? According to Descartes, the two are utterly distinct. The Sixth Meditation contains two arguments in defence of Cartesian dualism: First, since the mind and the body can each be conceived clearly and distinctly apart from each other, it follows that god could cause either to exist independently of the other, and this satisfies the traditional criteria for a metaphysical real distinction. Second, the essence of body as a geometrically defined region of space includes the possibility of its infinite divisibility, but the mind, despite the variety of its many faculties and operations, must be conceived as a single, unitary, indivisible being; since incompatible properties cannot inhere in any one substance, the mind and body are perfectly

distinct.

This radical separation of mind and body makes it difficult to account for the apparent interaction of the two in my own case. In ordinary experience, it surely seems that the volitions of my mind can cause physical movements in my body and that the physical states of my body can produce effects on my mental operations. But on Descartes's view, there can be no substantial connection between the two, nor did he believe it appropriate to think of the mind as residing in the body as a pilot resides within a ship. Although he offered several tentative suggestions in his correspondence with Princess Elizabeth, Descartes largely left for future generations the task of developing some reasonable account of volition and sensation, either by securing the possibility of mind-body interaction or by proposing some alternative explanation of the appearances. On the other hand, Cartesian dualism offers some clear advantages: For one thing, it provides an easy proof of the natural immortality of the human mind or soul, which cannot be substantially affected by death, understood as an alteration of the states of the physical organism. In addition, the distinction of mind from body establishes the absolute independence of the material realm from the spiritual, securing the freedom of scientists to rely exclusively on observation for their development of mechanistic explanations of physical events.

### **Cartesian Philosophy Consequences of Dualism**

Descartes worked out his own detailed theories about the physical operation of the material world in *Le Monde* (The World), but uncertainty about ecclesiastical reactions prevented him from publishing it. The final sections of the *Discourse*, however, include several significant hints about the positions he was prepared to defend. Their explanations of the activities of living organisms make the mechanistic implications of the Cartesian view more evident.

Since, as everyone acknowledges, non-human animals do not have souls, Descartes concluded that animals must be merely complex machines. Since they lack any immaterial thinking substance, animals cannot think, and all of the movements of their bodies can, in principle, be explained in purely mechanical terms. (Descartes himself incorrectly supposed that the nervous system functions as a complex hydraulic machine.) But since the structure of the human body and the behavior of human beings are similar to the structure and behavior of some animals, it is obvious that many human actions can also be given a mechanistic explanation. La Mettrie later followed this line of reasoning to its ultimate conclusion, supposing human beings to be nothing more than Cartesian machines.

### **Cartesianism**

The philosophy of Descartes won ready acceptance in the second half of the seventeenth century, especially in France and Holland. Although few of his followers, known collectively as Cartesians, employed his methods, they showed great diligence and ingenuity in their efforts to explain, defend, and advance his central doctrines.

In the physical sciences, for example, Cavendish, Rohault, and Régis were happy to abandon all efforts to employ final causes in their pursuit of mechanistic accounts of physical phenomena and animal behavior. On this basis, however, such philosophers were able to progress beyond a simple affirmation of the mysterious reality of mind-body interaction.

Metaphysicians like Cordemoy and Geulincx fared little better in their efforts to deal with this

crucial problem with dualism. If there is no genuine causal interaction between independent substances, we seem driven to suppose that the actions of mind and body are merely parallel or divinely synchronized.

Not everyone was entirely satisfied by the epistemological foundations of the Cartesian scheme, either. Critics like Arnauld, Nicole, and Foucher drew attention to the inherent difficulty of explaining in representationalist terms how our ideas of things can be known to resemble the things themselves and the implausibility of reliance upon innate ideas. Conway went even further, rejecting the dualistic foundations of Descartes's substance-ontology along with his approach to human knowledge.

### **Pascal: The Religious Mathematician**

One seventeenth-century thinker of greater independent significance was Blaise Pascal, with his unusual blend of religious piety, scientific curiosity, and mathematical genius. Led by his deep religious feelings to participate fully in the pietistic Jansenism of the Port-Royal community, Pascal maintained that formal reasoning about god can never provide an adequate substitute for genuine personal concern for the faith: "The heart has its reasons that reason cannot know."

Pascal's mathematical acumen was no less remarkable than that of Descartes; his work anticipated the development of game theory and the modern methods of calculating probability. In fact, his famous "Wager" applies these mathematical techniques to the prudence of religious conviction in the absence of adequate evidence: since the consequences of believing are infinitely beneficial if there is a god and only slightly inconvenient if there is not, while the outcome of atheism is only somewhat more pleasant if there is no god and eternally costly if there is, the expected value of theism is much greater than that of atheism, and it is reasonable to stake one's life on the possibility that god does exist.

### **Malebranche: Seeing All Things in God**

The most original and influential philosopher of the Cartesian tradition was Nicolas Malebranche. Noting the steady progress of efforts to provide mechanistic accounts of the behavior of the human body, Malebranche concluded that the mind and body are not only substantially distinct but causally independent of each other. The appearance of genuine interaction arises from what is in fact merely the perfect parallelism of events in the mental and physical realms.

According to Malebranche, then, our ideas of bodies do not result from any causal influence that physical objects have on our senses; rather, they are produced in our minds directly by god. Thus, he supposed, in sense perception what literally happens is that we "see all things in god." Similarly, our wills have no causal influence on the material world, but god provides for the coordination of our volitions with the movement of bodies. In general, since there is no causal interaction, it is the power of god alone that secures a perpetual, happy coincidence of the states and operations of minds and bodies.

Since only god's activity is efficacious in either mental or physical things, apparent causes in either realm are merely the occasions for the appearance of their supposed effects in the other. Thus, the views of Malebranche are often referred to collectively as occasionalism. Although the entire theory found few enthusiastic adherents, Malebranche's analysis of the regularities exhibited in

nature by causally independent beings and events was greatly influential on later philosophers, including Berkeley and Hume.

## **Spinoza: God, Nature, and Freedom**

Descartes regarded mathematical reasoning as the paradigm for progress in human knowledge, but Baruch Spinoza took this rationalistic appreciation even further, developing and expressing his mature philosophical views "in the geometrical manner." Thus, in the posthumously-published *Ethica Ordine Geometrico Demonstrata* (Ethics) (1677), Spinoza claimed to deduce the entire system of thought from a restricted set of definitions and self-evident axioms.

Drawing specific doctrines from Cartesian thought, medieval scholasticism, and the Jewish tradition, Spinoza blended everything together into a comprehensive vision of the universe as a coherent whole governed solely by the immutable laws of logical necessity. Rigorous thought reveals that there can be only a single substance, of which we (and everything else) are merely insignificant parts. Although we may find it difficult to take any comfort in Spinoza's account of our place in the world, we are bound to admire the logical consistency with which he works out all the details.

## **The Unity of Substance**

The definitions and axioms with which Book I of the Ethics begins are critical to Spinoza's enterprise, since they are intended to carry his central doctrines as deductive consequences. Although they generally follow the usages of the scholastic tradition, many of them also include special features of great significance to the thought of Spinoza.

Substance, for example, he defined not only as existing in itself but also as "conceived through itself." This places a severe limit on the possibility of interaction between things, since Spinoza declared that causation is a relation of logical necessity, such that knowledge of the effect requires knowledge of its cause. Few will disagree that god is a substance with infinite attributes, but this definition carries some surprising implications in Spinoza's view of the world; notice also that freedom, according to Spinoza, just means that a thing exists and acts by its own nature rather than by external compulsion.

The numbered propositions that follow make it clear what Spinoza is getting at. Since causal interaction is impossible between two substances that differ essentially, and no two substances can share a common attribute or essence, it follows that no substance can produce genuine change in any another substance. Each must be the cause of its own existence and, since it cannot be subject to limitations imposed from outside itself, must also be absolutely infinite. Things that appear to be finite individuals interacting with each other, then, cannot themselves be substances; in reality, they can be nothing more than the modifications of a self-caused, infinite substance. And that, of course, is god.

## **"Deus sive Natura"**

Spinoza supposed it easy to demonstrate that such a being does really exist. As the ontological argument makes clear, god's very essence includes existence. Moreover, nothing else could possibly prevent the existence of that substance which has infinite attributes in itself. Finally, although it depends on a posteriori grounds to which Spinoza would rather not appeal, the cosmological argument helps us to understand that since we ourselves exist, so must an infinite

cause of the universe. Thus, god exists.

What is more, god is a being with infinitely many attributes, each of which is itself infinite, upon which no limits of any kind can be imposed. So Spinoza argued that infinite substance must be indivisible, eternal, and unitary. There can be only one such substance, "god or nature," in which everything else is wholly contained. Thus, Spinoza is an extreme monist, for whom "Whatever is, is in god." Every mind and every body, every thought and every movement, all are nothing more than aspects of the one true being. Thus, god is an extended as well as a thinking substance.

Finally, god is perfectly free on Spinoza's definition. Of course it would be incorrect to suppose that god has any choices about what to do. Everything that happens is not only causally determined but actually flows by logical necessity from immutable laws. But since everything is merely a part of god, those laws themselves, and cause and effect alike, are simply aspects of the divine essence, which is wholly self-contained and therefore free. Because there is no other substance, god's actions can never be influenced by anything else.

### **The Natural Order**

God is the only genuine cause. From the essence of god, Spinoza held, infinitely many things flow in infinitely many different ways. The entire universe emanates inexorably from the immutable core of infinite substance. Though we often find it natural to think of the world from the outside looking in, as *natura naturata* (nature natured), its internal structure can be more accurately conceived from the inside looking out, as *natura naturans* (nature naturing).

Since all that happens radiates from the common core, everything hangs together as part of the coherent whole which just is god or nature in itself. The infinite substance and each of its infinitely many distinct attributes (among which only thought and extension are familiar to us) are eternal expressions of the immutable essence of god. From each attribute flow the infinite immediate modes (infinite intellect and motion or rest), and out of these in turn come the infinite mediate modes (truth and the face of the universe). Thus, every mode of substance (each individual mind or body) is determined to be as it is because of the divine essence. Even the finite modes (particular thoughts and actions) are inevitably and wholly determined by the nature of god. Hence, everything in the world is as it must be; nothing could be other than it is.

### **Thought and Extension**

In the same deductive geometrical form, Book II of the *Ethics* offers an extensive account of human beings: our existence, our nature, and our activities. Remember that we are aware of only two of the infinitely many attributes of god, extension and thought, and that each of them independently expresses the entire essence of the one infinite substance.

That is, in the natural world (god's body), the attribute of extension, modified by varying degrees of motion and rest, produces the face of the universe, which includes all of the particular physical events which are the modes of extension. (This is almost exactly like Descartes's account of the material world.) Similarly, in the mental realm (god's idea), the attribute of thought—modified by infinite intellect—produces the truth, which includes all of the particular mental events which are the modes of thought. Since they arise from distinct attributes, each of these realms is causally independent of the other and wholly self-contained: the natural world and the mental realm are separate closed systems.

Despite the impossibility of any causal interaction between the two, Spinoza supposed that the inevitable unfolding of each these two independent attributes must proceed in perfect parallel with that of the other. "The order and connection of ideas is the same as the order and connection of things." (And so, of course, must be the order and connection of each of the infinitely many other attributes of god.) Since the development of each aspect of the divine nature follows with logical necessity from its own fundamental attribute, and since all of the attributes, in turn, derive from the central essential being of one and the same infinite substance, each exhibits the same characteristic pattern of organization even though they have no influence on each other.

Thus, for every object of the natural world that exists as a mode of the attribute of extension, there is a corresponding idea in the mind of god that exists as a mode of the attribute of thought. For every physical event that takes place in the material realm as the result of exclusively physical causes, a corresponding mental event must occur in the infinite intellect as a result of purely mental causes. Since everything flows from the same infinite being, we may suppose that the structure of thought in infinite intellect comprises an accurate representation of the structure of every other attribute.

### **Mind and Body**

Consider what all of this implies for each of us as a living human being. We are not substances, according to Spinoza, for only god or Nature is truly substantial; we can exist only as modes, depending for our existence upon the reality of the one real being. Since the one infinite substance is the cause of everything, each of us can only be regarded as a tiny cross-section of the whole.

Of course, that cross-section does include elements from each of the infinitely many attributes of that substance. In particular, we know that in each case it involves both a human body, the movements of whose organic parts are all physical events that flow from god via the attribute of extension, and a human mind, the formation of whose ideas are all mental events that flow from god via the attribute of thought. Although there can be no causal interaction between the mind and the body, the order and connection of their internal elements are perfectly correlated.

Thus, in principle, the human mind contains ideas that perfectly represent the parts of the human body. But since many of these ideas are inadequate in the sense that they do not carry with them internal signs of their accuracy, we do not necessarily know our own bodies. If, for example, there must be in my mind an idea that corresponds to each particular organic state of my spleen; but since I am unaware of its bodily correlate, it provides me with no clear awareness of that representational object.

### **Human Knowledge**

Spinoza maintained that human beings do have particular faculties whose functions are to provide some degree of knowledge. I typically assume, for example, that there may be some correlation between thought and extension with regard to sensations produced by the action of other bodies upon my eyes, ears, and fingertips. Even my memory may occasionally harbor some evidence of the order and connection common to things and ideas. And in self-conscious awareness, I seem to achieve genuine knowledge of myself by representing my mind to itself, using ideas to signify other ideas.

Near the end of Book II, then, Spinoza distinguished three kinds of knowledge of which we may be capable: First, **opinion**, derived either from vague sensory experience or from the signification of words in the memory or imagination, provides only inadequate ideas and cannot be relied upon as a source of truth. Second, **reason**, which begins with simple adequate ideas and by analyzing causal or logical necessity proceeds toward awareness of their more general causes, does provide us with truth. But **intuition**, in which the mind deduces the structure of reality from the very essence or idea of god, is the great source of adequate ideas, the highest form of knowledge, and the ultimate guarantor of truth.

Spinoza therefore recommends a three-step process for the achievement of human knowledge: First, disregard the misleading testimony of the senses and conventional learning. Second, starting from the adequate idea of any one existing thing, reason back to the eternal attribute of god from which it derives. Finally, use this knowledge of the divine essence to intuit everything else that ever was, is, and will be. Indeed, he supposed that the Ethics itself is an exercise in this ultimate pursuit of indubitable knowledge.

### **Action, Goodness, and Freedom**

The last three Books of the Ethics collectively describe how to live consistently on Spinozistic principles. All human behavior results from desire or the perception of pain, so (like events of any sort) it flows necessarily from the eternal attributes of thought and extension. But Spinoza pointed out a crucial distinction between two kinds of cases: Sometimes I am wholly unaware of the causes that underlie what I do and am simply overwhelmed by the strength of my momentary passions. But at other times I have adequate knowledge of the motives for what I do and can engage in deliberate action because I recognize my place within the grander scheme of reality as a whole.

It is in this fashion that moral value enters Spinoza's system. Good (or evil) just is what serves (or hinders) the long-term interests of life. Since my actions invariably follow from emotion or desire, I always do what I believe to be the good, which will truly be so if I have adequate ideas of everything involved. The greatest good of human life, then, is to understand one's place in the structure of the universe as a natural expression of the essence of god.

But how can we speak of moral responsibility when every human action is determined with rigid necessity? Remember that, for Spinoza, freedom is self-determination, so when I acquire adequate knowledge of the emotions and desires that are the internal causes of all my actions, when I understand why I do what I do, then I am truly free. Although I can neither change the way things are nor hope that I will be rewarded, I must continue to live and act with the calm confidence that I am a necessary component of an infinitely greater and more important whole. This way of life may not be easy, Spinoza declared, "But all noble things are as difficult as they are rare."

### **Leibniz's Monadology**

G.W. Leibniz's *Monadology* (1714) is a very concise and condensed presentation of his theory that the universe consists of an infinite number of substances called monads. Leibniz discusses the nature of monadic perception and consciousness, the principles which govern truth and reason, and the relation of the monadic universe to God.

Leibniz defines a monad as a simple substance which cannot be divided into parts. A compound substance may be formed by an aggregation of monads. Thus, a compound substance may be divided into simple parts.

According to Leibniz, monads differ in quality, and no two monads are exactly alike. Each monad has its own individual identity. Each monad has its own internal principle of being. A monad may undergo change, but this change is internally determined. Changes in the properties of any monad are not externally determined by other monads.

Each monad has a plurality of properties and relations, which constitutes its perception. Each monad has its own perceptions which differ from the perceptions of other monads. Perceptual changes are constituted by the internal actions of monads. Leibniz describes three levels of monads, which may be differentiated by their modes of perception. A simple or bare monad has unconscious perception, but does not have memory. A simple or ordinary soul is a more highly developed monad, which has distinct perceptions, and which has conscious awareness and memory. A rational soul or spirit is an even more highly developed monad, which has self-consciousness and reason (both of which constitute "apperception").

Leibniz says that necessary and eternal truths may be known by reason. A rational soul may know necessary and permanent truths, in contrast to an ordinary soul which can only connect perceptions by means of memory. A rational soul can know eternal truths about the universe and about the relation of the universe to God. A rational soul thinks of itself as limited, but thinks of God as unlimited.

Leibniz explains that reason is governed by two main principles: the principle of contradiction, and the principle of sufficient reason. According to the principle of contradiction, a proposition must be either true or false. If two propositions are contradictory to each other, then one of the propositions must be true, and the other must be false. According to the principle of sufficient reason, nothing happens without a reason. No proposition can be true without a sufficient reason for its being true and not false.

Leibniz declares that there are two kinds of truth: truths of reason, and truths of fact. Truths of reason are a priori, while truths of fact are a posteriori. Truths of reason are necessary, permanent truths. Truths of fact are contingent, empirical truths. Both kinds of truth must have a sufficient reason. Truths of reason have their sufficient reason in being opposed to the contradictoriness and logical inconsistency of propositions which deny them. Truths of fact have their sufficient reason in being more perfect than propositions which deny them.

Leibniz also claims, however, that the ultimate reason of all things must be found in a necessary and universal substance, which is God. A primary substance is not material, according to Leibniz, because matter is infinitely divisible. Every monad is produced from a primary unity, which is God. Every monad is eternal, and contributes to the unity of all the other monads in the universe.

Leibniz says that there is only one necessary substance, and that this is God. A necessary substance is one whose existence is logically necessary. The existence of a necessary substance cannot be denied without causing some form of self-contradiction. Thus, God's existence is logically necessary. God is absolutely real, infinite, and perfect. All perfection and all reality comes from God. God, as the supreme monad, is an absolute unity.

Leibniz explains that the perfection of a monad is revealed by its activity. The imperfection of a monad is revealed by its passivity. A monad is perfect insofar as it is active, and is imperfect insofar as it is passive. Actions and reactions are reciprocal relations between monads, and are constantly changing. The actions of some monads are a sufficient reason for the reactions of other monads. The reactions of some monads are given sufficient reason by the actions of other monads. All of the actions and reactions of monads are governed by a principle of harmony, which is established by God.

Leibniz argues that, insofar as the rational soul or spirit can know eternal truths and can act according to reason, it can reflect God. The spiritual world is a moral world, which can guide the natural world. The goodness of God ensures that there is harmony between the spiritual world and the natural world, and establishes harmony between moral laws and natural laws. A perfect harmony of moral and natural law is found in the spiritual world, which Leibniz calls the City of God. Leibniz also says that there are an infinite number of possible universes in the mind of God, but that God has chosen a single universe whose sufficient reason is that it is the best possible universe (i.e. having the highest possible degree of perfection). This claim may be disputed, however, because it may be misused as an argument for an excessive and unjustifiable form of optimism.

Leibniz argues that God is supremely perfect, and that therefore God has chosen the best possible plan for the universe. God's plan for the universe necessarily produces the greatest amount of happiness and goodness, because it reflects God's absolute perfection. But Leibniz's argument may be disputed by the opposing argument that the best of all possible worlds may not necessarily contain both good and evil. The best of all possible worlds may not necessarily contain both happiness and unhappiness. The universe may not necessarily be governed by harmony, but may be governed by disharmony. The universe may not necessarily reveal unity, but may reveal disunity.

## **The Uses of Logic**

The last of the great Continental Rationalists was Gottfried Wilhelm Leibniz. Known in his own time as a legal advisor to the Court of Hanover and as a practicing mathematician who co-invented the calculus, Leibniz applied the rigorous standards of formal reasoning in an effort to comprehend everything. A suitably sophisticated logical scheme, he believed, can serve as a reliable guide to the ultimate structure of reality.

But Leibniz published little of his philosophical work during his own lifetime. For an understanding of the technical logical foundations of his system, we must rely upon letters and notebooks which became available only centuries later and upon the aphoristic summary of its results in *La Monadologie* (*Monadology*) (1714). His *Discours de Metaphysique* (*Discourse on Metaphysics*) (1686) and *Théodicée* (*Theodicy*) (1710) present to the general public more popular expositions of Leibniz's central themes. Our strategy will be to begin with the logical theories and work outward to the more accessible doctrines.

## **Truths of reason and fact**

The basis for Leibniz's philosophy is pure logical analysis. Every proposition, he believed, can be expressed in subject-predicate form. What is more, every true proposition is a statement of identity

whose predicate is wholly contained in its subject, like "2 + 3 = 5." In this sense, all propositions are analytic for Leibniz. But since the required analysis may be difficult, he distinguished two kinds of true propositions:

**Truths of Reason** are explicit statements of identity, or reducible to explicit identities by a substitution of the definitions of their terms. Since a finite analysis always reveals the identity-structure of such truths, they cannot be denied without contradiction and are perfectly necessary.

**Truths of Fact**, on the other hand, are implicit statements of identity, the grounds for whose truth may not be evident to us. These truths are merely contingent and may be subject to dispute, since only an infinite analysis could show them to be identities.

Anything that human beings can believe or know, Leibniz held, must be expressed in one or the other of these two basic forms. The central insight of Leibniz's system is that all existential propositions are truths of fact, not truths of reason. This simple doctrine has many significant consequences.

### **Complete Individual Substances**

Consider next how this logic of propositions applies to the structure of reality itself for Leibniz. The subject of any proposition signifies a complete individual substance, a simple, indivisible, dimensionless being or monad, while the predicate signifies some quality, property, or power. Thus, each true proposition represents the fact that some feature is actually contained in this substance.

Each monad is a **complete** individual substance in the sense that it contains all of its features—past, present, and future. Because statements of identity are timeless, the facts they express perpetually obtain. (Thus, for example, I am the person whose daughter was born in 1982 and the person who now develops this web site and the person who will vacation in Manitoba next summer; since each of these predicates can be truly affirmed of me, each of these features is contained in me.) Everything that was, is, or will ever be true of any substance is already contained in it.

Moreover, each monad is a complete **individual** substance in the sense that its being is utterly independent of everything else. Because statements of identity are self-contained, any apparent relation between substances must actually be a matching pair of features that each possesses alone. (Thus, for example, I happen to have the property of being Aaron's father, and Aaron happens to have the property of being my son, but these are two facts, not one.) Hence, on Leibniz's view, there can be no interaction between substances, each of which is purely active. Monads are "windowless."

Where Spinoza saw the world as a single comprehensive substance like Descartes's extended matter, then, Leibniz supposed that the world is composed of many discrete particles, each of which is simple, active, and independent of every other, like Descartes's minds or souls. The rationalists' common reliance upon mathematical models of reasoning led to startlingly different conceptions of the universe. Yet the rationality, consistency, and necessity within each system is clear.

## **Sufficient reason and identity of indiscernibles**

Another way of summing up the structure of the universe on Leibniz's view is by reviewing the great logical principles from which all truths are said to flow: The Principle of Contradiction generates the truths of reason, each of which states the connection between an individual substance and one of its finite number of essential features. It would be a contradiction to deny any of these propositions, since the substance would not be what it is unless it had all of these features. Truths of reason, then, are not influenced by any contingent fact about the world; they are true "in all possible worlds." Thus, for example, "Garth Kemerling is a human being" would be necessarily true even if my parents had been childless.

The Principle of Sufficient Reason generates the truths of fact, each of which states the connection between an existing individual substance and one of its infinitely many accidental features or relations. The sufficient reason for the truth of each of these propositions is that this substance does exist as a member of the consistent set of monads which constitutes the actual world. Truths of fact, then, depend upon the reciprocal mirroring of each existing substance by every other.

Thus, for example, "Garth Kemerling is an oldest child" is contingently true only because my parents had no children before I was born.

The Principle of the Identity of Indiscernibles establishes the fact that, within the set of monads that constitutes any possible world, no two can be exactly alike. If, on the contrary, there were two distinct but perfectly identical substances, Leibniz argued, then there could be no sufficient reason for each to occupy its own location rather than that of the other. More positively, since each monad mirrors the entire structure of the world, each must reflect a unique set of relations to every other.

Finally, the Principle of the Plenum (or principle of plenitude) affirms that the actual world, considered as a set of monads, is as full as it can possibly be. Since there is no genuine interaction among distinct substances, there would be no sufficient reason for the non-existence of any monad that would be consistent with the others within a possible world. Hence, anything that can happen will; every possibility within this world must be actualized. The world in which we live, then, is but one among the infinitely many possible worlds that might have existed. What makes this one special?

## **Space and Time**

Since we experience the actual world as full of physical objects, Leibniz provided a detailed account of the nature of bodies. As Descartes had correctly noted, the essence of matter is that it is spatially extended. But since every extended thing, no matter how small, is in principle divisible into even smaller parts, it is apparent that all material objects are compound beings made up of simple elements. But from this Leibniz concluded that the ultimate constituents of the world must be simple, indivisible, and therefore unextended, particles—dimensionless mathematical points. So the entire world of extended matter is in reality constructed from simple immaterial substances, monads, or entelechies.

In fact, Leibniz held that neither space nor time is a fundamental feature of reality. Of course individual substances stand in spatial relation to each other, but relations of this sort are reducible

in logic to the non-relational features of windowless monads. In exactly the same way, temporal relations can be logically analyzed as the timeless properties of individual monads. Space and time are unreal, but references to spatial location and temporal duration provide a convenient short-hand for keeping track of the relations among the consistent set of monads which is the actual world.

What is at work here again is Leibniz's notion of complete individual substances, each of which mirrors every other. A monad not only contains all of its own past, present, and future features but also, by virtue of a complex web of spatio-temporal references, some representation of every other monad, each of which in turn contains in a universe of windowless mirrors, each reflects any other, along with its reflections of every other, and so on ad infinitum. It is for this reason that an infinite analysis would be required to reveal the otherwise implicit identity at the heart of every truth of fact. In order fully to understand the simple fact that my eyes are brown, one would have to consider the eye-color of all of my ancestors, the anatomical structure of the iris, my personal ophthalmological history, the culturally-defined concept of color, the poetical associations of dark eyes, etc., etc., etc.; the slightest difference in any one of these things would undermine the truth of this matter of fact. Existential assertions presuppose the reality of just this one among all possible worlds as the actual world.

### **The Best of All Possible Worlds**

Both in the *Monadology* and at the more popular level of presentation that characterizes the *Discourse on Metaphysics*, Leibniz (like Descartes) resolved some of the most thorny philosophical problems by reference to god. God (alone) exists necessarily, and everything else flows from the divine nature. Limited only by contradiction, god first conceives of every possible world—the world with just one monad; the worlds with exactly two monads; those with three, with seventeen, with five billion, etc. Then god simply chooses which of them to create.

Of course even god must have a sufficient reason for actualizing this world rather than any other. The most direct advantage of this world is that (as the plenum principle requires) it is the fullest. That is, more things exist and/or more events actually take place in this world than in any other consistent set of interrelated monads. In a more lofty tone, Leibniz declared that a benevolent god would choose to create whatever possible world contained the smallest amount of evil; hence (in a phrase that would later be mocked by Voltaire) this is "the best of all possible worlds," according to Leibniz. Nothing about it could be changed without making things worse rather than better on the whole.

Similarly, the existence of a benevolent god can be used to account for the smooth operation of a universe that consists of indefinitely many distinct individual substances, none of which have any causal influence over any other. A crucial element of god's creative activity, Leibniz held, is the establishment of a "pre-established harmony" among all existing things. Like well-made clocks that have been synchronized, wound, and set in motion together, the monads that make up our world are independent, self-contained, purely active beings whose features coincide without any genuine interaction among them.

One special case of this pre-established harmony, of course, accounts for the apparent interaction of mind and body in a human being as nothing more than the perfect parallelism of their functions. In fact, the human mind is just the dominant member of a local cluster of monads which

collectively constitute the associated human body. Neither has any real effect on the other, but these monads are most clearly reflected in each others' foreground. Thus, in both sensation and volition, the divinely-ordained coincidence of bodily movements and mental thoughts creates an illusion of genuine causal influence.

### **Problem of freedom**

The possibility human knowledge emerges more clearly from a slightly more technical account of Leibniz's position. All monads have the capacity for perception of the external world in the sense that, as complete individual substances, each of them contains as properties unconscious images of its spatio-temporal relations to everything else. These innate ideas constitute the unique point of view from which any monad may be said to represent the world as a whole.

But Leibniz held that some monads—namely, the souls of animals and human beings—also have conscious apperception in the sense that they are capable of employing sensory ideas as representations of physical things outside themselves. And a very few monads—namely, spirits such as ourselves and god—possess the even greater capacity of self-consciousness, of which genuine knowledge is the finest example. Although Leibniz himself did not draw the inference directly, notice that if a cluster of dimensionless monads can make up an extended body, it might be equally possible for a cluster of unconscious monads to constitute a thinking thing.

What Leibniz did claim is that we have the free will required for moral responsibility even though all of our future actions are already contained in us (along with the future of the entire actual world). Any awareness of those contingent future actions would follow from the principle of sufficient reason only upon an infinite analysis of my nature. Hence, since I lack knowledge of what I will do tomorrow, it will seem to me as if I act freely when I do it. Like space and time, freedom is a benevolent illusion that adequately provides for life in an uncertain world.

### **Concluding note on the Rationalists**

Descartes, Spinoza, and Leibniz illustrate well the range of diverse outcomes that may result from an effort to understand the world through a priori knowledge. If their systems of thought seem implausibly remote from the world of ordinary experience, it may help to remember that modern science leads to a similar result. Once we grant that the reality of things may be quite different from the way they appear to us, only the internal coherence of the scheme of thought makes much difference.

### **Proofs for the existence of God**

The core idea of the ontological proof is to show that the concept of existence is somehow contained in the concept of God, and that therefore God's existence can be logically derived – without any further assumptions about the external world – from the very idea, or definition, of God. Now, G.W. Leibniz has argued repeatedly that the traditional versions of the ontological proof are not fully conclusive, because they rest on the tacit assumption that the concept of God is possible, i.e. free from contradiction. A complete proof will rather have to consist of two parts. First, a proof of premise

- God is possible. Second, a demonstration of the “remarkable proposition”
- If God is possible, then God exists. The present contribution investigates an interesting paper in which Leibniz tries to prove proposition

- It will be argued that the underlying idea of God as a necessary being has to be interpreted with the help of a distinguished predicate letter 'E' (denoting the concept of existence) as follows:
- $g =df \exists x E(x)$ . Principle (2) which Leibniz considered as "the best fruit of the entire logic" can then be formalized as follows:

$$(1) \Diamond E(\exists x E(x)) \rightarrow E(\exists x E(x)).$$

At first sight, Leibniz's proof appears to be formally correct; but a closer examination reveals an ambiguity in his use of the modal notions. According to (4), the possibility of the necessary being has to be understood in the sense of something which possibly exists. However, in other places of his proof, Leibniz interprets the assumption that the necessary being is impossible in the diverging sense of something which involves a contradiction. Furthermore, Leibniz believes that an »impossible thing«,  $y$ , is such that contradictory propositions like  $F(y)$  and  $\neg F(y)$  might both be true of  $y$ .

It will be argued that the latter assumption is incompatible with Leibniz's general views about logic and that the crucial proof is better reinterpreted as dealing with the necessity, possibility, and impossibility of concepts rather than of objects. In this case, the counterpart of (2) turns out to be a theorem of Leibniz's second order logic of concepts; but in order to obtain a full demonstration of the existence of God, the counterpart of (1), i.e. the self-consistency of the concept of a necessary being, remains to be proved. In several papers dating from 1676 onwards, Leibniz explained why he considered the traditional proof of the existence of God (as invented by St. Anselm and modified by Descartes and Spinoza) as insufficient. Thus in the "Meditations on knowledge, truth, and ideas" of 1684 (which contains an extensive discussion of the basic principles of Descartes' theory of knowledge), Leibniz analyzes the "old argument for the existence of God" as follows:

The argument goes like this: Whatever follows from the idea or definition of a thing can be predicated of the thing. God is by definition the most perfect being, or the being nothing greater than which can be thought. Now, the idea of the most perfect being includes ideas of all perfections, and amongst these perfections is existence. So existence follows from the idea of God. Therefore [...]

God exists. But this argument shows only that if God is possible then it follows that he exists. For we can't safely draw conclusions from definitions unless we know first that they are real definitions, that is, that they don't include any contradictions. If a definition does harbour a contradiction, we can infer contradictory conclusions from it, which is absurd.

Hence, according to Leibniz, the traditional proof establishes the truth of the conditional statement 'If God is possible, then God exists'.

But since the possibility, i.e. the self-consistency, of an arbitrary concept  $C$  may not generally be taken for granted, a complete demonstration requires in addition a proof of the antecedent 'God is possible'.<sup>2</sup> In this connection two different conceptions of God have to be distinguished:

- (A) God as the most perfect being ("ens perfectissimum"), and
- (B) God as the necessary being ("ens necessarium"). Accordingly, a complete proof of the

existence of God will either consist of the two propositions

- (1A) The most perfect being is possible
- (2A) If the most perfect being is possible, then it exists or of the two propositions
- (1B) The necessary being is possible
- (2B) If the necessary being is possible, then it exists.

Leibniz used to illustrate the necessity of the requirement of self-consistency of a concept by means of the example of »the fastest motion« which, allegedly, "entails an absurdity": Suppose there is a wheel turning with the fastest motion. Anyone can see that if a spoke of the wheel came to poke out beyond the rim, the end of it would then be moving faster than a nail on the rim of the wheel. So the nail's motion is not the fastest, which is contrary to the hypothesis.

Unfortunately, this famous example is quite inapt to illustrate the point in question, because – according to modern physics – the concept of the fastest motion doesn't contain a contradiction at all; it rather forms a cornerstone of Einstein's theory of relativity. However, in other papers Leibniz put forward more convincing examples of (implicitly) contradictory concepts such as »the greatest number« or »the greatest figure«.

Moreover, Leibniz pointed out that without the requirement of the self-consistency of the definition, the basic idea of the ontological proof might be misused to show not only the existence of a most perfect and necessary God, but similarly also the existence of a »most perfect man« or the existence of a »necessary beast«:

For example, let an entity A be defined as the absolutely necessary beast. Then one can argue that A has to exist as follows: Whatever is absolutely necessary will exist (by an indubitable axiom); now A is absolutely necessary (by definition), therefore A exists. But this is absurd, and one has to object that this definition or idea is impossible [...].

The variant of the ontological proof which makes use of the conception of the most perfect being has been investigated above all in the paper "Quod Ens Perfectissimum existit" which Leibniz composed in 1676 after having visited Spinoza in The Hague.

Leibniz's ideas about the »most perfect being« turned out to be very influential for the philosophical discussions of the 18th century, and, indeed, even for the revival of the ontological proof in the 20th century, notably by Kurt Gödel<sup>7</sup>. The present paper, however, concentrates on the second version of the proof which relies of the conception of a »necessary being«. Leibniz dealt with this topic mainly in the paper "Probatio existentiae DEI ex eius essentia" where he provided not only a short argument in favour of

- (1B) The necessary being is possible, but also an interesting, detailed proof of the conditional proposition
- (2B) If the necessary being is possible, then it exists. This proposition, which was praised by Leibniz as "one of the best fruits of the entire logic"<sup>8</sup>, will be examined in the subsequent section 2.

"Probatio existentiae DEI ex eius essentia" During his correspondence with Henning Huthmann, probably in January 1678, Leibniz devised three different versions of a "Derivation of the Existence of God from his Essence". One version was published already in 1926, while the other two variants

appeared only in 2006. 9 The most interesting variant runs as follows: Si Ens necessarium est possibile, actu existet. Nam ponamus non existere, inde ratiocinabor hoc modo:

- (i) 10 Ens Necessarium non existit, ex hypothesi.
- (ii) Quicquid non existit, illud possibile est non existere
- (iii) Quicquid possibile est non-existere illud falso dicitur non posse nonexistere
- (iv) Quicquid falso dicitur non posse non existere, illud falso dicitur esse necessarium. Nam necessarium est quod non potest non existere.
- (v) Ergo Ens necessarium falso dicitur esse necessarium.
- (vi) Quae conclusio est vel vera vel falsa.
- (vii) Si est vera, sequitur quod Ens necessarium implicet contradictionem, seu sit impossibile, quia de eo demonstrantur contradictoria, scilicet quod non sit necessarium. Conclusio enim contradictoria non nisi de re contradictionem implicante ostendi potest.
- (viii) Si est falsa, necesse est aliquam ex praemissis esse falsam. Sola autem ex praemissis falsa esse potest hypothesis, quod scilicet Ens necessarium non existat.
- (ix) Ergo concludimus Ens necessarium vel esse impossibile, vel existere.
- (x) Si ergo DEUM definiamus Ens a se, seu Ens ex cuius essentia sequitur existentia, seu Ens necessarium, sequitur DEUM si possibilis sit actu esse.

This is translated this as follows:

If the necessary being is possible, then it actually exists. For if we assume that it doesn't exist, one may reason as follows:

- (i) By hypothesis, the necessary being doesn't exist.
- (ii) Whenever something doesn't exist, it possibly doesn't exist.
- (iii) Whenever something possibly doesn't exist, it is falsely maintained to be impossible not to exist.
- (iv) Whenever something is falsely maintained to be impossible not to exist, then it is falsely maintained to be necessary. (For necessary is what is impossible not to exist.)
- (v) Therefore the necessary being is falsely maintained to be necessary.
- (vi) This conclusion is either true or false.
- (vii) If it is true, it follows that the necessary being contains a contradiction, or is impossible, because contradictory assertions have been proved about it, namely that it is not necessary. For a contradictory conclusion can only be shown about a thing which implies a contradiction.
- (viii) If it is false, necessarily one of the premises must be false. But the only premise that might be false is the hypothesis saying that the necessary being doesn't exist.
- (ix) Hence we conclude that the necessary being either is impossible, or it exists.
- (x) So if we define GOD as an "Ens a se", i.e. a being from whose essence its existence follows, i.e. a necessary being, it follows that GOD, if he is possible, actually exists.

### **Formalization and Logical Analysis of the "Probatio"**

In order to analyze the validity of Leibniz's proof, it must first be clarified how the idea of the possibility of God and the idea of a necessary being may be represented within the framework of modern logic. The modal operators of necessity,  $\Box$ , and possibility,  $\Diamond$ , are usually applicable only to propositions, but not to objects. Now, as Leibniz explained at the beginning of the Probatio, the possibility of an object,  $x$ , shall be understood as the possibility of  $x$ 's existence which in turn may

also be equated with x's essence.

Since, moreover, Leibniz considers 'existence' as a normal property, it may be represented by a distinguished predicate letter, say 'E'. If the name 'God' is abbreviated by an individual constant, say 'g', then the proposition 'God exists' takes the form 'E(g)', while the proposition 'God is possible', i.e. 'God possibly exists', can be formalized by ' $\diamond E(g)$ '. In sum, then, Leibniz's "remarkable proposition" 'If God is possible, then he exists' may be transformed into formula

$$(2) \diamond E(g) \rightarrow E(g).$$

Now just like a possible object is interpreted as an object which possibly exists, the traditional idea of God as a »necessary being« has to be interpreted as a being which necessarily exists. Thus in a marginal note to the Probatio, Leibniz paraphrased the "Ens necessarium" as an "Ens necessario existens". Therefore one may define

$$(3) g =_{df} \iota x E(x).$$

The crucial variant of (2), which Leibniz considered as the "best fruit of the entire logic", can hence be formalized as follows:

$$(4) \diamond E(\iota x E(x)) \rightarrow E(\iota x E(x)).$$

This formula is in full accordance with Leibniz's paraphrase „Si Ens necessario existens est possibile, utique actu existet“ (A II, 1, 588, fn. 1). Anyway, we are now in a position to formalize Leibniz's proof as follows:

- (i)  $\neg E(\iota x E(x))$  "By hypothesis, the necessary being doesn't exist."
- (ii)  $\Lambda x (\neg E(x) \rightarrow \diamond \neg E(x))$  "Whenever something doesn't exist, it possibly doesn't exist."
- (iii)  $\Lambda x (\diamond \neg E(x) \rightarrow \neg(\neg \diamond \neg E(x)))$  "Whenever something possibly doesn't exist, it is falsely maintained to be impossible not to exist."
- (iv)  $\Lambda x (\neg(\neg \diamond \neg E(x)) \rightarrow \neg E(x))$  "Whenever something is falsely maintained to be impossible not to exist, then it is falsely maintained to be necessary."
- (v)  $\neg E(\iota x E(x))$

"Therefore the necessary being is falsely maintained to be necessary." This first part of the Probatio is logically impeccable. It starts with the assumption (i), from which (ii) may be derived according to the well-known principle that, what is a fact, or is true, also must be possible ("ab esse ad posse valet consequentia"). (iii) contains an application of the principle of double negation ("duplex negatio affirmat"), while (iv) is based on the equivalence between 'necessarily p' and 'not possibly not-p'. Hence (i) logically entail (v)

However, (v) doesn't yet represent the desired proof of (4), for (v) only says (by logical contraposition) that the negation of (v), i.e.  $E(\iota x E(x))$ , entails the negation of (i), i.e.  $\neg E(\iota x E(x))$ . This inference constitutes an instance of the well-known schema  $p \rightarrow p$ , i.e. the traditional principle "ab necesse ad esse valet consequentia". What has, however, to be shown is that the same conclusion,  $E(\iota x E(x))$ , already follows from the much weaker premise  $\diamond E(\iota x E(x))$ , or (again by logical contraposition):

(β) (i) logically entails  $\neg\Diamond E(\iota x E(x))$ . Leibniz attempted to justify the stronger inference (β) as follows. According to the well-known principle “tertium non datur”, one has:

(vi)  $\neg E(\iota x E(x)) \vee \neg\neg E(\iota x E(x))$  “This conclusion [(v)] is either true or false.” Next it is argued:  
 $\neg E(\iota x E(x)) \rightarrow (\iota x E(x) \text{ is impossible})$ <sup>13</sup> “If it [(v)] is true, it follows that the necessary being contains a contradiction, or is impossible”.

$\neg\neg E(\iota x E(x)) \rightarrow E(\iota x E(x))$  “If it [(v)] is false, necessarily one of the premises must be false. But the only premise that might be false is hypothesis [i] saying that the necessary being doesn’t exist.” In view of (vi), the two results (vii) and (viii) taken together yield:

(ix)  $(\iota x E(x) \text{ is impossible}) \vee E(\iota x E(x))$  “Hence we conclude that the necessary being either is impossible, or it exists.” Finally, Leibniz rounds off his proof by paraphrasing (ix) as follows:

(x)  $(\iota x E(x) \text{ is possible}) \rightarrow E(\iota x E(x))$  “So if we define GOD as [...] a necessary being, it follows that GOD, if he is possible, actually exists.”

At first sight, also the second part of the Probatio appears to be logically correct, but upon closer inspection two problems become visible. First, step (vii) of the proof has not yet been sufficiently justified. It remains to be shown in which sense the assumption that the necessary being doesn’t necessarily exist,  $\neg E(\iota x E(x))$ , entails a contradiction. This point will be scrutinized in section 5.

Second, within the Probatio Leibniz uses the notion of possibility in an ambiguous way. According to the explanation given at the beginning of this section, the possibility of an entity x has to be understood in the sense of something which possibly exists,  $\Diamond E(x)$ .

However, in connection with steps (vii)-(x), Leibniz interprets the assumption that the necessary being is impossible in the diverging sense of an entity which involves a contradiction; and it is far from evident whether these two notions coincide with one another. The following section is devoted to the question whether the latter notion of an »impossible object« does make sense at all. The Problem of »Impossible objects« In step (vii) of the above proof, Leibniz maintained that “a contradictory conclusion can only be shown about a thing which implies a contradiction”.

Towards the end of the Probatio, he explains more exactly that an entity, y, is impossible if and only if “contradictory propositions” are true about y, and he argues that some such »impossible objects« do really exist: It is worthwhile noting here that a conclusion which entails a contradiction can nevertheless be true, namely if it is about an impossible thing. E.g., ‘A square circle is not a circle’. This proposition, although contradictory, is true, for it can be correctly derived from true premises as follows:

A square is not a circle  
A square circle is square  
Hence, A square circle is not a circle.<sup>14</sup> take a closer look at this inference which admits of at least two different interpretations! It appears quite natural to understand both the premises and the conclusion as universal propositions. In this case the syllogism (or better: quasi- syllogism)<sup>15</sup> amounts to the following inference: P1 Whatever is a square is not a circle

P2 Whatever is a square circle is a square  
K Whatever is a square circle is not a circle  
Letting ‘S’

and 'C' abbreviate the predicates 'is a square' and 'is a circle', respectively, the inference can be formalized as follows:

P1  $\forall x(S(x) \rightarrow \neg C(x))$

P2  $\forall x(S(x) \wedge C(x) \rightarrow S(x))$

K1  $\forall x(S(x) \wedge C(x) \rightarrow \neg C(x))$

This inference is logically valid and all its premises are true, for P1 is an analytic truth while P2 is a tautology. Furthermore, the conclusion K1 is somehow contradictory where its contradictoriness becomes more explicit if one considers the tautology  $\forall x(S(x) \wedge C(x) \rightarrow C(x))$  which, in addition to K1, yields the strengthened formula:

K2 =  $\forall x(S(x) \wedge C(x) \rightarrow C(x) \wedge \neg C(x))$ .

So Leibniz's claim, that one may derive a contradictory conclusion from true premises, turns out to be, at least somehow, correct. However, proposition K2 is not strictly contradictory, because it only maintains that if there were a square circle, y, then y would possess the contradictory properties of both being a circle and not being a circle. But since K2 is only a conditional, it doesn't entail the existence of an »impossible object« y such that  $C(y) \wedge \neg C(y)$ . In order to obtain a genuine inconsistency, one might resort to an alternative interpretation of the syllogism where the second premise "circulus quadratus est quadratus" is now taken in the sense of the particular proposition 'Some square circles are squares'. In terms of first order logic, this inference (of type "Ferio") would have to be formalized as follows:

P1  $\forall x(S(x) \rightarrow \neg C(x))$  P3  $\exists x(S(x) \wedge C(x) \wedge S(x))$  K3  $\exists x(S(x) \wedge C(x) \wedge \neg C(x))$

In this case, K3 represents an outright inconsistency, but this conclusion has no longer been inferred, as Leibniz maintained, entirely from "true propositions". Unlike P2, premise P3 is no longer a tautology. As a matter of fact, it is not true at all, for it entails the existence of an object, x, which would be both a square and a circle:

$\exists x(S(x) \wedge C(x))$ .

But this existential proposition directly negates the content of the other premise P1, namely, that whatever is a square can't (also) be a circle! Hence the above syllogism turns out to contain two logically incompatible premises, and it is small wonder that from this inconsistent pair of propositions another inconsistency, namely K3, can be logically derived. So Leibniz' argument fails to show that there exists an »impossible object« y such that contradictory propositions would be true about y.

Let it be mentioned in passing that the assumption of »impossible objects« would also be in conflict with the basic principles of classical, two-valued logic which Leibniz adheres to in all his later writings. Thus, e.g., in a paper of around 1686, he defended the principle of non-contradiction as follows: Above all I assume all propositions (both the affirmative and the negative ones) to be either true or false. If an affirmation is true, then the negation is false, and if the negation is true, then the affirmation is false [...] All this is usually understood by the Principle of Contradiction (Cf. GP 7, 299). Hence the assumption of a proposition which would be both true ('Square y is round') and false ('Square y is not round') contradicts this highest principle of reason.

Furthermore, for Leibniz the principle of non-contradiction is an indispensable basis for his construction of logical proofs. Thus in the fragment “De Principiis” he concisely emphasized: *Identica sunt vera, et contradictionem implicantia sunt falsa*, i.e. identical propositions are logically true, while propositions which entail a contradiction are logically false (Cf. C, 183). 5 Reconsideration of the “Probatio” (without Recourse to »Impossible Objects«) As has already been stressed in section 3, assumption (i), i.e.  $\neg E(\exists x E(x))$ , logically entails (v), i.e.  $\neg E(\exists x E(x))$ , which Leibniz considers as contradictory. The (alleged) inconsistency of this proposition is then used by Leibniz to conclude that its subject, i.e. the necessary being, must be an »impossible object«. But in view of the discussion of the foregoing section, such a detour (from an impossible proposition to an »impossible object«) is extremely problematic and should better be avoided. Why shouldn't we just stop at the inconsistency of proposition (v) and infer – by “reductio ad absurdum” – that the hypothesis (i), from which (v) was derived, therefore must be false? Briefly speaking, one might be tempted to simplify the Probatio as follows: (α) (i) logically entails (v) (γ) (v) is contradictory because it attributes to the necessary being the property of not being necessary. Hence (δ) Assumption (i), saying that the necessary being does not exist, must be false, i.e. the necessary being exists:  $E(\exists x E(x))$ . Alas, this argument – if valid – would not only constitute a proof of Leibniz's conditional thesis (2B) If the necessary being is possible, then it exists; but even a proof of the categorical proposition that the necessary being exists. So what about Leibniz's notorious claim that the usual versions of the ontological proof are incomplete and have to be supplemented by a proof of premise

(1B) ‘The necessary being is possible’? Well, the point is that our shortened »proof« contains the same grave mistake that is also hidden in step (vii) of the Probatio, namely the claim that (v) is a contradictory proposition. As a matter of fact, (v) »only« maintains that the necessarily existing being does not necessarily exist, formally  $\neg E(\exists x E(x))$ .

Although this proposition is rather strange, it is not strictly self-contradictory. In order to obtain a genuine contradiction, one would need an additional premise which Leibniz evidently took for granted, namely the assumption that the necessarily existing being (so-to-speak »by definition«) exists necessarily:

(xi)  $E(\exists x E(x))$ . Now there are basically two strategies to cope with this situation. First, one might try to find an additional proof for this formula; or, second, one might treat (xi) as an additional premise. In the latter case, however, Leibniz's entire proof would become severely circular. After all, the aim of the Probatio was to show that if the necessary being is possible, then it exists. If one now introduces (xi) as an additional premise, this would mean that one presupposes that the necessary being exists necessarily. From this assumption, of course, one may trivially infer<sup>16</sup> that the necessary being exists simpliciter,  $E(\exists x E(x))$ ; and a fortiori one may derive Leibniz's conditional thesis

(2B),  $\Diamond E(\exists x E(x)) \rightarrow E(\exists x E(x))!$

Such an argument really doesn't deserve the name of a proof. So let us see whether one may perhaps prove formula

(xi)! After all, in modern calculi of first order logic with identity and definite descriptions, one usually has an axiom like (DD)  $\Phi(\exists x \Phi(x))$ , which guarantees that (under a certain presupposition

not spelled out in DD) the  $\Phi$ , i.e. the one and only thing with property  $\Phi$ , trivially does have property  $\Phi$ . So if we substitute for  $\Phi$  the condition of necessary existence,  $E(x)$ , we obtain the desired result

(xi),  $E(\iota x E(x))$ . However, the crucial presupposition for the validity of DD says that the respective definite description term  $\iota x \Phi(x)$  satisfies the normal condition which means that there exists exactly one object  $x$  with property  $\Phi$ ! In the case of  $E(x)$ , this normal condition amounts to the existence and uniqueness of an  $x$  necessarily exists. Notwithstanding the question how the uniqueness of a necessary being, i.e.  $\forall x \forall y (E(x) \wedge E(y) \rightarrow x = y)$ , might ever be proved, it seems clear that the requirement of the existence of a necessary being,

(xii)  $\exists x(E(x))$ , again renders Leibniz's proof circular. However, this charge of circularity may perhaps turn out to be premature because there is a subtle ambiguity between the notion of existence as used in the consequent of (x), on the one hand, and in the additional premise (xiii), needed to validate the application of DD, on the other hand. In the former case, God's existence, i.e. the existence of the "Ens necessarium", is formalized by means of the predicate of existence as  $E(\iota x E(x))$ , while in the latter case an existential quantifier is used to express the existence of (at least one) entity  $x$  which falls under the predicate of necessary existence,  $\exists x(E(x))$ . In order to investigate this point a bit further, we now introduce an entirely different interpretation of the Probatio as based on Leibniz's own logic.

### Interpretation of the "Probatio" within the Framework of Leibniz's Logic

The text of the Probatio dates from 1676, while Leibniz's ripe logic of concepts was developed only between 1679 and 1690. The essentials of the algebra of concepts (L1) plus its quantifier extension (L2) before reconsidering Leibniz's main ideas about the ontological proof.

#### The Algebra of Concepts L1

The algebra of concepts grows out of the framework of 17th century syllogistic by three achievements. First, Leibniz drops the quantifier expression 'every' and formulates the universal affirmative proposition 'Every A is B' simply as 'A is B' or, equivalently, as 'A contains B'.

This fundamental proposition shall here be symbolized as  $A \in B$  while its negation will be abbreviated as  $A \notin B$ . Second, Leibniz introduces an operator of conceptual conjunction which combines two concepts A and B into AB (sometimes also written as "A+B"). Third, Leibniz allows the unrestricted use of conceptual negation ("Not-A") which shall here be symbolized as  $\sim A$ . Hence, in particular, one can form the inconsistent concept  $A \sim A$  and its tautological counterpart  $\sim(A \sim A)$ . Identity or coincidence of concepts may be defined as mutual containment: DEF 1 ( $A = B$ ) =df ( $A \in B$ )  $\wedge$  ( $B \in A$ ).

Alternatively, the algebra of concepts might be built up with '=' as a primitive operator while ' $\in$ ' is defined by DEF 2 ( $A \in B$ ) =df ( $A = AB$ ).

Another important operator may be introduced by definition. Concept B is possible if B does not contain a contradiction like  $A \sim A$ : DEF 3 P(B) =df ( $B \notin A \sim A$ ).

Leibniz uses many different locutions to express the self-consistency of a concept. Instead of 'A is possible' ("A est possibile") he often says 'A is a thing' ("A est res"), or 'A is a being' ("A est ens"). In

the opposite case of an impossible concept he sometimes calls A a »false term« (“terminus falsus”). Identity can be axiomatized by the law of reflexivity in conjunction with the rule of substitutivity: IDEN 1  $A = A$  IDEN 2 If  $A = B$ , then  $\alpha[A] \leftrightarrow \alpha[B]$ .

The containment relation is characterized by the following laws of reflexivity and transitivity:

CONT 1  $A \in A$

CONT 2  $A \in B \wedge B \in C \rightarrow A \in C$ .

The most fundamental principle for the operator of conceptual conjunction says: “That A contains B and A contains C is the same as that A contains BC” (cf. LLP, 58,fn. 4), i.e.: CONJ 1  $A \in BC \leftrightarrow A \in B \wedge A \in C$ .

Conjunction then satisfies the following laws:

CONJ 2  $AA = A$  CONJ 3  $AB = BA$  CONJ 4  $AB \in A$

CONJ 5  $AB \in B$ .

The next operator is conceptual negation. Leibniz had serious problems with finding the proper laws governing this operator. From the tradition, he knew little more than the “law of double negation”:

NEG 1  $\sim\sim A = A$ .

One important step towards a complete theory of conceptual negation was to transform the informal principle of contraposition, ‘Every A is B, therefore Every Not-B is Not-A’ into the following axiom of L1:

NEG 2  $A \in B \leftrightarrow \sim B \in \sim A$ .

Furthermore Leibniz discovered various variants of a “law of consistency”:

NEG 3  $A \neq \sim A$

NEG 4  $A = B \rightarrow A \neq \sim B$ .

NEG 5\*  $A \notin \sim A$

NEG 6\*  $A \in B \rightarrow A \notin \sim B$ .<sup>18</sup>

Principles NEG 5\* and NEG 6\* have been marked with a ‘\*’ in order to indicate that the laws as stated by Leibniz are not absolutely valid but have to be restricted to self-consistent terms:

NEG 5  $P(A) \rightarrow A \notin \sim A$

NEG 6  $P(A) \rightarrow (A \in B \rightarrow A \notin \sim B)$ .

The following two laws describe some characteristic relations between the possibility-operator P and the other operators of L1:

POSS 1  $A \in B \wedge P(A) \rightarrow P(B)$  POSS 2  $A \in B \leftrightarrow \neg P(A \sim B)$ .

All these principles have been discovered by Leibniz himself who thus provided an almost complete axiomatization of L1. As a matter of fact, the »intensional« algebra of concept can be proven to be equivalent to Boole’s extensional algebra of sets provided that one adds the following counterpart of the “ex contradictorio quolibet”:

NEG 7  $(A \sim A) \in B$ .

As regards the fundamental relation  $A \in B$ , it is important to observe that Leibniz's standard formulation 'A contains B' expresses the so-called »intensional« view, while we here want to develop an extensional interpretation in terms of the sets of individuals that fall under the concepts. Leibniz explained the mutual relationship between these two points of view in the following passage from the "New Essays on Human understanding":

The common manner of statement concerns individuals, whereas Aristotle's refers rather to ideas or universals. For when I say 'Every man is an animal' I mean that all the men are included among all the animals; but at the same time I mean that the idea of animal is included in the idea of man. 'Animal' comprises more individuals than 'man' does, but 'man' comprises more ideas or more attributes: one has more instances, the other more degrees of reality; one has the greater extension, the other the greater intension. If 'Int(A)' and 'Ext(A)' abbreviate the »intension« and the extension of a concept A, respectively, then the so-called law of reciprocity can be formalized as follows:

RECI  $\text{Int}(A) \subseteq \text{Int}(B) \leftrightarrow \text{Ext}(A) \supseteq \text{Ext}(B)$ .

From this it immediately follows that two concepts A, B have the same »intension« iff they have the same extension. This somewhat surprising result might seem to unveil an inadequacy of Leibniz's conception. However, »intensionality« in the sense of traditional logic must not be mixed up with intensionality in the modern sense. Furthermore, in Leibniz's view, the extension of a concept A is not just the set of actually existing individuals, but rather the set of all possible individuals that fall under concept A. Therefore one may define the concept of an extensional interpretation of L1 as follows:

DEF 4 Let U be a non-empty set (the domain of all possible individuals); let  $\varphi$  be a function such that  $\varphi(A) \subseteq U$  for each concept-letter A; and let V be a valuation function which assigns to each proposition  $\alpha$  of L1 a truth-value  $V(\alpha)$ . Then is an extensional interpretation of L1 if and only if:

- (1)  $\varphi(AB) = \varphi(A) \cap \varphi(B)$ ;
- (2)  $\varphi(\sim A) = \text{complement of } \varphi(A)$ ;
- (3)  $V(A \in B) = \text{true}$  iff  $\varphi(A) \subseteq \varphi(B)$ ;
- (4)  $V(P(A)) = \text{true}$  iff  $\varphi(A) \neq \emptyset$ .

According to (1), an individual x belongs to the extension of the conjunctive concept AB just in case x belongs to the extension of both concepts (and hence to their intersection). According to (2), the extension of the negative concept  $\sim A$  is the set of all individuals which do not fall under concept A. Condition (3) is a straightforward formalization of the law of reciprocity, while (4) says that a concept A is possible if and only if it has a non-empty extension.

At first sight, the latter requirement might appear to be somewhat inadequate, since there are certain concepts – such as that of a unicorn – which happen to be empty but which may nevertheless be regarded as possible, i.e. not involving a contradiction. However, the universe of discourse underlying the extensional interpretation of L1 does not consist of actually existing

objects only, but instead comprises all possible individuals.

Therefore the non-emptiness of the extension of A is both necessary and sufficient for the self-consistency of A. Clearly, if A is possible, then there must be at least one possible individual x that falls under concept A. It has often been noted that Leibniz's logic of concepts lacks the operator of disjunction. Although this is by and large correct, it doesn't imply any defect of the system L1 because the operator  $A \vee B$  may be introduced by definition: DEF 5  $A \vee B =_{df} \sim(\sim A \sim B)$ . On the background of the above axioms of negation and conjunction, the following standard laws become provable:

DISJ 1  $A \in (A \vee B)$

DISJ 2  $B \in (A \vee B)$

DISJ 3  $A \in C \wedge B \in C \rightarrow (A \vee B) \in C$ .

The Quantificational System L2

The quantifier logic L2 emerges from L1 by the introduction of so-called »indefinite concepts«. These concepts are symbolized by letters from the end of the alphabet X, Y, Z ..., and they function as quantifiers ranging over concepts. Thus in § 16 of the "General Inquiries" Leibniz explained: An affirmative proposition is 'A is B' or 'A contains B' [...].

That is, if we substitute the value for A, one obtains 'A coincides with BY'. For example, 'Man is an animal', i.e. 'Man' is the same as 'a ... animal' (namely, 'Man' is 'rational animal'). For by the sign 'Y' I mean something undetermined, so that 'BY' is the same as 'Some B', or 'A ... animal' [...], or 'A certain animal'. So 'A is B' is the same as 'A coincides with some B', i.e. 'A = BY'. With the help of the modern symbol for the existential quantifier, the latter law can be expressed more precisely as follows:

CONT 3  $A \in B \leftrightarrow \exists Y(A = BY)$ .

As Leibniz himself noted, the formalization of the UA according to CONT 3 is provably equivalent to the simpler representation according to DEF 2.20 On the one hand, according to the rule of existential generalization,

EXIST 1 If  $a \in [A]$ , then  $\exists Y a \in [Y]$ ,

$A = AB$  immediately entails  $\exists Y(A = YB)$ . On the other hand, if there exists some Y such that  $A = YB$ , then trivially also  $AB = YBB$ , i.e.  $AB = YB$  and hence (because of the premise  $A = YB$ )  $AB = A$ .<sup>21</sup> Next observe that Leibniz often used to formalize the PA 'Some A is B' by means of the indefinite concept Y as 'YA ∈ B'. In view of CONT 3, this representation may be transformed into the (elliptic) equation  $YA = ZB$ . However, both formalizations are somewhat inadequate because they are easily seen to be theorems of L2! According to CONJ 4,  $BA \in B$ , hence by EXIST 1:

CONJ 6  $\exists Y(YA \in B)$ .

Similarly, since, according to CONJ 3,  $AB = BA$ , a twofold application of EXIST 1 yields: CONJ 7  $\exists Y \exists Z(YA = BZ)$ .

These tautologies, of course, cannot adequately represent the PA which for an appropriate choice of concepts A and B may become false! In order to resolve these difficulties, consider a draft of a calculus probably written between 1686 and 1690, where Leibniz proved principle:

$$\text{NEG } 8^* A \notin B \leftrightarrow \exists Y(YA \in \sim B).$$

On the one hand, it is interesting to see that after first formulating the right hand side of the equivalence, »as usual«, in the elliptic way 'YA is Not-B', Leibniz later paraphrased it by means of the explicit quantifier expression "there exists a Y such that YA is Not-B"<sup>22</sup>. On the other hand, Leibniz discovered that NEG 8\* has to be improved by requiring more exactly that YA is possible, i.e. Y must be compatible with A:

$$\text{NEG } 8 A \notin B \leftrightarrow \exists Y(P(YA) \wedge YA \in \sim B).$$

In Leibniz's logical fragments there are only a few passages where indefinite concepts function as universal quantifiers. E.g., in C, 260 Leibniz put forward principle "(15) 'A is B' is the same as 'If Y is A, it follows that Y is B'" which clearly has to be understood as:

$$\text{CONT } 4 A \in B \leftrightarrow \forall Y(Y \in A \rightarrow Y \in B).$$

Furthermore, in § 32 GI, Leibniz at least vaguely recognized that just as  $A \in B$  (according to CONJ 6) is equivalent to  $\exists Y(A = YB)$ , so the negation  $A \notin B$  means that, for any indefinite concept Y,  $A \neq BY$ :  
 $\text{CONT } 5 A \notin B \leftrightarrow \forall Y(A \neq YB)$ .

Anyway, with the help of the universal quantifier '∀' one can formalize Leibniz's conception of individual concepts as maximally-consistent concepts in the following way:

$$\text{DEF } 6 \text{Ind}(A) \leftrightarrow_{\text{df}} P(A) \wedge \forall Y(P(AY) \rightarrow A \in Y).$$

Hence A is an individual concept iff A is self-consistent and A contains every concept Y which is compatible with A. The underlying idea of the completeness of individual concepts had been formulated in § 72 GI as follows: "So if BY is [»being«], and the indefinite term Y is superfluous, i.e., in the way that 'a certain Alexander the Great' and 'Alexander the Great' are the same, then B is an individual. If the term BA is [»being«] and if B is an individual, then A will be superfluous; or if BA=C, then B=C".<sup>25</sup> It should be noted that DEF 6 can be simplified by requiring that, for each concept Y, A either contains Y or contains ~Y:

$$\text{IND } 1 \text{Ind}(A) \leftrightarrow \forall Y(A \in \sim Y \leftrightarrow A \notin Y).$$

As a corollary it follows that the invalid principle  $\text{NEG } 9^* A \notin B \rightarrow A \in \sim B$ , which Leibniz again and again had considered as valid, in fact holds only for individual concepts:

$$\text{NEG } 9 \text{Ind}(A) \rightarrow (A \notin B \rightarrow A \in \sim B).$$

The definition of individual concepts, DEF 6, is semantically correct. If the idea of an extensional interpretation of L1 according to DEF 4 is duly extended to the quantifier logic L2, then the following condition becomes provable:

$V(\text{Ind}(A)) = \text{true}$  iff there exists a  $x \in U$  such that  $\Phi(A) = \{x\}$ . Hence the extension of an individual-concept  $A$  is just a unit-set containing the corresponding (possible) individual  $a \in U$ . With the help of the operator 'Ind', a second sort of quantifiers ranging over »individuals« (i.e., more exactly, over individual-concepts) may be introduced as follows:

DEF 7  $\forall X \alpha =_{df} \exists X(\text{Ind}(X) \wedge \alpha) \wedge X \alpha =_{df} \forall X(\text{Ind}(X) \rightarrow \alpha)$ .

E.g., the proposition  $\forall X(X \in B)$  now says that there is at least one individual concept  $X$  such that  $X$  contains  $B$ . This condition holds whenever concept  $B$  is self-consistent:

POSS 3  $P(B) \leftrightarrow \forall X(X \in B)$ .

Principle POSS 3 syntactically mirrors the semantic postulate (4) of DEF 4 according to which concept  $B$  is possible if and only if there is at least one possible individual  $x$  which belongs to the extension of  $B$ . Note that whenever  $A$  is an individual concept, then formula  $A \in C$  is so-to-speak the »intensional counterpart« of the »extensional« formula of first order logic,  $C(a)$ , which attributes property  $C$  to the individual  $a$ . Furthermore, the universal affirmative proposition  $B \in C$  may not only be paraphrased by  $\forall X(X \in B \rightarrow X \in C)$  (see principle CONT 4 above), but also by means of the new »object« quantifier ' $\wedge$ ' as follows:

CONT 5  $B \in C \leftrightarrow \wedge X(X \in B \rightarrow X \in C)$ .

Again, the formula on the right hand side,  $\wedge X(X \in B \rightarrow X \in C)$ , represents the »intensional counterpart« of the corresponding »extensional« formula of first order logic,  $\wedge x(B(x) \rightarrow C(x))$ .

the ontological proof, however, such an assumption may not simply be taken for granted! As was stressed at the beginning of this paper, Leibniz had repeatedly pointed out that a complete proof of the existence of God requires ademonstration of the premise that God is possible:

GOD 1  $P(G)$ .

Since, according to POSS 3, this premise is equivalent to the formula  $\forall X(X \in G)$ , it might seem that a proof of GOD 1 is already sufficient for the demonstration of the existence of God. After all, this formula is normally understood as saying that there »exists« an individual-concept  $X$  such that  $X$  is God. However, the range of the quantifier ' $\forall X$ ' is the universe of all possible individuals and not just the domain of all existing objects! Therefore ' $\forall X(X \in G)$ ' only means that there is some possible object  $X$  which has the property of a God while the issue of the ontological proof is whether such a possible God actually exists! Within the framework of L2, the real existence of God will rather have to be expressed by means of the »predicate« (or concept) of existence,  $E$ , in the form ' $G \in E$ '. The second part of the ontological proof can then be formalized as follows:

GOD 2  $P(G) \rightarrow G \in E$ .

It turned out, somewhat surprisingly, that GOD 2 is indeed a theorem of L2, provided that the concept of God is more specifically interpreted as an "Ens necessarium", i.e. as a being which necessarily exists. This traditional conception of God can be captured within L2 by the following definition:

GOD 3  $\wedge X(X \in G \leftrightarrow_{df} (X \in E))$ .

We must abstain from reproducing the proof of GOD 2 here because it rests on some further logical constructions (such as the idea of possible worlds as maximal collections of compossible individuals) which clearly exceed the scope of this paper.<sup>27</sup> Suffice it to say that the other part of the proof, GOD 1, turns out not to be a theorem of L2! So in the end, Leibniz's sophisticated ontological proof suffers the same fate as its various predecessors (and followers): There is no logical guarantee that God – whether conceived of as a “Ens necessarium” or as a “Ens perfectissimum – actually exists!

### **Locke: Ideas and their classification**

An extended look at philosophy in Great Britain during the seventeenth and eighteenth centuries. Here the favored model for achieving human knowledge was not the abstract mathematical reasoning so admired by the rationalists but the more concrete observations of natural science. Heeding the call of Francis Bacon, British scientists had pursued a vigorous program of observation and experiment with great success. Isaac Newton showed that both celestial and terrestrial motion could be explained by reference to a simple set of laws of motion and gravitation; Robert Boyle investigated the behavior of gasses and proposed a general theory of matter as a collection of corpuscles; and Thomas Sydenham began to use observational methods for the diagnosis and treatment of disease.

Philosopher John Locke greatly admired the achievements that these scientists (his friends in the Royal Society) had made in physics, chemistry, and medicine, and he sought to clear the ground for future developments by providing a theory of knowledge compatible with such carefully-conducted study of nature.

The goal of Locke's *An Essay Concerning Human Understanding* (1690), then, is to establish epistemological foundations for the new science by examining the reliability, scope, and limitations of human knowledge in contrast with the pretensions of uncritical belief, borrowed opinion, and mere superstition. Since the sciences had already demonstrated their practical success, Locke tried to apply their Baconian methods to the pursuit of his own philosophical aims. In order to discover how the human understanding achieves knowledge, we must trace that knowledge to its origins in our experience.

Locke's investigation into human knowledge began by asking how we acquire the basic materials out of which that knowledge is composed, our **ideas**. For Locke, an idea is *Essay I i 8*) (Note that this is an extremely broad definition: it includes concrete sensory images, abstract intellectual concepts, and everything in between. The colors and shapes I see before me right now are ideas, and so are my hunger, my memories of the ocean, my hopes for my children, the multiplication tables, and the principles of democratic government.) Ideas, then, are the immediate objects of all thought, the meaning or signification of all words, and the mental representatives of all things. Locke's question was, where do we get all of these ideas which are the content of our knowledge?

### **Refutation of innate ideas**

First, Locke eliminated one bad answer to the question. Most of Book I of the *Essay* is devoted to a detailed refutation of the belief that any of our knowledge is innate. Against the claims of the Cambridge Platonists and Herbert of Cherbury, Locke insisted that neither the speculative principles of logic and metaphysics nor the practical principles of morality are

inscribed on our minds from birth. Such propositions do not in fact have the universal consent of all human beings, Locke argued, since children and the mentally defective do not assent to them. Moreover, even if everyone did accept these principles, their universality could be better explained in terms of self-evidence or shared experience than by reference to a presumed innate origin. Innatism is the refuge of lazy intellectual dictators who wish thereby to impose their provincial notions upon others. Besides, Locke held, our knowledge cannot be innate because none of the ideas of which it is composed are innate.

As the correct answer to the question, Locke proposed the fundamental principle of empiricism: all of our knowledge and ideas arise from experience. The initially empty room of the mind is furnished with ideas of two sorts: first, by **sensation** we obtain ideas of things we suppose to exist outside us in the physical world; second, by **reflection** we come to have ideas of our own mental operations. Thus, for example, "hard," "red," "loud," "cold," "sweet," and "aromatic" are all ideas of sensation, while "perceiving," "remembering," "abstracting," and "thinking" are all ideas of reflection. ("Pleasure," "unity," and "existence," Locke held, are ideas that come to us from both sensation and reflection.) Everything we know, everything we believe, every thought we can entertain is made up of ideas of sensation and reflection and nothing else.

But wait. It isn't true that I can think only about what I myself have experienced; I can certainly think about dinosaurs (or unicorns) even though I have never seen one for myself. So Locke's claim must be about the ultimate origin of our ideas, the source of their content. He distinguished between simple and complex ideas and acknowledged that we often employ our mental capacities in order to manufacture complex ideas by conjoining simpler components. My idea of "unicorn," for example, may be compounded from the ideas of "horse" and "single spiral horn," and these ideas in turn are compounded from less complex elements. What Locke held was that every complex idea can be analyzed into component parts and that the final elements of any complete analysis must be simple ideas, each of which is derived directly from experience. Even so, the empiricist program is an ambitious one, and Locke devoted Book II of the Essay to a lengthy effort to show that every idea could, in principle, be derived from experience.

## **Complex Ideas**

Even if the simple ideas of sensation provide us with ample material for thinking, what we make of them is largely up to us. In his survey of ideas of reflection, Locke listed a variety of mental operations that we perform upon our ideas.

Notice that in each of these sections (Essay II ix-xii), Locke defined the relevant mental operations as we experience them in ourselves, but then went on to consider carefully the extent to which other animals seem capable of performing the same activities. This procedure has different results from Descartes's doctrinal rejection of animal thinking: according to Locke, only abstraction (the operation most crucial in forming the ideas of mixed modes, on which morality depends) is utterly beyond the capacity of any animal.

Perception of ideas through the senses and retention of ideas in memory, Locke held, are passive powers of the mind, beyond our direct voluntary control and heavily dependent on the material conditions of the human body. The active powers of the mind include distinguishing, comparing, compounding, and abstracting. It is by employing these powers, Locke supposed, that we manufacture new, complex ideas from the simple elements provided by experience. The resulting

complex ideas are of three sorts: Modes are complex ideas that combine simpler elements to form a new whole that is assumed to be incapable of existing except as a part or feature of something else. The ideas of "three," "seventy-five," and even "infinity," for example, are all modes derived from the simple idea of "unity." We can understand these ideas and know their mathematical functions, whether or not there actually exist numbers of things to which they would apply in reality. "Mixed modes" similarly combine simple components without any presumption about their conformity to existing patterns, yielding all of our complex ideas of human actions and their value. Substances are the complex ideas of real particular things that are supposed to exist on their own and to account for the unity and persistence of the features they exhibit. The ideas of "my only son," "the largest planet in the solar system," and "tulips," for example, are compounded from simpler ideas of sensation and reflection. Each is the idea of a thing (or kind of thing) that could really exist on its own. Since we don't understand all of the inner workings of natural objects, Locke supposed, our complex ideas of substances usually rely heavily on their secondary qualities and powers—the effects they are observed to have on ourselves and other things.

Relation are complex ideas of the ways in which other ideas may be connected with each other, in fact or in thought. The ideas of "younger," "stronger," and "cause and effect," for example, all involve some reference to the comparison of two or more other ideas.

Locke obviously could not analyze the content of every particular idea that any individual has ever had. But his defence of the empiricist principle did require him to show in principle that any complex idea can be derived from the simple ideas of sensation and reflection. The clarity, reality, adequacy, and truth of all of our ideas, Locke supposed, depend upon the success with which they fulfill their representative function. Here, we'll consider one of the most significant and difficult examples from each category:

## **Free Action**

Among our modal ideas, Locke believed that those of mixed modes, which combine both sensory and reflective elements, are especially important, since they include the ideas of human actions and provide for their moral evaluation. Among the mixed modes, the ideas of power, volition, and liberty are the most crucial and difficult. To them Locke devoted a chapter (II xxi) that grew, with alterations in later editions, to become the longest in the Essay.

The idea of power is illustrated every time we do something. Whether we think or move, the feeling that our mental preference leads to action provides a simple instance of power. The exercise of that power is volition or will, and the action taken as a result is a voluntary one. Liberty or freedom, on Locke's view, is the power to act on our volition, whatever it may be, without any external compulsion or restraint.

Under these definitions, the question of whether we have free will does not arise for Locke, since it involves what would later come to be called a category mistake. In particular, it does not matter whether we have control over our own preferences, whether we are free to will whatever we wish. In fact, Locke offered a strictly hedonistic account of human motivation, according to which our preferences are invariably determined by the desire to seek pleasure and avoid pain. What does matter for freedom and moral responsibility is that we can act on our preferences, whatever their source, without any outside interference. If I could have done otherwise (given a different preference), then I act freely and am responsible for my action.

## Distinction between primary and secondary qualities

Locke began his survey of our mental contents with the simple ideas of sensation, including those of colors, sounds, tastes, smells, shapes, size, and solidity. With just a little thought about specific examples of such ideas, we notice a significant difference among them: the color of the wall in front of me seems to vary widely from time to time, depending on the light in the room and the condition of my eyes, while its solidity persists independently of such factors. Following the lead of Galileo and Boyle, Locke explained this difference in corpuscularian fashion, by reference to the different ways in which the qualities of things produce our ideas of them.

The **primary qualities** of an object are its intrinsic features, those it really has, including the "Bulk, Figure, Texture, and Motion" of its parts. Since these features are inseparable from the thing even when it is divided into parts too small for us to perceive, the primary qualities are independent of our perception of them. When we do perceive the primary qualities of larger objects, Locke believed, our ideas exactly resemble the qualities as they are in things.

The **secondary qualities** of an object, on the other hand, are nothing in the thing itself but the power to produce in us the ideas of "Colors, Sounds, Smells, Tastes, etc." In these cases, our ideas do not resemble their causes, which are in fact nothing other than the primary qualities of the insensible parts of things. The **powers**, or tertiary qualities, of an object are just its capacities to cause perceptible changes in other things.

Thus, for example, the primary qualities of this rose include all of its quantifiable features, its mass and momentum, its chemical composition and microscopic structure; these are the features of the thing itself. The secondary qualities of the rose, on the other hand, include the ideas it produces in me, its yellow color, its delicate fragrance; these are the merely the effects of the primary qualities of its corpuscles on my eyes and nose. Like the pain I feel when I stick my finger on a thorn, the color and smell are not features of the rose itself.

Some distinction of this sort is important for any representative realist. Many instances of perceptual illusion can be explained by reference to the way secondary qualities depend upon our sensory organs, but the possibility of accurate information about the primary qualities is preserved, at least in principle. The botanical expert may be able to achieve detailed knowledge of the nature of roses, but that knowledge is not necessary for my appreciation of their beauty.

## Theory of Substance

The idea of a particular substance is the complex idea of a set of coexisting qualities and powers, together with the supposition that there is some unknown substrate upon which they all depend. Locke is derisive about the confused idea of this something, "we know not what," that is supposed by scholastic philosophers. But he cannot eliminate the concept of substance altogether, since he, too, must account for the existence and coherence of just this group of features.

About species or kinds of substances, Locke offers a more sophisticated explanation. Our complex idea of a specific kind of substance—"gold" or "horse," for example—is the collection of features by reference to which we classify individual substances as belonging to that kind. These **nominal essences**, developed for our convenience in sorting things into kinds, rely heavily upon the secondary qualities and powers that are the most obvious features of such things in our

experience—the color, weight, and malleability of gold, for example, and the shape, noises, and movements of horses.

As a corpuscularian, Locke supposed that individual substances must also have **real essences**, the primary qualities of their insensible parts, which cause all of their qualities. But since we cannot observe the "real inner constitutions" of things, we cannot use them for purposes of classification, nor can we even understand their causal influence on our perception. Since Locke doubted that real essences could ever be discovered, he was thrown back on the supposition of an underlying reality which we cannot know.

This account imposes a severe limitation on the possibilities of our knowledge of substances. According to Locke, the mechanical operations of nature remain hidden to us. Careful observation and experimentation may support a reliable set of generalizations about the appearances of the kinds of things we commonly encounter, but we cannot even conceive of their true natures.

## **Personal Identity**

Among our ideas of relations, the strongest is that of identity. Locke held that the criteria for identity depend upon the kind of thing we are considering. Substantial identity requires the unique spatio-temporal history that is just the existence of each substance, but this is not the only consideration in all cases.

The identity of the tree outside my window, for example, does not depend on the substantial identity of its parts (in fact, they change from day to day and season to season); what matters in this case is the organization of those parts into a common life. A similar explanation, Locke held, accounts for the identity of animals and human beings. We recognize living bodies at different times by the organization of their material parts rather than by their substantial composition.

In analogous fashion, Locke explained personal identity independently of identity of substance. The idea of the person is that of a moral agent who can be held responsible for his or her actions. But Locke used a series of hypothetical examples to show that the identity of an underlying immaterial substance or soul is neither necessary nor sufficient for personal identity in this sense. Even the identity of the same human body (though we may rely upon that for third-person attributions of identity) is not truly relevant. The only thing that does matter, on Locke's view, is that the person self-consciously appropriates actions as its own.

This is, as Locke says, a "forensic" notion of personal identity; its aim is to secure the justice and effectiveness of moral sanctions. If, and only if, I now remember having committed a particular act in the past can I be justly punished for having done so. If, and only if, I project myself into the future can the prospect of punishment or reward influence my deliberations about how to act now. Locke's way of thinking about personal identity has shaped discussions of the issue ever since.

## **Words**

Locke devoted Book III of the Essay to a discussion of language. His basic notion is clear: words signify ideas. Thus, the meaning of a word is always the idea it signifies in the minds of those who use it. Of course, those ideas are presumed in turn to represent things, but the accuracy of that representation does not directly affect the meaning of the word. The names of substances, for example, signify the complex ideas Locke called their nominal essences, not the real nature of the

substances themselves. Thus, common names for substances are general terms by means of which we classify things as we observe them to be; we can agree upon the meaning of such terms even though we remain ignorant of the real essences of the things themselves.

The chief point of Locke's theory of language was to eliminate the verbal disputes that arise when words are used without clear signification. It is always reasonable to ask for the meaning of a word, that is, to know what idea it signifies. If a speaker cannot supply the idea behind the word, then it has no meaning. Many of the academic squabbles that obstruct advancement in human knowledge, Locke believed, could be dissolved by careful attention to the meaning of words.

### **Theory of Knowledge and three grades of knowledge**

Having provided a thorough account of the origins of our ideas in experience, Locke opens Book IV of the Essay with a deceptively simple definition of knowledge. Knowledge is just perception of the agreement or disagreement of our ideas. We know the truth of a proposition when we become aware of the relation between the ideas it conjoins. This can occur in any of three distinct ways, each with its characteristic degree of certainty.

**Intuitive knowledge** involves direct and immediate recognition of the agreement or disagreement of two ideas. It yields perfect certainty, but is only rarely available to us. I know intuitively that three is not the same as seven.

In **demonstrative knowledge** we perceive the agreement or disagreement only indirectly, by means of a series of intermediate ideas. Since demonstration is a chain of reasoning, its certainty is no greater than its weakest link; only if each step is itself intuitively known will the demonstration as a whole be certain. If I know that A is greater than B and that B is greater than C, then I know demonstratively that A is greater than C.

Although intuition and demonstration alone satisfy the definition of knowledge, Locke held that the belief that our sensory ideas are caused by existing things deserves the name of **sensitive knowledge**. In the presence of a powerful, present idea of sensation, we cannot doubt that it has some real cause outside us, even though we do not know what that cause may be or how it produces the idea in us. I have only sensitive knowledge that there is something producing the odor I now smell.

### **Types of Knowledge**

Locke distinguished four sorts of agreement or disagreement between ideas, perception of which gives us four distinct types of knowledge:

Since knowledge of **identity and diversity** requires only a direct comparison of the ideas involved, it is intuitive whenever the ideas being compared are clear.

Knowledge of **coexistence** would provide detailed information about features of the natural world that occur together in our experience, but this scientific knowledge is restricted by our ignorance of the real essences of substances; the best we can do is to rely upon careful observations of the coincidental appearance of their secondary qualities and powers.

Mathematics and morality rest upon knowledge of **relation**, which Locke held to be demonstrative

whenever we form clear ideas and discover the links between them.

The degree of certainty in our knowledge of **real existence** depends wholly upon the content of our ideas in each case. Locke agreed with Descartes that we have intuitive knowledge of our own existence, and he supposed it possible to achieve demonstrative knowledge of god as the thinking creator of everything. But we have only sensitive knowledge of the existence of other things presently before our senses.

### **The Extent of Knowledge**

The result of all of this is that our knowledge is severely limited in its extent. On Locke's definition, we can achieve genuine knowledge only when we have clear ideas and can trace the connection between them enough to perceive their agreement or disagreement. That doesn't happen very often, especially where substances are at issue. The truths of mathematics are demonstrable precisely because they are abstract: since my ideas of lines, angles, and triangles are formed without any necessary reference to existing things, I can prove that the interior angles of any triangle add up to a straight line.

But any effort to achieve genuine knowledge of the natural world must founder on our ignorance of substances. We have "sensitive knowledge" of the existence of something that causes our present sensory ideas. But we do not have adequate ideas of the real essence of any substance, and even if we did, we would be unable to discover any demonstrative link between that real essence and the ideas it produces in us. The most careful observation can establish at best only the secondary qualities and powers that appear to coexist in our experience often enough to warrant our use of them as the nominal essence of a kind of substance.

Locke's efforts have therefore led to a sobering conclusion. Certainty is rarely within our reach; we must often be content with probable knowledge or mere opinion. Locke ultimately recommends that we adopt significantly reduced epistemological expectations.

### **The Great Concernments**

Despite all of these limitations, Locke believed that human knowledge is well-suited for the conduct of human life. We have all the knowledge we need to secure our "great concernments:" convenience in this life and the means for attaining a better life hereafter.

Survival and comfort in daily life are attainable in spite of our ignorance of the hidden operations of nature. We don't need to know the real essences of substances in order to make use of them productively. (Indeed, Locke suggests, additional information might actually make daily life more difficult.) Surely demonstrative knowledge of the true nature of fire or food is unnecessary for my survival; my natural aversion to the pain of being burned and desire for the pleasures of eating provide ample practical guidance.

Doing the right thing is also possible, since our action is properly guided by a demonstrable morality. The truths of morality are demonstrable for the same reason that the truths of mathematics are: the mixed modes that describe possible human actions, of the moral rules that govern them, and even of the possible agents that might perform them, are all complex ideas manufactured by the mind without reference to the real existence of substantial beings, so I can prove that murder is wrong.

Finally, we have all the knowledge we need to enter into a proper relation to our creator. God's existence is demonstrable on rational grounds, and the scriptures provide us with detailed information about the divine will for our lives. (The precise boundary between reason and revelation, Locke held, is itself known only as a matter of probable knowledge or opinion.) In the end, then, Locke believed that we have no reason to complain. Although restricted in extent, our knowledge is sufficient for our needs.

Respecting its limits will prevent us from wasting effort on pointless wrangling. Since our experience is itself limited, an empiricist epistemology can only advise caution and modesty in our claims to know.

### **Berkeley: Immaterialism**

As the self-proclaimed defender of common sense, Berkeley held that what we perceive really is as we perceive it to be. But what we perceive are just sensible objects, collections of sensible qualities, which are themselves nothing other than ideas in the minds of their perceivers. In the Dialogues Berkeley used Lockean arguments about the unreliability of secondary qualities in support of his own, more radical view.

Take heat, for example: does it exist independently of our perception of it? When exposed to great heat I feel a pain that everyone acknowledges to be in me, not in the fire, Berkeley argued, so the warmth I feel when exposed to lesser heat must surely be the same. What is more, if I dip both of my hands into a bowl of tepid water after chilling one and warming the other, the water will feel both warm and cold at the same time. Clearly, then, heat as I perceive it is nothing other than an idea in my mind.

Similar arguments and experiments establish that other sensible qualities—colors that vary with changes in ambient light, tastes and smells that change perceptibly when I have a cold, and sounds that depend for their quality on the position of my ears and conditions in the air—are, like heat, nothing but ideas in my mind. But the same considerations apply to primary qualities as well, Berkeley pointed out, since my perception of shape and size depend upon the position of my eyes, my experience of solidity depends upon my sense of touch, and my idea of motion is always relative to my own situation. Locke was correct in his view of secondary qualities but mistaken about primary qualities: all sensible qualities are just ideas.

But sensible objects are nothing more than collections of sensible qualities, so they are merely complex ideas in the minds of those who perceive them. For such ideas, Berkeley held, to be just is to be perceived (in Latin, *esse est percipi*). There is no need to refer to the supposition of anything existing outside our minds, which could never be shown to resemble our ideas, since "nothing can be like an idea but an idea." Hence, there are no material objects.

### **Material Substance is Inconceivable**

Locke's reference to an "unknown substratum" in which the features of material substances inhere is a pointless assumption, according to Berkeley. Since it is the very nature of sensible objects to be perceived, on his view, it would be absurd to suppose that their reality depends in any way upon an imperceptible core. This gives rise to a perfectly general argument against even the possibility of material substance.

Putting aside all of the forgoing lines of argument, Berkeley declared, the whole issue can be allowed to rest on a single question: is it possible to conceive of a sensible object existing independently of any perceiver? The challenge seems easy enough at first. All I have to do is think of something so remote—a tree in the middle of the forest, perhaps—that no one presently has it in mind. But if I conceive of this thing, then it is present in my mind as I think of it, so it is not truly independent of all perception.

According to Berkeley (and such later idealists as Fichte and Bradley) this argument shows irrefutably that the very concept of material substance as a sensible object existing independently of any perception is incoherent. No wonder the representationalist philosophy leads to skepticism: it introduces as a necessary element in our knowledge of the natural world a concept that is literally inconceivable!

## **Spirits**

Although he maintained that there can be no material substances, Berkeley did not reject the notion of substance altogether. The most crucial feature of substance is activity, he supposed, and in our experience the most obvious example activity is that of perceiving itself. So thinking substances do exist, and for these spirits (or souls or minds) to be is just to perceive (in Latin, *esse est percipere*).

Like Descartes and Leibniz, Berkeley held that each spirit is a simple, undivided, active being whose sole function is to think—that is, to have ideas such as those of sensible objects. Although each spirit is directly aware of its own existence and nature, it cannot be perceived. Since ideas are always of sensible qualities or objects for Berkeley, we have no ideas (but only notions) of spirits. This is a complete enumeration of what is real: active thinking substances and their passive ideas.

Strange though Berkeley's immaterialism may seem, it offers many clear advantages. It is a genuinely empiricist philosophy, since it begins with what we actually experience and claims to account for everything without making extravagant suppositions about unknowable entities. Next, we will consider how well this doctrine provides for common sense, science, and religion.

## **Common Sense**

Is Berkeley's immaterialism a reasonable view? He claimed to defend common sense against skeptical challenges, yet he maintained that sensible objects exist only in the minds of those who perceive them. Surely common sense includes the belief that ordinary things continue to exist when I am not perceiving them. Although all of my visual ideas disappear and reappear every time I blink my eyes, I do not suppose that the everything I see pops out of existence and then back in. While a strict phenomenalist might point out that there is no practical consequence even if it does, Berkeley disagreed.

The existence of what I see does not depend exclusively on my seeing it. Berkeley's central claim is that sensible objects cannot exist without being perceived, but he did not suppose that I am the only perceiver. So long as some sentient being, some thinking substance or spirit, has in mind the sensible qualities or objects at issue, they do truly exist. Thus, even when I close my eyes, the tree I now see will continue to exist, provided that someone else is seeing it.

This difference, Berkeley held, precisely marks the distinction between real and imaginary things. What I merely imagine exists in my mind alone and continues to exist only so long as I think of it. But what is real exists in many minds, so it can continue to exist whether I perceive it or not. (That's why, unsure of the reality of what I seem to see, I may ask someone else, "Did you see that?") The existence of sensible objects requires that they be perceived, but it is not dependent exclusively on my perception of them.

In fact, the persistence and regularity of the sensible objects that constitute the natural world is independent of all human perception, according to Berkeley. Even when none of us is perceiving this tree, god is. The mind of god serves as a permanent repository of the sensible objects that we perceive at some times and not at others. (Although Berkeley took great pains to deny it, this view of the divine role in perception is very similar to Malebranche's notion of "seeing all things in god.") So Berkeley's philosophy can claim to defend common sense. It emphasizes that bodies or sensible objects really are just the ideas we have of them, yet can also explain their apparent independence of our perception. All he rejects is the mysterious philosophical notion of the material object as an extended substance capable of existing independently of any perception. That supposition, he argued, is both unnecessary and untenable.

### **Science without Matter**

Even if we accept it as common sense, is Berkeley's immaterialism compatible with modern science? Certainly Galileo's astronomy, Newtonian mechanics, and the chemistry of Boyle all took for granted the existence and operation of physical objects. But Berkeley maintained that natural science, if properly conceived, could proceed and even thrive without assuming that bodies are material substances existing outside the mind.

Astronomy and optics seem to suppose that what we see exists at some distance from us. But Berkeley argued in his *New Theory of Vision* that our apparent perception of distance itself is a mental invention, easily explained in terms of the content of visual ideas, without any reference to existing material objects. In fact, Berkeley held, our visual and tactile perceptions are entirely independent. What we see and what we touch have nothing to do with each other; we have merely learned by experience to associate each with the other, just as we have learned to associate the appearance, the taste, and the smell of an apple. There is no reason to suppose that all of these qualities inhere in a common material substratum.

It follows that Locke was mistaken in supposing that our ideas of primary qualities have a special status because they arise from more than one of our senses. Although the corpuscularian hypothesis has yielded interesting results so far, Berkeley believed that science will soon enough outgrow it, learning to rely more directly on what we perceive for its hypotheses about what new experiences we rightly anticipate.

As we've already seen, Berkeley accounted for the persistence of bodies in terms of god's continuing perception of them. The causal regularities we observe in the natural world rely upon the same source. God's mind is an orderly one, and the apparent structures of space, time, and causality are nothing more than our awareness of the divine provision for our welfare. Natural science has plenty to do even in the absence of material objects, then: it is nothing less than a systematic exploration of the mind of god. (Here Berkeley came very close to the philosophy of

Malebranche.

More significantly for us, he also correctly anticipated much of the physical science of the twentieth century. Like Berkeley, we believe that the solidity of bodies is merely apparent, that a proper cosmology depends upon our capacity to conceive it, and that the role of science is to gather and correlate the independent observations of human perceivers. It is not surprising that physicists like Mach expressed an appreciation for the thought of Berkeley.

## **Religion**

The affinity between immaterialism and traditional religion is somewhat easier to understand. Materialism leads to atheism no less than to skepticism, Berkeley believed, since its belief that bodies exist outside the mind encourages the notion that the physical realm may always have existed independently of any spiritual influence. Immaterialism, by contrast, restores god to a role of central importance, not only as the chief among active thinking substances but also as the source of all sensible objects.

God's existence is made evident by everyday instances of perception, according to Berkeley. Since sensible objects are mind-dependent yet exhibit a persistence and regularity that transcends our perception of them, it follows that there must be a master-perceiver, god, in whose mind they always are. Thus, in the Dialogues, Philonous extols the beauty and majesty of the natural world, attributing them to the power and elegance of the divine mind. This leads to the traditional conception of god as deserving of worship because of the benevolent creation of all that we observe.

All in all, Berkeley developed a philosophical system worthy of no little respect. Immaterialism rests on the simple premise that there are no physical objects. Berkeley defended this notion with many clever arguments and worked out its implications consistently. Although counter-intuitive, immaterialism is difficult to refute.

## **Primary / Secondary qualities**

Distinction between perceived aspects of things. The primary qualities are intrinsic features of the thing itself (its size, shape, internal structure, mass, and momentum, for example), while the secondary qualities are merely its powers to produce sensations in us (its color, odor, sound, and taste, for example). This distinction was carefully drawn by Galileo, Descartes, Boyle, and Locke, whose statement of the distinction set the tone for future scientific inquiry. But Foucher, Bayle, and Berkeley argued that the distinction is groundless, so that all sensible qualities exist only in the mind of the perceiver.

## **Critique of abstract ideas**

Developing the basis for an empiricist immaterialism requires unlearning significant portions of what Locke taught us. Berkeley devoted the lengthy "Introduction" of his Principles of Human Knowledge to a detailed refutation of what he supposed to be one of Locke's most harmful mistakes, the belief that general terms signify abstract ideas.

As Berkeley correctly noticed, our experience is always of concrete particulars. When I contemplate the idea of "triangle," the image that comes to mind is that of some determinate shape; having the abstract image of a three-sided figure that is neither equilateral nor isosceles nor

scalene is simply impossible. It is unnecessary, too: for purposes of geometrical reasoning, any particular image can be used as a representative for all. (It is not at all clear that even Locke would have disagreed with this position.)

But the consequence of Berkeley's criticism is a theory of meaning entirely different from Locke's. General terms (or words of any sort) need not signify ideas of their own, on Berkeley's view. Instead, they acquire meaning by a process of association with particular experiences, which are in turn associated with each other. But of course mere association (as Locke himself had noted with respect to ideas) is not a reliable guide to reality.

In the Introduction to the Principles of Human Knowledge, Berkeley laments the doubt and uncertainty found in philosophical discussions, and he attempts to find those principles that drew philosophy away from common sense and intuition. He finds the source of skepticism in the theory of abstract ideas, which he criticizes.

### **Berkeley begins by giving a general overview of the doctrine:**

It is agreed on all hands, that the qualities or modes of things do never really exist each of them apart by it self, and separated from all others, but are mixed, as it were, and blended together, several in the same object. But we are told, the mind being able to consider each quality singly, or abstracted from those other qualities with which it is united, does by that means frame to it self abstract ideas. ... Not that it is possible for colour or motion to exist without extension: but only that the mind can frame to it self by abstraction the idea of colour exclusive of extension, and of motion exclusive of both colour and extension.

In §§8-9 he details the doctrine in terms of Locke's account in the Essay concerning Human Understanding. Although theories of abstraction date back at least to Aristotle (Metaphysics, Book K, Chapter 3, 1061a29-1069b4), were prevalent among the medievals, and are found in the Cartesians, there seem to be two reasons why Berkeley focused on Locke. First, Locke's work was recent and familiar. Second, Berkeley seems to have considered Locke's account the best available. As he wrote in his notebooks, "Wonderful in Locke that he could w<sup>n</sup> advanc'd in years see at all thro a mist yt had been so long a gathering & was consequently thick. This more to be admir'd than yt he didn't see farther".

According to Locke, the doctrine of abstract ideas explains how knowledge can be communicated and how it can be increased. It explains how general terms obtain meaning. A general term, such as 'cat' refers to an abstract general idea, which contains all and only those properties that one deems common to all cats, or, more properly, the ways in which all cats resemble each other. The connection between a general term and an abstract idea is arbitrary and conventional, and the relation between an abstract idea and the individual objects falling under it is a natural relation (resemblance). If Locke's theory is sound, it provides a means by which one can account for the meaning of general terms without invoking general objects (universals).

Berkeley's attack on the doctrine of abstract ideas follows three tracks. There is the "I can't do it" argument in Intro. There is the "We don't need it" argument in Intro. And there is the "The theory leads to inconsistencies" argument in Intro. which Berkeley deemed the "killing blow". As we shall see, Berkeley uses a similar tripartite attack on doctrine of material substance.

Having outlined Locke's account of abstraction in Introduction, which allegedly results in the idea of a human which is colored but has no determinate color – that the idea includes a general idea of color, but not a specific color such as black or white or brown or yellow – which has a size but has no determinate size, and so forth, Berkeley argues in §10 that he can form no such idea. On the face of it, his argument is weak. At most it shows that insofar as he cannot form the idea, and assuming that all humans have similar psychological abilities, there is some evidence that no humans can form abstract ideas of the sort Locke described.

But there is a remark made in passing that suggests there is a much stronger argument implicit in the section. Berkeley writes: To be plain, I own my self able to abstract in one sense, as when I consider some particular parts or qualities separated from others, with which though they are united in some object, yet, it is possible they may really exist without them. But I deny that I can abstract one from another, or conceive separately, those qualities which it is impossible should exist so separated; or that I can frame a general notion by abstracting from particulars in the manner aforesaid. Which two last are the proper acceptations of abstraction.

This three-fold distinction among types of abstraction is found in Arnauld and Nicole's *Logic or the Art of Thinking*. The first type of abstraction concerns integral parts. The head, arms, torso, and legs are integral parts of a body: each can exist in separation from the body of which it is a part (Arnauld and Nicole, p. 37). The second kind of abstraction "arises when we consider a mode without paying attention to its substance, or two modes which are joined together in the same substance, taking each one separately" (Arnauld and Nicole, p. 37). The third concerns distinctions of reason, for example, conceiving of a triangle as equilateral without conceiving of it as equiangular (Arnauld and Nicole, p. 38). Berkeley grants that he can abstract in the first sense – "I can consider the hand, the eye, the nose, each by it self abstracted or separated from the rest of the body" – but he denies that he can abstract in the latter two senses. The latter two cases represent impossible states of affairs. In §7 Berkeley noted that the abstractionists held that it is impossible for a mode to exist apart from a substance. Many abstractionists also accepted a conceivability criterion of possibility: If one can (clearly and distinctly) conceive of a state of affairs, then it is possible for that state of affairs to exist as conceived. This principle entails that impossible states of affairs are inconceivable. So, granting it is impossible for a mode to exist apart from a substance, it follows that it is impossible to conceive of a mode apart from a substance, that the second form abstraction is impossible. And if the second falls, the third falls as well, since the third requires that alternative descriptions of an object pick out no differences in reality. So, a traditional theory of modes and substances, the conceivability criterion of possibility, and abstraction are an inconsistent triad. The inconsistency can be resolved by dropping the doctrine of abstract ideas. Berkeley made this point explicitly in the first draft of the Introduction: It is, I think, a receiv'd axiom that an impossibility cannot be conceiv'd. For what created intelligence will pretend to conceive, that which God cannot cause to be? Now it is on all hands agreed, that nothing abstract or general can be made really to exist, whence it should seem to follow, that it cannot have so much as an ideal existence in the understanding.

One of the marks of the modern period is an adherence to the principle of parsimony (Ockham's Razor). The principle holds that the theoretically simpler of two explanations is more probably true. In the seventeenth and eighteenth centuries, this was sometimes expressed as "God does nothing in vain" So, if it is possible to construct a theory of meaning that does not introduce abstract ideas as a distinct kind of idea, that theory would be simpler and deemed more probably true. This is the strategy Berkeley adopts in Introduction.

Granting Locke that all existents are particulars (Locke 3.3.6, p. 410), Berkeley remarks, "But it seems that a word becomes general by being made the sign, not of an abstract general idea but, of several particular ideas, any one of which it indifferently suggests to the mind" (Intro. §11). Ideas remain particular, although a particular idea can function as a general idea. For example, when a geometer draws a line on a blackboard, it is taken to represent all lines, even though the line itself is particular and has determinate qualities. Similarly, a particular idea can represent all similar ideas. So, whether one takes Berkeley to mean that words apply immediately to objects or that meaning is mediated by paradigmatic ideas, the theory is simpler than the abstractionists' insofar as all ideas are particular and determinate.

In Introduction §13, Berkeley turns to Locke's abstract general idea of a triangle, an idea which "must be neither oblique nor rectangle, neither equilateral, equicrural, nor scalenon, but all and none of these at once. In effect, it is something imperfect that cannot exist, an idea wherein some parts of several different and inconsistent ideas are put together". Upon quoting the passage, Berkeley merely asks his reader whether he or she can form the idea, but his point seems to be much stronger. The described idea is inconsistent, and therefore represents an impossible state of affairs, and it is therefore inconceivable, since whatever is impossible is inconceivable. This is explicit in a parallel passage in the *New Theory of Vision*. After quoting the triangle passage, Berkeley remarks, "But had he called to mind what he says in another place, to wit, 'That ideas of mixed modes wherein any inconsistent ideas are put together cannot so much as exist in the mind, i.e. be conceived.' vid. B. iii.

C. 10. S. 33. *ibid.* I say, had this occurred to his thoughts, it is not improbable he would have owned it above all the pains and skill he was master of, to form the above-mentioned idea of a triangle, which is made up of manifest, staring contradictions".

If abstract ideas are not needed for communication – Berkeley takes the fact that infants and poorly educated people communicate, while the formation of abstract ideas is said to be difficult, as a basis for doubting the difficulty thesis (Intro. §14) he is able to give short shrift to the contention that abstract ideas are necessary for knowledge. The abstractionists maintain that abstract ideas are needed for geometrical proofs. Berkeley argues that only properties concerning, for example, a triangle as such are germane to a geometric proof. So, even if one's idea of a triangle is wholly determinate (consider a diagram on a blackboard), none of the differentiating properties prevent one from constructing a proof, since a proof is not concerned solely with the idea (or drawing) with which one begins. He maintains that it is consistent with his theory of meaning to selectively attend to a single aspect of a complex, determinate idea.

Berkeley concludes his discussion of abstraction by noting that not all general words are used to denote objects or kinds of objects. His discussion of the nondenotative uses of language is often taken to anticipate Ludwig Wittgenstein's interest in meaning-as-use.

### **esse est percipi**

Latin phrase meaning "to be is to be perceived." According to Berkeley, this is the most basic feature of all sensible objects; for spirits, on the other hand, *esse est percipere* ("to be is to perceive"). Granting this to be the most fundamental principle of idealistic philosophy, Moore argued that it is indefensible.

Berkeley's famous principle is *esse is percipi*, to be is to be perceived. Berkeley was an idealist. He held that ordinary objects are only collections of ideas, which are mind-dependent. Berkeley was an immaterialist. He held that there are no material substances. There are only finite mental substances and an infinite mental substance, namely, God. On these points there is general agreement. There is less agreement on Berkeley's argumentative approach to idealism and immaterialism and on the role of some of his specific arguments. His central arguments are often deemed weak.

The account developed here is based primarily on the opening thirty-three sections of the *Principles of Human Knowledge*. It assumes, contrary to some commentators, that Berkeley's metaphysics rests on epistemological foundations.

This approach is *prima facie* plausible insofar as it explains the appeal to knowledge in the title of the *Principles* (cf. Intro. §4), it is consistent with Berkeley's epistemic concerns in other writings (cf. TVV §18), and it provides an explanatory role for abstract ideas. There will be occasional digressions concerning the problems perceived by those who claim that Berkeley's approach was more straightforwardly metaphysical.

### **Berkeley begins his discussion as follows:**

It is evident to any one who takes a survey of the objects of human knowledge, that they are either ideas actually imprinted on the senses, or else such as are perceived by attending to the passions and operations of the mind, or lastly ideas formed by help of memory and imagination, either compounding, dividing, or barely representing those originally perceived in the aforesaid ways.. This seems to say that ideas are the immediate objects of knowledge in a fundamental sense (acquaintance). Following Locke, there are ideas of sense, reflection, and imagination. So, ordinary objects, as known, are collections of ideas marked by a single name. Berkeley's example is an apple.

If ideas are construed as objects of knowledge, then there must also be something that "knows or perceives them, and exercises divers operations, as willing, imagining, remembering about them". This Berkeley calls this 'mind' or 'spirit'. Minds (as knowers) are distinct from ideas (as things known). For an idea, to be is to be perceived (known). Since this holds for ideas in general, it holds for "sensations or ideas imprinted on the sense" in particular.

Berkeley contends that the "opinion strangely prevailing amongst men, that houses, mountains, rivers, and in a world all sensible objects have an existence natural or real, distinct from being perceived" is inconsistent, "a manifest contradiction". If one construes 'sensible objects' as ideas of sense, and ideas are objects of knowledge, then having a real existence distinct from being perceived would require that an object be known (as an idea) and unknown (as a thing distinct from being perceived), which is inconsistent. He explains the source of the error on the basis of the doctrine of abstract ideas, a discussion which parallels the discussion in Introduction. Ordinary objects, as known, are nothing but collections of ideas. If, like Descartes, Berkeley holds that claims of existence are justified if and only if the existent can be known, then ordinary objects must be at least collections of ideas. As Berkeley put it, "all the choir of heaven and furniture of the earth, in a word all those bodies which compose the mighty frame of the world, have not any subsistence without a mind, that their being is to be perceived or known". The only substance that

can be known is a spirit or thinking substance. But notice what has not yet been shown. It has not been shown that ordinary objects are only collections of ideas, nor has it be shown that thinking substances are immaterial. Berkeley's next move is to ask whether there are grounds for claiming ordinary objects are something more than ideas.

The above account is not the only interpretation of the first seven sections of the Principles. Many commentators take a more directly metaphysical approach. They assume that ideas are mental images, or objects of thought (Winker, p.6), or modes of a mental substance (Bracken, pp. 76ff), or immediate objects of perception (Pappas, pp. 21-22), or any of Berkeley's other occasional characterizations of ideas, and proceed to show that, on the chosen account of ideas, Berkeley's arguments fail. A. A. Luce tells us that Berkeley's characterization of an apple in terms of ideas is concerned with the apple itself, rather than a known apple, which suggests that Berkeley begs the question of the analysis of body. Many commentators tell us that what seems to be an allusion to ideas of reflection in the first sentence of §1 cannot be such, since Berkeley claims one has no ideas of minds or mental states. They ignore his allusions to ideas of reflection and the presumption that if there are such ideas, they are the effects of an active mind. Many commentators suggest that the argument for *esse is percipi* is in §3 – ignoring the concluding words in §2 – and find the “manifest contradiction” in §4 puzzling at best. Most commentators assume that the case for idealism – the position that there are only minds and mind-dependent entities – is complete by §7 and lament that Berkeley has not established the ‘only’. The epistemic interpretation we have been developing seems to avoid these problems.

Berkeley holds that ordinary objects are at least collections of ideas. Are they something more? In §§8-24 Berkeley examines the prime contenders for this “something more,” namely, theories of material substance. He prefaces his discussion with his likeness principle, the principle that nothing but an idea can resemble an idea. “If we look but ever so little into our thoughts, we shall find it impossible for us to conceive a likeness except only between our ideas” (PHK §8). Why is this? A claim that two objects resemble each other can be justified only by a comparison of the objects. So, if only ideas are immediately perceived, only ideas can be compared. So, there can be no justification for a claim that an idea resembles anything but an idea. If claims of existence rest on epistemically justified principles, the likeness principle blocks both grounds for claiming that there are mediately perceived material objects and Locke's claim that the primary qualities of objects resemble one's ideas of them.

One of the marks of the modern period is the doctrine of primary and secondary qualities. Although it was anticipated by Descartes, Malebranche, and others, the terms themselves were introduced in Robert Boyle's “Of the Origins of Forms and Qualities” (1666) and Locke's Essay. Primary qualities are the properties of objects as such. The primary qualities are solidity, extension, figure, number, and mobility. Secondary qualities are either the those arrangements of corpuscles containing only primary qualities that cause one to have ideas of color, sound, taste, heat, cold, and smell or, on some accounts, the ideas themselves. If the distinction can be maintained, there would be grounds for claiming that ordinary objects are something more than ideas. It is this theory of matter Berkeley considers first.

After giving a sketch of Locke's account of the primary/secondary quality distinction, his initial salvo focuses on his previous conclusions and the likeness principle. “By matter therefore we are to understand an inert, senseless substance, in which extension, figure, and motion, do actually subsist” (PHK §9). Such a view is inconsistent with his earlier conclusions that extension,

figure, and motion are ideas. The likeness principle blocks any attempt to go beyond ideas on the basis of resemblance. Combining the previous conclusions with the standard account of primary qualities requires that primary qualities both exist apart from the mind and only in the mind. So, Berkeley concludes that “what is called matter or corporeal substance, involves a contradiction in it”. He then turns to the individual qualities.

If there is a distinction between primary and secondary qualities, there must be a ground for the distinction. Indeed, given the common contention that an efficient cause must be numerically distinct from its effect, if one cannot show that primary and secondary qualities are distinct, there are grounds for questioning the causal hypothesis. Berkeley argues that there is no ground for the distinction. Appealing to what one knows – ideas as they are conceived – Berkeley argues that one cannot conceive of a primary quality such as extension without some secondary quality as well: one cannot “frame an idea of a body extended and moved, but I must withal give it some colour or other sensible quality which is acknowledged to exist only in the mind”. If such sensible qualities as color exist only in the mind, and extension and motion cannot be known without some sensible quality, there is no ground for claiming extension exists apart from the mind. The primary/secondary quality distinction collapses. The source of the philosophical error is cited as the doctrine of abstract ideas. His arguments in *Principles* show that no evidence can be found that any of the other so-called primary qualities can exist apart from the mind.

After disposing of the primary/secondary quality distinction, Berkeley turns to an older theory of material substance, a substratum theory. At least since Aristotle, philosophers had held that qualities of material objects depend on and exist in a substance which has those qualities. This supposed substance allegedly remains the same through change. But if one claims there are material substances, one must have reasons to support that claim. In *Principles* §§16-24 Berkeley develops a series of arguments to the effect that

- (1) one cannot form an idea of a substratum,
- (2) the theory of material substance plays no explanatory role, and
- (3) it is impossible to produce evidence for the mere possibility of such an entity.

Can one form an idea a substratum? No. At least one cannot form a positive idea of a material substratum itself – something like an image of the thing itself – a point that was granted by its most fervent supporters. The most one can do is form “An obscure and relative Idea of Substance in general”, “though you know not what it is, yet you must be supposed to know what relation it bears to accidents, and what is meant by its supporting them”. Berkeley argues that one cannot make good on the notion of ‘support’ – “It is evident support cannot here be taken in its usual or literal sense, as when we say that pillars support a building: in what sense therefore must it be taken?” (PHK §16) – so one does not even have a relative idea of material substratum. Without a clear notion of the alleged relation, one cannot single out a material substance on the basis of a relation to something perceived.

If an idea of a material substratum cannot be derived from sense experience, claims of its existence might be justified if it is necessary to provide an explanation of a phenomenon. But no such explanation is forthcoming. As Berkeley notes: “But what reason can induce us to believe the existence of bodies without the mind, from what we perceive, since the very patrons of matter themselves do not pretend, there is any necessary connexion betwixt them and our ideas? I say it is granted on all hands (and what happens in dreams, phrensies, and the like, puts it beyond

dispute) that it is possible we might be affected with all the ideas we have now, though no bodies existed without, resembling them". Since material substance is not necessary to provide an explanation of mental phenomena, reason cannot provide grounds for claiming the existence of a material substance.

Berkeley's final move against material substance is sometimes called the "Master Argument." It takes the form of a challenge, one on which Berkeley is willing to rest his entire case. "It is but looking into your own thoughts, and so trying whether you can conceive it possible for a sound, or figure, or motion, or colour, to exist without the mind, or unperceived. This easy trial may make you see, that what you contend for, is a downright contradiction" (PHK §22). Berkeley seems to argue that in any case one might consider – books in the back of a closet, plants deep in a wood with no one about, footprints on the far side of the moon – the objects are related to the mind conceiving of them. So, it is contradictory to claim that those objects have no relation to a mind. This is generally not considered Berkeley at his best, since many commentators argue that it is possible to distinguish between the object conceived and the conceiving of it. George Pappas has provided a more sympathetic interpretation of the passage. He contends that Berkeley is calling for an "impossible performance". Conceivability is the ground for claiming that an object is possible. If one conceives of an object, then that object is related to some mind, namely, the mind that conceives it. So, the problem is that it is not possible to fulfill the conditions necessary to show that it would be possible for an object to exist apart from a relation to a mind.

Thus, Berkeley concludes, there are no grounds for claiming that an ordinary object is more than a collection of ideas. The arguments in §§1-7 showed that ordinary objects are at least collections of ideas of sense. The arguments in §§8- 24 provide grounds for claiming that ordinary objects are nothing more than ideas. So, Berkeley is justified in claiming that they are only ideas of sense. Berkeley's argument for immaterialism is complete, although he has not yet provided criteria for distinguishing ideas of sense from ideas of memory and imagination. This is his task in §§29-33. Before turning to this, Berkeley introduces several remarks on mind.

Berkeley claims that an inspection of our ideas shows that they are causally inert. Since there is a continual succession of ideas in our minds, there must be some cause of it. Since this cause can be neither an idea nor a material substance, it must be a spiritual substance. This sets the stage for Berkeley's argument for the existence of God and the distinction between real things and imaginary things.

One knows that one causes some of one's own ideas . Since the mind is passive in perception, there are ideas which one's own mind does not cause. Only a mind or spirit can be a cause. "There is therefore some other will or spirit that produces them" . As such, this is not an argument for the existence of God, although Berkeley's further discussion assumes that at least one mind is the divine mind.

He is now in a position to distinguish ideas of sense from ideas of the imagination: "The ideas of sense are more strong, lively, and distinct than those of the imagination; they have likewise a steadiness, order, and coherence, and are not excited at random, as those which are the effects of human wills often are". This provides the basis for both the distinction between ideas of sense and ideas of imagination and for the distinction between real things and imaginary thing. Real things are composed solely of ideas of sense. Ideas of sense occur with predictable regularity; they form coherent wholes that themselves can be expected to "behave" in predictable ways. Ideas of sense

follow (divinely established) laws of nature.

So, Berkeley has given an account of ordinary objects without matter. Ordinary objects are nothing but lawfully arranged collections of ideas of sense.

## **Solipsism**

**Solipsism**, in philosophy, an extreme form of subjective idealism that denies that the human mind has any valid ground for believing in the existence of anything but itself. The British idealist F.H. Bradley, in *Appearance and Reality* (1893), characterized the solipsistic view as follows: Presented as a solution of the problem of explaining human knowledge of the external world, it is generally regarded as a *reductio ad absurdum*. The only scholar who seems to have been a coherent radical solipsist is Claude Brunet, a 17th-century French physician.

## **Solipsism and the Problem of Other Minds**

Solipsism is sometimes expressed as the view that “I am the only mind which exists,” or “My mental states are the only mental states.” However, the sole survivor of a nuclear holocaust might truly come to believe in either of these propositions without thereby being a solipsist. Solipsism is therefore more properly regarded as the doctrine that, in principle, “existence” means for me my existence and that of my mental states. Existence is everything that I experience – physical objects, other people, events and processes – anything that would commonly be regarded as a constituent of the space and time in which I coexist with others and is necessarily construed by me as part of the content of my consciousness.

For the solipsist, it is not merely the case that he believes that his thoughts, experiences, and emotions are, as a matter of contingent fact, the only thoughts, experiences, and emotions. Rather, the solipsist can attach no meaning to the supposition that there could be thoughts, experiences, and emotions other than his own. In short, the true solipsist understands the word “pain,” for example, to mean “my pain.” He cannot accordingly conceive how this word is to be applied in any sense other than this exclusively egocentric one.

## **The Importance of the Problem**

No great philosopher has espoused solipsism. As a theory, if indeed it can be termed such, it is clearly very far removed from common sense. In view of this, it might reasonably be asked why the problem of solipsism should receive any philosophical attention. There are two answers to this question. First, while no great philosopher has explicitly espoused solipsism, this can be attributed to the inconsistency of much philosophical reasoning. Many philosophers have failed to accept the logical consequences of their own most fundamental commitments and preconceptions. The foundations of solipsism lie at the heart of the view that the individual gets his own psychological concepts (thinking, willing, perceiving, and so forth.) from “his own cases,” that is by abstraction from “inner experience.”

This view, or some variant of it, has been held by a great many, if not the majority of philosophers since Descartes made the egocentric search for truth the primary goal of the critical study of the nature and limits of knowledge.

In this sense, solipsism is implicit in many philosophies of knowledge and mind since Descartes and any theory of knowledge that adopts the Cartesian egocentric approach as its basic frame of

reference is inherently solipsistic.

Second, solipsism merits close examination because it is based upon three widely entertained philosophical presuppositions, which are themselves of fundamental and wide-ranging importance. These are:

- (a) What I know most certainly are the contents of my own mind – my thoughts, experiences, affective states, and so forth.;
- (b) There is no conceptual or logically necessary link between the mental and the physical. For example, there is no necessary link between the occurrence of certain conscious experiences or mental states and the “possession” and behavioral dispositions of a body of a particular kind; and
- (c) The experiences of a given person are necessarily private to that person.

These presuppositions are of unmistakable Cartesian origin, and are widely accepted by philosophers and non-philosophers alike. In tackling the problem of solipsism, one immediately grapples with fundamental issues in the philosophy of mind. However spurious the problem of solipsism per se may strike one, these latter issues are unquestionably important. Indeed, one of the merits of the entire enterprise is the extent that it reveals a direct connection between apparently unexceptionable and certainly widely-held common sense beliefs and the acceptance of solipsistic conclusions. If this connection exists and we wish to avoid those solipsistic conclusions, we shall have no option but to revise, or at least to critically review, the beliefs from which they derive logical sustenance.

### **Historical Origins of the Problem**

In introducing “methodic doubt” into philosophy, René Descartes created the backdrop against which solipsism subsequently developed and was made to seem, if not plausible, at least irrefutable. For the ego that is revealed by the cogito is a solitary consciousness, a *res cogitans* that is not spatially extended, is not necessarily located in any body, and can be assured of its own existence exclusively as a conscious mind. (Discourse on Method and the Meditations). This view of the self is intrinsically solipsistic and Descartes evades the solipsistic consequences of his method of doubt by the desperate expedient of appealing to the benevolence of God. Since God is no deceiver, he argues, and since He has created man with an innate disposition to assume the existence of an external, public world corresponding to the private world of the “ideas” that are the only immediate objects of consciousness, it follows that such a public world actually exists. (Sixth Meditation). Thus does God bridge the chasm between the solitary consciousness revealed by methodic doubt and the intersubjective world of public objects and other human beings?

A modern philosopher cannot evade solipsism under the Cartesian picture of consciousness without accepting the function attributed to God by Descartes (something few modern philosophers are willing to do). In view of this it is scarcely surprising that we should find the specter of solipsism looming ever more threateningly in the works of Descartes’ successors in the modern world, particularly in those of the British empiricist tradition.

Descartes’ account of the nature of mind implies that the individual acquires the psychological concepts that he possesses “from his own case,” that is that each individual has a unique and privileged access to his own mind, which is denied to everyone else. Although this view utilizes

language and employs conceptual categories (“the individual,” “other minds,” and so forth.) that are inimical to solipsism, it is nonetheless fundamentally conducive historically to the development of solipsistic patterns of thought.

On this view, what I know immediately and with greatest certainty are the events that occur in my own mind – my thoughts, my emotions, my perceptions, my desires, and so forth. – and these are not known in this way by anyone else. By the same token, it follows that I do not know other minds in the way that I know my own; indeed, if I am to be said to know other minds at all – that they exist and have a particular nature – it can only be on the basis of certain inferences that I have made from what is directly accessible to me, the behavior of other human beings.

The essentials of the Cartesian view were accepted by John Locke, the father of modern British empiricism. Rejecting Descartes’ theory that the mind possesses ideas innately at birth, Locke argued that all ideas have their origins in experience. “Reflection” (that is introspection or “inner experience”) is the sole source of psychological concepts. Without exception, such concepts have their genesis in the experience of the corresponding mental processes.

If I acquire my psychological concepts by introspecting upon my own mental operations, then it follows that I do so independently of my knowledge of my bodily states. Any correlation that I make between the two will be effected subsequent to my acquisition of my psychological concepts. Thus, the correlation between bodily and mental states is not a logically necessary one. I may discover, for example, that whenever I feel pain my body is injured in some way, but I can discover this factual correlation only after I have acquired the concept “pain.” It cannot therefore be part of what I mean by the word “pain” that my body should behave in a particular way.

### **The Argument from Analogy**

What then of my knowledge of the minds of others? On Locke’s view there can be only one answer: since what I know directly is the existence and contents of my own mind, it follows that my knowledge of the minds of others, if I am to be said to possess such knowledge at all, has to be indirect and analogical, an inference from my own case. This is the so-called “argument from analogy” for other minds, which empiricist philosophers in particular who accept the Cartesian account of consciousness generally assume as a mechanism for avoiding solipsism.

Observing that the bodies of other human beings behave as my body does in similar circumstances, I can infer that the mental life and series of mental events that accompany my bodily behavior are also present in the case of others. Thus, for example, when I see a problem that I am trying unsuccessfully to solve, I feel myself becoming frustrated and observe myself acting in a particular way. In the case of another, I observe only the first and last terms of this three-term sequence and, on this basis, I infer that the “hidden” middle term, the feeling of frustration, has also occurred.

There are, however, fundamental difficulties with the argument from analogy. First, if one accepts the Cartesian account of consciousness, one must, in all consistency, accept its implications. One of these implications, as we have seen above, is that there is no logically necessary connection between the concepts of “mind” and “body;” my mind may be lodged in my body now, but this is a matter of sheer contingency. Mind need not become located in body. Its nature will not be affected in any way by the death of this body and there is no reason in principle why it should not have

been located in a body radically different from a human one.

By exactly the same token, any correlation that exists between bodily behavior and mental states must also be entirely contingent; there can be no conceptual connections between the contents of a mind at a given time and the nature and/or behavior of the body in which it is located at that time.

This raises the question as to how my supposed analogical inferences to other minds are to take place at all. How can I apply psychological concepts to others, if I know only that they apply to me? To take a concrete example again, if I learn what "pain" means by reference to my own case, then I will understand "pain" to mean "my pain" and the supposition that pain can be ascribed to anything other than myself will be unintelligible to me.

If the relationship between having a human body and a certain kind of mental life is as contingent as the Cartesian account of mind implies, it should be equally easy – or equally difficult – for me to conceive of a table as being in pain as it is for me to conceive of another person as being in pain. The point, of course, is that this is not so. The supposition that a table might experience pain is a totally meaningless one, whereas the ascription of pain to other human beings and animals that, in their physical characteristics and/or behavioral capabilities, resemble human beings is something which even very young children find unproblematic.

How is this to be accounted for? It will not do, in this context, to simply respond that a table does not have the same complex set of physical characteristics as a human body or that it is not capable of the same patterns of behavior as a human body. Because the Cartesian position implies that there is no logical connection between the mental and the physical, between the possession of a body of a particular kind and the capability for consciousness. Physical differentiation can and must be acknowledged, but it can play no role in any explanation of what it is to have a mental life.

I am surrounded by other bodies, some of which are similar to mine, and some of which are different. On Cartesian principles such similarities and such differences are irrelevant. The question as to whether it is legitimate for me to ascribe psychological predicates to entities other than myself, which the argument from analogy is designed to address, cannot hinge on the kind of body that I am confronted at a given time.

Assuming the validity of the Cartesian position, we have to infer that it makes as much or a little sense, on these premises, to attribute any psychological predicate to another human being as it does to attribute it to a table or a rock.

On these premises, it makes no sense to attribute consciousness to another human being at all. Thus on strict Cartesian principles, the argument from analogy will not do the work that is required of it to bridge the gulf between my conscious states and putative conscious states that are not mine. Ultimately, it must be confessed that on these principles I know only my own mental states and the supposition that there are mental states other than my own ceases to be intelligible to me. It is thus that solipsism comes to seem inescapable.

If the above argument is valid, it demonstrates that the acceptance of the Cartesian account of consciousness and the view that my understanding of psychological concepts derives, as do the concepts themselves, from my own case leads inexorably to solipsism. However, it may fairly be

said that the argument accomplishes more than just this. It can, and should, be understood as a *reductio ad absurdum* refutation of these Cartesian principles. Viewed from this perspective, the argument may be paraphrased as follows:

If there is no logical connection between the physical and the mental, if the physical forms no part of the criteria that govern my ascription of psychological predicates, then I would be able to conceive of an inanimate object such as a table as having a soul and being conscious. But I cannot attach any intelligibility to the notion of an inanimate object being conscious. It follows therefore that there is a logical connection between the physical and the mental: the physical does form part of the criteria that govern my ascription of psychological words.

## **The Physical and the Mental**

What then is this logical connection between the physical and the mental? This question can best be answered by reflecting, for example, on how a cartoonist might show that a particular table was angry or in pain. As indicated above, it is impossible to attach literal meaning to the assertion that a given inanimate object is angry or in pain, but clearly a certain imaginative latitude may be allowed for specific purposes and a cartoonist might conceivably want to picture a table as being angry for humorous reasons.

What is significant in this connection, however, is that to achieve this effect, the cartoonist must picture the table as having human features – the pictured table will appear angry to us only to the extent to that it possesses the natural human expression of anger.

The concept of anger can find purchase in relation to the table only if it is represented as possessing something like a human form. This example demonstrates a point of quite fundamental importance: so far from being acquired by abstraction from my own case, from my own “inner” mental life, my psychological concepts are acquired in a specifically intersubjective, social, linguistic context and part of their meaning is their primary application to living human beings.

To put this slightly differently, a person is a living human being and the human person in this sense functions as our paradigm of that which has a mental life; it is precisely in relation to their application to persons that we learn such concepts as “consciousness,” “pain,” “anger,” and so forth. As such, it is a necessary and antecedent condition for the ascription of psychological predicates such as these to an object that it should “possess” a body of a particular kind. Wittgenstein articulated this point in one of the centrally important methodological tenets of the *Investigations*: Only of a living human being and what resembles (behaves like) a living human being can one say: it has sensations; it sees; is blind; hears; is deaf; is conscious or unconscious. Consequently, the belief that there is something problematic about the application of psychological words to other human beings and that such applications are necessarily the products of highly fallible inferences to the “inner” mental lives of others, which require something like the argument from analogy for their justification, turns out to be fundamentally confused. The intersubjective world that we live with other human beings and the public language-system that we must master if we are to think at all are the primary data, the “proto-phenomena,” in Wittgenstein’s phrase.

Our psychological and non-psychological concepts alike are derived from a single linguistic

fountainhead. It is precisely because the living human being functions as our paradigm of that which is conscious and has a mental life that we find the solipsistic notion that other human beings could be “automatons,” machines devoid of any conscious thought or experience, bizarre and bewildering. The idea that other persons might all in reality be “automatons” is not one which we can seriously entertain.

## **Knowing Other Minds**

We are now in a position to see the essential redundancy of the argument from analogy. First, it is a misconception to think that we need any inferential argument to assure us of the existence of other minds. Such an assurance seems necessary only so long as it is assumed that each of us has to work “outwards” from the interiority of his/her own consciousness, to abstract from our own cases to the “internal” world of others.

As indicated above, this assumption is fundamentally wrong – our knowledge that other human beings are conscious and our knowledge of their mental states at a given time is not inferential in nature at all, but is rather determined by the public criteria that govern the application of psychological concepts. I know that a person who behaves in a particular way – who, for example, gets red in the face, shouts, gesticulates, speaks vehemently, and so forth – is angry precisely because I have learned the concept “anger” by reference to such behavioral criteria. There is no inference involved here. I do not reason “he behaves in this way, therefore he is angry” – rather “behaving in this way” is part of what it is to be angry and it does not occur to any sane person to question whether the individual who acts in this way is conscious or has a mental life.

Second, because the argument from analogy treats the existence of the mental lives of other living human beings as problematic, it seeks to establish that it is legitimate to infer that other living human beings do indeed have mental lives, that each one of us may be said to be justified in his confidence that he is surrounded by other persons rather than “automatons.” The difficulty here, however, is that the argument presupposes that I can draw an analogy between two things, myself as a person and other living human beings, that are sufficiently similar to permit the analogous comparison and sufficiently different to require it.

The question must be faced, however, is how or in what respects am I different from or similar to other human beings? The answer is that I am neither. I am a living human being, as are these others. I see about me living human beings and the argument from analogy is supposed to allow me to infer that these are persons like myself. However, the truth is that I have no criterion for discriminating living human beings from persons, for the very good reason that persons are living human beings – there is no conceptual difference between the two. Since the argument acknowledges that I know living human beings directly, it thereby implicitly acknowledges that I know other persons directly, thus making itself functionally redundant.

A final, frequently-encountered objection to the argument from analogy derives from the work of Strawson and Malcolm: the argument attempts to move inferentially from my supposed direct knowledge of my own mental life and “inner” states to my indirect knowledge of the mental states of others. It thus presupposes that I know what it means to assign mental states to myself without necessarily knowing what it means to ascribe them to others.

This is incoherent. To speak of certain mental states as being mine in the first place is to

discriminate them from mental states that are not mine and these, by definition, are the mental states of others. It follows, therefore, that in a fundamental sense the argument from analogy cannot get off the ground: one cannot know how to ascribe mental states to oneself unless one also knows what it means to ascribe mental states to others.

Plausible as this objection seems at first sight, it is (ironically, on Wittgensteinian criteria) quite mistaken. For it is not the case that when I am in pain I first identify the pain and subsequently come to recognize that it is one that I, as distinct from someone else, have. The personal pronoun "I" in the locution "I am in pain" is not the "I" of personal individuation – it does not refer to me or discriminate me as a publicly situated person as distinct from others.

The exponent of the argument from analogy is not guilty of the charge of presupposing the very thing that he is endeavoring to demonstrate, as both Strawson and Malcolm suggest. Wittgenstein in fact considered that there is a genuine asymmetry here, in relation to the ascription of psychological predicates to oneself and to others, which is dimly perceived but misrepresented by those who feel the need of the argument from analogy. Whereas one ascribes psychological states to others by reference to bodily and behavioral criteria, one has and requires no criteria at all to self-ascribe or self-avow them.

Thus the exponent of the argument from analogy sees, quite correctly, that present-tense, first-person psychological assertions such as "I am in pain" differ radically from third-person psychological predicate ascriptions, but thinks of the former as descriptions of "inner" mental states to which he alone has a privileged access. This is crucially wrong. Such uses of the word "I" as occur in present-tense, first-person psychological assertions do not identify a possessor; they do not discriminate one person from amongst a group. As Wittgenstein puts it, To say "I have pain" is no more a statement about a particular person than moaning is.

To ascribe pain to a third party, on the other hand, is to identify a concrete individual as the possessor of the pain. On this point alone Wittgenstein concurs with the exponent of the argument from analogy. However, Wittgenstein here calls attention to the fact that the asymmetry is not one that exists between the supposedly direct and certain knowledge that I have of my own mental states as distinct from the wholly inferential knowledge which, allegedly, I have of the mental states of others.

Rather, the asymmetry is that the ascriptions of psychological predicates to others require criterial justificatory grounds, whereas the self-avowals or self- ascriptions of such predicates are criterionless. It thus transpires that the argument from analogy appears possible and necessary only to those who misapprehend the asymmetry between the criterial bases for third-person psychological predicate ascription and the non-criterial right for their self- ascription or self-avowal for a cognitive asymmetry between direct and indirect knowledge of mental states.

The Cartesian egocentric view of the mind and of mental events that gives rise both to the specter of solipsism and attempts to evade it by means of the argument from analogy has its origins in this very misapprehension.

## **The Privacy of Experience**

What then of solipsism? To what extent does the foregoing undermine it as a coherent

philosophical hypothesis, albeit one in which no-one really believes? Solipsism rests upon certain presuppositions about the mind and our knowledge of mental events and processes. Two of these, the thesis that I have a privileged form of access to and knowledge of my own mind and the thesis that there is no conceptual or logically necessary link between the mental and the physical, have been dealt with above. If the foregoing is correct, both theses are false.

This leaves us with the final presupposition underlying solipsism, that all experiences are necessarily (that is logically) private to the individual whose experiences they are. This thesis – which, it is fair to say, is very widely accepted – also derives from the Cartesian account of mind and generates solipsistic conclusions by suggesting that experience is something that, because of its “occult” or ephemeral nature, can never literally be shared. No two people can ever be said to have the same experience. This again introduces the problem of how one person can know the experiences of another or, more radically, how one can know that another person has experiences at all.

Wittgenstein offers a comprehensive critique of this view. He attacks the notion that experience is necessarily private. His arguments against this are complex, if highly compressed and rather oracular.

Wittgenstein distinguishes two senses of the word “private” as it is normally used: privacy of knowledge and privacy of possession. Something is private to me in the first sense if only I can know it; it is private to me in the second sense if only I can have it. Thus the thesis that experience is necessarily private can mean one of two things, which are not always discriminated from each other with sufficient care:

- (a) only I can know my experiences or
- (b) only I can have my experiences.

Wittgenstein argues that the first of these is false and the second is true in a sense that does not make experience necessarily private, as follows: Under (a), if we take pain as an experiential exemplar, we find that the assertion “Only I can know my pains” is a conjunction of two separate theses: (i) I (can) know that I am in pain when I am in pain and (ii) other people cannot know that I am in pain when I am in pain. Thesis (i) is, literally, nonsense: it cannot be meaningfully asserted of me that I know that I am in pain. Wittgenstein’s point here is not that I do not know that I am in pain when I am in pain, but rather that the word “know” cannot be significantly employed in this way. This is because the verbal locution “I am in pain” is usually (though not invariably) an expression of pain – as part of acquired pain-behavior it is a linguistic substitute for such natural expressions of pain as groaning.

For this reason it cannot be governed by an epistemic operator. The prepositional function “I know that x” does not yield a meaningful proposition if the variable is replaced by an expression of pain, linguistic or otherwise. Thus to say that others learn of my pains only from my behavior is misleading, because it suggests that I learn of them otherwise, whereas I don’t learn of them at all – I have them.

Thesis (ii) – other people cannot know that I am in pain when I am in pain – is false. If we take the word “know” as it is normally used, then it is true to say that other people can and very frequently do know when I am in pain. Indeed, in cases where the pain is extreme, it is often

impossible to prevent others from knowing this even when one wishes to do so. Thus, in certain circumstances, it would not be unusual to hear it remarked of someone, for example, that “a moan of pain escaped him” – indicating that despite his efforts, he could not but manifest his pain to others. It thus transpires that neither thesis (i) nor (ii) is true.

If we turn to (b), we find that “Only I can have my pains” expresses a truth, but it is a truth that is grammatical rather than ontological. It draws our attention to the grammatical connection between the personal pronoun “I” and the possessive “my.” However, it tells us nothing specifically about pains or other experiences, for it remains true if we replace the word “pains” with many other plural nouns (e.g. “Only I can have my blushes”).

Another person can have the same pain as me. If our pains have the same phenomenal characteristics and corresponding locations, we will quite correctly be said to have “the same pain.” This is what the expression “the same pain” means.

Another person, however, cannot have my pains. My pains are the ones that, if they are expressed at all, are expressed by me. But by exactly the same (grammatical) token, another person cannot have my blushes, sneezes, frowns, fears, and so forth., and none of this can be taken as adding to our stockpile of metaphysical truths. It is true that I may deliberately and successfully keep an experience to myself, in which case that particular experience might be said to be private to me. But I might do this by articulating it in a language that those with whom I was conversing do not understand. There is clearly nothing occult or mysterious about this kind of privacy. (Investigations, II. xi, p. 222). Similarly, experience that I do not or cannot keep to myself is not private. In short, some experiences are private and some are not. Even though some experiences are private in this sense, it does not follow that all experiences could be private. As Wittgenstein points out, “What sometimes happens could always happen” is a fallacy. It does not follow from the fact that some orders are not obeyed that all orders might never be obeyed. For in that case the concept “order” would become incapable of instantiation and would lose its significance. (I. § 345).

## **The Incoherence of Solipsism**

With the belief in the essential privacy of experience eliminated as false, the last presupposition underlying solipsism is removed and solipsism is shown as foundationless, in theory and in fact. One might even say, solipsism is necessarily foundationless, for to make an appeal to logical rules or empirical evidence the solipsist would implicitly have to affirm the very thing that he purportedly refuses to believe: the reality of intersubjectively valid criteria and a public, extra-mental world. There is a temptation to say that solipsism is a false philosophical theory, but this is not quite strong or accurate enough.

As a theory, it is incoherent. What makes it incoherent, above all else, is that the solipsist requires a language (that is a sign-system) to think or to affirm his solipsistic thoughts at all. Given this, it is scarcely surprising that those philosophers who accept the Cartesian premises that make solipsism apparently plausible, if not inescapable, have also invariably assumed that language-usage is itself essentially private. The cluster of arguments – generally referred to as “the private language argument” – that we find in the Investigations against this assumption effectively administers the coup de grâce to both Cartesian dualism and solipsism.

Language is an irreducibly public form of life that is encountered in specifically social contexts.

Each natural language-system contains an indefinitely large number of “language-games,” governed by rules that, though conventional, are not arbitrary personal fiats. The meaning of a word is its (publicly accessible) use in a language. To question, argue, or doubt is to utilize language in a particular way. It is to play a particular kind of public language-game.

The proposition “I am the only mind that exists” makes sense only to the extent that it is expressed in a public language, and the existence of such language itself implies the existence of a social context. Such a context exists for the hypothetical last survivor of a nuclear holocaust, but not for the solipsist. A non-linguistic solipsism is unthinkable and a thinkable solipsism is necessarily linguistic. Solipsism therefore presupposes the very thing that it seeks to deny. That solipsistic thoughts are thinkable in the first instance implies the existence of the public, shared, intersubjective world that they purport to call into question.

## God's existence

The last major item in Berkeley's ontology is God, himself a spirit, but an infinite one. Berkeley believes that once he has established idealism, he has a novel and convincing argument for God's existence as the cause of our sensory ideas. He argues by elimination: What could cause my sensory ideas? Candidate causes, supposing that Berkeley has already established that matter doesn't exist, are (1) other ideas, (2) myself, or (3) some other spirit. Berkeley eliminates the first option with the following argument (PHK 25):

- (1) Ideas are manifestly passive—no power or activity is perceived in them.
- (2) But because of the mind-dependent status of ideas, they cannot have any characteristics which they are not perceived to have. Therefore,
- (3) Ideas are passive, that is, they possess no causal power.

It should be noted that premise (2) is rather strong; Phillip Cummins (1990) identifies it as Berkeley's “manifest qualities thesis” and argues that it commits Berkeley to the view that ideas are radically and completely dependent on perceivers in the way that sensations of pleasure and pain are typically taken to be.

The second option is eliminated with the observation that although I clearly can cause some ideas at will (e.g. ideas of imagination), sensory ideas are involuntary; they present themselves whether I wish to perceive them or not and I cannot control their content. The hidden assumption here is that any causing the mind does must be done by willing and such willing must be accessible to consciousness. Berkeley is hardly alone in presupposing this model of the mental; Descartes, for example, makes a similar set of assumptions.

This leaves us, then, with the third option: my sensory ideas must be caused by some other spirit. Berkeley thinks that when we consider the stunning complexity and systematicity of our sensory ideas, we must conclude that the spirit in question is wise and benevolent beyond measure, that, in short, he is God.

## Hume's Ideas

Hume's analysis of human belief begins with a careful distinction among our mental contents: **impressions** are the direct, vivid, and forceful products of immediate experience; **ideas** are merely feeble copies of these original impressions. Thus, for example, the background color of the screen

at which I am now looking is an impression, while my memory of the color of my mother's hair is merely an idea. Since every idea must be derived from an antecedent impression, Hume supposed, it always makes sense to inquire into the origins of our ideas by asking from which impressions they are derived.

To this beginning, add the fact that each of our ideas and impressions is entirely separable from every other, on Hume's view. The apparent connection of one idea to another is invariably the result of an association that we manufacture ourselves. We use our mental operations to link ideas to each other in one of three ways: resemblance, contiguity, or cause and effect. (This animal looks like that animal; this book is on that table; moving this switch turns off the light, for example.) Experience provides us with both the ideas themselves and our awareness of their association. All human beliefs (including those we regard as cases of knowledge) result from repeated applications of these simple associations.

Hume further distinguished between two sorts of belief. Relations of ideas are beliefs grounded wholly on associations formed within the mind; they are capable of demonstration because they have no external referent. Matters of fact are beliefs that claim to report the nature of existing things; they are always contingent. (This is Hume's version of the a priori / a posteriori distinction.) Mathematical and logical knowledge relies upon relations of ideas; it is uncontroversial but uninformative. The interesting but problematic propositions of natural science depend upon matters of fact. Abstract metaphysics mistakenly (and fruitlessly) tries to achieve the certainty of the former with the content of the latter.

### **Concerning Matters of Fact**

Since genuine information rests upon our belief in matters of fact, Hume was particularly concerned to explain their origin. Such beliefs can reach beyond the content of present sense-impressions and memory, Hume held, only by appealing to presumed connections of cause and effect. But since each idea is distinct and separable from every other, there is no self-evident relation; these connections can only be derived from our experience of similar cases. So the crucial question in epistemology is to ask exactly how it is possible for us to learn from experience. Here, Hume supposed, the most obvious point is a negative one: causal reasoning can never be justified rationally. In order to learn, we must suppose that our past experiences bear some relevance to present and future cases. But although we do indeed believe that the future will be like the past, the truth of that belief is not self-evident. In fact, it is always possible for nature to change, so inferences from past to future are never rationally certain. Thus, on Hume's view, all beliefs in matters of fact are fundamentally non-rational.

Consider Hume's favorite example: our belief that the sun will rise tomorrow. Clearly, this is a matter of fact; it rests on our conviction that each sunrise is an effect caused by the rotation of the earth. But our belief in that causal relation is based on past observations, and our confidence that it will continue tomorrow cannot be justified by reference to the past. So we have no rational basis for believing that the sun will rise tomorrow. Yet we do believe it!

### **Belief as a Habit**

Skepticism quite properly forbids us to speculate beyond the content of our present experience and memory, yet we find it entirely natural to believe much more than that. Hume held that these unjustifiable beliefs can be explained by reference to custom or habit. That's how we learn from

experience. When I observe the constant conjunction of events in my experience, I grow accustomed to associating them with each other. Although many past cases of sunrise do not guarantee the future of nature, my experience of them does get me used to the idea and produces in me an expectation that the sun will rise again tomorrow. I cannot prove that it will, but I feel that it must.

Remember that the association of ideas is a powerful natural process in which separate ideas come to be joined together in the mind. Of course they can be associated with each other by rational means, as they are in the relations of ideas that constitute mathematical knowledge. But even where this is possible, Hume argued, reason is a slow and inefficient guide, while the habits acquired by much repetition can produce a powerful conviction independently of reason. Although the truth of " $9 \times 12 = 108$ " can be established rationally in principle, most of us actually learned it by reciting our multiplication tables. In fact, what we call relative probability is, on Hume's view, nothing more than a measure of the strength of conviction produced in us by our experience of regularity.

Our beliefs in matters of fact, then, arise from sentiment or feeling rather than from reason. For Hume, imagination and belief differ only in the degree of conviction with which their objects are anticipated. Although this positive answer may seem disappointing, Hume maintained that custom or habit is the great guide of life and the foundation of all natural science.

### **Necessary Connection**

According to Hume, our belief that events are causally related is a custom or habit acquired by experience: having observed the regularity with which events of particular sorts occur together, we form the association of ideas that produces the habit of expecting the effect whenever we experience the cause. But something is missing from this account: we also believe that the cause somehow produces the effect. Even if this belief is unjustifiable, Hume must offer some explanation for the fact that we do hold it. His technique was to search for the original impression from which our idea of the necessary connection between cause and effect is copied.

The idea does not arise from our objective experience of the events themselves. All we observe is that events of the "cause" type occur nearby and shortly before events of the "effect" type, and that this recurs with a regularity that can be described as a "constant conjunction." Although this pattern of experience does encourage the formation of our habit of expecting the effect to follow the cause, it includes no impression of a necessary connection.

Nor do we acquire this impression (as Locke had supposed) from our own capacity for voluntary motion. Here the objective element of constant conjunction is rarely experienced, since the actions of our minds and bodies do not invariably submit to our voluntary control. And even if volition did always produce the intended movement, Hume argued, that would yield no notion of the connection between them. So there is no impression of causal power here, either.

Still, we do have the idea of a necessary connection, and it must come from somewhere. For a (non-justificatory) explanation, Hume refers us back to the formation of a custom or habit. Our (non-rational) expectation that the effect will follow the cause is accompanied by a strong feeling of conviction, and it is the impression of this feeling that is copied by our concept of a necessary connection between cause and effect. The force of causal necessity is just the strength of our

sentiment in anticipating efficacious outcomes.

## The Self

In a notorious passage of the Treatise, Hume offered a similar account of the belief in the reality of the self. Here there is the ordinary human supposition that lies behind our use of first-personal pronouns. Upon this relatively simple foundation, philosophers have erected the notion of an immaterial substance, a mind or soul that persists through time on its own. Hume's question is, "From what antecedent impression does the idea of the self arise?"

Hume pointed out that we do **not** have an impression of the self. No matter how closely I attend to my own experience, no matter how fully I notice the mental operations presently occurring "in my mind," I am never directly aware of "I." What I do experience is a succession of separate and individual ideas, associated with each other by relations of resemblance and causality. Although these relations may be extended through time by memory, there is no evidence of any substantial ground for their coherence. The persistent self and the immortal soul are philosophical fictions.

To suppose otherwise, Hume held, is to commit a category mistake: the self is just a bundle of perceptions, like the railroad cars in a train; to look for a self beyond the ideas would be like looking for a train beyond the cars. Our idea of a persistent self is simply a result of the human habit of attributing continued existence to any collection of associated parts. Like our idea of the necessary connection of cause with effect, belief in our own reality as substantial selves is natural, but unjustifiable.

## External World

Another perfectly ordinary feature of human cognition is our belief in the reality of the external world. As I write this lesson, I readily suppose that my fingers are touching a keyboard, that the sun is shining outside and that the radio is playing a Clapton song. In Hume's skeptical philosophy, what is the status of these beliefs?

The primitive human belief, Hume noted, is that we actually see (and hear, etc.) the physical objects themselves. But modern philosophy and science have persuaded us that this is not literally true. According to representationalists, we are directly aware of ideas, which must in turn be causally produced in our minds by external objects. The problem is that on this view we can never know that there really are physical objects that produce our sensory ideas.

We cannot rely on causal reasoning to convince us that there are external objects, Hume argued, since (as we have just seen) such reasoning arises from our observation of a constant conjunction between causes and effects. But according to the representationalist philosophy, we have no direct experience of the presumed cause! If we know objects only by means of ideas, then we cannot use those ideas to establish a causal connection between the things and the objects they are supposed to represent.

In fact, Hume supposed, our belief in the reality of an external world is entirely non-rational. It cannot be supported either as a relation of ideas or even as a matter of fact. Although it is utterly unjustifiable, however, belief in the external world is natural and unavoidable. We are in the habit of supposing that our ideas have external referents, even though we can have no real evidence for doing so. Representationalism thusly implodes: the ideas, originally introduced as

intermediaries between perceivers and things, end up absorbing both, rendering everything but themselves superfluous.

## **Skepticism**

Where does this leave us? Hume believed himself to be carrying out the empiricist program with rigorous consistency. Locke honestly proposed the possibility of deriving knowledge from experience, but did not carry it far enough. Bayle and Berkeley noticed further implications. Now Hume has shown that empiricism inevitably leads to an utter and total skepticism.

According to Hume, knowledge of pure mathematics is secure because it rests only on the relations of ideas, without presuming anything about the world. Experimental observations (conducted without any assumption of the existence of material objects) permit us to use our experience in forming useful habits. Any other epistemological effort, especially if it involves the pretense of achieving useful abstract knowledge, is meaningless and unreliable.

The most reasonable position, Hume held, is a "mitigated" skepticism that humbly accepts the limitations of human knowledge while pursuing the legitimate aims of math and science. In our non-philosophical moments, of course, we will be thrown back upon the natural beliefs of everyday life, no matter how lacking in rational justification we know them to be.

## **Personal Identity**

Later in eighteenth century, Scottish philosopher David Hume sought to develop more fully the consequences of Locke's cautious empiricism by applying the scientific methods of observation to a study of human nature itself. We cannot rely on the common-sense pronouncements of popular superstition, which illustrate human conduct without offering any illumination, Hume held, nor can we achieve any genuine progress by means of abstract metaphysical speculation, which imposes a spurious clarity upon profound issues. The alternative is to reject all easy answers, employing the negative results of philosophical skepticism as a legitimate place to start.

Stated more positively, Hume's position is that since human beings do in fact live and function in the world, we should try to observe how they do so. The key principle to be applied to any investigation of our cognitive capacities is, then, an attempt to discover the causes of human belief. This attempt is neither the popular project of noticing and cataloging human beliefs nor the metaphysical effort to provide them with an infallible rational justification. According to Hume, the proper goal of philosophy is simply to explain why we believe what we do. His own attempt to achieve that goal was the focus of Book I of the *Treatise of Human Nature* and all

## **Reason**

### **Grounds for Morality**

Having examined the epistemological basis for Hume's naturalism, we are ready to consider its application to human conduct. In morality as in all else, Hume supposed, our beliefs and actions are the products of custom or habit. Since all of our most scientific beliefs have exactly the same foundation, this account preserves the natural dignity of moral judgments.

Hume devoted the second book of the *Treatise* to an account of the human passions and a discussion of their role in the operation of the human will. It is our feelings or sentiments, Hume

claimed, that exert practical influence over human volition and action. Observation does reveal a constant conjunction between having a motive (not a reason) for acting and performing the action in question. Hence, with the same reliability that characterizes our belief in any causal relation, on Hume's view, we further believe that our feelings have the power to result in actions.

At one level, of course, this entails that we are determined to act as we do. Our feelings or sentiments produce our actions with the same degree of causal necessity, the same habitual expectation that the future will resemble the past, as that by which the rotation of the earth causes the sun to rise. (Like Locke, Hume denied that determination of this sort is relevant to our moral freedom; only when my actions are observed to be the effects of some cause outside myself could I decline to accept my own responsibility for them.) So a proper science of human nature will account for human actions, as well as for human beliefs, by reference to the natural formation of habitual associations with human feelings.

Clearly, rationality had no place in this account of morality. Although reason may judge relations of ideas and matters of fact, its most vivid outcomes never compel us to act as even the weakest of feelings may do. No compilation of facts, however complete or reliable, ever entails a moral obligation or results in action. "Reason is, and ought to be, only the slave of the passions," Hume held. All human actions flow naturally from human feelings, without any interference from human reason.

### **Moral Sentiment**

It does not follow that all actions are of equal value. On Hume's view, the judgments and recommendations of traditional morality arise not from reason, but from a moral sense. As a straightforward matter of fact (discoverable by experience), virtue is always accompanied by a feeling of pleasure, and vice by a feeling of pain. Thus, we praise an instance of virtuous action precisely because it arouses in us a pleasant feeling, and we avoid committing a vicious action because we anticipate that doing so would produce pain. Our feelings provide a natural guide for moral conduct.

Hume worked out the details of this account in Book III of the *Treatise*. The ideas of benevolence, utility, and justice arouse our deepest and most pervasive feelings, he maintained, and these feelings in turn motivate us toward actions of moral worth. I offer assistance to those in need because it makes me feel good to do so, and I am fair in my dealings with others because it would make me feel bad if I were not. All of morality rests firmly upon the natural human inclination to seek pleasure and avoid pain.

This noncognitive derivation of morality from emotion rather than from reason may seem hopelessly subjective at first glance, but remember that on Hume's view our confidence in causal efficacy has a similar source. I do what is morally right in the same way that I believe there is an external world—by following my natural inclinations in the absence of rational evidence. Thus, Hume regarded himself as having provided morality with a status no less significant in human life than that of natural science.

### **God's Existence**

Finally, we pause for a quick look at Hume's views on religion. In his own time, he was often regarded as a great enemy of organized religion. The posthumously published *Dialogues* offer an

extended treatment of the intellectual interchanges among facile orthodoxy, natural theology, and philosophical skepticism. There Hume took great care to expose what he believed to be the great mistake of trying to prove that god exists.

The newly-popular argument from design supposes that the order and beauty of the universe reflect the greatness and demonstrate the reality of its ultimate cause. Hume noted that since this analogical argument claims to infer a cause from presumed effects, it must be grounded as a matter of fact on the experience of a constant conjunction. But since in fact we have not observed repeated instances of gods creating universes, we cannot have formed the habit of associating our experience of the one with our inferences about the other. No causal relationship can ever be established from the observation of a unique example.

What is more, Hume argued that even if it were possible to engage in causal reasoning in this case, it could not warrant the intended conclusion. The presumed cause must always be supposed to be proportional to the observed effect, so the manifest imperfections of this world could never support belief in the perfection of its creator. The argument from design is a two-edged sword, as likely to persuade us of the frailty or malevolence as of the power and benevolence of the presumed cause of the world as we know it.

## **Miracles**

Nor did Hume suppose that references to the miraculous would provide a rational basis for religion. In this case, we do have the experience of constant conjunction to establish the "laws of nature" of which any purported miracle is a violation, and we have only the testimony of witnesses to establish the fact of the miracle itself. Since this testimony and the motives of the witnesses who offer it are always open to question, Hume argued, we will believe that the miracle occurred only when the possibility of false testimony seems an even greater violation of the natural order.

Some scholars suppose that the final paragraph of the essay "On Miracles" (Inquiry Section X) and the closing words of the Dialogues reflect Hume's acceptance of religious fideism, the notion that religion is properly a matter of faith, not reason. On this view, a fideistic Hume could hold that belief in the existence of god or the immortality of the soul is no less natural than belief in the existence of bodies or the persistence of the self. An alternative interpretation, however, accepts the lengthy rejection of religious orthodoxy as sincere while attributing the brief, moderate endings as a half-hearted effort to take the edge off. Certainly Hume's influence on the philosophy of religion has been primarily of the latter sort.

## **The Passions and the Will**

According to Hume's theory of the mind, the passions (what we today would call emotions, feelings, and desires) are impressions rather than ideas (original, vivid and lively perceptions that are not copied from other perceptions). The direct passions, which include desire, aversion, hope, fear, grief, and joy, are those that "arise immediately from good or evil, from pain or pleasure" that we experience or think about in prospect; however he also groups with them some instincts of unknown origin, such as the bodily appetites and the desires that good come to those we love and harm to those we hate, which do not proceed from pain and pleasure but produce them. The indirect passions, primarily pride, humility (shame), love and hatred, are generated in a more complex way, but still one involving either the thought or experience of pain or pleasure. Intentional actions are caused by the direct passions (including the instincts). Of the indirect passions Hume

says that pride, humility, love and hatred do not directly cause action; it is not clear whether he thinks this true of all the indirect passions.

Hume is traditionally regarded as a compatibilist about freedom and determinism, because in his discussion in the Enquiry concerning Human Understanding he argues that if we understand the doctrines of liberty and necessity properly, all mankind consistently believe both that human actions are the products of causal necessity and that they are free. In the Treatise, however, he explicitly repudiates the doctrine of liberty as "absurd... in one sense, and unintelligible in any other". The two treatments, however, surprisingly enough, are entirely consistent.

Hume construes causal necessity to mean the same as causal connection (or rather, intelligible causal connection), as he himself analyzes this notion in his own theory of causation: either the "constant union and conjunction of like objects," or that together with "the inference of the mind from the one to the other". In both works he argues that just as we discover necessity (in this sense) to hold between the movements of material bodies, we discover just as much necessity to hold between human motives, character traits, and circumstances of action, on the one hand, and human behavior on the other. He says in the Treatise that the liberty of indifference is the negation of necessity in this sense; this is the notion of liberty that he there labels absurd, and identifies with chance or randomness (which can be no real power in nature) both in the Treatise and the first (epistemological) Enquiry.

Human actions are not free in this sense. However, Hume allows in the Treatise that they are sometimes free in the sense of 'liberty' which is opposed to violence or constraint. This is the sense on which Hume focuses in ECHU: "a power of acting or not acting, according to the determinations of the will;" which everyone has "who is not a prisoner and in chains". It is this that is entirely compatible with necessity in Hume's sense. So the positions in the two works are the same, although the polemical emphasis is so different – iconoclastic toward the libertarian view in the Treatise, and conciliatory toward "all mankind" in the first Enquiry.

Hume argues, as well, that the causal necessity of human actions is not only compatible with moral responsibility but requisite to it. To hold an agent morally responsible for a bad action, it is not enough that the action be morally reprehensible; we must impute the badness of the fleeting act to the enduring agent. Not all harmful or forbidden actions incur blame for the agent; those done by accident, for example, do not. It is only when, and because, the action's cause is some enduring passion or trait of character in the agent that she is to blame for it.

## **The Critical Philosophy**

Next we turn to the philosophy of Immanuel Kant, a watershed figure who forever altered the course of philosophical thinking in the Western tradition. Long after his thorough indoctrination into the quasi-scholastic German appreciation of the metaphysical systems of Leibniz and Wolff, Kant said, it was a careful reading of David Hume that "interrupted my dogmatic slumbers and gave my investigations in the field of speculative philosophy a quite new direction." Having appreciated the full force of such skeptical arguments, Kant supposed that the only adequate response would be a "Copernican Revolution" in philosophy, a recognition that the appearance of the external world depends in some measure upon the position and movement of its observers. This central idea became the basis for his life-long project of developing a critical philosophy that could withstand them.

Kant's aim was to move beyond the traditional dichotomy between rationalism and empiricism. The rationalists had tried to show that we can understand the world by careful use of reason; this guarantees the indubitability of our knowledge but leaves serious questions about its practical content. The empiricists, on the other hand, had argued that all of our knowledge must be firmly grounded in experience; practical content is thus secured, but it turns out that we can be certain of very little. Both approaches have failed, Kant supposed, because both are premised on the same mistaken assumption.

Progress in philosophy, according to Kant, requires that we frame the epistemological problem in an entirely different way. The crucial question is not how we can bring ourselves to understand the world, but how the world comes to be understood by us. Instead of trying, by reason or experience, to make our concepts match the nature of objects, Kant held, we must allow the structure of our concepts shape our experience of objects. This is the purpose of Kant's Critique of Pure Reason (1781, 1787): to show how reason determines the conditions under which experience and knowledge are possible.

### **Classification of judgements, possibility of synthetic a priori judgements**

In the Prolegomena to any Future Metaphysic (1783) Kant presented the central themes of the first Critique in a somewhat different manner, starting from instances in which we do appear to have achieved knowledge and asking under what conditions each case becomes possible. So he began by carefully drawing a pair of crucial distinctions among the judgments we do actually make.

The first distinction separates a priori from a posteriori judgments by reference to the origin of our knowledge of them. **A priori** judgments are based upon reason alone, independently of all sensory experience, and therefore apply with strict universality. **A posteriori** judgments, on the other hand, must be grounded upon experience and are consequently limited and uncertain in their application to specific cases. Thus, this distinction also marks the difference traditionally noted in logic between necessary and contingent truths.

But Kant also made a less familiar distinction between analytic and synthetic judgments, according to the information conveyed as their content. **Analytic** judgments are those whose predicates are wholly contained in their subjects; since they add nothing to our concept of the subject, such judgments are purely explicative and can be deduced from the principle of non-contradiction. **Synthetic** judgments, on the other hand, are those whose predicates are wholly distinct from their subjects, to which they must be shown to relate because of some real connection external to the concepts themselves. Hence, synthetic judgments are genuinely informative but require justification by reference to some outside principle.

Kant supposed that previous philosophers had failed to differentiate properly between these two distinctions. Both Leibniz and Hume had made just one distinction, between matters of fact based on sensory experience and the uninformative truths of pure reason. In fact, Kant held, the two distinctions are not entirely coextensive; we need at least to consider all four of their logically possible combinations:

- Analytic a posteriori judgments cannot arise, since there is never any need to appeal to experience in support of a purely explicative assertion.

- Synthetic a posteriori judgments are the relatively uncontroversial matters of fact we come to know by means of our sensory experience (though Wolff had tried to derive even these from the principle of contradiction).
- Analytic a priori judgments, everyone agrees, include all merely logical truths and straightforward matters of definition; they are necessarily true.
- **Synthetic a priori** judgments are the crucial case, since only they could provide new information that is necessarily true. But neither Leibniz nor Hume considered the possibility of any such case.

Unlike his predecessors, Kant maintained that synthetic a priori judgments not only are possible but actually provide the basis for significant portions of human knowledge. In fact, he supposed (pace Hume) that arithmetic and geometry comprise such judgments and that natural science depends on them for its power to explain and predict events. What is more, metaphysics—if it turns out to be possible at all—must rest upon synthetic a priori judgments, since anything else would be either uninformative or unjustifiable. But how are synthetic a priori judgments possible at all? This is the central question Kant sought to answer.

## Mathematics

Consider, for example, our knowledge that two plus three is equal to five and that the interior angles of any triangle add up to a straight line. These (and similar) truths of mathematics are synthetic judgments, Kant held, since they contribute significantly to our knowledge of the world; the sum of the interior angles is not contained in the concept of a triangle. Yet, clearly, such truths are known a priori, since they apply with strict and universal necessity to all of the objects of our experience, without having been derived from that experience itself. In these instances, Kant supposed, no one will ask whether or not we have synthetic a priori knowledge; plainly, we do. The question is, how do we come to have such knowledge? If experience does not supply the required connection between the concepts involved, what does?

Kant's answer is that we do it ourselves. Conformity with the truths of mathematics is a precondition that we impose upon every possible object of our experience. Just as Descartes had noted in the Fifth Meditation, the essence of bodies is manifested to us in Euclidean solid geometry, which determines a priori the structure of the spatial world we experience. In order to be perceived by us, any object must be regarded as being uniquely located in space and time, so it is the spatio-temporal framework itself that provides the missing connection between the concept of the triangle and that of the sum of its angles. Space and time, Kant argued in the "Transcendental Aesthetic" of the first Critique, are the "pure forms of sensible intuition" under which we perceive what we do.

Understanding mathematics in this way makes it possible to rise above an old controversy between rationalists and empiricists regarding the very nature of space and time. Leibniz had maintained that space and time are not intrinsic features of the world itself, but merely a product of our minds. Newton, on the other hand, had insisted that space and time are absolute, not merely a set of spatial and temporal relations. Kant now declares that both of them were correct! Space and time are absolute, and they do derive from our minds. As synthetic a priori judgments, the truths of mathematics are both informative and necessary.

This is our first instance of a transcendental argument, Kant's method of reasoning from the fact that we have knowledge of a particular sort to the conclusion that all of the logical presuppositions

of such knowledge must be satisfied. We will see additional examples in later lessons, and can defer our assessment of them until then. But notice that there is a price to be paid for the certainty we achieve in this manner. Since mathematics derives from our own sensible intuition, we can be absolutely sure that it must apply to everything we perceive, but for the same reason we can have no assurance that it has anything to do with the way things are apart from our perception of them. Next time, we'll look at Kant's very similar treatment of the synthetic a priori principles upon which our knowledge of natural science depends.

## **Preconditions for Natural Science**

In natural science no less than in mathematics, Kant held, synthetic a priori judgments provide the necessary foundations for human knowledge. The most general laws of nature, like the truths of mathematics, cannot be justified by experience, yet must apply to it universally. In this case, the negative portion of Hume's analysis—his demonstration that matters of fact rest upon an unjustifiable belief that there is a necessary connection between causes and their effects—was entirely correct. But of course Kant's more constructive approach is to offer a transcendental argument from the fact that we do have knowledge of the natural world to the truth of synthetic a priori propositions about the structure of our experience of it.

As we saw last time, applying the concepts of space and time as forms of sensible intuition is necessary condition for any perception. But the possibility of scientific knowledge requires that our experience of the world be not only perceivable but thinkable as well, and Kant held that the general intelligibility of experience entails the satisfaction of two further conditions:

First, it must be possible in principle to arrange and organize the chaos of our many individual sensory images by tracing the connections that hold among them. This Kant called the synthetic unity of the sensory manifold.

Second, it must be possible in principle for a single subject to perform this organization by discovering the connections among perceived images. This is satisfied by what Kant called the transcendental unity of apperception. Experiential knowledge is thinkable only if there is some regularity in what is known and there is some knower in whom that regularity can be represented. Since we do actually have knowledge of the world as we experience it, Kant held, both of these conditions must in fact obtain.

## **The metaphysical and the transcendental Deduction of the Categories**

Since (as Hume had noted) individual images are perfectly separable as they occur within the sensory manifold, connections between them can be drawn only by the knowing subject, in which the principles of connection are to be found. As in mathematics, so in science the synthetic a priori judgments must derive from the structure of the understanding itself.

Consider, then, the sorts of judgments distinguished by logicians (in Kant's day): each of them has some quantity (applying to all things, some, or only one); some quality (affirmative, negative, or complementary); some relation (absolute, conditional, or alternative); and some modality (problematic, assertoric, or apodeictic). Kant supposed that any intelligible thought can be expressed in judgments of these sorts. But then it follows that any thinkable experience must be understood in these ways, and we are justified in projecting this entire way of thinking outside ourselves, as the inevitable structure of any possible experience.

The result of this "Transcendental Logic" is the schematized table of categories, Kant's summary of the central concepts we employ in thinking about the world, each of which is discussed in a separate section of the Critique:

<b>Quantity</b>	<b>Quality</b>
Unity	Reality
Plurality	Negation
Totality	Limitation
Axioms of Intuition	Anticipations of Perception
<b>Relation</b>	<b>Modality</b>
Substance	Possibility
Cause	Existence
Community	Necessity
Analogies of Experience	Postulates of Empirical Thought

Our most fundamental convictions about the natural world derive from these concepts, according to Kant. The most general principles of natural science are not empirical generalizations from what we have experienced, but synthetic a priori judgments about what we could experience, in which these concepts provide the crucial connectives.

### **Phenomena and Noumena**

Having seen Kant's transcendental deduction of the categories as pure concepts of the understanding applicable a priori to every possible experience, we might naturally wish to ask the further question whether these regulative principles are really true. Are there substances? Does every event have a cause? Do all things interact? Given that we must suppose them in order to have any experience, do they obtain in the world itself? To these further questions, Kant firmly refused to offer any answer.

According to Kant, it is vital always to distinguish between the distinct realms of phenomena and noumena. **Phenomena** are the appearances, which constitute the our experience; **noumena** are the (presumed) things themselves, which constitute reality. All of our synthetic a priori judgments apply only to the phenomenal realm, not the noumenal. (It is only at this level, with respect to what we can experience, that we are justified in imposing the structure of our concepts onto the objects of our knowledge.) Since the thing in itself (Ding an sich) would by definition be entirely independent of our experience of it, we are utterly ignorant of the noumenal realm.

Thus, on Kant's view, the most fundamental laws of nature, like the truths of mathematics, are knowable precisely because they make no effort to describe the world as it really is but rather prescribe the structure of the world as we experience it. By applying the pure forms of sensible

intuition and the pure concepts of the understanding, we achieve a systematic view of the phenomenal realm but learn nothing of the noumenal realm. Math and science are certainly true of the phenomena; only metaphysics claims to instruct us about the noumena.

### **Rejection of speculative metaphysics**

Although our knowledge of mathematics and natural science yield easily to a Kantian analysis, the synthetic a priori judgments of metaphysics are much more difficult to explain. Here the forms of intuition and concepts of understanding are useless, since they find application only in the realm of our experience, while metaphysics seeks to transcend experience completely, in order to discover the nature of reality itself as comprehended under pure reason.

Metaphysical speculation properly begins with the same method as the "Aesthetic" and "Analytic," Kant supposed, but it invariably ends up in a "Dialectic." The transcendental arguments we employ in metaphysics need not restrict their determination to the phenomenal realm alone, since their aim is genuine knowledge of the noumena. Synthetic a priori judgments in metaphysics must be grounded upon truly transcendental ideas, which are regarded as applicable to things in themselves independently of our experience of them.

### **The Ideas of Reason – soul, God and world as a whole**

Kant's exposition of the transcendental ideas begins once again from the logical distinction among categorical, hypothetical, and disjunctive syllogisms. From this distinction, as we have seen, the understanding derives the concepts of substance, cause, and community, which provide the basis for rules that obtain as natural laws within our experience. Now, from the same distinction, the reason must carry things further in order to derive the transcendental ideas of the complete subject, the complete series of conditions, and the complete complex of what is possible. Thus, the "completion" of metaphysical reasoning requires transcendental ideas of three sorts, but Kant argued that each leads to its characteristic irresolvable difficulty.

The **Psychological Idea** is the concept of the soul as a permanent substance which lives forever. It is entirely natural to reason (as in Descartes's cogito) from knowledge that "I think" to my real existence as one and the same thinking thing through all time, but Kant held that our efforts to reach such conclusions are "Paralogisms," with only illusory validity. It is true that thought presupposes the unity of apperception and that every change presupposes an underlying substance, but these rules apply only to the phenomena we experience. Since substantial unity and immortality are supposed to be noumenal features of the soul as a thing in itself, Kant held, legitimate a priori judgments can never prove them, and the effort to transcend in this case fails.

The **Cosmological Idea** is the concept of a complete determination of the nature of the world as it must be constituted in itself. In this case, Kant held, the difficulty is not that we can conclude too little but rather that we can prove too much. From the structure of our experience of the world, it is easy to deduce contradictory particular claims about reality: finitude vs. infinity; simplicity vs. complexity; freedom vs. determinism; necessity vs. contingency. These "Antinomies" of Pure Reason can be avoided only when we recognize that one or both of the contradictory proofs in each antinomy holds only for the phenomenal realm. Once again, it is the effort to achieve transcendental knowledge of noumena that necessarily fails.

The **Theological Idea** is the concept of an absolutely perfect and most real being (or god). Again it

is natural to move from our recognition of dependence within the phenomenal realm to the notion of a perfectly independent noumenal being, the "Transcendental Ideal." But traditional attempts to prove that god really exists, founded as they are on what we experience, cannot establish the reality of a being necessarily beyond all experience.

The general point of the Transcendental Dialectic should by now be clear: metaphysical speculation about the ultimate nature of reality invariably fails. The synthetic a priori judgments which properly serve as regulative principles governing our experience can never be shown to have any force as constitutive of the real nature of the world. Pure reason inevitably reaches for what it cannot grasp.

## **The Limits of Reason**

Now that we've seen Kant's answers to all three parts of the Prolegomena's "Main Transcendental Question" and have traced their sources in the Critique of Pure Reason, we are in a position to appreciate his careful delineation of what is possible in metaphysical thought and what is not. What most clearly is not possible is any legitimate synthetic a priori judgment about things in themselves. The only thing that justifies the application of regulative principles in mathematics and natural science is their limitation to phenomena. Both sensible intuition and the understanding deal with the conditions under which experience is possible. But the whole point of speculative metaphysics is to transcend experience entirely in order to achieve knowledge of the noumenal realm. Here, only the faculty of reason is relevant, but its most crucial speculative conclusions, its deepest convictions about the self, the world, and god, are all drawn illegitimately.

What is possible—indeed, according to Kant what we are bound by our very nature as rational beings to do—is to think of the noumenal realm **as if** the speculative principles were true (whether or not they are). By the nature of reason itself, we are required to suppose our own existence as substantial beings, the possibility of our free action in a world of causal regularity, and the existence of god. The absence of any formal justification for these notions makes it impossible for us to claim that we know them to be true, but it can in no way diminish the depth of our belief that they are.

According to Kant, then, the rational human faculties lead us to the very boundaries of what can be known, by clarifying the conditions under which experience of the world as we know it is possible. But beyond those boundaries our faculties are useless. The shape of the boundary itself, as evidenced in the Paralogisms and Antinomies, naturally impels us to postulate that the unknown does indeed have certain features, but these further speculations are inherently unjustifiable.

The only legitimate, "scientific" metaphysics that the future may hold, Kant therefore held, would be a thoroughly critical, non-speculative examination of the bounds of pure reason, a careful description of what we can know accompanied by a clear recognition that our transcendental concepts (however useful they may seem) are entirely unreliable as guides to the nature of reality. It is this task, of course, that Kant himself had pursued in the First Critique.

## **Hegel and Absolute Idealism**

The greatest of all the German idealists was Georg Wilhelm Friedrich Hegel, who methodically constructed a comprehensive system of thought about the world. Focused like Kant on the goal of showing how some fundamental unity underlies the confusing multiplicity of experiential

contents, Hegel took a much more systematic approach by making absolute consciousness the key source of ultimate connections among all other things. Above all else, Hegel held that reality must be rational, so that its ultimate structure is revealed in the structure of our thought. Everything that is thinkable, especially apparent contradictions, must be resolvable under some common concept of the reason.

Even more than Aristotle and the Stoics, Hegel believed that the study of logic is an investigation into the fundamental structure of reality itself. According to Hegel, all logic (and, hence, all of reality) is dialectical in character. As Kant had noted in the Antinomies, serious thought about one general description of the world commonly leads us into a contemplation of its opposite. But Hegel did not suppose this to be the end of the matter; he made the further supposition that the two concepts so held in opposition can always be united by a shift to some higher level of thought. Thus, the human mind invariably moves from thesis to antithesis to synthesis, employing each synthesis as the thesis for a new opposition to be transcended by yet a higher level, continuing in a perpetual waltz of intellectual achievement.

Being, for example, is a basic concept that serves as a clear starting-point for any serious thinker, but serious contemplation of its nature reveals it to be so utterly devoid of specific content that the mind is naturally led to the thought of Nothing as its opposite; but these two are not really contradictory, since both may be unified under the more sophisticated and comprehensive notion of Becoming. If, on the other hand, our thesis is the concept of Being as a naive immediate presentation of experience, then its natural antithesis is the idea of Essence as knowledge mediated by classification; and the synthesis that unites these concepts is that of the Notion as a self-mediating interpretation of thought and reality combined.

On the grandest scale of conceivability, all of thought (including the dialectical logic itself) is comprised by the thesis Idea, whose natural antithesis is Nature, the otherness of the known considered independently of its relation to the knower; and the grand synthesis of the two is **Spirit**, the self-knowing, self-actualizing totality of all that is—namely, the Absolute itself. This embodies Hegel's fundamental convictions that reality is wholly rational and that whatever is rational must be real. Human thought is merely one portion of the Becoming of Absolute Spirit, which is (through us) thinking and creating itself as it goes. Even this development, as Hegel described it in the Phenomenology of Spirit, is best understood as the triadic transition from subjective to objective to absolute Spirit.

### **The conception of Geist (spirit) Subjective Spirit**

Considered as subjective, Spirit may be observed, through truths about human nature described by the discipline of psychology, in the structure of thought exhibited by each individual human being. In every concrete instantiation, consciousness strives to reach perfect knowledge, and the path of its struggle can, of course, be described as the movement from thesis through antithesis to synthesis:

The first level of consciousness is that of sensory awareness of objects. Despite the fact that sensory images invariably appear to us as concrete particulars, wholly unrelated to each other, we naturally universalize the apparent regularities of their appearance, imposing upon them the forms of space and time and the generalized laws of nature.

Recognition of the role we ourselves play in the origination of these Kantian regulative principles, Hegel supposed, leads us directly to the antithesis of sensory experience, the self-conscious awareness of the individual thinker, who acknowledges self as individual ego. Although this ultimately implies the existence of other selves as well, its immediate consequence is a tendency toward skepticism about the world of objects.

But Hegel held that these levels are transcended by their synthesis in universal consciousness, an abstract awareness of one's own place within the greater scheme of absolute spirit. The objects of my experience and my awareness of myself are unified by the recognition that each is wholly contained in the fundamental reality of a common whole. Here the faculty of reason is crucial, since it most clearly draws upon what is common to us all.

### **Objective Spirit**

Considered objectively, Spirit involves the interaction among many selves that are the proper subject of ethics and social or political theory. Once again, of course, Hegel maintained that a correct understanding of these fields is to be derived not by generalizing from what we observe, but rather by tracing the dialectic through new triads.

Ethics, on Hegel's view, begins with the concept of freedom understood as the right of each individual human being to act independently in pursuit of its own self-interest. The antithesis to this is the emergence of moral rules, which require the imposition of duty as a constraint upon the natural liberty of human desire. The synthesis of the two for Hegel is "the ethical life," which emerges from a sincere recognition of the significance of one's own stake in the greater good of the whole.

Political order has its origins in family life, in which the basic needs of all individuals are served by mutual feeling, without any formal principle of organization. The antithesis to this is civil life, in which the incorporation of so many more individual units often leads to a system of purely formal regulation of conduct, demanded by law without any emotional bond. The synthesis of the two, then, is the State, which Hegel believed to unite society into a sort of civil family, organized in legal fashion but bound together by a profound emotional sense of devotion.

According to Hegel, then, the modern nation must serve as an actualization of the self-conscious ethical will of a people {Ger. *Völk*}. Although this sounds something like Rousseau's general will, Hegel's version puts all of the emphasis on the collective expression of what is best for the people rather than on each individual's capacity to discover it for herself or himself. This view of the state fits well with the rise of modern nationalism in Europe during the nineteenth century, where the national spirit {Ger. *Völkergeist*} of each group emerges distinctively from every other.

### **Absolute Spirit**

Finally, when considered most purely, as absolute in itself, Spirit is just the historical process of human thought toward ever-greater awareness of the fundamental unity of all reality. In order to see how the Absolute gradually discovers and expresses its own nature, Hegel proposed, we need only observe the way in which the Spirit of the World (*Weltgeist*) develops dialectically in three distinguishable arenas, a triad of triads through which human culture achieves its transcendental aim.

Since it appreciates and evaluates the Absolute entirely through its presentations among the senses, Art is first to be considered. Effective artistic expression, Hegel supposed, must always transcend the subject/object dichotomy by leading us to awareness of some underlying unity. Historically, human art has embodied the dialectical development of the Absolute's sensory being, starting with the thesis of symbolic representation of natural objects and proceeding to its antithesis in highly stylized classical art before rising to the synthesis of Romantic expression. The antithesis of Art as a whole is the abstract notion of the Absolute as an objectified other, the divine being contemplated by Religion. Although traditional religion often speaks of god in personal terms, its theological exposition usually emphasizes the radical differentness of the deity and its incomprehensibility to us. Again, the historical development of religion displays a dialectical structure: the thesis is worship of nature, which gives rise to a religion of individuality tempered by revealed law, and both are transcended in the synthesis of Protestant Christianity, which unifies them under the notion of god in human form.

This leaves room for the grand culminating synthesis of human culture, which is (of course!) **Philosophy**, in which the Absolute learns to cognize itself in perfectly literal terms. As the self-conscious awareness of the Absolute, Hegel's philosophy unifies the sensibility of art and the objectification of religion by regarding the dialectical logic of reason as the ultimate structure of reality. Here, too, there has been historical development, most recently the emergence of absolute idealism as a synthesis transcending the dispute between empiricism and rationalism.

### **The Inexorability of History**

As we have already seen, Hegel's view of the world is determinedly historical; he believed that history itself (involving another triad, of original/reflective/philosophical history) exhibits the growth of self-consciousness in the Absolute, the process of development by means of which the Weltgeist comes to know itself. But since history inevitably follows the pattern of logical necessity through the dialectical movement from thesis to antithesis to synthesis, the present age must be the highest stage of development. Certainly Hegel regarded the cultural achievements of his own time—nationalism, romanticism, protestantism, and idealism—as the culmination of all that had gone before, with his own philosophical work as its highest expression. Here is nineteenth-century optimism at its peak, full of self-confidence in the possibilities of rationality and enlightenment. Many thinkers of the nearly two centuries since Hegel's time have raised serious questions about the reliability of this modernist promise.

### **Hegel's Dialectics**

"Dialectics" is a term used to describe a method of philosophical argument that involves some sort of contradictory process between opposing sides. In what is perhaps the most classic version of "dialectics", the ancient Greek philosopher, Plato, for instance, presented his philosophical argument as a back-and-forth dialogue or debate, generally between the character of Socrates, on one side, and some person or group of people to whom Socrates was talking (his interlocutors), on the other. In the course of the dialogues, Socrates' interlocutors propose definitions of philosophical concepts or express views that Socrates challenges or opposes. The back-and-forth debate between opposing sides produces a kind of linear progression or evolution in philosophical views or positions: as the dialogues go along, Socrates' interlocutors change or refine their views in response to Socrates' challenges and come to adopt more sophisticated views. The back-and-forth dialectic between Socrates and his interlocutors thus becomes Plato's way of arguing against the earlier, less sophisticated views or positions and for the more

sophisticated ones later.

“Hegel’s dialectics” refers to the particular dialectical method of argument employed by the 19th Century German philosopher, G.W.F. Hegel, which, like other “dialectical” methods, relies on a contradictory process between opposing sides. Whereas Plato’s “opposing sides” were people (Socrates and his interlocutors), however, what the “opposing sides” are in Hegel’s work depends on the subject matter he discusses. In his work on logic, for instance, the “opposing sides” are different definitions of logical concepts that are opposed to one another. In the *Phenomenology of Spirit*, which presents Hegel’s epistemology or philosophy of knowledge, the “opposing sides” are different definitions of consciousness and of the object that consciousness is aware of or claims to know. As in Plato’s dialogues, a contradictory process between “opposing sides” in Hegel’s dialectics leads to a linear evolution or development from less sophisticated definitions or views to more sophisticated ones later. The dialectical process thus constitutes Hegel’s method for arguing against the earlier, less sophisticated definitions or views and for the more sophisticated ones later. Hegel regarded this dialectical method or “speculative mode of cognition” as the hallmark of his philosophy, and used the same method in the *Phenomenology of Spirit*, as well as in all of the mature works he published later—the entire *Encyclopaedia of Philosophical Sciences* (including, as its first part, the “Lesser Logic” or the *Encyclopaedia Logic* [EL]), the *Science of Logic* [SL], and the *Philosophy of Right* [PR].

Note that, although Hegel acknowledged that his dialectical method was part of a philosophical tradition stretching back to Plato, he criticized Plato’s version of dialectics. He argued that Plato’s dialectics deals only with limited philosophical claims and is unable to get beyond skepticism or nothingness. According to the logic of a traditional *reductio ad absurdum* argument, if the premises of an argument lead to a contradiction, we must conclude that the premises are false—which leaves us with no premises or with nothing. We must then wait around for new premises to spring up arbitrarily from somewhere else, and then see whether those new premises put us back into nothingness or emptiness once again, if they, too, lead to a contradiction. Because Hegel believed that reason necessarily generates contradictions, as we will see, he thought new premises will indeed produce further contradictions. As he puts the argument, then, the scepticism that ends up with the bare abstraction of nothingness or emptiness cannot get any further from there, but must wait to see whether something new comes along and what it is, in order to throw it too into the same empty abyss.

Hegel argues that, because Plato’s dialectics cannot get beyond arbitrariness and skepticism, it generates only approximate truths, and falls short of being a genuine science

### **Hegel’s description of his dialectical method**

Hegel provides the most extensive, general account of his dialectical method in Part I of his *Encyclopaedia of Philosophical Sciences*, which is often called the *Encyclopaedia Logic* [EL]. The form or presentation of logic, he says, has three sides or moments. These sides are not parts of logic, but, rather, moments of “every logical concept”, as well as “of everything true in general” (EL Remark to §79; we will see why Hegel thought dialectics is in everything in section 4). The first moment—the moment of the understanding—is the moment of fixity, in which concepts or forms have a seemingly stable definition or determination.

The second moment—the “dialectical” or “negatively rational” moment—is the moment of

instability. In this moment, a one-sidedness or restrictedness in the determination from the moment of understanding comes to the fore, and the determination that was fixed in the first moment passes into its opposite. Hegel describes this process as a process of “self-sublation”. The English verb “to sublimate” translates Hegel’s technical use of the German verb *aufheben*, which is a crucial concept in his dialectical method. Hegel says that *aufheben* has a doubled meaning: it means both to cancel (or negate) and to preserve at the same time.

The moment of understanding sublimes itself because its own character or nature—its one-sidedness or restrictedness—destabilizes its definition and leads it to pass into its opposite. The dialectical moment thus involves a process of self-sublation, or a process in which the determination from the moment of understanding sublimes itself, or both cancels and preserves itself, as it pushes on to or passes into its opposite.

The third moment—the “speculative” or “positively rational” moment—grasps the unity of the opposition between the first two determinations, or is the positive result of the dissolution or transition of those determinations. Here, Hegel rejects the traditional, *reductio ad absurdum* argument, which says that when the premises of an argument lead to a contradiction, then the premises must be discarded altogether, leaving nothing. As Hegel suggests in the *Phenomenology*, such an argument is just the skepticism which only ever sees pure nothingness in its result and abstracts from the fact that this nothingness is specifically the nothingness of that from which it results.

Although the speculative moment negates the contradiction, it is a determinate or defined nothingness because it is the result of a specific process. There is something particular about the determination in the moment of understanding—a specific weakness, or some specific aspect that was ignored in its one-sidedness or restrictedness—that leads it to fall apart in the dialectical moment. The speculative moment has a definition, determination or content because it grows out of and unifies the particular character of those earlier determinations, or is “a unity of distinct determinations”. The speculative moment is thus “truly not empty, abstract nothing, but the negation of certain determinations” (EL §82). When the result “is taken as the result of that from which it emerges”, Hegel says, then it is “in fact, the true result; in that case it is itself a determinate nothingness, one which has a content”. As he also puts it, “the result is conceived as it is in truth, namely, as a determinate negation [bestimmte Negation]; a new form has thereby immediately arisen”. Or, as he says, “[b]ecause the result, the negation, is a determinate negation [bestimmte Negation], it has a content”.

Hegel’s claim in both the *Phenomenology* and the *Science of Logic* that his philosophy relies on a process of “determinate negation [bestimmte Negation]” has sometimes led scholars to describe his dialectics as a method or doctrine of “determinate negation”.

There are several features of this account that Hegel thinks raise his dialectical method above the arbitrariness of Plato’s dialectics to the level of a genuine science. First, because the determinations in the moment of understanding sublimate themselves, Hegel’s dialectics does not require some new idea to show up arbitrarily. Instead, the movement to new determinations is driven by the nature of the earlier determinations. Indeed, for Hegel, the movement is driven by necessity. The nature of the determinations themselves drives or forces them to pass into their opposites. This sense of necessity—the idea that the method involves being forced from earlier moments to later ones—leads Hegel to regard his dialectics as a kind of logic. As he says in the

Phenomenology, the method's "proper exposition belongs to logic". Necessity—the sense of being driven or forced to conclusions—is the hallmark of "logic" in Western philosophy.

Second, because the form or determination that arises is the result of the self- sublation of the determination from the moment of understanding, there is no need for some new idea to show up from the outside. Instead, the new determination or form is necessitated by earlier moments and hence grows out of the process itself. Unlike in Plato's arbitrary dialectics, then—which must wait around until some other idea comes in from the outside—in Hegel's dialectics "nothing extraneous is introduced", as he says. His dialectics is driven by the nature, immanence or "inwardness" of its own content. As he puts it, dialectics is "the principle through which alone immanent coherence and necessity enter into the content of science".

Third, because later determinations "sublate" earlier determinations, the earlier determinations are not completely cancelled or negated. On the contrary, the earlier determinations are preserved in the sense that they remain in effect within the later determinations. When Being-for-itself, for instance, is introduced in the logic as the first concept of ideality or universality and is defined by embracing a set of "something-others", Being-for-itself replaces the something- others as the new concept, but those something-others remain active within the definition of the concept of Being-for-itself. The something-others must continue to do the work of picking out individual somethings before the concept of Being- for-itself can have its own definition as the concept that gathers them up. Being- for-itself replaces the something-others, but it also preserves them, because its definition still requires them to do their work of picking out individualsomethings.

The concept of "apple", for example, as a Being-for-itself, would be defined by gathering up individual "somethings" that are the same as one another (as apples). Each individual apple can be what it is (as an apple) only in relation to an "other" that is the same "something" that it is (i.e., an apple). That is the one- sidedness or restrictedness that leads each "something" to pass into its "other" or opposite. The "somethings" are thus both "something-others". Moreover, their defining processes lead to an endless process of passing back and forth into one another: one "something" can be what it is (as an apple) only in relation to another "something" that is the same as it is, which, in turn, can be what it is (an apple) only in relation to the other "something" that is the same as it is, and soon, back and forth, endlessly. The concept of "apple", as a Being-for-itself, stops that endless, passing-over process by embracing or including the individual something-others (the apples) in its content. It grasps or captures their character or quality as apples. But the "something-others" must do their work of picking out and separating those individual items (the apples) before the concept of "apple"—as the Being-for-itself—can gather them up for its own definition. We can picture the concept of Being-for-itself like this:

### **Applying Hegel's dialectical method to his arguments**

Scholars often use the first three stages of the logic as the "textbook example" to illustrate how Hegel's dialectical method should be applied to his arguments. The logic begins with the simple and immediate concept of pure Being, which is said to illustrate the moment of the understanding. We can think of Being here as a concept of pure presence. It is not mediated by any other concept—or is not defined in relation to any other concept—and so is undetermined or has no further determination. It asserts bare presence, but what that presence is like has no further determination. Because the thought of pure Being is undetermined and so is a pure abstraction, however, it is really no different from the assertion of pure negation or the absolutely negative. It is

therefore equally a Nothing. Being's lack of determination thus leads it to sublimate itself and pass into the concept of Nothing, which illustrates the dialectical moment.

But if we focus for a moment on the definitions of Being and Nothing themselves, their definitions have the same content. Indeed, both are undetermined, so they have the same kind of undefined content. The only difference between them is "something merely meant", namely, that Being is an undefined content, taken as or meant to be presence, while Nothing is an undefined content, taken as or meant to be absence. The third concept of the logic—which is used to illustrate the speculative moment—unifies the first two moments by capturing the positive result of—or the conclusion that we can draw from—the opposition between the first two moments. The concept of Becoming is the thought of an undefined content, taken as presence (Being) and then taken as absence (Nothing), or taken as absence (Nothing) and then taken as presence (Being). To Become is to go from Being to Nothing or from Nothing to Being, or is, as Hegel puts it, "the immediate vanishing of the one in the other". The contradiction between Being and Nothing thus is not a *reductio ad absurdum*, or does not lead to the rejection of both concepts and hence to nothingness—as Hegel had said Plato's dialectics does—but leads to a positive result, namely, to the introduction of a new concept—the synthesis—which unifies the two, earlier, opposed concepts.

We can also use the textbook Being-Nothing-Becoming example to illustrate Hegel's concept of *aufheben* (to sublimate), which, as we saw, means to cancel (or negate) and to preserve at the same time. Hegel says that the concept of Becoming sublimes the concepts of Being and Nothing (SL-M 105; cf. SL-dG 80). Becoming cancels or negates Being and Nothing because it is a new concept that replaces the earlier concepts; but it also preserves Being and Nothing because it relies on those earlier concepts for its own definition. Indeed, it is the first concrete concept in the logic. Unlike Being and Nothing, which had no definition or determination as concepts themselves and so were merely abstract, Becoming is a "determinate unity in which there is both Being and Nothing". Becoming succeeds in having a definition or determination because it is defined by, or piggy-backs on, the concepts of Being and Nothing.

This "textbook" Being-Nothing-Becoming example is closely connected to the traditional idea that Hegel's dialectics follows a thesis-antithesis-synthesis pattern, which, when applied to the logic, means that one concept is introduced as a "thesis" or positive concept, which then develops into a second concept that negates or is opposed to the first or is its "antithesis", which in turn leads to a third concept, the "synthesis", that unifies the first two. Versions of this interpretation of Hegel's dialectics continue to have currency. On this reading, Being is the positive moment or thesis, Nothing is the negative moment or antithesis, and Becoming is the moment of *aufheben* or synthesis—the concept that cancels and preserves, or unifies and combines, Being and Nothing. We must be careful, however, not to apply this textbook example too dogmatically to the rest of Hegel's logic or to his dialectical method more generally (for a classic criticism of the thesis-antithesis-synthesis reading of Hegel's dialectics, see Mueller 1958). There are other places where this general pattern might describe some of the transitions from stage to stage, but there are many more places where the development does not seem to fit this pattern very well. One place where the pattern seems to hold, for instance, is where the Measure—as the combination of Quality and Quantity—transitions into the Measureless, which is opposed to it, which then in turn transitions into Essence, which is the unity or combination of the two earlier sides. This series of transitions could be said to follow the general pattern captured by the "textbook example": Measure would be the moment of the understanding or thesis, the Measureless would be the dialectical moment or

antithesis, and Essence would be the speculative moment or synthesis that unifies the two earlier moments. However, before the transition to Essence takes place, the Measureless itself is redefined as a Measure—undercutting a precise parallel with the textbook Being- Nothing-Becoming example, since the transition from Measure to Essence would not follow a Measure-Measureless-Essence pattern, but rather a Measure- (Measureless?)-Measure-Essence pattern.

Other sections of Hegel's philosophy do not fit the triadic, textbook example of Being-Nothing-Becoming at all, as even interpreters who have supported the traditional reading of Hegel's dialectics have noted. After using the Being- Nothing-Becoming example to argue that Hegel's dialectical method consists of "triads" whose members "are called the thesis, antithesis, synthesis", W.T. Stace, for instance, goes on to warn us that Hegel does not succeed in applying this pattern throughout the philosophical system. It is hard to see, Stace says, how the middle term of some of Hegel's triads are the opposites or antitheses of the first term, "and there are even 'triads' which contain four terms!". As a matter of fact, one section of Hegel's logic—the section on Cognition—violates the thesis- antithesis-synthesis pattern because it has only two sub-divisions, rather than three. "The triad is incomplete", Stace complains. "There is no third. Hegel here abandons the triadic method. Nor is any explanation of his having done so forthcoming".

Interpreters have offered various solutions to the complaint that Hegel's dialectics sometimes seems to violate the triadic form. Some scholars apply the triadic form fairly loosely across several stages. Others have applied Hegel's triadic method to whole sections of his philosophy, rather than to individual stages. For G.R.G. Mure, for instance, the section on Cognition fits neatly into a triadic, thesis-antithesis-synthesis account of dialectics because the whole section is itself the antithesis of the previous section of Hegel's logic, the section on Life. Mure argues that Hegel's triadic form is easier to discern the more broadly we apply it. "The triadic form appears on many scales", he says, "and the larger the scale we consider the more obvious it is".

Scholars who interpret Hegel's description of dialectics on a smaller scale—as an account of how to get from stage to stage—have also tried to explain why some sections seem to violate the triadic form. J.N. Findlay, for instance—who, like Stace, associates dialectics "with the triad, or with triplicity"—argues that stages can fit into that form in "more than one sense". The first sense of triplicity echoes the textbook, Being-Nothing-Becoming example. In a second sense, however, Findlay says, the dialectical moment or "contradictory breakdown" is not itself a separate stage, or "does not count as one of the stages", but is a transition between opposed, "but complementary", abstract stages that "are developed more or less concurrently". This second sort of triplicity could involve any number of stages: it "could readily have been expanded into a quadruplicity, a quintuplicity and so forth". Still, like Stace, he goes on to complain that many of the transitions in Hegel's philosophy do not seem to fit the triadic pattern very well. In some triads, the second term is "the direct and obvious contrary of the first"—as in the case of Being and Nothing. In other cases, however, the opposition is, as Findlay puts it, "of a much less extreme character" (Findlay 1962: 69). In some triads, the third term obviously mediates between the first two terms. In other cases, however, he says, the third term is just one possible mediator or unity among other possible ones; and, in yet other cases, "the reconciling functions of the third member are not at all obvious". Let us look more closely at one place where the "textbook example" of Being- Nothing-Becoming does not seem to describe the dialectical development of Hegel's logic very well. In a later stage of the logic, the concept of Purpose goes through several iterations, from Abstract Purpose, to Finite or Immediate Purpose, and then through several stages of a syllogism to Realized Purpose. Abstract Purpose is the thought of any kind of purposiveness, where the purpose has not been

further determined or defined. It includes not just the kinds of purposes that occur in consciousness, such as needs or drives, but also the “internal purposiveness” or teleological view proposed by the ancient Greek philosopher, Aristotle, according to which things in the world have essences and aim to achieve (or have the purpose of living up to) their essences. Finite Purpose is the moment in which an Abstract Purpose begins to have a determination by fixing on some particular material or content through which it will be realized. The Finite Purpose then goes through a process in which it, as the Universality, comes to realize itself as the Purpose over the particular material or content (and hence becomes Realized Purpose) by pushing out into Particularity, then into Singularity (the syllogism U-P-S), and ultimately into ‘out-there-ness,’ or into individual objects out there in the world.

Hegel’s description of the development of Purpose does not seem to fit the textbook Being-Nothing-Becoming example or the thesis-antithesis-synthesis model. According to the example and model, Abstract Purpose would be the moment of understanding or thesis, Finite Purpose would be the dialectical moment or antithesis, and Realized Purpose would be the speculative moment or synthesis. Although Finite Purpose has a different determination from Abstract Purpose (it refines the definition of Abstract Purpose), it is hard to see how it would qualify as strictly “opposed” to or as the “antithesis” of Abstract Purpose in the way that Nothing is opposed to or is the antithesis of Being.

There is an answer, however, to the criticism that many of the determinations are not “opposites” in a strict sense. The German term that is translated as “opposite” in Hegel’s description of the moments of dialectics—*entgegensetzen*—has three root words: *setzen* (“to posit or set”), *gegen*, (“against”), and the prefix *ent-*, which indicates that something has entered into a new state. The verb *entgegensetzen* can therefore literally be translated as “to set over against”. The “*engegengesetzte*” into which determinations pass, then, do not need to be the strict “opposites” of the first, but can be determinations that are merely “set against” or are different from the first ones. And the prefix *ent-*, which suggests that the first determinations are put into a new state, can be explained by Hegel’s claim that the finite determinations from the moment of understanding sublate (cancel but also preserve) themselves: later determinations put earlier determinations into a new state by preserving them.

At the same time, there is a technical sense in which a later determination would still be the “opposite” of the earlier determination. Since the second determination is different from the first one, it is the logical negation of the first one, or is not-the-first-determination. If the first determination is “e”, for instance, because the new determination is different from that one, the new one is “not-e”. Since Finite Purpose, for instance, has a definition or determination that is different from the definition that Abstract Purpose has, it is not-Abstract- Purpose, or is the negation or opposite of Abstract Purpose in that sense. There is therefore a technical, logical sense in which the second concept or form is the “opposite” or negation of—or is “not”—the first one—though, again, it need not be the “opposite” of the first one in a strict sense.

Other problems remain, however. Because the concept of Realized Purpose is defined through a syllogistic process, it is itself the product of several stages of development (at least four, by my count, if Realized Purpose counts as a separate determination), which would seem to violate a triadic model. Moreover, the concept of Realized Purpose does not, strictly speaking, seem to be the unity or combination of Abstract Purpose and Finite Purpose. Realized Purpose is the result of (and so unifies) the syllogistic process of Finite Purpose, through which Finite Purpose focuses on

and is realized in a particular material or content. Realized Purpose thus seems to be a development of Finite Purpose, rather than a unity or combination of Abstract Purpose and Finite Purpose, in the way that Becoming can be said to be the unity or combination of Being and Nothing.

These sorts of considerations have led some scholars to interpret Hegel's dialectics in a way that is implied by a more literal reading of his claim, in the *Encyclopaedia Logic*, that the three "sides" of the form of logic—namely, the moment of understanding, the dialectical moment, and the speculative moment—"are moments of each [or every; jedes] logically-real, that is each [or every; jedes] concept". The quotation suggests that each concept goes through all three moments of the dialectical process—a suggestion reinforced by Hegel's claim, in the *Phenomenology*, that the result of the process of determinate negation is that "a new form has thereby immediately arisen". According to this interpretation, the three "sides" are not three different concepts or forms that are related to one another in a triad—as the textbook *Being-Nothing-Becoming* example suggests—but rather different momentary sides or "determinations" in the life, so to speak, of each concept or form as it transitions to the next one. The three moments thus involve only two concepts or forms: the one that comes first, and the one that comes next.

For the concept of Being, for example, its moment of understanding is its moment of stability, in which it is asserted to be pure presence. This determination is one-sided or restricted however, because, as we saw, it ignores another aspect of Being's definition, namely, that Being has no content or determination, which is how Being is defined in its dialectical moment. Being thus sublates itself because the one-sidedness of its moment of understanding undermines that determination and leads to the definition it has in the dialectical moment. The speculative moment draws out the implications of these moments: it asserts that Being (as pure presence) implies nothing. It is also the "unity of the determinations in their comparison [Entgegensetzung]": since it captures a process from one to the other, it includes Being's moment of understanding (as pure presence) and dialectical moment (as nothing or undetermined), but also compares those two determinations, or sets (-setzen) them up against (-gegen) each other. It even puts Being into a new state (as the prefix *ent-* suggests) because the next concept, Nothing, will sublate (cancel and preserve) Being.

The concept of Nothing also has all three moments. When it is asserted to be the speculative result of the concept of Being, it has its moment of understanding or stability: it is Nothing, defined as pure absence, as the absence of determination. But Nothing's moment of understanding is also one-sided or restricted: like Being, Nothing is also an undefined content, which is its determination in its dialectical moment. Nothing thus sublates itself: since it is an undefined content, it is not pure absence after all, but has the same presence that Being did. It is present as an undefined content. Nothing thus sublates Being: it replaces (cancels) Being, but also preserves Being insofar as it has the same definition (as an undefined content) and presence that Being had. We can picture Being and Nothing like this (the circles have dashed outlines to indicate that, as concepts, they are each undefined);

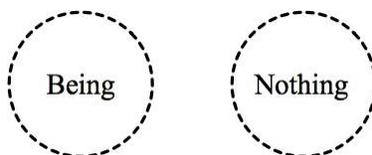

Figure 4

In its speculative moment, then, Nothing implies presence or Being, which is the “unity of the determinations in their comparison [Entgegensetzung]”; alternative translation), since it both includes but—as a process from one to the other— also compares the two earlier determinations of Nothing, first, as pure absence and, second, as just as much presence.

The dialectical process is driven to the next concept or form—Becoming—not by a triadic, thesis-antithesis-synthesis pattern, but by the one-sidedness of Nothing— which leads Nothing to sublimate itself—and by the implications of the process so far. Since Being and Nothing have each been exhaustively analyzed as separate concepts, and since they are the only concepts in play, there is only one way for the dialectical process to move forward: whatever concept comes next will have to take account of both Being and Nothing at the same time. Moreover, the process revealed that an undefined content taken to be presence (i.e., Being) implies Nothing (or absence), and that an undefined content taken to be absence (i.e., Nothing) implies presence (i.e., Being). The next concept, then, takes Being and Nothing together and draws out those implications—namely, that Being implies Nothing, and that Nothing implies Being. It is therefore Becoming, defined as two separate processes: one in which Being becomes Nothing, and one in which Nothing becomes Being. We can picture Becoming this way:

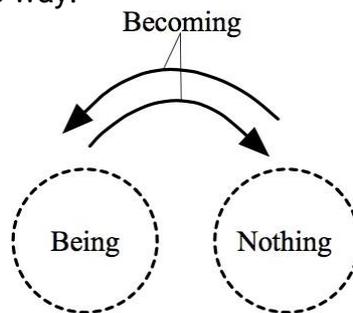

Figure 5

In a similar way, a one-sidedness or restrictedness in the determination of Finite Purpose together with the implications of earlier stages leads to Realized Purpose. In its moment of understanding, Finite Purpose particularizes into (or presents) its content as “something-presupposed” or as a pre-given object. I go to a restaurant for the purpose of having dinner, for instance, and order a salad. My purpose of having dinner particularizes as a pre-given object—the salad. But this object or particularity—e.g. the salad—is “inwardly reflected”: it has its own content—developed in earlier stages—which the definition of Finite Purpose ignores. We can picture Finite Purpose this way:

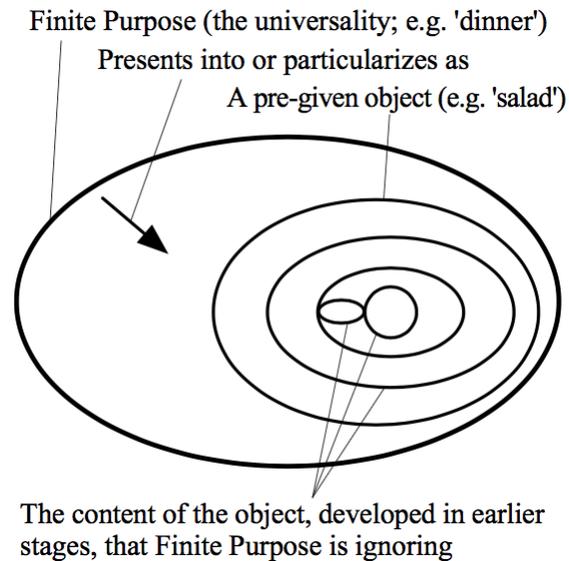

Figure 6

In the dialectical moment, Finite Purpose is determined by the previously ignored content, or by that other content. The one-sidedness of Finite Purpose requires the dialectical process to continue through a series of syllogisms that determines Finite Purpose in relation to the ignored content. The first syllogism links the Finite Purpose to the first layer of content in the object: the Purpose or universality goes through the particularity (e.g., the salad) to its content, the singularity (e.g., lettuce as a type of thing)—the syllogism U-P-S. But the particularity is itself a universality or purpose, “which at the same time is a syllogism within itself [in sich]” (EL Remark to §208; alternative translation), in relation to its own content. The salad is a universality/purpose that particularizes as lettuce (as a type of thing) and has its singularity in this lettuce here—a second syllogism, U-P-S. Thus, the first singularity (e.g., “lettuce” as a type of thing)— which, in this second syllogism, is the particularity or P—“judges” (EL §207) or asserts that “U is S”: it says that “lettuce” as a universality (U) or type of thing is a singularity (S), or is “this lettuce here”, for instance. This new singularity (e.g. “this lettuce here”) is itself a combination of subjectivity and objectivity: it is an Inner or identifying concept (“lettuce”) that is in a mutually-defining relationship (the circular arrow) with an Outer or out-there-ness (“this here”) as its content. In the speculative moment, Finite Purpose is determined by the whole process of development from the moment of understanding—when it is defined by particularizing into a pre-given object with a content that it ignores—to its dialectical moment—when it is also defined by the previously ignored content. We can picture the speculative moment of Finite Purpose this way:

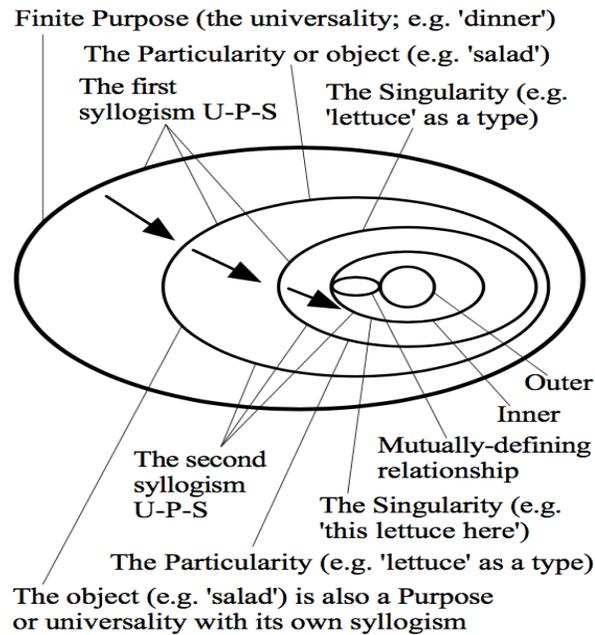

Figure 7

Finite Purpose's speculative moment leads to Realized Purpose. As soon as Finite Purpose presents all the content, there is a return process (a series of return arrows) that establishes each layer and redefines Finite Purpose as Realized Purpose. The presence of "this lettuce here" establishes the actuality of "lettuce" as a type of thing (an Actuality is a concept that captures a mutually-defining relationship between an Inner and an Outer), which establishes the "salad", which establishes "dinner" as the Realized Purpose over the whole process. We can picture Realized Purpose this way:

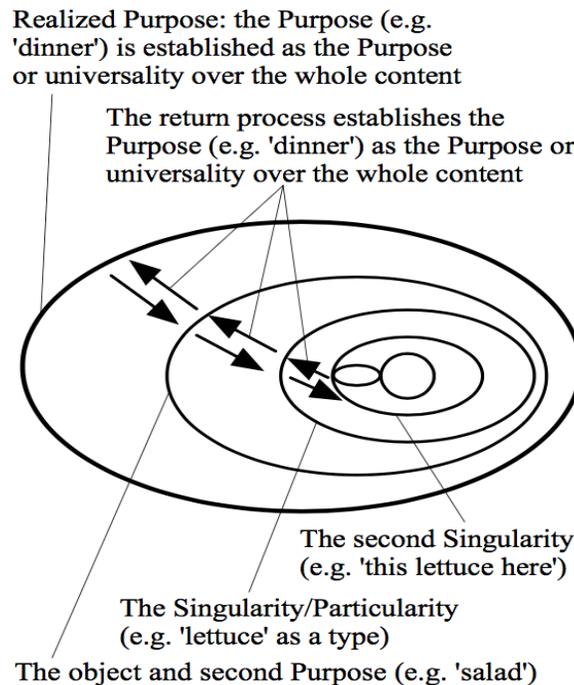

Figure 8

If Hegel's account of dialectics is a general description of the life of each concept or form, then any section can include as many or as few stages as the development requires. Instead of trying to squeeze the stages into a triadic form—a technique Hegel himself rejects—we can see the process as driven by each determination on its own account: what it succeeds in grasping (which allows it to be stable, for a moment of understanding), what it fails to grasp or capture (in its dialectical moment), and how it leads (in its speculative moment) to a new concept or form that tries to correct for the one-sidedness of the moment of understanding. This sort of process might reveal a kind of argument that, as Hegel had promised, might produce a comprehensive and exhaustive exploration of every concept, form or determination in each subject matter, as well as raise dialectics above a haphazard analysis of various philosophical views to the level of a genuine science.

## **HEGEL'S CONCEPT OF FREEDOM**

Hegel's conception of freedom might perhaps be called 'contextual', though this is a term which to my knowledge has not been applied to his or any other idea of freedom. I mean by this that Hegel conceives freedom always in a social context, or more accurately in the context of human interaction. The structure of such interaction constitutes the context of freedom in which it becomes something concrete and definite, an actuality rather than a mere idea. In pursuing Hegel's line of inquiry it is possible to distinguish four major kinds of freedom and four corresponding contexts or models of human interaction. These are: natural, ethical, civil and political, and I propose to look at them in this order.

### **Natural Freedom**

The foundation of the Hegelian theory of freedom rests on his concept of the will. Will is not a separate faculty, distinct from reason; thought and will are simply two aspects or modes of reason: 'the will is ... a special way of thinking, thinking translating itself into existence, thinking as the urge to give itself existence' (PhR, § 4 A). In choosing, deciding and acting a man thinks, reflects and uses concepts; he manifests or expresses his rationality, which is his essential characteristic. The way a man views himself, the image he has of himself or, more adequately, the conception he has of himself as a human being determines what kind of will he has and therefore what kind of interaction with other men is possible for him. Freedom is therefore bound up with self-consciousness and true freedom presupposes true self-consciousness.

The self-consciousness which purifies its object, content, and aim, and raises them to the universality effects this as thinking getting its own way in the will. Here is the point at which it becomes clear that it is only as thinking intelligence that the will is genuinely a will and free. The slave does not know his essence, his infinity, his freedom; he does not know himself as human in essence; and he lacks this knowledge of himself because he does not think himself. This self-consciousness which apprehends itself through thinking as essentially human, and thereby frees itself from the contingent and the false, is the principle of right, morality, and all ethical life.

The will itself, at its most basic, is a complex idea; in the simplest act of willing Hegel distinguishes three elements or 'moments'. According to Hegel's theory of 'subjective spirit' will is foreshadowed in impulse and sentiment, which largely determine our conduct in childhood. At the level of development at which will and thought can be clearly distinguished from desire and feeling an act of will contains according to Hegel:

(1) 'the element of pure indeterminacy or that pure reflection of the ego into itself which involves the dissipation of every restriction and every content'. This is the element of withdrawal from, or rejection of, all external determinators, an assertion of the will's independence vis-à-vis the external world. When the will's self-determination consists in this alone, or when representative thinking regards this side by itself as freedom and clings to it, then we have negative freedom or freedom as the Understanding conceives it.

(2) The second moment, 'the particularisation of the ego', consists in the ego giving itself 'differentiation, determination and positing a determinacy as a content and object'. This content may be something natural a need or desire - or something rational - some thought or principle of action. The determination or focusing of the ego on something definite or particular, the self-identification of the ego with it, constitutes the second, 'positive' element involved in willing, the second partial but essential aspect of the will.

(3) 'The will is the unity of both these moments.... It is the selfdetermination of the ego, which means that at one and the same time the ego posits itself as its own negative, i.e. as restricted and determinate, and yet remains by itself, i.e. in its self-identity and universality' (i.e. as a source of all determinations). 'This is the freedom of the will and it constitutes the concept or substantiality of the will, its weight so to speak, just as weight constitutes the substantiality of a body'.

Differently put, an act of will implies an agent capable of rejecting all courses of action except the one that he really chooses to follow.

When a man is so self-determined but the only content of his will the only source of his determinations - are his impulses, appetites and desires, he has what Hegel calls an 'immediate or natural' will (§ II). Such a will does not act according to its rational nature, although it is capable of utilitarian rationality; Hegel admits that impulses can be compared and evaluated in the light of experience and selected on grounds of satisfaction or happiness (§ 20). The indeterminacy of the will in the absence of a truly rational criterion of choice constitutes 'arbitrariness' (Willkiir). Such indeterminate, arbitrary will has sometimes been considered a paradigm of free will, but this is a serious mistake in Hegel's view.

The choice which I have is grounded in the universality of the will, in the fact that I can make this or that mine. This thing that is mine is particular in content and therefore not adequate to me and so is separate from me; it is only potentially mine, while I am the potentiality of linking myself to it. Choice, therefore, is grounded in the indeterminacy of the ego and the determinacy of a content. Thus the will, on account of this content, is not free, although it has an infinite aspect in virtue of its form. No single content is adequate to it and in no single content is it really at grips with itself. Arbitrariness implies that the content is made mine not by the nature of my will but by chance. Thus I am dependent on this content, and this is the contradiction lying in arbitrariness. The man in the street thinks he is free if it is open to him to act as he pleases, but his very arbitrariness implies that he is not free. When I will what is rational, then I am acting not as a particular individual but in accordance with the concept of ethics in general. In an ethical action, what I vindicate is not myself but the thing.

In other words, true freedom is ethical freedom and can only be reached in an ethical community. Because the arbitrary wills of men do not coincide when they act capriciously, an orderly,

structured society of natural men is impossible. It can only be conceived as an abstraction, 'a state of nature', in which impulse and violence reign unchecked, a Hobbesian state of 'war of all against all' in which life is 'nasty, brutish and short' and from which man should seek to escape by all means. Hegel regards 'natural freedom' as the freedom peculiar to such a state of nature; it is the only freedom which independent, egocentric and impulse-driven individuals can possibly have when they find themselves in a shared physical space. However, arbitrary choice has a place in a rational normative order, as Hegel admits in his account of civil society; in fact it is one of its fundamental constituents.

## **Ethical Freedom**

In order to have a minimum kind of stable interaction possible it is necessary that all men should recognise certain rules or principles of action, and follow them in practice. The minimum amount of rules that a rational agent will recognise and accept as rational will obviously be those which safeguard his life, limb and possessions, and which guarantee to him an area of activity free from the invasion and interference of others. Within this area each man can do what he pleases and can exercise his natural, immediate or arbitrary will to the fullest extent compatible with an equal opportunity of everybody else in society to do the same. The system of such rational rules, based on reciprocity and a necessary minimum of restriction, Hegel calls 'abstract right'. It is really the natural law of the seventeenth and eighteenth centuries, which was based on the revival of Roman law; in his discussions of the Roman Empire Hegel makes it clear that the idea of law as defining and protecting private rights of individuals was discovered precisely in that epoch of world history. Hegel's analysis of abstract right and its component elements of personality (capacity for rights), property, contract and wrongdoing in the *Philosophy of Right* add much to our understanding of his conception of freedom. Hegel bases the system of personal rights on man's appropriation of natural objects and the recognition of possessions as rightful property by other men. By appropriating things man rises above nature and asserts his independence as a free agent: 'a person is a unit of freedom aware of its sheer independence'. However, the principles of abstract right are 'actualised' in the positive legal system of civil society and thus become a part of the broader normative order of *Sittlichkeit*. They need not be discussed separately.

The same applies to the sphere of morality which in Hegel's view forms another element of ethical life. By morality Hegel means conduct determined by one's conscience, noble intentions or subjective judgement of what is absolutely good. Abstract right (and the positive law based upon it) is indifferent to motives and merely requires external conformity to objective rules of conduct. The question about the self-determination and motive of the will now enters . . . in connection with morality. Since man wishes to be judged in accordance with his own self-determined choices, he is free in this relation to himself whatever the external situation may impose upon him . . . Man's worth is estimated by reference to his inward action and hence the standpoint of morality is that of freedom aware of itself.

As we have already seen this is the conception of freedom Hegel ascribes to Rousseau and Kant and criticizes as inadequate - false in theory and disastrous in practice. However, as an element of *Sittlichkeit* it has an essential place in modern social and political life. It is a necessary corrective to all normative structures based on positive law, conventional morality and traditional institutions. *Sittlichkeit* is the real context in which men achieve freedom or self-determination. It is a structure of human interaction based on established laws and institutions which have survived the test of experience but also theoretical scrutiny. It is the actual, social mechanism through which men are

shaped into ethical agents - creatures in practice acting according to laws, recognising and fulfilling obligations, sometimes sharing aims and purposes with other men, and pursuing them through their joint endeavours. When Hegel speaks of ethical life as a 'substance' and men as its accidents' he wishes to draw our attention to the thoroughgoing way in which ethical life moulds man's nature or 'socialises' individuals." Sittlichkeit comprises the existing normative world, the historical world of human relations and ideals, and is so to speak the soil in which abstract right and morality grow. Without it the other two are meaningful only as hypothetical conditions or abstract models of human interaction.

The right and the moral cannot exist independently; they must have the ethical as their support and foundation, for the right lacks the moment of subjectivity, while morality in turn possesses that moment alone, and consequently both the right and the moral lack actuality by themselves.

In concrete historical terms the right and the moral are simply 'moments' or aspects of Sittlichkeit, which develop within the matrix of man's traditional social life in the course of world history, in the modern era, and enrich the primitive, simple, undifferentiated customary ethics with new and important elements: self-interest and conscience or, in Hegelian terminology, 'particularity' and 'subjectivity'. In terms of European culture Sittlichkeit is the ethical existence of the modern European man when he has become aware of his individuality, asserted its rights in theory and practice, and at the same time has accepted the necessity of an objectively existing ethical order in which his individuality is realised.

Looked at from another angle ethical life is the sum total of the determinants of the will - the ethical norms, rules or principles of actions which provide the substance of human decisions in so far as they are the acts of concrete thinking, choosing and willing agents. The key normative idea of Sittlichkeit is duty.

In Sittlichkeit the agent is faced with clusters of duties arising out of his concrete social position, for example as husband or father, employer or employee, teacher or student, member of an estate, profession or corporation, a voter, a parliamentary representative or a civil servant. These duties are not abstract or general as Kantian categorical imperatives are; they are contextual, particularised, tied to our special social roles, dependent on the sphere of activity in which we are engaged. The more complex, articulated and developed a structure society or community forms, the wider is the range of roles available to its individual members, but also the more elaborate the system of duties which ethically bind them. In other words duties are the content of laws, institutions, organisations and communities which together make up the structure of an ethical community. And in so far as they have been internalised as habits and dispositions, they are the content of volitions.

Hegel defines the freedom peculiar to Sittlichkeit ('ethical freedom') in terms of duty. This is paradoxical only if we accept the Hobbesian view that duties bind us and restrict our freedom of movement. But for Hegel there is no paradox.

The bond of duty can appear as a restriction only on indeterminate subjectivity or abstract freedom, and on the impulses either of the natural will or of the moral will which determines its indeterminate good arbitrarily. The truth is, however, that in duty the individual finds his liberation; first, liberation from dependence on mere natural impulse and from the depression which as a particular subject he cannot escape in his moral reflections on what ought to be and what might

be; secondly, liberation from the indeterminate subjectivity which, never reaching reality or the objective determinacy of action, remains self-enclosed and devoid of actuality. In duty the individual acquires his substantive freedom.

In the Addition to this paragraph he concludes: Thus duty is not a restriction on freedom, but only on freedom in the abstract, i.e. on unfreedom. Duty is the attainment of our essence, the winning of positive freedom.

This conception of freedom as the conscientious acceptance and fulfilment of one's ethical obligations (in Bradley's famous phrase 'my station and its duties') may at first sight appear somewhat unattractive. Even if Hegel's perfect freedom was not simply the obedience to the Prussian state that it has sometimes been alleged to be, this kind of 'substantial' or 'positive' freedom appears compatible with all sorts of situations in which there is very little liberty as it is generally understood by liberals or democrats. A traditional patriarchal society, a feudal monarchy or a modern collectivise, highly regulated state would all seem happily to fit Hegel's conception of an ethical order. But to think that would be to ignore the peculiar modern dimensions of Sittlichkeit represented by abstract right and morality, which have just been mentioned. To count as true Sittlichkeit the ethical order in our own epoch must be shot through with personal rights and spheres of autonomy, and be acceptable to individual conscience. It must (in other words) incorporate the principles of particularity and subjectivity.

Hegel develops this point at great length in the Philosophy of Right in the sections of ethical life dealing with civil society and the state, but a word must be said about his concept of family which is, in fact, the basic form of ethical life. The family (i.e. the modern family) also has a subjective dimension - for example in the free choice of partners in marriage or the decision to beget children. It may also satisfy particular needs and desires of individuals for companionship, affection, emotional security and sexual gratification; to some extent it still has an economic function. Yet the dominant elements even in the modern family are 'universality' and 'objectivity'. It is a community which, despite love and affection, often faces its members as something burdensome, something which essentially restricts their arbitrary will. It requires of everybody frequent acts of self-sacrifice and the submersion of particularity in a common life. It is also, for the children at least, a necessity they cannot easily escape. The family is the only community in the modern world where Sittlichkeit in its primordial sense operates in a more or less pure form through precept, habit, unconscious imitation and other devices; these shape the individual's natural will and teach him the elements of ethical life - the recognition and acceptance of multifarious duties and moral discipline over desires and appetites, a discipline which is external to start with, but gradually becomes internalised as self-discipline.

In one sense Sittlichkeit pervades all aspects of social life, all relations, institutions, organisations and communities; it is, so to speak, their ethical substratum. But in the modern world it takes on the shape of two distinct ethical systems - complex and interdependent ('organic') social wholes the civil and the political order. In the latter, as in the family, the universal and the substantial elements predominate.

## **Civil Freedom**

By contrast with the family and the political community the elements of particularity and subjectivity (self-interest and personal choice) come to the fore in, and are the dominant

characteristics of, civil society. In civil society men interact with the minimum of ethical or legal constraints. In § 206 of the Philosophy of Right Hegel observes that in modern society, in the choice of a career or trade (and therefore class or estate membership), 'the essential and final and determining factors are subjective opinions and the individual arbitrary will, which win in this sphere their right, their merit and their dignity'. In Plato's Republic and in the ancient world generally (as Hegel points out in PhR, § 206R) one's social status was largely determined by the accident of birth or by the fiat of a despotic authority; free choice of one's role in society was not recognized or secured by appropriate law and institutions as it is in the modern civil society.

when subjective particularity is upheld by the objective order in conformity with it and is at the same time allowed its rights, then it becomes the animating principle of the entire civil society, of the development alike of mental activity, merit and dignity. The recognition and the right that what is brought about by reason of necessity in civil society and the state shall at the same time be effected by the mediation of the arbitrary will is the more precise definition of what is primarily meant by freedom in common parlance.

'Freedom in common parlance', or what one might call 'civil freedom' in the context of civil society, implies for Hegel the presence of various civil and economic rights, the right of association, the right to a trial by jury, the right to promote group interests through corporations, and the right to public assistance and protection against misfortune or the vagaries of the market. Many of them represent the enactment and institutionalisation of the sphere of abstract right - the realm of legal prohibitions which make it possible for men to act without getting into each other's way. In § 230 he seems to anticipate the rise of the so-called social or welfare state rights because he argues that 'the right actually present in the particular requires . . . that the securing of every single person's livelihood and welfare be treated and actualised as a right, i.e. that particular welfare as such be treated'. 'The police' in his special sense of the word and the corporation are concerned with the security of such social rights.

If we consider the question of duties, we can see that civil society with its complex and increasingly articulated structure provides individuals with a host of new social roles and ethical duties. They are not left to custom or convention alone. They are formulated in clear and unambiguous laws. Positive law, when rationally reformed, ensures that our actual social obligations do not contradict the principles of abstract right and morality, for example do not involve slavery, serfdom, arbitrary restrictions on property, compulsory religious attendance or membership of a religious sect. As a self-conscious ethical agent the modern man accepts his obligations gladly and performs them willingly. But he does nevertheless make a sacrifice of a part of his individuality in so doing. Modern community, so to speak, compensates the individual for this sacrifice by furthering his self-interest, by protecting his private rights and welfare, by caring for him as an individual. And this care is extended to him equally and universally as a man, irrespective of religion or nationality, as his basic human right.

## **Political Freedom**

The culminating point of the development of individual will towards freedom in the Philosophy of Right is the political realm, the sphere of the supreme public authority of 'the strictly political state'. It would seem to follow that 'political freedom' - the ethical freedom corresponding to this sphere of interaction - is the highest form of human freedom. We find, however, that 'political freedom' is an elusive concept in the Philosophy of Right, and Hegel has rather more to say about it in his

minor political works, especially those which he wrote before he took up residence in Berlin. The most likely explanation is that the completion of the Philosophy of Right coincided with the onset of reaction in Prussia, after a period of considerable liberalism, and it is more than likely that prudence (or political expediency) tempered Hegel's theoretical zeal in this area of his political philosophy. In fact the clearest acknowledgment of the importance of public freedom occurs in the Philosophy of Right not in the section on the constitution of the state, but in the context of Hegel's discussion of the corporation, which is an institution of civil society. The primary work of the corporation is to achieve security and other sectional benefits for its members, to promote group interests; but it incidentally fosters various ethical characteristics in its members - a sense of honesty, group pride, a sense of belonging and the consciousness of a common end for which they are united. 'As family was the first, so the Corporation is the second ethical root of the state, the one planted in civil society'.

Under modern political conditions, the citizens have only a restricted share in the public business of the state, yet it is essential to provide men - ethical entities - with work of a public character over and above their private business. This work of a public character, which the modern state does not always provide, is found in the Corporation. It is in the Corporation that unconscious compulsion first changes into a known and ethical mode of life.

In the strictly political section of the Philosophy of Right we get only a vague idea what political freedom means and why it is the culminating moment in the development of the will to complete self-determination. Although Hegel purports to offer a dialectical argument, it is clear that for pragmatic reasons he does not think that the opportunity to exercise political freedom need be as wide as the scope to enjoy civil freedom, and makes political freedom a universal right of all citizens only in a very attenuated form. Effectively political participation is a privilege of an elite. There are a number of reasons why Hegel nevertheless thinks the state to be vitally important for freedom and why it is in the state, a politically organised and governed community, that human freedom reaches its fullest embodiment. Let us imagine that we are members of a Hegelian civil society which appears to be fully rational and developed, in that it genuinely respects and promotes our particular interests and subjective choices through an appropriate system of laws and institutions. We fully enjoy what Hegel calls 'freedom in the common parlance', or civil freedom. Are we then completely self-conscious and self-determined, or is there still some extra element or dimension of freedom which is lacking? Hegel would probably answer this question along the following lines.

(1) Civil society, although autonomous, is ultimately subject to the political state and its governmental authority ('state power'). Rights may be abrogated, as they are in times of war or civil disturbance; property may be taxed for public purposes; corporate rights may be curtailed or independent social activities taken over by public bodies.

In contrast with the spheres of private rights and private welfare (the family and civil society), the state is from one point of view an external necessity and their higher authority; its nature is such that their laws and interests are subordinate to it and dependent on it.

When the need for the state's intervention arises there is no machinery within civil society to explain and justify the need, and without it the intervention has the appearance of an arbitrary, high-handed activity. The certainty that sacrifices for the sake of the common good or some other

higher ethical principles are justified requires an exchange of views, an expression of opinions, an institutional channel for the debate of public issues. Although Hegel in the Philosophy of Right goes out of his way to stress the capricious and often trivial character of public opinion, and wishes to curb its 'excesses', he regards it as a necessary element of political life and the chief manifestation of 'subjective freedom' in the public realm.

The formal subjective freedom of individuals consists in their having and expressing their own private judgments, opinions and recommendations on affairs of state. This freedom is collectively manifested as what is called 'public opinion'.

The operation of public opinion presupposes the freedom of the press, publication and association, all of which can exist in civil society and indeed constitute essential civic freedoms. Hegel, however, argues - quite correctly - that such public opinion is either impotent or dangerous as long as it is not related to governmental authority. It is the function of a representative body to remedy this defect. This body, which Hegel call, 'the Assembly of Estates', forms part of the governmental authority or state power', and is a specifically political, not civil, institution.

The Estates have the function of bringing public affairs into existence not only implicitly, but also actually, i.e., of bringing into existence the moment of subjective formal freedom, the public consciousness as an empirical universal, of which the thoughts and opinions of the Many are particulars.

in them [the Estates] the subjective moment in universal freedom - the private judgement and private will of the sphere called 'civil society' in this book - comes into existence integrally related to the state.

It is well known that in the Philosophy of Right Hegel is extremely vague about the power of the Estates' Assembly, and in all his political writings he insists that rational suffrage is not universal, direct and individual, but limited, indirect and based on communities or organised interests. It should reflect the social articulation of the national and ethical community. Nevertheless, even in the Philosophy of Right, he treats the principle of representation as a rational feature of the modern state.

(2) Hegel makes the further point that the representative assembly, like the rest of the supreme public authority, is concerned with laws and policies which are necessarily general and must be discussed in universal, rational terms.

The state, therefore knows what it wills and knows it in its universality, i.e. as something thought. Hence it works and acts by reference to consciously adopted ends, known principles, and laws which are not merely implicit but are actually present to consciousness.

In the final analysis such ends and principles are part of the general culture of a particular country and express its 'national spirit'. Public opinion and representative institutions are the means through which the principles are related to the practical concerns of the community, where fundamental issues of public life are raised and thrashed out in debate. This makes deputies and the country at large conscious of the principles underlying the actual ethical order, reveals possible inadequacies and contradictions, and generates demands for reform. As for J. S. Mill, so for Hegel,

representative government is an essential agency of national education. Political institutions promote the kind of national and political self-consciousness which men do not acquire by being mere members of civil society, and they contribute to freedom because they clarify the principles on which the ethical, social and political life of their community is based.

(3) Another reason for Hegel's dissatisfaction with civil freedom as an adequate form of ethical freedom stems from the form of human interaction peculiar to civil society. Although 'burghers' come to depend closely on each other and form a relatively integrated society, their social interdependence is brought about to some extent by the external forces of needs, labour, the division of labour and the market, and not merely through inner individual commitment or personal choice. Also, while performing their duties to each other and cooperating closely, men remain primarily their own private ends - they (or as Hegel would say, their wills) do not consciously pursue their 'substantial' end, which is the existence of an ethical community making complete freedom possible. They promote the interest of such community only implicitly, indirectly, unconsciously. To this extent they remain within the realm of necessity more akin to nature than to the spiritual realm of freedom. The unity of particularity and universality in civil society is achieved without the knowledge and will of its members and so is not the identity which the ethical order requires, because at this level, that of division, both principles are self-subsistent. It follows that this unity is present here not as freedom but as necessity, since it is by compulsion that the particular rises to the form of universality and seeks and gains its stability in that form.

By contrast in the political community or the state the universal does not prevail or achieve completion except along with particular interests and through the co-operation of particular knowing and willing and individuals likewise do not live as private persons for their own ends alone, but in the very act of willing these they will the universal in the light of the universal, and their activity is consciously aimed at none but the universal end.

Man as potentially free, self-determined agent, once he has become conscious of his nature, cannot allow himself to be determined by social forces operating on him externally, like natural forces, all the more so as those forces are in the last resort the product of his thought and will and so are potentially under his control. His proper end - the membership of a rational ethical community - must be his own conscious aim, otherwise he is not fully free. By participating in political activities, the public affairs of his state, the individual makes a direct contribution to the life and development of the community and thereby increases his self-determination. As we have seen, a start towards this kind of freedom is made already in civil society through the corporation, which changes the unconscious compulsion of working for others in the market economy into 'a known and thoughtful ethical mode of life'. The modern state creates further opportunities for participation to its citizens, although it allocates different shares according to education, property and status.

(4) Hegel's final line of argument that political freedom is distinct from civil freedom, and represents the highest stage in the development of freedom, is his version of Rousseau's idea of the General Will. Rousseau insisted that the General Will had to express or manifest itself in the actions of individual citizens performing public functions, especially voting on laws. The General Will is the rational or moral will of citizens acting for the common good (the general interest of the body politic) rather than for their own personal good or private interest. For Hegel the common good or public interest is identical with the totality of rational laws and institutions of a community

and constitutes the 'objective will' of the community.

Confronted with the claims made for the individual will, we must remember the fundamental conception that the objective will is rationality simplicity or in conception, whether it be recognised or not by individuals, whether their whims be deliberately for it or not.

But although Hegel differs from Rousseau by postulating a transcendent General Will which, as the 'objective will' of a rationally structured community, is more than the sum of individual wills, he agrees with him that such will must express or manifest itself in the actual thinking and willing of individual citizens, consciously identifying their subjective will with the 'objective will' and its needs. This union of subjective and objective will constitutes 'concrete freedom', which is higher than the abstract subjective and objective freedoms taken by themselves. It is through the political institutions of the ethical community that the reconciliation of the subjective and objective aspects of the will is effected.

In the Philosophy of Right the necessity of the subjective will assenting to laws and other requirements of the common good is argued by Hegel only with the reference to the monarch, as the official head of the political community, but in his Philosophy of Mind, the third part of the Encyclopaedia of the Philosophical Sciences (1830), this necessity is explicitly stated also with reference to the mass of citizens. In paragraph 544 of this work Hegel raises the question 'in what sense are we to understand the participation of private persons in state affairs?', and after ruling out superior intelligence or good will of the people as an adequate reason he answers his question as follows:

The desirability of private persons taking part in public affairs is partly to be put in their concrete, and therefore more urgent, sense of general wants. But the true motive is the right of the community (collective) spirit to appear as an externally universal will, acting with orderly and express efficacy for the public concerns. By such satisfaction of this right it gets its own life quickened, and at the same time breathes fresh life in the administrative officials; who thus have it brought home to them that not merely have they to enforce duties but also to have regard to rights. Private citizens are in the state the incomparably greater number and form the multitude of such as are recognised as persons. Hence the rational will (will-reason) exhibits its existence in them as a preponderating majority of freemen, or in its 'reflectional universality' which has its actuality vouchsafed it as a participation in the sovereignty.

The meaning of this somewhat poorly translated passage is fairly clear: the rational will of the ethical community, public, affairs must be mediated through the wills of the multitude and must take the form of an externally universal (general) will', i.e. one embodied in the particular wills of the citizens exercising political rights or participating in sovereignty. Only then does the general will become fully alive and acquire universal existence.

We may therefore conclude that Hegel has largely justified his claim that 'the [modern] state is the actuality of concrete freedom'. Freedom defined as the self-determination of a rational, moral and ethical agent reaches its fullest development only in a politically organised modern community, in which he interacts with other citizens and the government through free public debate, suffrage and representation. Political liberty, involved in these activities, is distinct from civil liberty. The *raison d'être* of civil society and the justification of civil freedom is the private interest and subjective choice of the individual bourgeois which, mediated through a system of economic and social

relations as well as laws, institutions and authorities, promotes the interest of the ethical community only indirectly and in the last resort. The *raison d'être* of political community and the justification of political liberty are the good of the ethical community itself, the common good or the public interest, which the fully self-conscious and self-determined citizen promotes for its own sake. In so doing he actualises his own deepest freedom and realises his nature not simply as a particular but as a universal, communal being. Political freedom, although roughly hewn, is the indispensable coping stone of Hegel's theory of freedom which (so to speak) is the obverse of his theory of political community. And the two theories taken as a whole represent Hegel's adaptation of Plato's idea of 'ethical substance' to the modern world and the solution of Rousseau's problems of political association how to live in community with others and yet remain a free individual.

# MCQs

1. intellectual midwifery is the theory of knowledge put forward by:

- (a) Plato
- (b) Thales
- (c) Comte
- (d) Socrates

Answer:d

2. --- is a Skeptic.

- (a) David Hume
- (b) Emmanuel Kant
- (c) Hegel
- (d) None of these

Answer:a

3. Esse est Percipi is the concept of

- (a) Rene Descartes
- (b) Benedict Spinoza
- (c) George Berkeley
- (d) Francis Bacon

Answer:c

4. The metaphysical view that there are many realities is known as

- (a) Dualism
- (b) pluralism
- (c) Monism
- (d) Non-dualism

Answer:b

5. The theory that holds reason as the source of knowledge is

- (a) Idealism
- (b) Rationalism
- (c) Empiricism
- (d) None of the above

Answer:b

6. Inborn ideas are known as:

- (a) Adventitious ideas
- (b) Factitious ideas
- (c) Innate ideas

(d) a b&c

Answer:c

7. The Philosophy of Hegel is known as

(a) Phenomenal idealism

(b) Personal idealism

(c) Objective idealism

(d) Absolute idealism

Answer:d

8. The founder of Positivism is

(a) Saint Simon

(b) C. S Pierce

(c) August Comte

(d) Francis Bacon

Answer:c

9. The author of Novum Organum is

(a) Rene Descartes

(b) Lemnitzer

(c) John Dewey

(d) Francis Bacon

Answer:d

10. The science of values is known as

(a) Axiology

(b) Sociology

(c) Ontology

(d) Cosmology

Answer:a

11. Metaphysics is the work of

(a) Socrates

(b) Plato

(c) Aristotle

(d) Thales

Answer:c

12. Early Skepticism is also known as

(a) pyrrhonism

(b) Positivism

(c) Materialism

(d) Idealism

Answer:a

13. The Greek word Pragma means

- (a) Truth
- (b) Act or deed
- (c) Utility
- (d) Beauty

Answer:b

14. The author of Republic

- (a) Socrates
- (b) Descartes
- (c) Plato
- (d) Hume

Answer:c

15. The metaphysical view that there is one ultimate reality is called

- (a) Dualism
- (b) Pluralism
- (c) Monism
- (d) None of these

Answer:c

16. According to the modern scientists matter is

- (a) Light
- (b) Energy
- (c) Illusion
- (d) All of these

Answer:b

17. ——— is a Greek atomist

- (a) Democritus
- (b) Xenophanes
- (c) Xenophon
- (d) Zeno

Answer:a

18. epistemology studies

- (a) Origin and Nature of knowledge
- (b) Validity of knowledge
- (c) Extent of knowledge
- (d) a, b & c

Answer:d

19. The two branches of Metaphysics are

- (a) Religion and Theology
- (b) Rationalism and Empiricism
- (c) Ontology and Cosmology
- (d) Materialism and Spiritualism

Answer: c

20. The three distempers of learning according to Francis Bacon are:

- (a) Mind, body and God
- (b) Ideas, experience and thought.
- (c) Fantastical, contentious and delicate
- (d) Tribe, cave and theatre

Answer: c

21. Philosophy is concerned with

- (a) The irrational
- (b) Beauty
- (c) ( c ) The ideal
- (d) experimentation

Answer: c

22. Ethics is a ---

- (a) Positive science
- (b) Normative science
- (c) Descriptive science
- (d) None of these

Answer: b

23. --- seeks to clarify and refine the process of knowing

- (a) Epistemology
- (b) Axiology
- (c) Metaphysics
- (d) Ethics

Answer: a

24. The Latin word --- is the root of rationalism

- (a) Sophia
- (b) Reason
- (c) Ratio
- (d) Experiential

Answer: c

25. --- insists on a priori knowledge.

- (a) Positivism

- (b) Empiricism
- (c) Rationalism
- (d) None of these

Answer:c

26.----- was written by Kant

- (a) Novum Organum
- (b) Republic
- (c) Critique of Pure Reason.
- (d) politics

Answer:c

27.Ontology deals with

- (a) Matter
- (b) Knowledge
- (c) Being
- (d) None of these

Answer:c

28.The method of Kant was

- (a) Dialectic
- (b) Critical
- (c) Speculative
- (d) Conversational

Answer:b

29.True knowledge is

- (a) Prama
- (b) Aprama
- (c) Pramana
- (d) Prameya

Answer:a

30.Berkeley argues that allknowledge is derived from

- (a) Impression
- (b) Ideas
- (c) Axioms
- (d) Postulates

Answer:b

31.----- helps in getting correctknowledge through anumana

- (a) Vyapti
- (b) Paksha

- (c) Sadhya
  - (d) Badha
- Answer:a

32. The words of a trustworthy person is known as

- (a) Satya
- (b) Dharma
- (c) Aptavakya
- (d) Linga

Answer:c

33. In Philosophy, what is an argument?

- (a) Debate
- (b) Verbal persuasion
- (c) Rational justification
- (d) opposition

Answer:c

34. The method of philosophy is

- (a) Rational reflection
- (b) Dogmatism
- (c) Empirical study
- (d) Revelation

Answer:a

35. ——— is a materialist

- (a) Gautama
- (b) Hegel
- (c) Marx
- (d) Spinoza

Answer:c

36. The author of Advancement of Learning

- (a) Karl Marx
- (b) Thomas Hobbes
- (c) Francis Bacon
- (d) Kant

Answer:c

37. A theory is a conclusion, where a method is a

- (a) Style
- (b) Manner
- (c) Inference
- (d) Procedure

Answer:d

38. Philosophy is the root and science is the

- ( a ) Fruit
- ( b ) Branch
- ( c ) Nourishment
- ( d ) Stem

Answer:a

39. Who said ? Philosophy is the Science of sciences

- ( a ) Plato
- ( b ) Voltaire
- ( c ) August's Comte
- ( d ) Russell

Answer:c

40. Bacon recommended ----- method to attain correct knowledge

- ( a ) Inductive
- ( b ) Intuitive
- ( c ) Mathematical
- ( d ) Doubt

Answer:a

41. Questions of philosophy are---- ones

- ( a ) Causal
- ( b ) Systematic
- ( c ) Inconsistent
- ( d ) Dogmatic

Answer:b

42. ----- said "whatever is. Clearly and distinctly perceived is true"

- ( a ) Locke
- ( b ) Berkeley
- ( c ) Descartes
- ( d ) None of these

Answer:c

43. According to Skepticism knowledge is -----

- ( a ) Certain
- ( b ) Possible
- ( c ) Uncertain
- ( d ) None of these

Answer:c

44. Cosmology was the characteristic of---- Philosophers.

- ( a ) Ionian
- ( b ) Cartesian
- ( c ) Scholastic
- ( d ) All these

Answer:a

45. For Idealism ——— is primary

- ( a ) Mind
- ( b ) Body
- ( c ) Perception
- ( d ) Sense experience

Answer:a

46. The problem of Universals was first introduced into philosophy by:

- ( a ) Aquinas
- ( b ) Aristotle
- ( c ) Plato
- ( d ) Berkeley

Answer:c

47. "Tabula rasa" is the term coined by:

- ( a ) John Locke
- ( b ) Kant
- ( c ) Socrates
- ( d ) Spinoza

Answer:a

48. The author of Meditations is

- ( a ) Leibniz
- ( b ) Patanjali
- ( c ) Descartes
- ( d ) Kanada

Answer:c

49. The only pramana accepted by Carvakas:

- ( a ) Inference
- ( b ) Comparison
- ( c ) Verbal testimony
- ( d ) Perception

Answer:d

50. Nyaya syllogism has ——— statements

- ( a ) One
- ( b ) Five
- ( c ) Three
- ( d ) Two

Answer:b

51. The two Heterodox schools in Indian Philosophy are:

- ( a ) Nyaya and Vaisheshika
- ( b ) Buddhism and Jainism
- ( c ) Sankhya and Yoga

( d ) Purva and Uttaramimamsa

Answer:b

52.The father of philosophy :

( a ) Descartes

( b ) Thales

( c ) Aristotle

( d ) Francis Bacon

Answer:b

53.Who said “ Two things fill me with awe and wonder the starry heavens above and the Moral law within”.

( a ) Karl Marx

( b ) Bertrand Russell

( c ) Kant

( d ) David Hume

Answer:c

54.A Treatise of Human Nature is the work of:

( a ) Karl Popper

( b ) David Hume

( c ) John Dewey

( d ) John Locke

Answer:b

55.The most original contribution of American thought at the end of nineteenth century:

( a ) Pragmatism

( b ) Positivism

( c ) Empiricism

( d ) Rationalism

Answer:a

56.According to Kant genuine knowledge appears in the form of— judgment.

( a ) Analytic

( b ) Synthetic

( c ) Synthetic a posteriori

( d ) Synthetic a priori

Answer:d

57.Leibniz was a—

( a ) Monist

( b ) Pluralist

( c ) Dualist

( d ) Non-dualist

Answer:b

58.Who is known as Cartesian dualist?

- ( a ) August Comte
- ( b ) Rene Descartes
- ( c ) St. Thomas Aquinas
- ( d ) Derrida

Answer:b

59. Who is the father of modern philosophy?

- ( a ) Descartes
- ( b ) Spinoza
- ( c ) Hobbes
- ( d ) Leibniz

Answer:a

60. ——— is a Subjective idealist

- ( a ) Hegel
- ( b ) Kant
- ( c ) Plato
- ( d ) Berkeley

Answer:d

61. Who is a philosopher, in the original sense of the word?

- ( a ) A person primarily interested in the truth about moral matters.
- ( b ) Someone who studies the stars and planets.
- ( c ) A clever and tricky arguer.
- ( d ) A lover and pursuer of wisdom, regardless of the subject matter.

Answer:d

62. The three main divisions of Philosophy are metaphysics, epistemology, and ———

- ( a ) Axiology
- ( b ) Sociology
- ( c ) Anthropology
- ( d ) Cosmology

Answer:a

63. A logical sentence is called ———

- ( a ) Proposition
- ( b ) Syllogism
- ( c ) Preposition
- ( d ) Clause

Answer:a

64. The first Philosophy refers to ———

- ( a ) Aesthetics
- ( b ) Metaphysics
- ( c ) Epistemology
- ( d ) Ethics

Answer:b

65. The study of philosophy stimulates

- ( a ) Dogmatism
- ( b ) Critical thinking
- ( c ) Blind faith
- ( d ) All these

Answer:b

66. Mathematics is a study of certain and --- truths

- ( a ) Self-evident.
- ( b ) Numerical Comment [Office1]:
- ( c ) geometrical
- ( d ) Theoretical

Answer:a

67. Descartes was a --- thinker

- ( a ) Empirical
- ( b ) Rational
- ( c ) Materialistic
- ( d ) Idealistic

Answer:b

68. Which American mathematician/philosopher laid the foundation of Pragmatism

- ( a ) William James
- ( b ) J. Dewey
- ( c ) C.S Pierce
- ( d ) Spinoza

Answer:c

69. The Problem of Knowledge was written by ---

- ( a ) Aristotle
- ( b ) Plato
- ( c ) A.J Ayer
- ( d ) Collingwood

Answer:c

70. Spinoza's method is known as ---

- ( a ) Axiomatic
- ( b ) Theoretical
- ( c ) Geometrical
- ( d ) Doubt

Answer:a

71. The study of the origin and development of the universe is known as ---

- ( a ) Ontology
- ( b ) Cosmology
- ( c ) Zoology

( d ) Sociology

Answer:b

72. Who said ? "God is dead"

( a ) Schopenhauer.

( b ) Sartre

( c ) Popper

( d ) Nietzsche

Answer:d

73. Who is the father of existentialism?

( a ) Soren Kierkegaard.

( b ) Camus

( c ) Sartre

( d ) Heidegger

Answer:a

74. --- Introduced the term Aesthetics

( a ) Kant

( b ) Hegel

( c ) Baumgarten

( d ) Aristotle

Answer:d

75. Socratic method is

( a ) Skeptical

( b ) Conceptual

( c ) Conversational

( d ) All of these

Answer:d

76. The theory of understanding is explained in transcendental ---

( a ) Analytic.

( b ) Synthetic

( c ) Aesthetic

( d ) Pragmatic

Answer:a

77. Know thyself is the maxim of ---

( a ) Plato

( b ) Zeno

( c ) Socrates

( d ) Aristotle

Answer:c

78. Phaedros is the Work of ----

( a ) Heraclitus

- ( b ) Aristophanes
  - ( c ) Plato
  - ( d ) Anaxagoras
- Answer:c

79. Cogito ergo sum means:
- ( a ) I doubt therefore I am
  - ( b ) I think therefore I am
  - ( c ) I see therefore I am
  - ( d ) I question therefore I am .
- Answer:b

80. Leibniz was a ---- thinker
- ( a ) English
  - ( b ) French
  - ( c ) German
  - ( d ) American
- Answer:c

81. Plato was the teacher of ----
- ( a ) Georgias
  - ( b ) Socrates
  - ( c ) Aristotle
  - ( d ) Protogoras
- Answer:c

82. ---- is an Empiricist
- ( a ) Locke
  - ( b ) Berkeley
  - ( c ) Hume
  - ( d ) all of these
- Answer:d

83. The doubt of Descartes shouldnot be confused with ----
- ( a ) Skepticism
  - ( b ) Solipsism
  - ( c ) Idealism
  - ( d ) Intuitionism
- Answer:a

84. Locke is a ----
- ( a ) Idealist
  - ( b ) phenomenologist
  - ( c ) Critical realist
  - ( d ) Representative realist
- Answer:d

85. The Skepticism of Descartes is known as ----

- ( a ) Pure Skepticism
- ( b ) phenomenal Skepticism
- ( c ) Methodological Skepticism
- ( d ) None of these

Answer:c

86. Who said " Accept nothing as true which we do not perceive clearly and distinctly

- ( a ) Descartes
- ( b ) Spinoza
- ( c ) Leibniz
- ( d ) Kant

Answer:a

87. ---- explained the world with the theory of Monads

- ( a ) Democritus
- ( b ) St. Anselm
- ( c ) Leibniz
- ( d ) William James

Answer:c

88. ---- is said to be the origin of Philosophy

- ( a ) Greed
- ( b ) Wonder
- ( c ) Fear
- ( d ) None of these

Answer:b

89. The mind body relationship theory of Descartes is known as ----

- ( a ) Psycho physical parallelism
- ( b ) Interactionism
- ( c ) Pre established harmony
- ( d ) None of these

Answer:b

90 .Wittgenstein says that language is a

- ( a ) Statement
- ( b ) Picture of reality
- ( c ) Judgement
- ( d ) Concept

Answer:b

91. ---- rejected Metaphysics as meaningless

- ( a ) Logical positivists
- ( b ) Rationalists
- ( c ) Idealists
- ( d ) Spiritualists

Answer:a

92. --- means knowledge that follows some other knowledge

- ( a ) pratyaksa
- ( b ) Upamana
- ( c ) Sabda
- ( d ) Anumana

Answer:d

93. The invariable concomitance between hetu and sadhya is known as

- ( a ) Vyapati
- ( b ) Paksa
- ( c ) linga
- ( d ) None of these

Answer:a

94. The Pramana for knowing the nonexistence of a thing is

- ( a ) Anumana
- ( b ) Upamana
- ( c ) Arthapathi
- ( d ) Anupalabधि

Answer:d

95. Agama comes under ---

- ( a ) Sabha
- ( b ) Pratyaksa
- ( c ) Anumana
- ( d ) Upasana

Answer:a

96. According to Indian epistemology the person who knows is ---

- ( a ) premeya
- ( b ) Pramatha
- ( c ) Prama
- ( d ) Aprama

Answer:b

97. In Nyaya syllogism the statement to be proved is known as ---

- ( a ) Pratinja
- ( b ) Major premise
- ( c ) Udaharana
- ( d ) Nigamana

Answer:a

98. --- is known as queen Science

- ( a ) Mathematics
- ( b ) Physics
- ( c ) Philosophy

( d ) Psychology Answer:c

99. The author of Discourse of the method is ----

- ( a ) Sartre
- ( b ) Descartes
- ( c ) Malebranche
- ( d ) Hobbes

Answer:b

100. The author of Prince is ----

- ( a ) Machiavelli
- ( b ) Plato
- ( c ) Bruno
- ( d ) Aristotle

Answer:a

101. In India Philosophy is known as ----

- ( a ) Brahma Vidya
- ( b ) Atmabodha
- ( c ) Darshana
- ( d ) Yogavidya

Answer:c

102. The philosophy of God is called ----

- ( a ) Theology
- ( b ) Religion
- ( c ) philology
- ( d ) All of these

Answer:a

103. The proponent of Advaita Vedanta is ----

- ( a ) Ramanuja
- ( b ) Madhvacharya
- ( c ) Jaimini
- ( d ) Sankara

Answer:d

104. Nyaya Vaisesika accepts ---- pramanas.

- ( a ) Two
- ( b ) Three
- ( c ) Five.
- ( d ) Four

Answer:d

105. The philosopher seeks to harmonise the ideals of Truth, Good and ----

- ( a ) Love.
- ( b ) God
- ( c ) beauty.

( d ) knowledge

Answer:c

106.Henri Bergson advocated---

( a ) Intuitionism

( b ) Empiricism

( c ) Apriorism

( d ) Sensationalism

Answer:a

107.--- says "Understandingmakes Nature ".

( a ) Bergson

( b ) Herbert Spencer

( c ) Kant.

( d ) Lamarck

Answer:c

108.The highest Value in thePurusharthas:

( a ) Artha.

( b ) Kama

( c ) Dharma.

( d ) Moksa

Answer:c

109.Dialectical materialism is thetheory of---

( a ) Hegel

( b ) Marx

( c ) Nietzsche

Answer:b

110.--- is the father ofSpiritualistic pluralism

( a ) Locke

( b ) Dewey

( c )Leibniz

( d ) W. James

Answer:c

111.--- accepted four kinds ofcause

( a ) Aristotle.

( b ) David Hume

( c ) J. S Mill.

( d ) Plato

Answer:a

112.The author of Passions of theSoul is

( a ) Spinoza

( b ) A.J Ayer

- (c) Aristotle.
  - (d) Descartes
- Answer:d

113.---- said " Philosophy is the science of knowledge " .

- ( a ) Schelling
- ( b ) Fichte
- ( c ) Marx
- ( d ) Bruno

Answer:b

114.---- believes in the transcendence of God

- ( a ) Deism.
- ( b ) Theism
- ( c ) Agnosticism.
- ( d ) Atheism

Answer:a

115. According to ---- All is God and God is all.

- ( a ) Monotheism.
- ( b ) Monism
- ( c ) Henotheism.
- ( d ) Pantheism

Answer:d

116. According to Kant knowledge appears in the form of ----

- ( a ) Statement
- ( b ) Reasoning
- ( c ) Judgement.
- ( d ) Proposition

Answer:c

117. Space, time and categories of understanding are ---- forms of knowledge

- ( a ) a priori.
- ( b ) a posteriori
- ( c ) intuitive.
- ( d ) All of these

Answer:a

118.---- is the work of Kant.

- ( a ) Leviathan
- ( b ) Critique of Judgement
- ( c ) Ethics
- ( d ) Republic

Answer:b

119. Transcendental aesthetic deals with the theory of

- ( a ) Understanding.
- ( b ) Sensations
- ( c ) Aesthetic Judgement.
- ( d ) Moral Judgement

Answer:b

120.Ethics is also known as ----

- ( a ) Axiology
- ( b ) Moral Philosophy
- ( c ) Utilitarianism.
- (d)All of these

Answer:b

121.Philosophy of art comes under----

- ( a ) Aesthetics.
- ( b ) Ethics
- ( c ) Anthropology.
- ( d ) None of these

Answer:a

122.---- are the supreme norms of life.

- ( a ) Men.
- ( b ) Gods
- ( c ) Values.
- ( d ) All of these

Answer:c

123.Ex NihiloNihilfit means-----

- ( a ) I think therefore I am.
- ( b ) Out of nothing comes nothing
- ( c ) To be or not to be
- ( d ) None of these

Answer:b

124.The philosophy of the Upanishadis Known as ----

- ( a ) Non- Dualism.
- ( b ) Monistic Spiritualism
- ( c ) Dualism.
- ( d ) Pluralism

Answer:b

125.---- awoke Kant from his dogmatic slumber

- ( a ) Locke 's empiricism.
- ( b ) Hume's Essays
- ( c ) Leibniz's talks.
- ( d ) Berkeley's Dialogues

Answer:b

126. Denial of the ultimate knowledge of the existence of God is known as ----

- ( a ) Atheism.

- (c) God cannot exist, even in one's understanding

(d) God only exists in one's understanding

Answer:b

259. Choose the answer that best fills in the missing step in Anselm's argument:

(i) God is that than which nothing greater can be conceived.

(ii) God exists in one's understanding.

(iii) But then we can conceive something greater than God.

(iv) This is a contradiction, so if God exists in our understanding, God must exist

(a) If God exists in one's understanding, then God must exist in reality.

(b) It is possible for something to exist in one's understanding but not in reality.

(c) God is also something greater than can be conceived.

(d) If God only exists in one's understanding, we could still conceive of God existing in reality.

Answer:d

260. According to Anselm, not only is God that which nothing greater can be conceived, God is also...

(a) Omniscient, Omnipotent, and Allgood.

(b) The truth.

(c) Something greater than can be conceived.

(d) What gives meaning to our lives.

Answer:d

261. Anselm's "ontological" argument for the existence of God

(a) begins with easily observed facts about the world.

(b) moves from the premise that I exist to the conclusion that God exists.

(c) purports to establish that "There is no God" is self-contradictory.

(d) begins from the idea of God as the greatest thing I can

Answer:c

262. Anselm's argument

(a) moves from existence to essence.

(b) presupposes that God exists.

(c) starts from essence and ends with existence.

(d) begins with premises derived from Christian faith.

Answer:c

263. Thomas Aquinas

(a) depends on Anselm's ontological argument to buttress faith with reason.

(b) rejects Anselm's argument as invalid.

(c) thinks that God's existence cannot be proved, but must be accepted on faith.

(d) holds that we are not in the right epistemological position to use Anselm's argument.

Answer:d

264. Existence, Aquinas tells us,

- (a) is included in form, the principle of actuality in things.
- (b) is something we can take for granted.
- (c) is something added to the essence of finite things.
- (d) derives from essence, and from essence alone.

Answer:c

265. The argument for God's existence from change

- (a) claims that every change is a transition from actuality to potentiality.
- (b) assumes that something can be simultaneously both potentially hot and actually hot.
- (c) assumes that changes can be traced back to infinity.
- (d) argues that without a first cause of change there would be no intermediate causes of change.

Answer:d

266. Arguing from efficient causality, Aquinas says that

- (a) there must be something that is the efficient cause of itself.
- (b) the eternity of the world proves that God is not an efficient cause.
- (c) a series of causes going on forever proves that God is eternal.
- (d) a series of causes cannot go on forever.

Answer:d

267. When we say that God is good, according to Aquinas, we mean

- (a) that God is not bad.
- (b) to use the word "good" in an equivocal sense.
- (c) exactly what we mean when we use the word "good" in regard to created things—otherwise we wouldn't know what we do mean.
- (d) to apply the word "good" by analogy or proportion.

Answer:d

268. What we know first and most easily, according to Aquinas,

- (a) is the soul.
- (b) are the contents of our own minds.
- (c) are things like carrots and clouds.
- (d) are ideas of things like carrots and clouds.

Answer:d

269. What is right for us to do, according to natural law,

- (a) can be known only through careful attention to what is described as natural in the Scriptures.
- (b) is whatever naturally feels right.
- (c) is whatever God, the author of nature, arbitrarily legislates as right.
- (d) expresses our nature as rational human beings.

Answer:d

270 is not a representative of Rationalism

- (a) Kant

- (b) Descartes
- (c) Spinoza
- (d) All these

Answer:a

271. Descartes is considered as the founder of -----

- (a) Empiricism
- (b) Rationalism
- (c) Idealism
- (d) None of these

Answer:b

272. Generally the rise of modern Philosophy had been marked by -----

- (a) Critical thinking
- (b) Reflective spirit
- (c) Revolt against authority
- (d) All these

Answer:d

273. Descartes is a -----Philosopher

- (a) Greek
- (b) French
- (c) German
- (d) American

Answer:b

274. John Lock is -----Philosopher

- (a) Rationalist
- (b) Empiricist
- (c) Idealist
- (d) None of these

Answer:b

275. Cogito ergo sum is a key concept in the philosophy of -----

- (a) Leibniz
- (b) Spinoza
- (c) Descartes
- (d) None of these

Answer:c

276. The term 'natura naturans' is introduced by -----

- (a) Leibniz
- (b) Spinoza

- (c) Descartes
  - (d) Kant
- Answer:b

277. The doctrine of force relates to -

- (a) Monadology
- (b) Interactionism
- (c) Scholasticism
- (d) All these

Answer:a

278 is not a Rationalist

- (a) Kant
- (b) Descartes
- (c) Leibniz
- (d) All these

Answer:a

279 are the affections or modifications of substance

- (a) Modes
- (b) God
- (c) Attributes
- (d) None of these

Answer:a

280. Whose philosophy is conceived as Absolute Idealism

- (a) Kant
- (b) Hegel
- (c) Descartes
- (d) Spinoza

Answer:b

281. 'An Essay concerning human Understanding' is the work of -----

- (a) Spinoza
- (b) Descartes
- (c) Locke
- (d) None of these

Answer:c

282. Theory of Pre-established harmony is postulated by

- (a) Descartes
- (b) Leibniz
- (c) Spinoza
- (d) Hegel

Answer:b

283. Locke and Berkeley belong to ----- school

- (a) Empiricism
- (b) Rationalism
- (c) Idealism
- (d) None of these

Answer:a

284. Leibniz belongs to----- school

- (a) Rationalism
- (b) Empiricism
- (c) Idealism
- (d) None of these

Answer:a

285. According to Berkeley matter is an -----

- (a) Immanent idea
- (b) Abstract idea
- (c) Pure idea
- (d) All these

Answer:b

286. 'To be is to be perceived' is a theory of -----

- (a) Descartes
- (b) Leibniz
- (c) Spinoza
- (d) Berkeley

Answer:d

287. 'Ethics' is written by -----

- (a) Leibniz
- (b) Spinoza
- (c) Descartes
- (d) None of these

Answer:b

288 is the view that God is the immanent principle of universe

- (a) Pluralism
- (b) Dualism
- (c) Pantheism
- (d) Atheism

Answer:c

289. Hume is -----philosopher

- (a) Empiricist
- (b) Rationalist
- (c) Idealistic
- (d) None of these

Answer:a

290. Which one of the following is a secondary quality according to Locke

- (a) Solidity
- (b) Colour
- (c) Extension
- (d) Solidity

Answer:b

291. Who among the following is considered as the Subjective Idealist

- (a) Spinoza
- (b) Leibniz
- (c) Berkeley
- (d) None of these

Answer:c

292. 'All our reasoning about causality is derived from nothing but custom'. This relates to ----

- (a) Kant
- (b) Hegel
- (c) Leibniz
- (d) Hume

Answer:d

293. Kant's Rational theology deals with ..

- (a) The idea of God
- (b) Unity of self
- (c) The idea of world
- (d) None of these

Answer:a

294. Who among the following is an Idealist philosopher

- (a) Descartes
- (b) Kant
- (c) Locke
- (d) None of these

Answer:b

295. Descartes took-----as the model of his philosophical method

- (a) Religion
- (b) Mathematics
- (c) Sociology
- (d) Arts

Answer:b

296 is not a secondary quality according to Locke

- (a) Taste
- (b) Colour
- (c) Extension
- (d) None of these

Answer:c

297. 'Real is Rational, Rational is Real' is the concept of -----

- (a) Locke
- (b) Leibniz
- (c) Spinoza
- (d) Hegel

Answer:d

298. Who is considered as the father of modern philosophy

- (a) Kant
- (b) Descartes
- (c) Both (a) and (b)
- (d) Neither (a) nor (b)

Answer:b

299. According to Kant ----- judgments are always a priori

- (a) Synthetic
- (b) Ethical
- (c) Analytical
- (d) None of these

Answer:c

300. Which one of the following is a primary quality according to Locke

- (a) Colour
- (b) Figure
- (c) Extension
- (d) None of these

Answer:c

301. Tabula rasa refers to -----

- (a) Empty cabinet

- (b) Subtle emotion
- (c) Knowledge
- (d) None of these

Answer:a

302. Kant's Rational cosmology dealswith -----

- (a) Unity of self
- (b) The idea of God
- (c) The idea of one world
- (d) All these

Answer:c

303. Which one of the following is a work of Kant

- (a) Ethics
- (b) Monadology
- (c) Critique of pure reason
- (d) All of these

Answer:c

304. Psycho physical parallelism is a theory of ----

- (a) Descartes
- (b) Leibniz
- (c) Spinoza
- (d) None of these

Answer:c

305. Hegel developed his philosophy on the foundation laid by -----

- (a) Descartes
- (b) Fichte
- (c) Aristotle
- (d) None of these

Answer:b

306. Kant's Rational Psychology dealswith -----

- (a) The idea of world
- (b) The idea of God
- (c) Unity of self
- (d) None of these

Answer:c

307 is the method adopted by Kant

- (a) Inductive
- (b) Deductive

- (c) Empirical
- (d) Transcendental

Answer:d

308 is a mind body theory of Descartes

- (a) Psycho physical parallelism
- (b) Interactionism
- (c) Pre-established harmony
- (d) All these

Answer:b

309. According to Kant , knowledge of things – in –itself is called -----

- (a) Phenomena
- (b) Substance
- (c) Noumena
- (d) None of these

Answer:c

# **UNIT – 3**

## **Indian Ethics**

## **Purusārtha**

Puruṣārtha is purpose/fulfillment of life. By fulfilling Puruṣārtha, man gets fulfillment for life as well as sustains the society.

Purusārtha, The concept of purusārthas is the fundamental principle of Indian social ethics. The word purusārtha means “attainments” or “life purposes”. The aim of every person is to attain the four noble ends or purusārtha. These four purusārthas are – Dharma, Artha, Kāma and Moksha.

## **Dharma**

Dharma or the principle of righteousness is considered to be the supreme of the purusārthas. Dharma in Indian tradition is different from the Western concept of religion. The word religion has been derived from the latin root religare which means “to connect”. In this sense religion is a set of principles which connects human beings with God or which connects the thisworldly and the thatworldly. Therefore, religion essentially has some notion of God or some other supernatural entity. It is a particular way of worshipping.

On the other hand derived from the Sanskrit root dhr, which connotes to sustain, support or uphold, dharma has a wide range of meaning: it is the essential foundation of something or of things in general, and thus signifies ‘truth’; it is that which is established, customary, proper and therefore, means ‘traditional’ or ceremonial; it is one’s duty, responsibility, imperative and thereby ‘moral obligation’; it is that which is right, virtuous, meritorious, and accordingly ‘ethical; and it is that which is required, precepted, or permitted through religious authority, and thus legal.

Therefore, dharma in ancient India was a code of conduct for members of the society. P.V. Kane also defines dharma in terms of privileges, duties and obligations of a person. In the words of Kane, 61 “the word dharma passed through several transitions of meaning and ultimately its most prominent significance came to be the privileges, duties and obligations of man of the castes, as a person in a particular stage of life”. We find various forms of dharma in the sense of duty in ancient India like

1. Sāmānya Dharma— Some general rules which are universal in nature like truth, non-violence and non-stealing.
2. Rāj Dharma— Duties of the king.
3. Stree Dharma— Duties of woman.
4. Dāmpatya Dharma— Duties of husband and wife.
5. Varna Dharma— Duties of varnas.
6. Āshrama Dharma— Duties in the different stages of life.
7. Āpad Dharma— Duties during the crisis period.

## **Artha**

Artha is the second purusārtha. The term artha refers to worldly prosperity or wealth. It includes all the material means of life. Kautilya maintains that wealth is the basis of human requirements and that social well-being depends ultimately on material prosperity. Indian thinkers had recognised the pursuit of wealth as a legitimate human aspiration. But artha must be acquired by right means.

## **Kāma**

Kāma means worldly pleasures or sensual pleasures. It refers to some of the innate desires and urges in human beings. In the narrow sense kāma means sexual pleasure but in the wider sense it involves sexual, emotional and aesthetic life all together.

## **Moksha**

It is the ultimate purusārtha. Moksha means salvation or liberation from the cycle of birth and death. It is the summum bonum of human existence.

## **Varnāshrama System**

Various texts talk of varnāshramadharma or the dharma of different classes and dharma in the different stages of life. In ancient India there was a common dharma for all members of society which must be followed by all equally. But at the same time there were different codes of conduct for different classes or varnas called varna-dharma. Similarly, it was desired to follow different dharma at the different stages or āshrama of life called āshrama-dharma.

## **Varnas**

First reference of varna is seen in the Rig Veda. The tenth chapter of Rig Veda called Purusasūkta mentions the organic theory of the origin of varnas according to which varnas originated from the different organs of the Prajāpati or the creator. Manu also mentions that God created various varnas from his various organs. He created brahmins from his mouth, kshatriyas from his arms, vaishyas from his thighs and shudras from his legs. Though logically this explanation cannot be accepted but this clearly points out the varying significance of various varnas.

A much significant feature of this varna system was that the top three varnas— brahmins, kshatriyas and vaishyas were described as dvija or twice born. Their first birth was natural birth. But they were considered to be born again at the time of the pious yajñopavīta samskāra when they were invested with the sacred thread and included into the Aryan society as its full fledged member.

## **Brahmins**

Brahmins were at the top of varna hierarchy. They were believed to possess great spiritual powers. Thus they had a divine existence. In law, they claimed great privileges. Normally brahmins were exempt from execution, torture and corporal punishment. The main functions prescribed for brahmins were learning, teaching and priesthood.

## **Kshatriya**

The second class was the ruling class described as kshatriya or rājanya. Kshatriyas represented heroism, courage and strength. They constituted the warrior class.

The duty of kshatriyas was protection which had both internal and external aspects. External protection meant to protect the society from external invasion where as internal protection meant governance in peace and protection from anarchy. Kshatriyas had the right to possess arms.

## **Vaishyas**

Vaishyas represented the trading and commercial class. Though they were entitled to the services of the priesthood and to the ceremony of yajñopavīta, they were third in the social hierarchy.

According to Manu 63 the main task of the vaishya was to keep and maintain cattle. But it seems that later on vaishyas became economically a very important class of society. The ideal vaishya possessed the expert knowledge of jewels, metals, cloth, threads, spices, perfumes etc. In this sense vaishyas were the ancient Indian businessmen. In brahmanic literature, vaishyas are given few rights and humble status but Buddhist and Jaina literature mention many wealthy merchants living a luxurious life.

## **Shudras**

Shudras were at the bottom of the social hierarchy. They pursued the task of serving the other three varnas. They were not twice born. They were deprived of various rights. They were in fact second class citizens, on the fringes of Aryan society.

A.L. Basham maintains that shudras were of two types— 'not excluded' or anirvāsita and 'excluded' or nirvāsita. The distinction was made on the basis of the customs of the shudra group and the profession followed by the members of the group. Anirvāsita shudras were the part of Indian varna system whereas nirvāsita shudras were quite outside the pale of Hindu society and virtually indistinguishable from the strata of people known as untouchables.

Manu 65 prescribes the same penance for killing a shudra by a brahmin as for killing a cat or dog.

## **Untouchables**

A large number of people were deprived of all human rights. Having any contact with them might lead to the fall from grace by a normal Hindu. They were untouchables. Sometimes they are regarded as the excluded shudras whereas sometimes they are called the 'fifth class' (pancham varna). Probably, they were the aboriginal tribes who were defeated by the Aryans.

Most important of these groups was the Chāndāla. They were not allowed to live in the Aryan towns or villages. Their chief means of livelihood were the carrying and cremation of corpses and execution of criminals who were awarded the death penalty. According to the law books of ancient India, Chāndālas should be dressed in the garments of the corpses they cremated, should eat his food from broken vessels and should wear only those ornaments which were made of iron.

Later on the four varnas were divided into various subcategories called caste. The caste system is governed by two important rules: First, endogamy or marriage within the members of same caste, Second, the observance of certain rules of commensality whereby food was to be received from and consumed in the presence of either members of the same caste or of a higher caste but could not be consumed together with the members of the lower caste.

## **Two Paths: Shreyas and Preyas**

There is a beautiful stanza in the second chapter of the first cycle of Kathopanishad in which it is said – "The good and the pleasant come to a man and the thoughtful mind turns around them and distinguishes. The wise choose out the good from the pleasant, but the dull soul chooses the pleasant rather than the getting of his good and its having." (Kathopanishad, 1.2.2, translated by Sri Aurobindo) The two most important words in this verse which need to be understood in their root-sense are shreyas and preyas. In this issue my attempt is to explain the root-sense of these two words.

The word **shreyas** is derived from the root-sound **shri** which means to cause to lean or rest on, lay on or in, fix on, fasten to, direct or turn towards, spread or diffuse light or radiance or beauty over. The most common word from this root is **aashraya** meaning support, refuge, shelter, dependence etc. The third person singular form of the root **shri** in present tense is **shrayati** or **shrayate**. The word **shrii** is another most familiar word from this root which means light, lustre, radiance, splendour, glory, beauty, grace, loveliness, prosperity, welfare, good fortune, success, auspiciousness, wealth, treasure, riches, high rank, power, might, majesty, royal dignity etc. Goddess Lakshmi is known as shrii because she is the refuge and support of all existence; she is the goddess of beauty and harmony. It is the greater harmony that supports all movements in the creation, without that there will be no creation. The word **shriimaan** (feminine **shriimatii**) is one who is in possession of **shrii**, the one who shines with the knowledge of soul, lives in the light of the spirit. To achieve the knowledge that leads to the realization of the cosmic consciousness in each and everything is the object of **shriividya**. The word **shreshtha** which means the most excellent is also from the same root. The word **shreyas**, derived from the root **shri**, therefore, means that which diffuses light, brings happiness and bliss, and is good. It has the following meanings: auspicious, fortunate, conducive to welfare or prosperity, bliss, fortune, happiness, most splendid or beautiful, most excellent or distinguished, best, propitious, well disposed to, superior, preferable, better, better than etc. The word **shreyaskara** means that which promotes happiness and is favourable. The word **nihshreyas** is another important word in this group. It is formed by combining the prefix **nis** with the word **shreyas**. The prefix **nis** conveys the sense of certainty, fullness, completeness and integrality. So, **nihshreyas** refers to that which is certainly and completely good. The word **nihshreyas** is related to the soul's salvation. When we fall back entirely on the inner support or resources, then the real quest begins to bear fruit. This leads to the realization that our real existence is in the soul. This is **nihshreyas**, the perfect goodness or true happiness.

The word **preyas** is derived from the root **prii** which means: to please, gladden, delight, gratify, cheer, comfort, soothe, propitiate; to like, love, be kind to, to refresh. The third person singular form of this root in present tense is either **priiNaati** or **priiyate**. The words like **priiti**, **prema** and **priya** are derived from this root. The word **priiti** means pleasure, joy, gladness, satisfaction, amity, love etc.; **prema** means love and affection; **priya** refers to fondness, one who is dear to, favourite, liked. So the word **preyas** means that which is pleasant.

According to a verse in Kathopanishad (1.2.2) from between **shreyas** (that which is good to the soul) and **preyas** (that which is pleasing to the senses) the wise one always chooses the **shreyas**. In a true sense **preyas** is that pleasure which is born from the contact of the senses with the objects and 'is nectar to the lips at the first touch, but there is a secret poison in the bottom of the cup and after it the bitterness of disappointment, satiety, fatigue, revolt, disgust, sin, suffering, loss, transience.' And that which is born of the satisfaction of the higher mind and spirit is **shreyas**. This refers to the best and most inward with us. At first this may, though not necessarily, be like a poison but in the end it straight leads to the nectar of immortality. So, **preyas** is something pleasing to the senses and leads to failure and disappointment. And **shreyas** is something good to the growth of the soul which ultimately leads to **nihshreyas**, the perfect happiness.

## Preyas

Preyas is a Sanskrit word which can be translated as "dearer", "more agreeable" or "more desired". Preyas can also mean "immediately palatable," and as such it is known in yogic and Hindu philosophy as a way of life which is based on seeking instant gratification.

If one lives their life according to preyas, they make choices as to what will bring the most immediate pleasure. This may include sensory enticements, worldly enjoyment and material gains.

### **Explanation of Preyas**

The revered yogic text, the Bhagavad Gita explains the concept of preyas as a way of living that only gratifies the senses in the short term. Preyas has a strong appeal, but its rewards are only fleeting. Instead the Bhagavad Gita advocates an alternative approach to life, shreyas, which means to delay immediate pleasure and reward in order to pursue greater spiritual growth and ultimate happiness.

Sometimes preyas is thought of as the worldly path available to mankind, whereas shreyas is the spiritual. Thus preyas can be considered to be a valuable step on the spiritual journey, as it gradually leads to shreyas as long as the practitioner learns to discriminate and renounce its lures.

### **Shreyas**

Shreyas is a Sanskrit term meaning "that which brings light or happiness and is good." It can also be translated as meaning "auspicious," "fortune" or "conducive to well-being and prosperity." Shreyas comes from the root sound, shri, which means "to cause to lean in or rest on," "diffuse light" or "beauty."

In yogic philosophy, the word, shreyas, is often used to refer to an approach to life in which immediate gratification and short-term pleasure is delayed or deferred in order to pursue greater goals. This is considered the best approach for long-term happiness.

### **Explanation of Shreyas**

In understanding shreyas as an approach to life, greater presence and more conscious choices are needed in order to consider the future implications of decisions made together. In this way, shreyas brings about greater personal growth and development.

Shreyas is sometimes taught in contrast to an alternative approach of preyas, which means "immediately palatable." It refers to that which gratifies the senses and is instantly pleasurable. The well-known yogic text, the Bhagavad Gita, refers to these concepts and advocates for choosing shreyas, or the ultimate good, over preyas, the short-term reward.

### **Dharma**

Dharma is an important Hindu, Buddhist and yogic concept, referring to a law or principle which governs the universe. For an individual to live out their dharma is for them to act in accordance with this law. Dharma is considered to be one of the three jewels of Buddhism, alongside sangha and buddha, together paving the path to enlightenment. In Hinduism, it is one of the four main philosophical principles along with Artha, Kama and Moksha. It can also be understood as a law of righteousness and satya (truth), giving order to the customs, behaviours and ethics which make life possible.

The implication of dharma is that there is a right or true way for each person to carry out their life in order to serve both themselves and others. Dharma is closely related to the concepts of duty and selfless service, or seva, and is therefore a fundamental principle of yoga. Although it can be a

challenging concept to grasp since it has no single-word English translation, a close adaptation is "right way of living".

## **Explanation Dharma**

The word dharma comes from the Sanskrit root word dhri, which means "to hold," "to maintain," or "to preserve." In the early Vedas and other ancient Hindu texts, dharma referred to the cosmic law that created the ordered universe from chaos. Later, it was applied to other contexts, including human behaviors and ways of living that prevent society, family and nature from descending into chaos. This included the concepts of duty, rights, religion and morally appropriate behavior, and so dharma came to be understood as a means to preserve and maintain righteousness.

On an individual level, dharma can refer to a personal mission or purpose. Traditionally, an individual's dharma is thought to be pre-determined. Depending on karma, a soul is born into a particular caste or social group, either as a reward or a punishment for actions in their past lives. Their path in life is set by universal laws, and the only way to progress is to live within this path and work toward their destined purpose. According to the Bhagavad Gita, it is better to do your own dharma poorly than to do another's well.

It is said that all beings must accept their dharma for order and harmony to exist in the world. If an individual is following their dharma, they are pursuing their truest calling and serving all other beings in the universe by playing their true role.

To Hindus, all entities have their own dharma: even the sun must shine and the bees must make honey. In Buddhism, dharma additionally means acting in accordance with the teachings of the Buddha and the Four Noble Truths.

The result of living in this "right way" is believed to be self-realization and enlightenment. Above all, when your life is aligned with your dharma, it brings a sense of joy and fulfillment.

**The Sanskrit word Dharma** has no direct translation into English. Among other things, it can be thought of as righteousness in thought, word, and action. It comes from the root Dhr, which means to uphold, sustain, or uplift. Thus another interpretation of the word in English would be 'the collection of natural and universal laws that uphold, sustain, or uplift.' i.e. law of being; law of nature; individual nature; prescribed duty; social and personal duties; moral code; civil law; code of conduct; morality; way of life; practice; observance; justice; righteousness; religion; religiosity; harmony.

## **Dharma also refers to the following people from historic texts:**

- Yama, the lord of the departed and the judge of the actions of the departed souls; Justice personified as born from Yama, who is the divine father of Sāma, Kāma, Harṣa, Vidura and Yudhiṣṭhira
- the prajāpati who was the husband of 13 of the daughters of Dakṣa and the father of Hari and Nārāyana
- the son of Aṅu and the father of Ghṛtas
- a son of the Hehaya and father of Netra
- son of Pṛthuśravā; the 15th jaina arhat of the present avasarpinī

- a son of Gāndhāra and father of Dhṛta.

## Defining Dharma

The definition of Dharma as that which upholds, sustains and uplifts does not define the object that is being upheld, sustained, or uplifted. It does not imply any specific object (living or inanimate) and thus applies to all possible objects. It represents a 'Principle' or a 'Quality of being' that can be widely used in a variety of contexts to mean a variety of different ideas.

In the Mahabharata, Yudhistira asks Bhishma to explain the meaning and scope of Dharma. Bhishma replies: Tadrisho ayam anuprashno yatra dharmaha sudurlabaha Dushkamha pralisankhyatum tatkenatra vysvasyathi Prabhavarthaya bhutanam dharmappravachanam kritam Yasyat prabhavasamyuktaha sa dharma iti nischayaha.

It is most difficult to define Dharma. Dharma has been explained to be that which helps the upliftment of living beings. Therefore, that which ensures the welfare of living beings is surely Dharma. The learned rishis have declared that that which sustains is Dharma.

In the Karna Parva, Lord Krishna explains Dharma to Arjuna in the following words: Dharanat dharmamityahu dharmo dhara-yate prajahaYat syad dharanasamyuktam sa dharma iti nischayaha Dharma sustains the society. Dharma maintains the social order. Dharma ensures well being and progress of humanity. Dharma is surely that which fulfills these objectives.

Rishi Jaimini, the author of Purva Mimamsa and Uthara Mimamsa, explains Dharma as: Sa hi nisreyasena pumshamsamyunaktiti pra-tijaneemahe tadabhidhiyate chodanalakshno ariho dharmaha Dharma is that which is indicated by the Vedas as conducive to the highest good. Madhavacharya, in his commentary on Parashara Smriti, explains the meaning of dharma as Dharma is that which sustains and ensures progress and welfare of all in this world and eternal Bliss in the other world. Dharma is promulgated in the form of commands. (positive and negative vidhi and nishedha).

Dharma embraces every type of righteous conduct, covering every aspect of life essential for the sustenance and welfare of the individual and society. Further, it includes those rules which guide and enable those who believe in God and heaven to attain moksha.

## Dharma as Cosmic Order

The earliest import of the word Dharma, arises from the ancient Vedic idea of Ritam (or Cosmic Order). The entire universe is sustained by a cosmic order, which are physical laws that govern the motion of stars, suns, planets, satellites, asteroids and other physical bodies. For example, the law of gravity sustains life on the earth – since without it everything would fly away, never to come back. Similarly there are other natural laws that are responsible for sustaining and upholding various natural phenomenon. For example, why electrons keep revolving around the nucleus of an atom, why atoms combine in ways to form molecules, why the earth goes around the sun, and why human beings breathe out carbon-dioxide while plants breathe out oxygen. There are thus physical laws, chemical laws, biological laws, even psychological laws that both underlie the behavior and also sustain and maintain various natural phenomena.

There are geophysical laws that govern the occurrence of mountains, forests, climates, seas and

rivers, and the numerous phenomena we see on this planet. There are climatic laws that govern the seasons: summer follows spring, spring follows winter, and winter follows autumn and so on. The winds blow as though by an internal law – gently in normal times, and as hurricanes and gales, in abnormal times. And even the hurricanes and gales come only during their appointed season. The snows melt in the high mountains during summer, and the rivers flow in full spate, and thus the whole cycle of life is sustained.

There are biological laws that govern the birth, growth, sustenance and death of all things living, from the single-celled amoeba to the complex human being.

There is a digestive system that digests food, and a respiratory system that transforms oxygen into energy, a nervous system that carries impulses, a brain that initiates thought and co-ordinates movement, and so on. The Laws of Evolution have governed the progressive differentiation of species, and Laws of Destruction have destroyed numerous species in their time. There are laws that govern how the heart works, how the breath works, how hunger works and how food works, how speech works, how the mind works, how emotions work and how imagination works. It could be said that it is the Dharma of the Wind to blow, the Dharma of the Sun to heat up the world, the Dharma of the Ice to freeze and melt, the Dharma of Fire to burn. It is the Dharma of the Plants to give out oxygen, and the Dharma of the Animals to give out carbon dioxide. And behind the delicate workings and inter-relations between the various cosmic phenomena, there is an order, an intelligently engineered and organized system, a set of laws that seem to be at work governing the great forces and powers (Shakti) at play behind these laws.

This is Dharma as the cosmic order, that includes many dynamic sub-orders, each represented by powers and forces of great intensity and magnitude, each governed by their own dharma or internal law of being and working – each interacting upon one another, within the boundaries of that law, sustaining, maintaining and upholding all things material and phenomenal in this Universe.

### **Dharma as a Social Order**

While recognizing that in its inherent definition, Dharma must include all these natural cosmic laws that pertain to the physical universe, it is when the word is applied to Human life, that it gains additional significance. In the Mahabharata, Lord Krishna states that Dharma sustains society, maintains social order, and ensures wellbeing and progress of humanity.

Every society is prone to internal and external conflict. Individuals are fallible and prone to fall to the passions of greed, desire, jealousy and anger that may lay hold of the mind and give rise to all forms of social disturbance. In order to curb this likelihood, proper education and training must be provided and a sense of order living imparted. To live in peace in accordance to Dharma, individuals must learn to gain a free range of expression and experience while at the same time, know not to transgress the freedom and liberty of others.

Dharma, in this situation, is the collection of laws that uphold, sustain, and uplift society, social order, and the well-being and progress of humanity. It is the prescriptions and proscriptions that give rise to harmony, workability and stability in any society.

Every society has recognized the need for these as seen in religions that have created

commandments and injunctions, backed by threats of extraordinary punishments for transgression in the present life and afterlife.

Dharma has indeed been given an elevated place in the consciousness, enshrined through numerous stories and puranas, epics and tales in order to make it accessible to all, ranging from the uneducated villager to the powerful king, from the rishi to the merchant, irrespective of their station and role in society. This ensures that Dharma, the law of right living and conduct, is enshrined and passed on from father to son, from mother to daughter - from generation to generation.

### **Dharma as Ethical behavior**

Dharma includes the Golden rule "Do unto others as others would do unto you", and therefore the set of all possible values such as speaking the truth, being kind, speaking pleasant words, being respectful, demonstrating reverence towards the earth and the natural resources etc. Dharma includes all possible values, and not any one specific set of values, defined by any one individual or religious tradition, at a historical point of time. Dharma extends itself into the specific ways of life, our value systems, and attitudes.

When an individual conforms to a certain universal matrix of behavioral norms, (s)he contributes in the sustenance, maintenance, and the upliftment of societal order and thus the society itself. On the other hand, if the universal norms are transgressed, then a chain of actions and reactions takes place, which creates disorder. For example, the abused child becomes an abuser himself, or the hurt individual hurts another.

### **Dharma as Duty or Responsibility**

Dharma can be said to be expressed in the duties and responsibilities of an individual or a community that ensures the harmony and balance in society as a whole, in terms of its inter-relations and its dependencies. So Dharma upholds, sustains and uplifts all the various constituents of this universe, who are woven together in a common interdependent existence. When the parents perform their duties or discharge their responsibilities towards their children, that naturally sustains and uplifts their children. And when children perform their duties towards their parents, their actions sustain and uplift the parents. When there is a break in the discharge of the responsibilities of a parent towards a child, there is set in motion, a great cycle of disharmony, and society itself becomes unbalanced in some way.

Similarly when the citizens perform their duties or discharge their responsibilities (i.e. pay their taxes, don't break laws), this sustains the well-being of the society (and the State), and when the State discharges its responsibilities towards its citizens, that upholds, sustains and uplifts its citizens.

When the society discharges its duties and responsibilities towards the Earth and all its inhabitants i.e. plants and animals, then the Earth itself is upheld, sustained and uplifted. When humanity consumes the resources of the Earth indiscriminately, then that can unsettle the balance and harmony in this world and result in disaster.

## **Dharma as Service to the Community**

Ordinary human endeavors involve the pursuit of Artha and Kama – which can be loosely translated as security and pleasure, respectively. People's lives are predominantly given to the commitment of their professional lives, and the various pleasures that the physical world has to offer for experience. They hold on to their jobs for financial security, build and buy houses for security, invest in retirement funds for a secure future, and pursue various pastimes for pleasure. Infact, for most people, life is confined to the pursuit of Artha and Kama.

It is when they awaken to a wider possibility – that of subordinating personal interests in favor of ensuring the wellbeing of others – whether those others are within the family, neighborhood, village, city or state, or a specific community or even the country or the world – their lives take on a wider dimension. A commitment to pursue the greater good, clearly sustains, maintains, upholds and uplifts the prevailing social order, especially the community that is the beneficiary. Dharma is therefore inherent to any community service – whether it is the building of a school or running a hospital or an orphanage, or creating a philanthropic foundation or running a shelter for the homeless.

Dharmic life, is a life of self-less service, of sacrifice and contribution. It is the lifestyle that has been held in India from time immemorial as an ideal life, a life worth emulating, a life that one aspires towards. Making a difference in society at large, somehow honors and fulfills the human spirit, and brings to life the true possibility and potential of human existence. Every Purana thus extols Dharma. In the Ramayana this idea is personified in Lord Rama – who is widely called Vighrahaan Dharma – the embodiment of Dharma.

## **Dharma as Self-Expression**

Each human being is endowed with specific qualities and gifts. Some are born with a a talent for music or sports, while others have developed a talent for management. Some have a deep well developed intellectual disposition while others are blessed with great energy and entrepreneurship for social activity. Ultimately a human being uplifts himself, sustains and upholds his spirit, when heor she truly fully develops and expresses his or her unique gifts in the service of humanity.

Man must grow to his full potential, in conformity with his own inner law of being his Svadharma. Such self-actualization is consistent with the complete unfoldment of the specific gifts, talents and qualities that one is blessed with and results in the true fulfillment of one's life's potential as well as bestows these special gifts and talents to those surrounding such a person. This flowering of a human being is also Dharma - this developing of an inner potential and possibility to its full height and range of expression, this unfolding of human genius consistent with the individual's own inner law of being and action, and this manifestation in physical reality, the power of the human mind, thought, feeling and action.

When society has created the conditions of harmony and stability, the pre- conditions of progress are created. Such a society flowers naturally and easily, and there is an outburst of human creativity – and all manner of creative expression is found to arise. In short periods of time, such societies have brought forth great advances in art, architecture, science and technology, philosophy and thought, literature and drama, and all other fields of human development.

## **Dharma as a means for Moksha**

Progress of humanity can be conceived in many different terms – scientific, social, industrial, technological, arts, economic, political and so on. India's civilization has always conceived of humanity's progress in spiritual terms, and given it a pre- eminent significance. It is in the context of spiritual progress, that the notion of Dharma attains its fullest import. The Rig Veda was realized and composed on the banks of the Saraswati River many millennia ago. It describes the purpose of human life succinctly in the phrase "Atmano mokshartham jagat hitayacha" which means 'the pursuit of moksha while keeping in view the welfare of the world.' From a spiritual context, the ultimate fulfillment of a human life arises in the pursuit and attainment of moksha. A life of Dharma then is a life that keeps in full view the spiritual end of human life and harmonizes one's everyday life with the progression towards that end.

Dharma becomes the means to attain a spiritual end of life. Thus Dharma is that which sustains, upholds, and uplifts the spiritual progress of humanity, both individually and as a collective. Without a complete understanding of the essentially spiritual journey that human beings are on, without a recognition of the nature of the inner reality of the individual, and the relationship with the universe, and without establishing a notion of Bhagwan as the all-pervasive reality of this universe, the word Dharma cannot be fully understood.

## **Scriptural Discussions**

Dharma is outlined in both Sruti and Smriti. For example, the Rig Veda refers to it as Ritam later on, the Atharva Veda also refers to it. The Kalpa Sutras, a Vedanga, contain the Dharma Sutras, Sruta Sutras, Grihya Sutras and Sulba Sutras. Of these, Dharma Sutras outline dharma. Because of the critical importance of grhastha ashrama to the society, Grihya sutras (to be followed by Grhastha) are separately mentioned. These Sutras are specific to the adherents of each Veda Shakha. There are many other metrical codes written, for instance by Manu, Parashara and Vasistha, that serve the same purpose. Apart from these, the Itihasa and Puranas detail the nature of Dharma and illustrate through stories what is Dharma in various life situations.

Sutras are guidelines and not impositions. They provide a guide to persons desiring to go by a particular path regarding what benefits and what retards them in their path. The prayaschitta for deviation also applies only to someone wanting to go by a specific path.

Among the Smritis for instance, the Manusmriti has more of a record of what is/was, rather than a prescription. It is a statement of what kind of social setup existed and what were the norms followed. Parashara smriti, being more recent, is said to be applicable to kaliyuga. So the following are the texts needed to understanding Dharma:

1. Sutras (Dharma, Grihya)
2. Smritis
  - Metrical codes like Manusmriti
  - Itihasa Puranas

There are three sources of knowledge of Dharma:

1. Through scriptures
2. Through elders

3. By observing the behavior of noble men in different situations The concepts involved in understanding Dharma:
- Varna Dharma
  - Ashrama Dharma
  - Concept of Karma

These are overlapping and not exclusive concepts.

## **Types of Dharma**

Dharma can be classified into many subsets depending on application area and to whom or what is being discussed. For people, the following are examples of dharma that typically apply for day-to-day life:

- Vyakti dharma - the dharma of an individual
  - Parivarika dharma - family dharma (also called kutumba dharma)
  - Samaja dharma - societal dharma
  - Rashtra dharma - national dharma
  - Manava dharma - the dharma of mankind
  - Varna dharma - professional dharma
  - apad dharma - exceptional/abnormal situational dharma
  - Yuga dharma - dharma applicable for an age
  - Ashrama dharma - dharma for stage of life
- Dharma in Common Usage

Mahatma Gandhi brought the phrase "Ahimsa Paramo Dharma" into common usage stating (in contradiction to scripture) that non-violence was the topmost Dharma for all and he is often quoted by many people and leaders.

### **Dharma as a Civilizational Principle**

Ancient Rishis saw rights and responsibilities as two sides of the same coin and decided to emphasize responsibilities and duty over rights whereas other civilizations emphasized rights. They knew that when responsibilities and duties are fulfilled, people receive their rights. For example, when parents fulfill their duties and responsibilities for their children—their children receive their rights. The same principle applies for a nation and its citizens. Where people live in conformity with their dharma, the individual rights of all others are naturally granted. A culture that emphasizes rights over duties only results in a competitive clamoring where each group and sub-group organizes itself to lobby and fight for its rights. Whereas in Sanatana Dharma, one is taught to live consistently with one's dharma (swadharma), and leave the rest to Ishwara or Bhagwan

### **Varnashrama-dharma**

Varnashrama-dharma defines duties for the individual, classified according to four divisions of labour and four stages in life. These specific duties change, for example as one passes through the different ashrams. Varnashrama-dharma is the basis for accommodating diversity, and attributing different social and spiritual standards to various sections of society. Although varnashrama- dharma relates largely to social matters, it is not divorced from sanatana- dharma but is a means of recognising a common goal approached from different starting points. Some Hindu thinkers consider that the current, rigid caste system is a result of neglecting the principle of spiritual equality inherent in sanatana- dharma.

According to Hindu texts, Varnashrama-dharma is not a man-made system but refers to natural classifications that appear to various degrees in all human societies. Individuals have different innate tendencies for work and exhibit a variety of personal qualities. There are also natural phases in life, when it is easier and more rewarding to perform certain activities. Hinduism teaches that individuals best realise their potential by taking into account such natural arrangements, and that society should be structured and organised accordingly.

Each varna and ashram has its own specified dharma. What may be desirable for one section of society may be degrading for another. For example, absolute non-violence, which includes refraining from animal sacrifice, is essential for the priestly class but considered wholly unworthy of a kshatriya (warrior). Generating wealth and producing children are essential for householders, but intimate contact with money and women is spiritually suicidal for the renunciate. Underlying all these apparent differences is the common goal of advancing in spiritual life based on sanatana-dharma. Without the spiritual equality and sense of service inherent in sanatanadharm, varnashrama-dharma tends to degrade into the rigid and exploitative caste system.

## Key Points

- Varnashrama-dharma – duties performed according to the system of four varnas (social divisions) and four ashrams (stages in life).
- Focus is on responsibilities (which naturally fulfil the rights of others).
- Four varnas – brahmanas (priests, teachers, and intellectuals), kshatriyas (police, army, and administration), vaishyas (farmers, merchants, and business people), shudras (artisans and workers).
- Four ashrams – student life, household life, retirement, and renunciation.

## Useful Analogy The social body

The social body and its components are likened to the human form.

- Society is compared to a body with the brahmanas as the head, kshatriyas as the arms, vaishyas as the belly (or thighs) and the shudras as the legs
- Social functions are determined according to this analogy. For example, the brahmanas are the eyes and mouth of society. They provide a spiritual vision for society and teach people accordingly. Just as the arms are raised to defend the body, the kshatriya's main duty is to protect society. The vaishya's main duty is material nourishment, and the shudra supports all other sections of society.
- They are sometimes related to the same metaphor, with the successive stages of student life, household life, retirement and renunciation represented by the legs, belly, arms and head respectively.

## Sadharana dharma

Sadharana-dharma, general morality, is often defined according to prohibitions (yama) and recommended practices (niyama). Hindu opinion varies as to the exact number of each. Sādhāraṇadharmā literally means 'dharma that is common to all'.

## Classification of Dharma

The word 'dharma' has been used in the scriptures in several senses out of which the meaning

'duties and good conduct' is the most common. Dharma is usually classified into two categories:

1. Sādhāraṇa or sāmānya dharma
2. Viśeṣa-dharma

### **Peculiarities of Sādhāraṇa Dharma**

It is common to all walks of life. It pertains to all persons without exception. It is generally described as comprising the following ten qualities:

1. Ahimsā - not harming others
2. Satya - truth
3. Asteya - non-stealing
4. Dāna - giving gifts
5. Kṣānti - forbearance
6. Dama - self-control
7. Śama - keeping the mind at peace
8. Akārpaṇya - not demeaning oneself
9. Śauca - cleanliness and purity
10. Tapas - austere life

### **Virtues of Aspirant of Sādhāraṇa Dharma**

Other virtues included in such lists given by other sources are:

1. Nābhimānitā - absence of arrogance and pride
2. Anāyāsa - avoiding too much of exertion
3. Priya-vāditā - gentle speech
4. Maitrī - friendly feeling
5. Aspr̥hā - absence of greed
6. Anasuyā - absence of jealousy
7. Guruśuśrusā - serving the elders
8. Tirthānusaraṇa - going on a pilgrimage
9. Devabrāhmaṇapujana - worship of God and brāhmaṇas

### **Yajña**

Yajña is the central concept of Śrauta -- the tradition that follows from the Śruti (Veda). There are many concepts that are based on and evolved from the concept of yajña. The word yajña comes from the root-"yaj" which means to worship. Yajña is a broad concept which is hard to translate into English. The closest single English word for yajña is sacrifice. There are multiple synonyms of the word yajña that convey different aspects of this broad concept. For instance it is also called "karma", meaning action or the act of sacrifice/offering/worshiping. In the general sense it can be understood as any action done with the sense of sacrifice, like praying, remembering, meditating. In the specific sense it is the act of offering oblations to propitiate a Devata.

The word karma is also used in different contexts. Yajña is karma in the general sense. In the more specific sense, karma is the component rite of a yajña. In the most general sense, karma refers to any action. The path of karma/yajña is called Karma yoga or Karma mārga.

## The Theory of Yajña/Karma Mārga

Karma mārga is based on the concept of Dharma. The result of an action performed is determined by the Dharmic or adharmic nature of the action. Dharma determines the fruit of karma and karma determines the course of experience of beings. Karma Mīmāṃsā the base text for Karma Mīmāṃsā, opens up by saying "athāto dharma jijñāsa", to expound the nature of Dharma. The text clearly states that karma and its results are based on Dharma - "Dharma mātre tu karmasyād nivṛtṭefi prayājavat". In karma mārga, mukti is possible through karma nivṛtṭi, through the performance of righteous karma.

The object of central importance in karma mārga is karma or action. Worship or sacrifice too, assumes importance in the path of karma, primarily as the "act of worshiping or sacrifice" (karma), rather than the "state of worshiping" (which is the object in upāsana mārga). In contrast to the yoga/upāsana mārga where the worshiper and the process of worship dissolve in the object of worship (Īśvara), in Karma the act of worship assumes importance.

Being action-centric does not make yajña any more outward or superficial compared to Upāsana mārga. For instance, Baudhayana's "nā rudro rudram arcayet" (one who is not Rudra cannot worship Rudra - meaning one becomes or unites with Rudra in order to worship Him, by invoking Him) is interpreted differently in Karma and Upāsana mārgas. Upāsana, the state of union of the seeker and Rudra is primary, while the act of worship is secondary. In karma, the union is taken to be implicit, and the act of Rudra worshiping Himself becomes primary.

In the grand scheme, everything involved – the one who is performing sacrifice, the rites, the material involved, the offerings, the one who receives the offerings, are each a part of the act of sacrifice. Even sacrifice becomes part of a grander sacrifice (the universe itself is a grand sacrifice, involving many rites like creation). The Puruṣa sūkta of Rig Veda for example, explains this grand sacrifice. Sacrifice itself is the purpose in yajña, and there is no greater purpose. Everything else – desires, transcending desires, liberation -- are only by-products.

In Karma Yoga sacrifice assumes primary importance and Īśvara assumes secondary importance. The affirmation of Īśvara in the path of Karma is not unanimous. Īśvara and Nirīśvara approaches are held by Gīta and Karma Mīmāṃsā respectively. In Nirīśvara approach Karma phala or the result of sacrifice follows the rules of Dharma. In Īśvara Vāda, Īśvara receives the offerings of a sacrifice, presides over the sacrifice and gives the Karma phala.

## Pravṛtṭi and Nivṛtṭi

There are two directions of movement or phases in life, pravṛtṭi and nivṛtṭi. Pravṛtṭi is accumulating and indulging. Nivṛtṭi is clearing debts and transcending. In pravṛtṭi, yajña brings material possessions, righteousness and heavenly bliss. This helps man fulfill his aspirations as well as contribute to social living. Man gradually grows beyond desires and becomes more impersonal. This is how he enters the nivṛtṭi phase. During nivṛtṭi, yajña is done without any desire, merely as a duty. This helps in clearing past karma, but this greatly helps the well-being of surroundings (loka kalyāṇa). This is the way the realized soul performs yajña. This is the niṣkām karma explained in the Karma Yoga of Bhagavad Gīta. In nivṛtṭi, yajña brings eternal bliss. Brahmandavalli of the Taittirīya Upanishad expounds the gradation of happiness experienced by men, manes, Devatas, lord of Devatas, teacher of the Devatas, creator of Devatas and the creator of the universe in the ascending order, increasing hundred fold for each level. At each level, the bliss is equated to that of

a veda-wise person (Śrotriya) who overcame his desire (kāma hatasya). In pravṛtti one experiences the bliss of Devas. In nivṛtti one grows beyond desires and experiences the bliss of Brahman. In nivṛtti, yajña brings liberation.

If this is seen in parallel to the ashrama dharma, brahmacarya and grhastha ashramas involve pravṛtti. In brahmacarya, one increases his debts through his dependence, for sustenance as well as learning. In grhastha ashrama he attempts to repay these by offering the same back to the society, but increases his sources of attachment in that attempt. Through fulfillment of responsibilities and desires, one enters nivṛtti. Vānaprastha is the phase of containment, where rites are performed without any personal material desire. However some of the rites like pitru yajña are still performed. Sanyāsa is the phase of complete renunciation. It is not mandatory for a Sanyāsi to perform any yajña/karma, for he can renounce karma itself.

## Constituents of Yajña

The primary constituents of a Yajña are the inspiration or urge of the doer (bhāvana), learning (svādhyāya), rites involved (karma), offerings (tyāga), devata and the results (phala).

## Karma

There are two types of rites in a sacrifice, principal (artha karma) and subsidiary (guṇa karma). Guṇa karmas are the constituent accessory rites associated with a principal rite. In artha karma, the rite is primary and material is subsidiary to the rite. Material is treated as accessory. In guṇa karma, material is primary and rite secondary to it.

## Artha Karma

**Artha karmas are three types.**

- Nitya karma, done regularly. Example of nitya karma is Agni hotra (the homa done thrice a day).
- Naimittika karma, done occasionally. These are rites involving specific occasions. Those like pitru tarpana are naimittika rites. Nitya and naimittika rites are mandatory. There are specific Vedic injunctions that make the rites mandatory.
- Kāmya karma, done optionally. Optional rites are performed when a specific purpose is intended to be served through a sacrifice. The sacrifices like soma yāga and vājapeya are examples of optional rites. These are in turn three types based on the results they give. The rites that give results in the present life are called aihika. The ones whose results are enjoyed after the present life (such as heaven, prosperity in the next life or breaking the cycle of life itself) are called āmuṣmika. The rites that give both kinds of results are called aihika-āmuṣmika.

## Guṇa Karma

Guṇa karmas, which are subsidiary and form components of artha karmas, are intended for purification (samskāra). They are four types:

- utpatti (origination – for instance creating fire for the sacrifice)
- āpti (obtaining/attaining – for instance learning required to perform the rite)
- vikṛti (modification – for instance husking or cooking rice for sacrifice)
- samskṛti (consecration/purification – for instance purifying the material by sprinkling water and/or through mantra).

Subsidiary rites are in general meant for purification. This is again of two types, disposal (pratipatti) and purification.

Prāyaścitta or expiation rites are also part of the subsidiary rites/guṇa karmas. Bhāvana  
Bhāvana is the urge, inspiration to perform yajña. This is caused by the desire for its result. Thus from the perspective of yajña, desire is seen as an inspiration to performing karma. Need and desire are the two inspirations for beings to perform karma that run the activity of phenomenal world.

### **Bhāvana has three aspects:**

- what is desired
- what is the means
- what is the method.

From the injunctions of Śruti, these are learned. For instance, from injunctions such as “one who desires cattle should perform Citra”.

In pravṛtti mārga, one performs karma with a desired result. Following the injunctions of the scriptures and being righteous, one can fulfill these. However in the advanced stages in karma mārga, sacrifice alone remains the purpose. All that is desired is also desired for the sake of performing sacrifice, making yajña the ultimate purpose. The Camaka of Sri Rudram starts with praying for a variety of material gains, fulfillment of desires, grace of devatas, asking for devatas themselves, the various ingredients involved in sacrifice, the different rites of a sacrifice, and then towards conclusion, makes all these along with the life, mind, speech, soul and the whole sacrifice, a part of the sacrifice itself. This explains how desire is positively treated, and then sublimated in karma mārga.

### **Svadyaya**

Svadyaya means learning one’s Veda (the branch of Veda one is ordained to pursue) along with the Vedangas. It is through learning that one gains the knowledge of the rites he should perform as his duty, the rites he can perform for various other desired purposes, how to perform those, and what his conduct should be to gain the desired results (these could be material or heavenly or liberation).

Svadyaya is the primary duty during brahmacarya, and forms the basis for performing all the rites of subsequent ashramas.

### **Tyāga**

Tyāga is associated with offering. There are three kinds of offerings:

- yāga (sacrifice)
- dāna (giving)
- homa (offering)

Of these, the word yāga refers to principal rite and the other two are associated with subsidiary

rites.

Dāna is transferring one's right over what is given, to the one who is taking. This does not involve any expectation of result (though it has an invisible result, and it ensues only when the result is not desired for).

Homa is offering of havis in Agni. This involves tyāga of what is being offered, with the mention "na mama", meaning what is being offered is no more mine, it belongs to the Devata (or the pitri as the case may be) to whom the offering is being made. There is no expectation of result in the homa itself, but its result will become part of the result of the entire sacrifice.

Homa is central to any agni karya or sacrifice performed in Agni. It has become almost synonymous to the word yajña itself. However it should be understood that homa is a component of yajña. In some kinds of yajña which do not involve Agni karya, oblations are offered as dana instead of homa.

## Devata

Devata is a constituent of sacrifice as well as its result. Devatas consume the havis offered in a sacrifice and give the result of sacrifice performed. As a result of sacrifice, along with the desired result, the grace of devata remains.

When sacrifice is performed without desiring a result, devata's grace remains the result of sacrifice. Devata is mantra-baddha, meaning He is bound to give the result of a sacrifice/mantra when invoked. Thus the result of any form of worship is bound to come.

Havis offered in a sacrifice is the food for Devatas. Devatas grow on havis and bring the well-being of men (through rains and so on). Thus Devatas grow on man's offerings and man's elevation is brought by the Devatas. Thus through mutual nourishment, men and Devatas bring about the well-being of all.

This is explained in the Karma Yoga of Bhagavad Gīta:

देवाभवायतानेन ते देवा भावयन्तु वः । परस्परं भावयन्तः श्रेयः परमवाप्स्यथ ॥३-११॥	devān bhāvayatānena te devā bhāvayantu vafi parasparam bhāvayantafisreyah param avapsyatha
---	--

All life is said to be a yajña. Every action, when made as an offering to the Īśvara, is a yajña. Worshipping, eating food, fighting war, creating wealth, contributing to human knowledge, running family, each of these is a yajña. Doing these as offerings to derive something greater, makes these actions yajñas. When these actions are not done for material gain but with a selfless motive, that is the highest form of yajña. Sacrifice brings transcendence. Transcendence through sacrifice is the meaning of life in the Vedic religion.

## **Agni**

Agni is called Deva Mukha and is the central deity for yajña. Oblations (havis) are offered in the fire and Agni is said to carry those to the Devas.

Offering and the carrier of offerings are inseparable and the former is stated to be the consort of the latter (Agni). There are two contexts of offering, the para (pertaining to Devas) and apara (pertaining to Pitris). The presiding deities of these two kinds of offerings are Svāha and Swaha respectively. These are the two consorts of Agni. The offerings to Devas and Pitris are made through these two.

## **Phala**

The result of a sacrifice ensues from the results of each of the subsidiary rites, combined with the result of the main rite.

Each rite creates a unique result, in terms of visible or invisible effect. This is called apurva. The total of unique results of all the rites of a sacrifice cause the grand unique final result of the sacrifice, called Mahāpurva.

Different schools hold different opinions on the results of nitya karmas. According to Prabhākara School it is said that there is no additional benefit or fruit of performing nitya karmas but there is a loss of merit or righteousness in not performing those. According to Kumāriḷa Bhaṭṭa, there will be an additional merit even in the performance of nitya karmas. In case of kāmya rites, since they are optional, there is only an additional result in performing those.

There are two kinds of results of a sacrifice – visible (pratyakṣa) and invisible (ālaukika). Pratyakṣa is the visible gain that results from performing the sacrifice, material or otherwise. Alaukika result can be like begetting heaven in pravṛtti and mukti in nivṛtti (through karma nivṛtti).

## **Prayoga**

Literally prayoga means performance. It is the performance of sacrifice, the application of text to perform yajña. The injunctions to perform the sacrifice or vidhi are found in Brahmana portion of Veda. Kalpa Sūtrās explain the prayoga part further.

There are different stages in performing a sacrifice. It begins with cleaning the place and building the altar. Then the dravya is acquired. Then the priest is invited to officiate. Following that the altar is decorated and Agni invoked. Then the purification of each of the dravya is done. Then the homas (in the fire) and danas (alms etc) are done. The sacrifice concludes with cleaning up the place and taking the fruit of sacrifice.

## **Yajña Dravya and Homas**

Agni karya forms the core of a sacrifice. It includes purification rites and the homas. The ingredients used in a yajña are called dravya. There are six ingredients involved in performing an Agni Karya. They are:

Homa

- Sruk and Sruva (ladles used for making offering in fire)
- Idhma (wooden pieces/sticks used as fuel in the sacrifice – also called samidhas)
- Pātras (bowls)

There are three kinds of pātras used:

- the prokṣiṇi (used for purification)
- ājya (to hold the clarified butter)
- pūrṇa pātra (literally “complete”, the one used for completion of the rite)

Based on the dravya used and rites performed, there are two major classes of prayoga – Catuṣpātra (using four ingredients) and Ṣaṭpātra (using six ingredients). Ṣaṭpātra involves the usage all the six dravyas mentioned above. Catuṣpātra does not involve idhma and pūrṇa pātra. However, the regular rite that a brahmachari performs, does not mandatorily involve any pātra (though usage is not prohibited). Most of the prayogas nitya or otherwise, involve Ṣaṭpātra prayoga.

Some of the sacrifices are referred to variously as involving more than six primary ingredients. For instance marriage ritual in Āpastamba sāmpradāya is called dasa pātra (involving 10 ingredients). Major yāgas like Vajapeya use many more.

However all of them come under Ṣaṭpātra only and the additional dravya is classified as one of the six - idhma or ajya for instance.

In general, Catuṣpātra is sufficient for the regular homas to prajāpati, Indra Agni etc. In order to propitiate a specific deity, one has to perform Ṣaṭpātra. This involves additional dravya and homas. Dravya depends on the nature of rite. It could be rice, corn, specific samidhas, blades of grass, milk, curd etc. Fifty eight homas (to Prajāpati, Dikpālakas and Grahas Lokapālakas etc) inclusive of Cakṣur- homas (literally the homas of eyes - two homas with clarified butter poured in the fire circularly, as if they are the eyes of Agni) and done in the beginning of the sacrifice. Then oblations to the main deity of the sacrifice are offered. Jayādi homas (additional homas to propitiate various Devatas representative of faculties of consciousness, prāyaścitta homas etc) follow that, and it is concluded with Pūrṇāhuti (literally the “completion” oblation or the conclusive one).

These homas also include the prāyaścitta rites (expiation rites), as applicable. However prāyaścitta rites are common to Catuṣpātra and Ṣaṭpātra.

Participants of a Yāga

The primary participant of a sacrifice is the one who performs it – the owner or the yajamāni. A

dvija performs regular rites himself. However any major yāga requires the yajamāni to be accompanied by his consort, she should offer the fire (Āpastamba Sūtras). In case of a kāmya prayoga, a ṛtvija (priest) is involved.

In major yāgas, there are at least four ṛtviks involved. They are hota, adhvaryu, brahma and udgāta. Hota should be learned in Rig Veda, and chants the Ṛks.

Ādhvaryu is the one who performs the sacrifice (makes the yajamāni do it with instructions). He should be learned in Yajurveda. Udgāta sings the Sāma Veda. Brahma supervises the sacrifice.

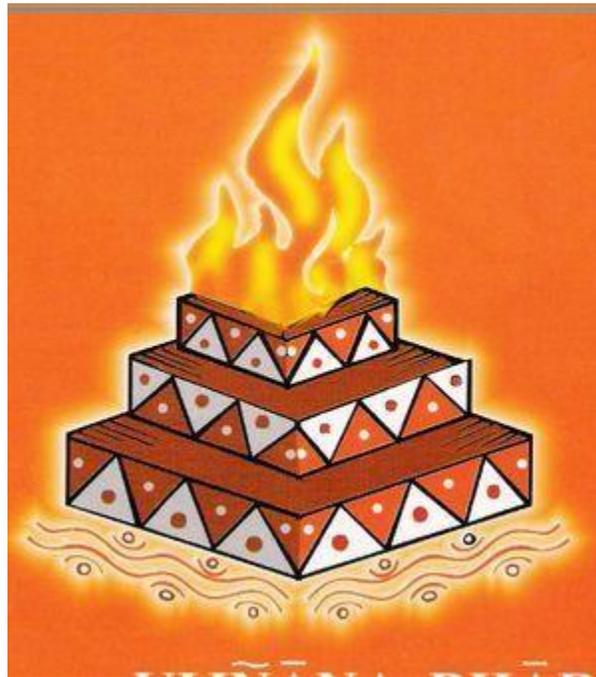

## Yāga Sāla

The regular rites are conducted in a designated place in the house. Major yāgas are performed in premises meant for them, called yāga śālās.

Yāga sāla follows a specific architecture/layout. It has four entrances, representing the four Vedas. The four entrances have four gates, decorated with the leaves of four kinds of trees, or rather named after the four trees. They are Nyagrodha, Aswattha, Audumbara and Plaksha. In the four directions altars are built in shapes specified against those positions (they could be circular, square or following any other geometry according to the Śrauta Śūtras). The eight Dikpālakas preside over the eight (four directions and four corners) positions of the yāga sāla. Homas are performed in those designated places to the corresponding devatas, according to the rites of the respective Vedas.

There are positions designated for the yajamāni, each of the ṛtvijas, dravya and the audience. Besides there is a bali sthana, where the bali (sacrificial offering) is made.

## Classification of Agni

There are three types of Agni, grouped as "tretāgni"s.

- Gārhapatya (literally belonging to the gṛha pati or the owner of the house)

- Dakṣiṇa
- Āhavanīyā
- Gārhapatya is the origin of the other two, and all the three are worshiped regularly. Besides, Aupāsana is performed by gṛhasthas.

Agnis are also classified into two types:

- Viharaṇīyā (those that can be moved)
- Upastheya (those that are fixed/deposited at a place).

Each of these two have eight sub-categories and are positioned in different places in the premises where sacrifice is performed.

### The Viharaṇīyā Agnis are:

1. Vibhūraṣi Pravāhā, positioned near the Āgnīdhra's (one of the ṛtviks) place
2. Vahnirasi Havyavāhana, positioned near the Hota's abode
3. Śvātroṣi Praceta, at the place of Maitra Varuṇa (the place where these Devatas are invoked)
4. Tuthoṣi Viswaveda, invoked at the place of the ṛtvik designated as Brāhmaṇāccha
5. Uśi Gasi Kavi, positioned near ṛtvik designated Potru
6. Anghāri rasi jambhārī, near the ṛtvik designated Neṣṭru
7. Avasyurasi Duvasvān, near the ṛtvik called Acchāvāk
8. Śundhyūrasi Mārjālīya, near the ṛtvik called Mārjāla (the one who does mārjana or purification and consecration)

### The Upastheyas are:

1. Samrādasi Kṛuśānū, positioned at the secondary altar in the north. This is the Āhavanīyā Agni.
2. Pariśadyoṣi Pavamāna, positioned at Dhruva sthali
3. Pratakvāsi nabhasvān, positioned at the Cātvāla sthāna
4. Asamṛṣtoṣi Havyasūda, positioned at śamitra (the place of paśu)
5. Ṛtadhāmāsi Suvarjyoti, positioned at Audumbara (the ṛtvija who chants the Sāma Veda).
6. Brahmajyotirasi suvardhāma, positioned with the Brahma (chief ṛtvik) of the sacrifice
7. Ajoṣyepakāt, positioned at the sukhaśāla. This is the Gārhapatya.
8. Ahirasi budhniya, positioned with the Yajamāni.

### Types of Yajna

Yajñas can be classified in different ways. One of them is periodicity. Apart from the Panca Maha Yajñas, Aupāsana and Agnihotra are performed every day. Any other yajña is occasional – performed fortnightly, monthly, yearly or even once in a life time. Agnihotra is the homa done thrice a day. Darśa and Pūrṇamasa are done on new moon and full moon days. Parvani sraddha is done once a month.

Most of the other Yajñas can be done once a year or even in a lifetime. Another classification is the scale of the rite. The ones like Agnihotra are done in the house while the sacrifices like soma yāga or vājapeya need to be undertaken at a much bigger scale involving priests. The rites undertaken at a household level are called gṛhya rites. The ones performed at a collective level are called śrauta

rites.

### Samskāras

Samskāra is a rite that involves mantra. There are forty samskāras or rites performed in one's lifetime:

- Seven are paka Yajñas (aṣṭaka, sthālipāka, parvana, srāvaṇi, āgrahayani, caitri and āsvīyujī). They involve consecrating cooked items.
- Seven are Soma Yajñas (agnistoma, atyagnistoma, uktya, shodasi, vājapeya, atirātra and aptoryama). The yāgā that involves the extraction, utility and consumption of Soma (in the general sense nectar, but extract of a particular tree specifically) is called a Soma Yajña. Others are usually referred to as haviryāñnas.
- Seven are Havir Yajñas (agniyādhāna, agni hotra, Darśa-Pūrṇamāsa, āgrayana, cāturmāsya, niruudha paśu bandha, sautrāmaṇi). They involve offering havis.
- Five are the panca mahā Yajñās.
- Four are Vedavratas, which are done during Vedic education.
- Remaining ten are one-time samskāras that are done at different stages in life. They are garbhādhānā, pumsavana, sīmanta, jātakarma, nāmakaraṇa, annaprāsana, caula, upanayana, snātaka and vivāha. These are specified by the gṛhya sūtrās.

### The Concepts Involved Anna (Food)

Anna or food is the basis of life. Life is sustained by the consumption of life, and this is the inherent principle of nature. And sustenance of life is the highest principle. At the same time, consumption of life defeats the same principle (for other creatures). Harming any living being is against that principle. Thus there arises the need for reconciliation between the principle of consumption and the principle of sustenance. This is explained by the concept of sacrifice.

Body is called anna-maya kosha or the sheath of food. It is the upādhi, the basis for every rite, through performance of which the purpose of life is fulfilled. The rite undertaken for sustaining the upādhi, namely consumption, is one of the most sacred and important ones. However, this means that only the consumption, done with the sense of sacrifice, or with the sense of sustaining the upādhi, is considered sacred. Superfluous consumption of life, is against the principle of sustenance.

Most of the offerings in a Sacrifice are edible offerings. Havis offered in a sacrifice is the food for Devatas. In turn, they bring prosperity to man. Offering and consuming are the two sides of a sacrifice. However, each participant offers as well as consumes.

Thus while explaining violence/consumption to be inherent in nature, it is sought to be minimized by the same principle that makes it inevitable.

When eating is performed as a rite, there are two aspects in food - consecration and consumption. Consumption of life involves consuming the karma samskāra of the creature being consumed. Therefore the food is first consecrated, offered to Īśvara who is the ultimate absolver of every samskāra. Anna is called sāda. With consecration, the food becomes prasāda, a remain/fruit of sacrificial offering. In fact consumption is also done with the sense that Īśvara the essence of each being is consuming the food in the form of the oneself.

The Smritis give guidelines for the preparation consecration and consumption of food, along with what kind of food is to be taken. This depends on many factors. Some of them are

- Varṇa of the person - practicing brahmins should be vegetarians in general and consuming specific vegetables in particular. However this has exceptions.
- The kind of Dīkṣa undertaken - one should be particular about diet during specific Dīkṣās like Maṇḍala Dīkṣa or Cāturmāsya.
- The Devata being worshiped - each Devata is propitiated with a specific kind of food, cooked with specific ingredients to the like of the Devata. The same is consecrated and consumed.

## **Bali (Sacrifice)**

Bali or sacrifice is the most controversial topic in yajña, because of its implications. Broadly, there are two ways to look at it: the literal sacrifice and symbolic sacrifice. Literal sacrifice involves sacrificing an animal. In symbolic sacrifice, a piṣṭa paśu is offered. This could be kūṣmānda (ash gourd) or any other consumable. Yajñas mostly involve symbolic sacrifice (piṣṭa paśu) and seldom involve a literal sacrifice.

Bali in a sacrifice is part of the optional rites, one of the offerings involved in kāmya rites. The Bali sthana of the yāga śāla is designated for this, where there is a Yupa (pillar) positioned. Vedic injunctions regarding sacrifices, such as “saptadasa prājāpatyān paśūn ālabhet” are explicit in their message. However, such injunctions are interpreted in different ways. One of them is the symbolic interpretation of “paśu” as the one that is bound by pāśa (binding), and making sacrifice symbolic. The other is the literal interpretation, where a symbolic bali (piṣṭa paśu) is offered.

The history of yajña shows that Yajñas rarely involved animal sacrifices and that they were always a matter of inconvenience to the Vedic seers. There is a story in the Purāṇa that tells how animal sacrifice is made redundant in yajñas. The ṛṣis had an argument with the Devatas that they would offer only symbolic sacrifice and not animals. The Devatas did not like it. Ṛṣis mandated that animals will not be offered in yajña, and king Vasu conducted a sacrifice by inviting the ṛṣis as ṛtviks for the sacrifice, in which he made only symbolic sacrifices, and mandated that Devatas should not make it obligatory for yajñas to involve animal sacrifices. Appreciative of this, the ṛṣis mandated that in every sacrifice the havis after pūrṇāhuti should go to Vasu. To this day major sacrifices involve havis to Vasu starting with the mantra “Vasordhāra juhoti”.

The fact that Vasordhāra is performed, makes it clear that the sacrifice is not intended to be literal, from the ṛṣis’s perspective. Seers like Sankara have taken the path of advocating symbolic bali in temples and interpreting ritual itself in a symbolic way in case of personal worship.

## **Texts**

The samhita portion of the Veda contains the mantras used for yajña. The Brahmana portion of the Veda deals with Karma kānda. Specifically, out of the four Vedas, Yajurveda is the primary Veda concerned with yajña. It is called Yajurveda because it is composed of Yajus or the mantras used for yajña.

Kalpa Sūtrās deal with the rules, regulations and austerities of yajña, the geometry of altars, and the rites to be undertaken at each stage of life.

Pūrva Mīmāṃsa deals extensively with the philosophy of yajña, how to understand the mantra and brahmana portions, and their application in sacrifice. This is also called Karma Mīmāṃsa. The text expounding Karma Mīmāṃsa is Jaimini's Mīmāṃsa Sūtras. This is divided into 12 chapters, called lakṣaṇās. It is primarily an inquiry into the Brahmana portion of the Veda and deals with various sacrifices, their purposes and methods. The authentic commentary on Pūrva Mīmāṃsa is Śābara Bhāṣya. In turn, Kumārila Bhaṭṭa's Tantra Vārtika is a commentary of Śābara Bhāṣya. Jaimini also wrote a four-chapter supplement to Mīmāṃsa, called Sankarsha Kānda. It is also called Madhyama Mīmāṃsa, Madhyama Kānda, Devata Kānda and Upāsana Kānda. It deals with the purpose of mantras, the nature and essence of devatas, and the purpose of worshiping devatas.

### Yajña in the four Ashramas

In all the four ashramas, nitya and naimittika rites should be performed. However the prescribed rites are different in each ashrama.

In brahmacarya, the principal rite to be performed is svadhyaya - Vedic learning. This is apart from other rites like daily oblations to Agni and service of Guru.

In grhastha ashrama, one should perform the panca maha yajñas (or nitya karma astaka as the school may be). Along with these, his family and social responsibilities as the smṛiti prescribes, form part of his main rites in grhastha ashrama.

In vānaprastha, many of the rites of grhastha ashrama become optional and even unnecessary. Nitya and naimittika karmas should be performed. Raising children as an injunction is no longer relevant here. However pitru tarpana is still done during vānaprastha. Teaching should be done. In sanyāsa, there is no compulsion on karma, though minimal nitya karma is performed. A sanyāsi also undertakes naimittika rites such as Caturmasya (four-month austerity undertaken in a year). Even teaching is optional for him.

### Yajña in the Daily life of Gṛhastha: The Panca Maha Yajñas

A Gṛhastha is supposed to do five yajñas every day. These are called panca mahayajñas. These are offerings to Devatas, Ṛṣis, Pitris (departed fathers), creatures and men. They are called deva yajña, ṛishi yajña, pitṛ yajña, bhūta yajña and manuṣya yajña respectively.

Man has four debts, to Devatas, pitris, ṛishis and fellow-men. These are called deva ṛna, ṛṣi ṛna, pitṛ ṛna and manuṣya ṛna. By doing the above yajñas, man repays those debts and fulfills his purposes in life.

By praying to Devatas and offering oblations to them, and through sacrifices one clears his debts to Devatas. This is called deva yajña.

By gaining Vedic knowledge, by teaching, sharing and passing it on to subsequent generations one clears his debts towards the seers. This is called ṛṣi yajña.

By offering oblations to pitris, and by continuing the race by begetting progeny, raising them properly, by getting good name for the lineage, one clears his debt towards the pitris. This is called pitṛ yajña.

By showing compassion towards fellow men, by treating the guests well, by helping those in need, by excusing those by which one has been wronged, by doing actions that are beneficial to men, one clears his debts towards his fellowmen. This is called manuṣya yajña.

Bhūta yajña is showing compassion towards living beings in general. This includes abstaining from inflicting violence and killing, living as a part of nature without harming it.

### **Extension of the concept of Yajña**

Yajnic life is an ancient school, and over time, it became impractical to lead such life because of the rigorous discipline it requires. There are still people who perform regular sacrifice. But the concept of yajña has been extended in different ways, without losing its spirit.

### **Karma**

The widest application has been the karma concept in life. Many of the ideals seen today in learned men, such as being righteous, maintaining a moral code, doing actions without being particular about results, not harming anyone unnecessarily, being content and not greedy, fulfilling desires in a righteous way, keeping righteousness above desires, and doing every action as a sacrifice, follow directly from yajnic principles. Leading a life with these ideals is treated as equal to living a yajnic life, and causing liberation through karma nivṛtti. The karma yoga that many of the men live (though they are not into the path of worship) is a reflection of the yajnic ideal in their lives.

The yajnic ideal thus has wide impact, and positively influences a moral social order. Smārta which developed after Śrauta, has also based its ideal on the same ideal of dharma.

### **Symbolic Yajña**

The other extension of the concept of yajña is found in its yogic interpretation, as being performed in the subtle body. Śrī Sūkta of Rig Veda khila portion is used in sacrifices and also in Sri Vidya. Saubhagya Lakshmi Upanishad explains the yogic import of Śrī Sūkta. Yāga becomes antaryāga (the inner sacrifice) – performing homa in the svādhiṣṭhāna agni.

In Mantra Vidyas mantra sadhana is likened to yajña. In fact this is supported explicitly by smṛiti, for instance Manusmṛiti says that a dvija becomes dvija by mantra japa alone, even if he cannot perform the panca maha yajñas. Smārta, the religion of smṛiti, follows the Smārta Sūtras (Dharma Sūtras and Gṛhya Sūtras), part Vedanga Kalpa. Smārta and Śrauta are so closely associated that they are usually referred to as the combination Smārta-Śrauta. Smārta prescribes japa, homa, tarpana and sandhyavandana as part of nitya karma, the eight daily rituals to be performed. These are from Brahmana as well as Aranyaka portion. For instance the Sandhya Vandana prakarana itself is found in Taittirīya Aranyaka (Maha Narayana Upanishad). Dharma Sūtrās add one more category to the three classical kinds of karma (nitya, naimittika and kāmya) – the prāyaścitta or expiation rites.

Thus in the general sense mantra japa, kundalini yoga etc are sacrifices, but the sacrificial approach to the same aim differs from the yogic approach. For instance, mantra japa itself is the sacrifice to be done, and devata is a result of the sacrifice. In yogic terms this is described differently: mantra is the means to achieving yoga with the devata.

Temple, the institution that made religion reachable to common man, is a replica of yajña śāla (the place where yajña is conducted) – in its major components as well as concept. The rites of a temple as prescribed by Āgamās are four-fold, (nitya, naimittika, kāmya and prāyaścitta) the same as that in Śrauta/Smārta.

## **Jnāna and Karma Approaches**

Jnāna Mārga is expounded in Vedānta and thus, Vedānta treats yajña/karma to be a means of purification, a preparation for acquiring jnāna. Beyond that, in jnāna mārga, spiritual knowledge is the means of liberation, and not worship. The different categories of yajña, such as vedic ritual, the subtle body yogas such as mantra yoga and kundalini yoga are acknowledged in jnāna mārga as means to attain the necessary state for pursuing the path of knowledge.

This is in contrast with all the karmic and yogic paths, where performing each of those rites at their highest level is the means for liberation. For instance, in karma yoga, karma nivṛtti begets liberation. In mantra yoga realizing para vak is the final realization. In laya yoga dissolving the individual consciousness in the cosmic consciousness is liberation. In kundalini yoga the gross and the subtle unite with the causal being through the movement of kundalini. All these involve different upādhis of the subtle body – mind, prāna and nādis.

Detachment and consecration, the two approaches of jnāna and karma respectively, reflect in the rituals prescribed in these paths. For instance, while anger is sought to be overcome in the former, it is praised as a divine inspiration in the latter.

Jnāna mārga involves nididhyasana, which is the intellectual's approach – the path of discrimination. Through contemplation (on the import of mahavakyas) one learns to discriminate between ātma and non-ātma (ātma-anātma vivecana). And realizing one's identity as ātma, as different from anātma, is liberation – because ātma is always liberated. Jīva is bound because he does not identify himself as ātma but identifies himself with various upādhis. Jnāna mārga is about discriminating these upādhis from self.

Adi Sankara reconciles karma with jnāna approach by categorizing karma as the preparatory stage for acquiring jnāna. In jnāna mārga, liberation is possible only through jnāna. In fact the self is always liberated, and the state of liberation for a being is the knowledge of difference between self and non-self (ātma-anātma vivecana). Karma purifies and prepares the being for the state of knowledge/discrimination.

As the means to acquire the necessary purity and wisdom for pursuing this path, jnāna mārga acknowledges the performance of nitya karma. Beyond that, worship or ritual has no greater importance in jnāna mārga. Thus most of the yajnic procedures are redundant from the viewpoint of jnāna mārga.

However this only differentiates between the Karma and Jnāna approaches, and does not necessarily make one of them superior. Vedantic approach is prescribed for a person who is technically out of the social fold, whose righteousness does not depend much on fulfillment of responsibilities. Fulfilling one's responsibilities is the primary criterion for detachment, and without that one is not deemed fit for the path of knowledge. In the path of karma, such fulfillment with

dissociation brings about the necessary change for salvation.

## The concept of Rna

- *Rna* means debts, or duties or obligations that we have to perform or repay.
- According to the Vedic and the Upanishadic world-view, each man is bound by some duties and obligation in life.
- These duties are not just the mere boundations but real modes of social freedom.
- It has been said that, man is said to owe some debts or man is said to perform his duties towards Gods, men and animals.
- As per our Vedic traditions, no man is to touch his meals without offering parts of it first to his Gods, fathers, other men and animals.
- This is primarily done to inculcate the virtue of charity and unselfishness amongst people and to practice harmony within the world.
- These duties are distinguished into five levels, they are;
  - Man is said to owe debts to the Gods. It is mentioned in Taitariya Upanishad.
  - Man is said to owe debts to the Seers or Rishis.
  - Man is said to owe debts to Manes or Ancestors
  - Man is said to owe debts to other Men. It is mentioned in text, Sthathapratha Brahman.
  - Man is said to owe debts to those belonging to lower creations, for instance, animals. It is mentioned in Sthathapratha Brahman.
- In short, according to the Vedic and the Upanishadic world-view, life is a round of fulfilling duties and obligations.
- Hence, a man who discharges these owes and fulfils one's duties and obligations are called a virtuous man.

## The Five Debts or the Panca-Rna

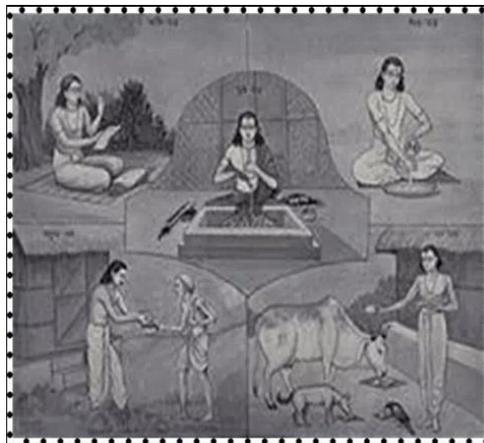

Image of the Five Debts or the Panca-Rna

## **The first-three Rnas are of utmost importance.**

**Deva Rna:** or debt towards Gods, it can be repaid by performing sacrifices or yajnas to God. It belongs to both, Grihastha and Vanaprastha Ashrams.

**Rishi Rna:** or debt towards Seers, it can be repaid by studying the Vedas and practising Brahmacharya. It belongs to Brahmacharya Ashrama.

**Pitr Rna:** or debt towards Ancestors, it can be repaid by taking care of the family and carrying on the family lineage. It belongs to Grihastha Ashrama.

**Manushya Rna:** or debt towards other Men, it can be repaid by helping other men in need, for instance, by offering food, financial assistance, etc.

**Rna towards Lower Creation:** For example, debt towards Animals, it can be repaid by taking care of them, feeding them food, etc.

**According to Manu-smriti,** "a man can aspire to achieve moksha or liberation only when he has repaid the three Rnas."

## **The Concept of Duty**

### **Duty-based or Deontological ethics**

Deontological (duty-based) ethics are concerned with what people do, not with the consequences of their actions.

- Do the right thing.
- Do it because it's the right thing to do.
- Don't do wrong things.
- Avoid them because they are wrong.

Under this form of ethics you can't justify an action by showing that it produced good consequences, which is why it's sometimes called 'non-Consequentialist'. The word 'deontological' comes from the Greek word deon, which means 'duty'.

Duty-based ethics are usually what people are talking about when they refer to 'the principle of the thing'.

Duty-based ethics teaches that some acts are right or wrong because of the sorts of things they are, and people have a duty to act accordingly, regardless of the good or bad consequences that may be produced.

Some kinds of action are wrong or right in themselves, regardless of the consequences. Deontologists live in a universe of moral rules, such as:

- It is wrong to kill innocent people
- It is wrong to steal
- It is wrong to tell lies
- It is right to keep promises

Someone who follows Duty-based ethics should do the right thing, even if that produces more harm (or less good) than doing the wrong thing: People have a duty to do the right thing, even if it produces a bad result. So, for example, the philosopher Kant thought that it would be wrong to tell a lie in order to save a friend from a murderer.

If we compare Deontologists with Consequentialists we can see that Consequentialists begin by considering what things are good, and identify 'right' actions as the ones that produce the maximum of those good things.

Deontologists appear to do it the other way around; they first consider what actions are 'right' and proceed from there. (Actually this is what they do in practice, but it isn't really the starting point of deontological thinking.)

So a person is doing something good if they are doing a morally right action.

## **Good and bad points**

### **Good points of duty-based ethics**

- emphasises the value of every human being
- Duty-based ethical systems tend to focus on giving equal respect to all human beings.
- This provides a basis for human rights - it forces due regard to be given to the interests of a single person even when those are at odds with the interests of a larger group.
- says some acts are always wrong
- Kantian duty-based ethics says that some things should never be done, no matter what good consequences they produce. This seems to reflect the way some human beings think.
- Rossian duty-based ethics modified this to allow various duties to be balanced, which, it could be argued, is an even better fit to the way we think.
- provides 'certainty'
- Consequentialist ethical theories bring a degree of uncertainty to ethical decision-making, in that no-one can be certain about what consequences will result from a particular action, because the future is unpredictable.
- Duty-based ethics don't suffer from this problem because they are concerned with the action itself - if an action is a right action, then a person should do it, if it's a wrong action they shouldn't do it - and providing there is a clear set of moral rules to follow then a person faced with a moral choice should be able to take decisions with reasonable certainty.
- Of course things aren't that clear cut. Sometimes consequentialist theories can provide a fair degree of certainty, if the consequences are easily predictable.
- Furthermore, rule-based consequentialism provides people with a set of rules that enable them to take moral decisions based on the sort of act they are contemplating.
- deals with intentions and motives
- Consequentialist theories don't pay direct attention to whether an act is carried out with good or bad intentions; most people think these are highly relevant to moral judgements.
- Duty-based ethics can include intention in at least 2 ways...
- If a person didn't intend to do a particular wrong act - it was an accident perhaps - then from a deontological point of view we might think that they hadn't done anything deserving of

criticism. This seems to fit with ordinary thinking about ethical issues.

- Ethical rules can be framed narrowly so as to include intention.

### **Bad points of duty-based ethics**

- absolutist
- Duty-based ethics sets absolute rules. The only way of dealing with cases that don't seem to fit is to build a list of exceptions to the rule.
- allows acts that make the world a less good place
- Because duty-based ethics is not interested in the results it can lead to courses of action that produce a reduction in the overall happiness of the world.
- Most people would find this didn't fit with their overall idea of ethics: ...it is hard to believe that it could ever be a duty deliberately to produce less good when we could produce more...

### **A C Ewing, The Definition of Good, 1947**

- hard to reconcile conflicting duties
- Duty-based ethics doesn't deal well with the cases where duties are in conflict.

### **Kantian duty-based ethics**

Immanuel Kant (1724-1804) was arguably one of the greatest philosophers of all time. Kant thought that it was possible to develop a consistent moral system by using reason. If people were to think about this seriously and in a philosophically rigorous manner, Kant taught, they would realise that there were some moral laws that all rational beings had to obey simply because they were rational beings, and this would apply to any rational beings in any universe that might ever exist: The supreme principle of morality would have an extremely wide scope: one that extended not only to all rational human beings but to any other rational beings who might exist - for example, God, angels, and intelligent extraterrestrials.

### **Samuel J. Kerstein, Kant's Search for the Supreme Principle of Morality, 2002**

Kant taught (rather optimistically) that every rational human being could work this out for themselves and so did not need to depend on God or their community or anything else to discover what was right and what was wrong. Nor did they need to look at the consequences of an act, or who was doing the action.

Although he expressed himself in a philosophical and quite difficult way, Kant believed that he was putting forward something that would help people deal with the moral dilemmas of everyday life, and provide all of us with a useful guide to acting rightly.

### **What is good?**

Although Kantian ethics are usually spoken of in terms of duty and doing the right thing, Kant himself thought that what was good was an essential part of ethics. Kant asked if there was anything that everybody could rationally agree was always good. The only thing that he thought satisfied this test was a good will: It is impossible to conceive anything in the world, or even out of it, which can be taken as good without limitation, save only a good will.

## **Immanuel Kant, Groundwork of the Metaphysics of Morals**

All Kant means is that a good will alone must be good in whatever context it maybe found. It is not good in one context and bad in another. It is not good as a means to one end and bad as a means to another. It is not good if somebody happens to want it and bad if he doesn't. Its goodness is not conditioned by its relation to a context or to an end or to a desire.

## **H J Paton, The Categorical Imperative, 1948**

Other things that we might think of as good are not always good, as it's possible to imagine a context in which they might seem to be morally undesirable. Kant then pondered what this meant for human conduct. He concluded that only an action done for 'a good will' was a right action, regardless of the consequences.

But what sort of action would this be? Kant taught that an action could only count as the action of a good will if it satisfied the test of the Categorical Imperative.

## **Kant's Categorical Imperative**

Kant's version of duty-based ethics was based on something that he called 'the categorical imperative' which he intended to be the basis of all other rules (a 'categorical imperative' is a rule that is true in all circumstances.)

The categorical imperative comes in two versions which each emphasise different aspects of the categorical imperative. Kant is clear that each of these versions is merely a different way of expressing the same rule; they are not different rules.

## **Moral rules must be universalisable**

The first one emphasises the need for moral rules to be universalisable. Always act in such a way that you can also will that the maxim of your action should become a universal law. To put this more simply: Always act in such a way that you would be willing for it to become a general law that everyone else should do the same in the same situation.

This means at least two things:

- if you aren't willing for the ethical rule you claim to be following to be applied equally to everyone - including you - then that rule is not a valid moral rule. I can't claim that something is a valid moral rule and make an exception to it for myself and my family and friends. So, for example, if I wonder whether I should break a promise, I can test whether this is right by asking myself whether I would want there to be a universal rule that says 'it's OK to break promises'.

Since I don't want there to be a rule that lets people break promises they make to me, I can conclude that it would be wrong for me to break the promise I have made.

- if the ethical rule you claim to be following cannot logically be made a universal rule, then it is not a valid moral rule.

So, for example, if I were thinking philosophically I might realise that a universal rule that 'it's OK to break promises in order to get one's own way', would mean that no-one would ever believe another person's promise and so all promises would lose their value. Since the existence of

promises in society requires the acceptance of their value, the practice of promising would effectively cease to exist. It would no longer be possible to 'break' a promise, let alone get one's own way by doing so.

### **Moral rules must respect human beings**

Kant thought that all human beings should be treated as free and equal members of a shared moral community, and the second version of the categorical imperative reflects this by emphasizing the importance of treating people properly. It also acknowledges the relevance of intention in morality. Act so that you treat humanity, both in your own person and in that of another, always as an end and never merely as a means....man and, in general, every rational being exists as an end in himself and not merely as a means to be arbitrarily used by this or that will. In all his actions, whether they are directed to himself or to other rational beings, he must always be regarded at the same time as an end...

### **Immanuel Kant, The Categorical Imperative**

Kant is saying that people should always be treated as valuable - as an end in themselves - and should not just be used in order to achieve something else. They should not be tricked, manipulated or bullied into doing things.

This resonates strongly with disapproving comments such as "he's just using her", and it underpins the idea that "the end can never justify the means".

Here are three examples of treating people as means and not ends:

- treating a person as if they were an inanimate object
- coercing a person to get what you want
- deceiving a person to get what you want

Kant doesn't want to say that people can't be used at all; it may be fine to use a person as long as they are also being treated as an end in themselves.

### **The importance of duty**

Do the right thing for the right reason, because it is the right thing to do. Kant thought that the only good reason for doing the right thing was because of duty - if you had some other reason (perhaps you didn't commit murder because you were too scared, not because it was your duty not to) then that you would not have acted in a morally good way.

But having another reason as well as duty doesn't stop an action from being right, so long as duty was the 'operational reason' for our action.

If we do something because we know it's our duty, and if duty is the key element in our decision to act, then we have acted rightly, even if we wanted to do the act or were too scared not to do it, or whatever.

### **Rossian duty-based ethics**

Kantian ethics seems pretty uncompromising and not really suited to the untidiness of many moral choices that people have to make.

The 20th Century philosopher W. D. Ross [Sir David Ross] (1877-1971) suggested that it would be helpful to look at two kinds of duty:

- Prima facie duties
- Actual duties

### **Prima facie duties**

- are self-evident and obvious duties (prima facie is a Latin expression meaning 'on first appearances' or 'by first instance') can be known to be correct if a person thinks about them and understands them:
- when we have reached sufficient mental maturity and have given sufficient attention to the proposition it is evident without any need of proof, or of evidence beyond itself

### **W D Ross, The Right and the Good, 1930**

- should be promoted, "all things considered"
- can be outweighed by other prima facie duties.

### **Actual duties**

This is the duty people are left with after they have weighed up all the conflicting prima facie duties that apply in a particular case: the ground of the actual rightness of the act is that, of all acts possible in the circumstances, it is that whose prima facie rightness in the respects in which it is prima facie right most outweighs its prima facie wrongness in any respects in which it is prima facie wrong.

### **W D Ross, The Right and The Good, 1930**

Ross listed seven prima facie duties:

- Fidelity
- Reparation
- Gratitude
- Justice
- Beneficence
- Self-improvement
- Non-maleficence (avoiding actions that do harm)

Calling these 'duties' may be a bit misleading, as they are not so much duties as "features that give us genuine (not merely apparent) moral reason to do certain actions".

Ross later described prima facie duties as "responsibilities to ourselves and to others" and he went on to say that "what we should do (our duty proper [our actual duty]) is determined by the balance of these responsibilities."

## **Problems with the Rossian approach**

Ross's idea still leaves some problems:

- How can we tell which prima facie duties are involved in a particular case?
- How can we compare and rank them in order to arrive at a balance which will guide us as to our actual duty?

Ross thought that people could solve those problems by relying on their intuitions.

## **Karma Yoga**

Karma yoga is one of the four classical schools of yoga alongside Jnana (knowledge or self-study), Bhakti (devotion) and Raja (meditation), each offering a path to moksha (spiritual liberation) and self-realization.

Derived from the Sanskrit term for "action", karma is understood by both Hindu and Buddhist traditions to be the sum of a person's deeds in past, present and future states of existence. In yoga, karma is known as the path of action, or selfless service towards others.

Karma yoga is considered to be one of the most practical and effective means of spiritual development.

## **Explanation Karma Yoga**

Karma yoga was first outlined in the Bhagavad Gita, the 700-verse Hindu scripture estimated to date back to somewhere between the 5th and 2nd centuries B.C.E. The Bhagavad Gita offers several approaches to liberation from suffering, self-realization and connection with the Divine, of which Karma yoga is arguably the most practical.

The text highlights the importance of selfless action, in which service is offered from the heart, with full attention and awareness. Attachment to the outcome of one's actions is said to bring suffering, particularly when something is expected in return. In order to truly practice Karma yoga, the practitioner must act with no expectations and serve others without thinking of the results. As such, Karma yoga diminishes the ego and helps to dissolve any sense of separation between self and other. Acting in this way is believed to purify the mind, and it is considered the most virtuous approach to service.

Although volunteering one's time and effort is a common example of Karma yoga, the concept teaches that all actions, even the most mundane, can become part of one's spiritual path. It is considered the attitude to the action, rather than the action itself, which makes something Karma yoga.

As such, the essence of the practice is to act with the right motives, in the right way, to the best of one's ability whilst surrendering attachment to the outcome.

To Karma yogis, selfless action is a form of prayer and connection with the Divine. Some teachings even suggest mantra chanting whilst engaging in Karma yoga, in order to purify the mind and develop a selfless mindset.

Practicing Karma yoga also involves fully accepting one's dharma (duty in life) in order to let go of selfish desires.

## **Svadharmā**

**Svadharmā** (Skt., sva, 'own', + dharma, 'duty, right'). In Hinduism, one's own right, duty, or nature; one's own role in the social and cosmic order. Svadharmā is relative to one's caste and stage of life (cf. varṇāśramadharmā), and to one's situation (cf. āpaddharmā). Svadharmā or relative dharma often conflicts with sādharma, universal dharma, or sanātana dharma, absolute or eternal dharma. For example, to kill is a violation of eternal dharma, yet a warrior's svadharmā (own duty, nature) is to kill.

## **Explanation Svadharmā**

Dharma embraces every type of righteous conduct covering every aspect of life essential for the sustenance and welfare of the individual and society and includes those rules which guide and enable those who believe in the Divine. At the pragmatic level it transforms into right action. Then the question that arises is 'what is right action?' Indian philosophical frameworks give a series of direction for the same as well.

Right action is one that is governed by one's svadharmā, kuladharmā, āśrama dharma, varṇa dharma and rāshtriya dharma. Thus there is a series of dharma in hierarchical order starting from the individual level to the national level. It also goes beyond that to the global level pertaining to the cosmic period to which we belong, called the yuga dharma.

- Svadharmā is the action determined by one's nature, spiritual temperament and essential character. It is the natural instinct in all of us that stimulates us to act at a subconscious level, without thinking. One's nature is in turn determined by one's physical, pranic and mental constitutions, namely triguṇas (sattva, rajas, tamas) and body constituency (vata, pitta, kapha). More on svadharmā a little later.
- Kula dharma is political, social, and community-related activities, which are based upon unselfishness, satya (Truth), ahimsā (non-violence), and moral and ethical values.
- Āśrama dharma is determined by the stage in life we belong to. The four āśramas laid out in the Vedas are brahmacharya, gṛhastha, vanaprastha and sannyasa. Each stage in life has its own set of norms and values to uphold in order to sustain one's own identity and the family and society at large. Widely these are considered as four stages of life, while a differing perspective is that these are four options that are open for one to choose to live through his life. Thus one can choose to live as a brahmachari all through his life while one might take the path of sannyasa quite early in life like Sankara. These choices are again guided by one's svadharmā.
- Varṇa dharma pertains to the personality type to which one belongs. Even though the Vanashrama has been highly distorted and grossly abused in form of the caste system, in its original form it was an efficient social system that prescribed professions to individuals based on their qualities and natural temperaments and traits. Each varṇa (Brahmin, Kshatriya, Vaishya and Shudra) has its own nature (dharma). Knowing it to suit one's career is the ancient form of 'personality-job fit'. The story of Satyakama Jabala in the Upanishads stand testimony to this, where Satyakama who was born to Jabala, a woman who did not know who his father was, was initiated into brahmanhood by a rishi because he stood for truth, which was the quality of a brahmin.

- Rashtriya dharma governs the conduct of each one of us as a responsible citizen of our nation.
- Yuga dharma that which sustains the universe at each yuga. There is a vedic analogy of dharma as a cow with four legs, where each leg is an aspect of kala - a yuga. In the first phase, satya yuga, the cow (dharma) was hale and healthy with all its four legs intact. When time transited into the second phase, dvapara yuga, it limped with three legs, denoting slow degenerating of values (dharma). In its third phase, treya yuga, it almost became immobile with just two legs. In its current phase, kali yuga, it is crippled and close to collapse with just one leg left. Prophetically, Bhishma says in the Mahabharata that in the kali yuga 'dharma will become adharma and adharma dharma'. Subsequently Krishna says in the Gita that whenever such an erosion of dharma happens through the ages he will come again and again to reinstate the rightful place of dharma.
- Following one's dharma helps us align our body, mind and self with nature and eventually the divine. By establishing a hierarchy of dharmas it is ensured that no one acts arbitrarily at their own whims but act responsibly considering various factors into account.

## **lokasamgraha**

Western models and constructs have dominated research in leadership. Cross-cultural research in leadership has questioned the validity of western models, but because of its focus on ethics or universals, it has not provided much insight to managers in non-western cultures. We need to develop indigenous models of leadership that can provide insights to guide people's daily behavior in work and social settings. To fill this lacuna, a small step is taken, and an Indian model of leadership is presented. The construct of lokasamgraha is derived from the bhagavadgita, and its relevance for leadership is examined. The construct of lokasamgraha is further analyzed in the context of Indian concept of self, stages of life (varNAzrama dharma), and the four objectives of life (puruSArthas).

This approach results in a rich cultural model of leadership. The construct of lokasamgraha proposes that not only leaders but also their followers should act so that all their actions are for the greater public good. In other words, leadership is about serving others. All actions, thus, are to be performed without hankering after the outcomes or fruits of one's efforts, which is the doctrine of niSkAma karma proposed in the bhagavadgita. The model is grounded in the idea that willy-nilly we are all on a spiritual journey. Implications of this model for global psychology and future research are discussed.

## **Apurva**

Apurva literally means 'not existing previously'. The word 'apurva' is a technical term employed by the Purva-mīmāṃsā system of philosophy which advocates the performance of all the prescribed Vedic rituals as the only means of obtaining the summum-bonum of life.

Vedic sacrifices are said to produce results such as attaining heaven. The doubt that naturally arises is :

- How can an act performed here and now produce a result much later and somewhere else?
- Does it not violate the law of cause and effect?

This objection is answered by the Purvamimāṃsā system by formulating the theory of śakti (potential energy). Just as a seed possesses in it the imperceptible power with the help of which it

can produce the sprout, so does the soul possess the power to manifest the results of Vedic rituals. These rituals, as soon as completed, generate in the soul that śakti or power. Since this power did not exist previously (a-purva = not existing previously) but is generated as a result of the rites, it is termed as 'apurva.' This apurva gets exhausted after producing its results.

## **Explanation Apurva**

The term Mīmāṃsā in the title stands for Pūrvamīmāṃsā (PM). PM is the biggest of the six orthodox systems of Indian Philosophy (IP) which may be renamed as Indian Hermeneutics in modern idioms. It is so because the system concerned itself with the interpretation of the Veda and evolved principles of sentence- interpretation for this purpose. Jaimini, for the first time, systematized these principles by composing the Mīmāṃsāsūtras. In other words, the Mīmāṃsāsūtras of Jaimini (JS) are nothing but rules and principles of interpreting the Veda. These were evolved out of the need to interpret the whole Veda meaningfully. This arose because of the questions and objections of the heterodox systems regarding the authenticity and authority of the Veda. Actually the Veda was the basis of the ritual culture, prevalent in the then society. According to the view of the heterodox systems, the Veda contained many meaningless sentences, many non-understandable, ambiguous, ridiculous and also contradictory sentences.

Such a text, in their opinion, could not be the basis of a culture. This was the main point of the opponents. To answer these questions and to establish the authority of the Veda beyond all possible doubt, it was necessary to interpret the whole Veda and to show that it contained no redundant sentences. It was a challenging task which Jaimini took up and achieved the goal of the system by composing twelve chapters of Mīmāṃsādarśana. He started with some presuppositions. They were:

1. The Veda is eternal. It is not a creation of any human being i.e. it is self-valid or autonomous.
2. It is also not created by God. No God is required to be postulated for this purpose.
3. Action (i.e. ritual) is the meaning of the Veda. This means the Veda is meant for inducing a human being into an activity which leads to his good.
4. The action, in other words, is the duty (Dharma) of human beings, which can be understood only from the Veda.

Along with these basic assumptions many criteria were evolved to establish that there was no lacuna in the Vedic texts and as such the Veda must be accepted by the society as the source and basis of the ritual culture. In the light of the first presupposition that the Veda is autonomous, the PM system held that the Veda had to be interpreted on the basis of itself. As far as possible, for this purpose, no help of any source should be taken which is external to the Veda. As such many questions were answered taking recourse to the Veda itself. Vedic sentences were classified into five categories: vidhi (injunction), mantra (incantation), nāmadheya (name of a rite), niṣedha (negative injunction) and arthavāda (narratives).

In the light of the third presupposition above that action is the meaning of the Veda, injunctive sentences which prescribed different acts to be taken up or which refrained the human being from taking up a particular act were treated as the most important sentences among the five types. It was accepted that the injunctive sentences primarily prescribe an act as a means of obtaining desired result or refrain a human being from an act which may lead to some undesired result. Here one important logical difficulty was to explain the cause and effect relationship between the ritual

and the result it was supposed to yield. To solve this difficulty, PM evolved the concept and theory of Apūrva.

First understand the exact difficulty in accepting the cause and effect relationship between the yāga and its result and then look into the point how the concept of Apūrva could overcome this difficulty. The yāga was defined as 'offering an oblation in the fire with reference to some deity'. Offering is an act. For accomplishing the main act of offering there were many preparatory and subsidiary acts which formed the part and parcel of the yāga in the sense that they contributed towards the main offering. Thus, yāga was a collection of many small acts along with the main act. An act is a momentary phenomenon so, yāga also being an act is momentary. It vanishes in the thin air as soon as it is performed. The result of the yāga, such as heaven would occur quite late after the performance, when it does not exist anymore. To produce the effect it is required that the cause should be present before the effect and also at the time when it is produced. In other words, both cause and effect should be collocated. To show the collocation of the cause and the effect in the present case, there are two options: either it should be said that the yāga continues to exist until the effect of the yāga is produced or it should be accepted that even if yāga is destroyed it produces its effect.

However, both these options are not acceptable as none of them stands logical. As the yāga is an act it cannot continue to exist until the effect is produced because an act is momentary and it also is not logical to say that the destroyed and hence absent yāga produces its effect later because it is not possible for the dead parents to produce a son. Thus, both the options are rejected because they do not stand logically consistent. Here, Pārthasārathī Mishra brings in the concept of Apūrva. The argument is: the yāga, no doubt, gets destroyed when performed but it produces something before getting destroyed. This something is given the name Apūrva.

Apūrva means that which was not there before the performance of yāga. So this is the logic behind accepting the concept of Apūrva. Pārthasārathī Mishra puts in a single verse: *Vinaṣṭasyasatastavāt na kāryārambhasambhavafi; Kṣaṇikatvena siddhasya navasthānām ca yuktimat. Atafi Apūrvam eva kalpayitavyam.*

### **What is Apūrva?**

Kumārila Bhaṭṭa answers this question as follows: *Karmabhyafi prāg ayogyasya karmaṇafi puruṣasya vā Yogyatā śāstrāgamya ya para sa'pūrvamiṣyate.* This means: the potential which was absent before the performance of the act and which is produced after the performance that (potency or potential) is known as Apūrva. (vide *Tantravārtika* (TV) of Kumārila, on the *Bhāṣya* of Sābara (SBh), on the JS II.1.5). Kumārila explains: Before the ritual is performed it cannot be the means of (obtaining) heaven and the performer also is not in a position (is not compatible) to obtain the result like svarga. So one has to accept that performance of a ritual generates some potential. Because if there is no such potency then it will mean the performance and the non-performance of the rite are the same.

Therefore, the potential in the performer as well as in the performance is named as Apūrva in this (i.e. PM) system. (TV on SBh on JS II.1.5.) The next question is: What is the means of knowing Apūrva? Kumārila answers: There is only one means of knowing it and that is śrutarthāpatti. Arthāpatti means implication or presumption. Kumārila explains, perception etc. cannot be the means of knowing Apūrva. It has to be known by implication. He says: *śrutarthāpattirevaika*

pramāṇam tasya veśyate.

(Ibid) To elaborate, the Vedic sentence which enjoins that a sacrifice leads to heaven and the subsidiaries (of the sacrifice) help the main sacrifice, must also accept (by default) that the acts have the potency of generating the effect only because those acts which have no potency, cannot produce the effect. Further, an act is momentary and also not perceptible. Hence it can never be simultaneous with the effect it produces. Kumārila argues, this is true with reference to a single act, what to talk of the rites like darśapurṇamāsa which consist of many acts and are also separated by time. (Darśa and Purṇamāsa are performed on new-moon-day and fullmoon-day respectively.

Thus, they are separated from each other by a fortnight. They consist of three main rites each.) So if it is accepted that without generating any potency in the performer, the rites simply vanish then the person will be the same before and after the performance. But if the Apūrva is accepted to come into being after each and every performance then the performer will become capable of enjoying the result of his action. Another advantage would be, even if the acts do not exist one can explain the simultaneity of the subsidiary acts on one hand and that of the main act and the result on the other. Thus, by now two points are clear that Apūrva is a potency produced by the act taken up by the performer and it is to be known by implication.

### **Where is Apūrva produced and where does it reside?**

Kumārila's answer to this is: Ātmaiva cāśrayas tasya kriyāpyatraiva ca sthitā (ibid). The Apūrva is produced and resides in the self (ātman) because kriya, the act also resides there. It is the self who resolves to perform the act and through this resolution he alone is accepted to be the agent of all acts and hence when they get vanished, they do so after generating the potency of enjoying the results like heaven etc. in the (ātman of the) performer. Here a question may be asked how come the act gets vanished but its potency remains even after? The answer that Kumārila gives is: had the potency inhered in the act itself then certainly it would have vanished along with the act but if it is accepted that the potency resides in the performer, there is no question of its getting destroyed. Then further there may arise the question: how is it that the potency of one (that of the act) resides in another (in the performer)?

Kumārila says, the performer and the act are not absolutely different from each other. Moreover, the potency, or the śakti i.e. Apūrva is inferred on the basis of its effect and it has to be accepted to reside in the substratum where it will be utilized to bring about the effect. Such a substratum could be the same or different, it does not matter. The only point is, it should be a substratum which is capable of bringing about the result. This is why Apūrva is accepted to reside in the ātman. This will explain how the result is collocated with the cause.

### **How many Apūrvas are to be postulated?**

Kumārila's straight forward answer is: At first one Apūrva is accepted on the basis of presumption. To explain, without Apūrva it is not possible to explain why the injunctions like, darśapurṇamāsaḥ svargakāmo yajeta explicitly state that the yāga is instrumental in bringing about heaven. Thereafter, to explain this very fact that the yāga is the cause and svarga the effect through Apūrva; one may accept more Apūrvas.

To quote Kumārila: Arthāpatter ihapūrvam Pūrvam ekam pratīyate. Tatastāt siddhaye bhūyafi syādapūrvāntara-kalpanā. (Ibid) The purport of this statement is: As the main yāga generates the

final result, only one (main) Apūrva is accepted at first. But as the main yāga consists of many subsidiaries, it is necessary to accept more Apūrvas to explain how the main Apūrva is produced through the subsidiaries. In other words, for contributing to the main yāga and also to the main Apūrva all the subsidiary rites must have sahitya i.e. togetherness and also there has to be simultaneity or togetherness between the subsidiaries and the main rite for which it is necessary to postulate more Apūrvas. Thus there will be many Apūrvas.

Nevertheless, there are grounds to postulate them. Kumārila asserts, Pramāṇavadyadr̥ṣṭāni kalpyante subahunyapi; Adr̥ṣṭasatabhāgo'pi na kalpyo hy apramāṇakafi. (Ibid) What Kumārila means is this: one may postulate many or good many Apūrvas if there is a reason to accept them. But without a ground one should never accept even one hundredth of Adr̥ṣṭa. Here he has used the term Adr̥ṣṭa. Adr̥ṣṭa is another name for Apūrva. We shall come to this point later.

What one gathers from the statement of Kumārila is the fact that basically one Apūrva is accepted to explain the cause and effect relationship between the ritual and its result but when it comes to look into the fact about how that one Apūrva is produced, it becomes necessary to postulate more Apūrvas.

To explain: Apūrva is the intermediate causal link between the performance of the ritual and its result. It is known from an injunctive sentence of the Veda, such as darśapurṇamāsābhyām svargakāmo yajeta that the performance of the rite is the instrument and heaven is the effect, we have already seen. Apūrva is accepted to be the link between the two to explain their relationship. True. But, a ritual, again, consists of many subordinate acts. A ritual is a conglomeration of many acts. If it is so, then the same question persists regarding all these acts. The fact that each and every act is momentary does not change.

Hence, just as there is a need of a link between the main performance and the result, so also there is a need of a link between any two acts being performed. This becomes clear by the example that we have seen above. The two rituals, darśa and purṇamāsa consist of three rites each and are performed on new-moon and full-moon-days respectively. The point is, the dual number in darśapurṇamāsābhyām says that these are two rituals. The performance of these two leads to heaven. Here also the question of togetherness of these two rituals arises and also there arises a question of togetherness of all subsidiaries which are required to be performed to complete these two rituals as well as even to complete one single act.

Accordingly, one has to postulate more Apūrvas to solve the question of togetherness of all acts. This is the intention of Kumārila. This is how one finds in the later texts of PM different types of Apūrva explained elaborately. To continue with the example of darśapurṇamāsa, it is accepted that each of the subsidiaries generates one Apūrva (angapūrva) all the Apūrvas produced by the subsidiaries contribute to produce utpattyapūrva, utpattyapūrvas, again, contribute to produce two samudāyapūrvas, which, in turn, contribute towards generating the pradhānapūrva. This main potency would reside in the performer until the result is produced. This pradhānapūrva is also called paramapūrva or caramapūrva or phalapūrva because, it is the main and final Apūrva which would produce the phala when it is due to the sacrificer. So we have seen some main types of Apūrva here. Thus, the PM theory of Apūrva has filled in the apparent gap between the cause and its effect. In the absence of this theory it would not have been possible to accept the cause and effect relation between the ritual performance and the future effect on one hand and it would have been impossible to establish the authority of the injunctive sentences of the Veda on the other.

Injunctions of the Veda, both positive and negative, are the most important parts of the Veda which guide a human being to take up right acts and to avoid the wrong ones respectively.

How is this theory connected with the Karma theory? Let us look into the significance of the Mīmāṃsā theory of Apūrva in the context of the karma theory of IP. The origin of the karma theory is the Veda. In the Śatapatha Brahmaṇa (IV.4.1.2) it is mentioned that everyone is born in this world fashioned by himself. The Kaṭhōpaniṣad says, one enters the womb of a mother and attains a bodily form, another goes to a plant, each of these as per his or her own deeds and knowledge (Kaṭha Upa V.7).

### **The Bṛhadāraṇyaka upaniṣad asserts:**

Just as one acts and behaves, so will he be born. He becomes holy by holy deeds and he becomes evil by evil deeds. (Sādhukāri sādhu bhavati, pāpakāri pāpo bhavati. Puṇyafi puṇyena karmaṇa, pāpafi pāpakena. Bṛh Upa- IV.4.5). From these and such references it is clear that a good act leads to a good result and a bad one to an evil one. The acts are primarily divided into Worldly and Vedic. The above theory is true in both the divisions of acts. In other words, any type of act, when it does not produce its verifiable result immediately, does produce some potency which remains with the agent and yields its fruit at the proper time, only because the act itself, being an act, is momentary and perishes immediately after it is performed.

The question here is: do we call the potency produced by the worldly acts like studies or drinking ghee or agriculture by the name Apūrva? Or is there any other name for it?

Etymologically, it is possible to call any such potency by the name Apūrva but Kumārila does not accept it to be so. In his opinion, in case of worldly acts also one has to accept that they produce some śakti, some potency because only on that basis can one explain their results on a later date. But he categorically denies the name Apūrva to be given to such worldly potency. He argues, this potency is not called Apūrva because the acts are not Vedic.

So, it seems that according to him, the potency generated by the worldly act (laukika karman) may be known as adṛṣṭa. Adṛṣṭa literally means unseen. It is understood that such potency is not visible or verifiable but it certainly exists because it is inferred on the ground of the result that it later produces.

Kumārila asserts:

Laukikām cāpi yat karma phale kālāntarodgatau; Tatrāpi śaktirevāste na tv apūrvamiheṣyate. (Ibid) This means, even in the case of a worldly act, where the result comes later, one has to accept the potency (generated by the act) but the same is not known as Apūrva. He further explains his point with the help of examples we have mentioned earlier, i.e. studies or drinking ghee or agriculture.

These are worldly acts the results of which are not seen as soon as the acts are performed. The results are certainly seen at a later date.

Observations:

From whatever we have discussed so far, it is clear that the theory of Apūrva which is a contribution of PM, was originally evolved to explain the cause and effect relation between a performance of ritual and its result. This, in other words, is a logical postulation to bridge the

apparent gap between them. It may be considered as a function (vyāpāra) of the ritual which is instrumental in bringing about the final result. Its nature is that of a potency, generated by the performance.

Later on, this theory is extended to all good and bad acts to explain the happiness and suffering of a human being. A human being goes on accumulating good and bad potency through his good and bad acts respectively. The same leads him towards happiness or suffering. This theory, most significantly, puts the responsibility of human happiness and suffering on the shoulders of one's own acts. Nobody or nothing else is responsible for the state of affairs in which a person finds himself. In other words, a fate of man is earned by himself. PM holds that this world has no beginning. The cycle of the universe is anādi and hence human life also is anādi. This means, a human being is and has always been engaged in some act or the other. (The Bhagavadgītā III.5 says Na hi kaścit kṣaṇamapi jātu tiṣṭhatyakarmakṛt.) If the act is good one accumulates good potency (puṇya), and if it is bad one obtains evil potency (pāpa). This is Adṛṣṭa. This has been going on beginninglessly. The Nyāya system, which accepts God as the creator of the universe and does not accept the world to be beginningless, has accepted Adṛṣṭa as the cause of human happiness or suffering. God simply monitors the phenomenon of the results distributed to all as per their Adṛṣṭa.

Even God cannot go beyond Adṛṣṭa. Here the theory of Adṛṣṭa saves God from the blame of not being equal to all. Udayana, in his Nyāyakusumāñjali, has accepted Adṛṣṭa as the cause of difference (vaicitrya) in the world. Hence, it is one's Adṛṣṭa (puṇya or pāpa) that is responsible for one's happiness or suffering. Thus, the original theory of Apūrva, when applied to the karma theory, is capable of explaining all apparent gaps and disparities in the world.

## **Sadhya and Sadhana**

The characterising feature of human beings, that distinguishes them from other species of animals, is the presence of a comparatively much more developed intelligence and the capability to think beyond the very basic activities of eating, sleeping, mating and defending, which can be found in all the species of animals on the earth, in the water and in the sky. All individuals, regardless of their circumstances, are sure to set some goal for their life. The Vedic literatures and the previous sages have mentioned three goals that humans can strive for, and the respective paths that can be adopted to attain those goals have also been elaborately described in the Vedas. The Goal, known as 'Sadhya' in Sanskrit, and means to achieve it, or 'Sadhana', are very important and one should ascertain the Sadhya of their life and the Sadhan, performing which shall lead them to the attainment of the Sadhya.

The first of the three Sadhyas mentioned in the Vedas is Bhukti, or material enjoyment, and the means to attain it is given in the Karma Khanda section of the Vedas. These generally include performing sacrifices, giving charity, performing social service, building wells and hospitals, serving guests, and leading a pious lifestyle among other such activities. These activities result in the person enjoying a comfortable life and being promoted to some higher planet after death, where he may be able to enjoy better quality of material enjoyment. This Sadhya is recommended for those who are not yet eligible for striving for a better Sadhya. However, since the result, Bhukti, of these pious activities is not eternal and one falls down from his position of better sense enjoyment in the higher planets after his pious merits have been exhausted, it cannot be considered to be the highest Sadhya. By following this path one does not attain freedom from the

cycle of repeated birth and death in this material world full of miseries. It is therefore considered to be the lowest of all the Sadhyas. However, one who is eligible to follow this path and does so sincerely, following the injunctions of the Sahstras and leads a pious life, may, due to some great good fortune, come into contact

with a great personality and, due to their association, develop eligibility for a higher Sadhya. The second Sadhya mentioned is Mukti, or liberation from material bondage, and the Sadhana, or path to be followed for attaining it, is mentioned in the Jnan Khanda section of the Vedas. The Sadhana for attaining Mukti includes Pranayam, Ashtanga Yoga and other Yoga practises for restraining the senses from their objects and endeavouring to merge one's identity into that of the Brahma Jyoti or impersonal Brahman. The Panchopasana system also falls into this category of Sadhana. The resultant Sadhya attained by following this path, which, according to the Supreme Lord Krishna as stated by Him in the Bhagawat Gita, is wrought with troubles, is merging of the soul into Brahman. This is, however, also not the highest Sadhya as it is also not eternal. Attainment of Mukti, or liberation, is something which happens once and is not an eternal and ongoing truth. Although praised in the Jnan Khanda section of the Vedas, the bhaktas of Bhagawan condemn this idea of merging into the impersonal feature of the Lord as it is almost the same as spiritual suicide, for they give up their individuality and cease to exist. Only by some great good fortune, when a Jnani comes into the association of a bhakta of bhagawan, can they come to the platform of striving to attain the ultimate Sadhya.

The third and the only Sadhya that does not lead to a higher stage of understanding, as it is itself the highest, is Bhakti, or devotional service rendered to the Lord. The Sadhana or means of attaining Bhakti have been mentioned in the Vedas delineating the path of Bhakti, and Srimad Bhagwatam is the best amongst all these Vedic literatures describing the process of Bhakti yoga. The practices performed on this path include Shravanam, Kirtanam, Vishnu smaranam, pada sevanam and so on. The resultant Bhakti transports one to the eternal abode of the Lord, where the devotee renders transcendental loving service to the Supreme Personality of Godhead, thus enjoying eternal life, full knowledge and unlimited bliss. The lesser goal of Mukti is automatically attained by the Bhaktas as they are always transcendental to the material nature, being situated in the transcendental abode, far away from the external energy of the Lord. The followers of this most glorious path worship the Personalised feature of the Lord, who is complete with all transcendental qualities and the abode of wonderful loving pastimes.

One should, therefore, very carefully analyse the various Sadhyas, ascertaining their goal of life, and follow the respective Sadhana. It is only by great good fortune that one takes to the path of Bhakti and strives to achieve the best of all Sadhyas. One who does so is the only person who has understood his true position and the real purpose of life. Having ascertained Bhakti to be one's Sadhya, the sadhaka, or the practitioner should associate with the advanced devotees of the Lord and endeavour to make rapid progress on the path back home, back to Godhead.

## **Sadhana**

Sadhana (Sanskrit: साधन) is a Sanskrit term used to refer to a daily spiritual practice. Sadhana represents a disciplined surrendering of the ego, in which the practitioner uses tools such as asana, pranayama, meditation and chanting on a daily basis.

Anything that is practiced with awareness, discipline and the intention of spiritual growth can be

considered as sadhana, but it must be practiced alone and for the sake of the individual. As such, it does not need to be a physical activity; even daily self-study of yogic or spiritual scriptures is a form of sadhana.

Sadhana is also a means of forging a ritual connection with God or universal energy. It encourages the practitioner, known as the sadhaka, to use self-discipline in order to achieve power over the ego and maintain connection with universal oneness. With regular daily practice, the practitioner continually realigns his or her inner self, slowly progressing toward the very ultimate expression of consciousness known as samadhi.

## **Explanation of Sadhana**

The term sadhana comes from the Sanskrit root, sadhu, meaning “go straight to a goal”. Routinely applying mind, body and spirit in the pursuit of a spiritual goal is the most natural and efficient way to surrender the ego, to find relief from suffering and to attain peace.

For this reason, sadhana is the cornerstone of the discipline of yoga. Yoga provides a huge variety of tools for this purpose, ranging from physical practices, such as asana (postures) and pranayama (breathing techniques), to more introspective applications, such as svadhyaya (self-study) and meditation.

With intention, awareness, discipline and daily practice, almost anything can be considered as sadhana. When formulating your own sadhana, it is important to choose practices that work for you, in order to provide the best conditions for you to stay committed with ease. It may be useful to vary the practices used for sadhana from time to time, so as to keep the practice from becoming an automated or obligatory routine. Ancient Hindu and Buddhist texts, such as Sadhanamala, offer suggestions for hundreds of sadhana practices designed for various results.

Discipline is arguably the most important facet of sadhana, so it does help to practice at the same time each day. The time of day itself is not important - for some, practicing sadhana soon after awakening helps them to keep up the practice without distraction or excuses, whereas for others, evenings allow them more focus or concentration.

Although sadhana is centred around an ultimate spiritual goal, the practice itself should be undertaken without any specific goal in mind. Sadhana should be practiced for the sake of maintaining the practice, and as a means of cultivating discipline. To focus the mind on a goal during sadhana will bring ego into the practice, rather than the sense of surrender that is required.

## **Itikartavyatā**

Itikartavyatā literally means ‘mode of performing a duty’. It is a technical term used in the Purvamimāṃsā Sūtras. and answers the question as to how a thing is to be accomplished.

When someone is hungry, he has to prepare food and eat it. For this he has to cook the raw rice which again needs the necessary vessels and fire using fuel sticks. Similarly, if a person wants to perform a Vedic sacrifice, he must be given detailed instructions. This is called ‘itikartavyatā’. Itikartavya (acts): The Itikartavyata denotes the type of kartavya prakar or kriyaprakar. Elements like Abhidhana, Bodha and Jijnasa fall under the them Itikartavyata. Mimamsa philosophy considers Abhidhana, bodha, and jijnasa as byapar (business). The bhavakas are involved in byapar (work) like

Abhidhana, bodha, and jijnasa.

## **Karma**

According to the basic Sanskrit definition of karma, it simply means “action”. Laws of karma are all about the positive or negative valance of our words, thoughts, and deeds.

In essence, everything we do creates a corresponding energy that comes back to us in some form or another. Difficult karmic experiences catalyze learning and growth, and can later lead to good karma if we work towards positive change.

Everything we do is linked to our karma:

- How we treat others;
- How we see our own role in the world;
- The way we use resources;
- How we develop our characters.

## **Law of Karma**

The Law of Karma is infallible and everyone invariably is subjected to it. Sometimes we are oblivious to the fact that most of our lifetime is spent in undergoing destiny which is created by our karmas or deeds in our past births. As per the law of karma, every positive deed which we do, generates a ‘merit’; while every negative deed results in a ‘demerit or sin’ which subsequently we need to repay by enduring happiness or unhappiness. All major events in our life are predestined – for instance the family that we are born into, to whom we will get married etc. During our day-to-day interactions, we are either settling an old account or creating a new one. If an account is not settled in the present birth it is carried over to the next birth. Although, we are not consciously aware of the give-and-take karmic accounts generated in our previous births. In our subsequent births, we may or may not be equipped to settle our destiny and the paradox is that at the same time we are creating new karmic accounts. Thus, this loop of karma and destiny binds us and we remain entangled in it. The only way through which we can nullify our give and take account and destiny is through sustained and regular spiritual practice. In understanding the Law of Karma, we can see how spiritual practice can be useful to even those of us who have absolutely no spiritual interest and who only wish to be immersed in worldly pursuits. Even for those worldly relations to be fruitful they need to be insulated from destiny.

## **The 12 Laws Of Karma**

As we explore the 12 distinct laws of karma, think about how we've previously seen these laws come into play in your own life. Consider, too, how we can use our knowledge of these laws to create good karma that supports our dreams and goals. Understanding all of these types will help us design our own karma busting mantra or affirmation, should we feel we need it.

As noted above, the key to moving beyond apparently “bad” karma is to live in a way that shows we are learning from past mistakes. So, any mantra we recite should reflect this.

### **1. The Great Law**

Sometimes called “the Law of Cause and Effect”, the Great Law tells us that in order to get the things we want, we must also embody those things.

The message here is similar to that of the Law of Attraction. In other words, whatever you give out is also what you will receive, whether it is positive or negative. So, if you want love in your life, be loving. If you want to enjoy financial abundance, be generous. And if you want to have honest, open relationships then you need to offer authenticity and honesty to the people you care about as well.

## **2. The Law of Creation**

According to the Karmic Law of Creation, we need to be active participants in our lives if we want to get what we desire. We cannot simply wait for things to happen to us. We should aim to surround ourselves with what we want in our lives and look to our environments for clues about what we need.

A major part of understanding the Law of Creation is seeing that things outside ourselves tell us what's going on inside. So, if you don't like the way your life looks right now, look within and ask yourself what needs to change.

## **3. The Law of Humility**

Out of the 12 laws of karma, Buddhism can be seen as often emphasizing the importance of the Law of Humility. What you need to remember about this karmic rule is that you need to accept the true reality of something before you'll ever be able to change it.

For example, if you constantly blame others for things that you created or you see anyone who disagrees with you as a villain, you're out of step with reality. You will, therefore, find it very difficult to make the shifts you need. Consistent self-reflection can help you make the most of the Law of Humility.

## **4. The Law of Growth**

If you've ever heard the famous saying "Wherever you go, there you are", you've already thought about the Law of Growth in a certain sense.

The message here is that you need to expect a change of yourself before you expect it of the world around you (or indeed the people in the world around you). Ultimately, you only have control over yourself. Therefore, it is how you use this control that shapes how the universe responds to you.

So, focus on your development before trying to control or change others; let them come to their own conclusions about what needs to change.

## **5. The Law of Responsibility**

In terms of meaning, karma is often thought of in terms of The Law of Responsibility. In particular, it's helpful to remember that you are the source of what happens throughout your journey. What is happening around you is a mirror for what is happening within you; that is the sense in which you are responsible for all of your life experiences, whether fantastic or unpleasant.

Like the Law of Growth, this karmic law aims to teach you that you should be looking to take ownership of the good and bad things you create, rather than constantly looking outside yourself to find excuses.

## **6. The Law of Connection**

If you reached this guide because you were wondering how to remove bad karma of past life experiences, remembering the Law of Connection can help you. This law emphasizes the interconnected nature of the past, present, and future, and reminds us that our control over the present and future can help us to obliterate the bad energy of the past (whether it is from our current life or a previous life).

Another point made by the Law of Connection is that it takes time to redress karmic wrongs from the past. However, each small step can have unexpectedly powerful effects.

## **7. The Law of Focus**

According to the Law of Focus, you will do better in life if you can follow a single train of thought to the exclusion of others. Our minds are not equipped to follow multiple trains of thought with equal competency. So, if you have several important goals, try to follow them in a linear, ranked order rather than giving each goal only a fraction of your energy.

Another vital lesson here is that if you focus on your higher values; you won't be able to focus on "lower" emotions or thoughts like those that come from resentment, anger or possessiveness.

## **8. The Law of Giving and Hospitality**

In Hindi, karma meaning is closely tied to the Law of Giving and Hospitality. This law teaches that if you believe a certain thing, then you will naturally be called upon at some stage to demonstrate your commitment to that truth. The focus here is on the link between belief and practice. It suggests and encourages the importance of ensuring that your actions reflect your deeper beliefs.

This law is also about the way in which the universe will "test" you. Life gives us opportunities to put learned lessons into practice (and showing you when you need to do further work on some aspect of your character).

## **9. The Law of Here and Now**

As noted above, in Buddhism, karma is connected to ideas about accepting the truth of your reality. Equally, Buddhists typically link karma to the theme of truly living in the present moment. If you cling too hard to past feelings, experiences, and beliefs, you will always have one foot in the past. Likewise, if you focus on anxiety or on greed, you will always have one foot in the future. Following the Law of Here and Now means reminding yourself that the present is all you really have and that it is there to be fully engaged with and enjoyed.

## **10. The Law of Change**

When you think about the Law of Change, you connect with the message that the universe gives us what we need. So, you will find that history continually repeats itself until you demonstrate that you've learned what you need to in order to create a different future.

If you notice that you seem to be stuck in a loop, this is because there's something fundamental that has not yet been addressed. Meanwhile, if things around you begin to change in sudden and dramatic ways, take this as a sign that you have recently taken significant steps in your growth.

## **11. The Law of Patience and Reward**

To put it succinctly, the Law of Patience and Reward claims that all of your greatest successes require consistent hard work. This means that you need to be patient, regardless of your goals in life.

If you expect immediate results, you will ultimately be disappointed; your successes will be minor in comparison to what you're capable of achieving. Instead, look to figure out your true purpose. Act in accordance with that purpose and enjoy the reward of knowing you are doing what you are supposed to with your current life. In time, associated successes (emotional and material) will follow.

## **12. The Law of Significance and Inspiration**

Last but not least, the Law of Significance and Inspiration is a good law to reflect on when you need a motivational boost or start to feel like you don't matter.

This particular aspect of karma stresses that every contribution you make will influence the Whole, however small or great that contribution may be. Whenever you make creative, loving contributions to the world around you, your act inspires similarly positive behavior from others and attracts more positivity back into your life.

You may not always feel significant, but you always are. Without your presence, the energy of the universe would be fundamentally altered.

## **Ethical implications**

Ethical implications consider the impact or consequences that psychological research has on the rights of other people in a wider context, not just the participants taking part in the research.

As globalization intensifies and the world becomes increasingly interconnected, it behooves us to understand how Asians tend to understand themselves, others, and the world they inhabit. Inquiring into Asian cultural orientations in general and into Buddhism in particular offers us the opportunity to deepen our understanding of our own worldview by questioning our philosophical presuppositions. Furthermore, looking into Asian conceptions of ethics and karma will help us facilitate not only relations with Asian people – who account for roughly one third of the world's people – but also help us attenuate conflict before it reaches a critical stage.

Dealing strictly in general tendencies, as particular strains of thought are too profuse to accommodate in this presentation, I will suggest that recent work in Ch'an Buddhism by Buddhist scholar Peter D. Hershock offers a compelling view of karma that takes ethical training into account without reducing karma to a function of morality and without necessarily tying karma and ethical training to reincarnation or any other appeal that remains outside the scope of our ordinary experience. As a heterodox philosophical practice emerging in Northern India, Buddhism not only disavows the external authority of the Vedas and Brahmanic ritualism but also insists upon our investigation of and trust in our own experience. That is to say, the Buddha relocates authority in the individual person.

Buddhist philosophy, especially ethics, is based upon the Four Noble Truths. Just as the first three truths (the Truth of Craving, the Truth of the Origins of Craving, and the Truth of the Cessation of

Craving) inform the Eightfold Path, so the trainings of concentration (mindfulness, effort, concentration) and wisdom (view and thought) inform ethical training (speech, action, and livelihood). In general, Buddhism suggests that the suffering we experience stems from our ignorance of the way things are: impermanent, empty of intrinsic essence, interdependent, and irreducibly karmic. Furthermore, ignorance of the way things are leaves one vulnerable to the three poisons: hatred, delusion, and anger. The combination of ignorance and action has deleterious effects on our thoughts and actions, creating impressions upon the mind that cause suffering. In Vedanta and some forms of Buddhism, these impressions have a direct effect upon rebirth.

## **Ethics & Ethical Training**

There are at least two obstacles to understanding the working relationship between ethics and karma:

- (1) we tend to reduce ethics to either restraint or obedience; and
- (2) we tend to take the full significance of ethical training for granted.

What Brannigan has called —the tyrannies of space and time suggest that we confuse or limit our view of ethical training by an uncritical attachment to the local order of things, believing —that only the local is real and —that only the moment matters (2005, 7). The latter belief is especially troublesome for Westerners and for many Buddhists because —the moment is usually construed as a past, present, or future moment, thereby implying that there is a discrete self-existence unimplicated in change.

Freeing ourselves from these limiting views, according to Brannigan, allows us to grasp the fuller significance of ethical training and living an ethical life. Some Buddhist points of view maintain that ethical principles are derived from an awareness of the desire on the part of singular, sentient beings to experience happiness and avoid suffering by adopting a deeply penetrating equanimity, and not the other way around. With meditative and careful attentiveness, I am able to notice the awareness of equanimity arising in my own mind. Acknowledging and acting upon such awareness of suffering generates compassion, allowing space for my own happiness and the extension of good will to others and contributing to the welfare of all sentient beings (Tsering 2005, 26). This stands in stark contrast to dominant Western ethical views, which generally insist that our awareness of a moral obligation to others is based on a rational or pararational<sup>1</sup> experience of the Good, mediation by a deity, the formal operations of rationality, following rules, or experiencing feelings of sentiment or sympathy.

Generally speaking, ethical training in Mahayana, pre-Mahayana, and Theravada Buddhism is a foundation for the higher order operations of concentration and wisdom. In Buddhism, the Eightfold Noble Path is practiced as the three trainings: ethics (right speech, action, and livelihood), concentration (right effort, mindfulness, and concentration), and wisdom (right view and thought) (Tsering 2005, 125). All three trainings are, like all phenomena, interdependent. Thus, ethical training serves concentration and wisdom by allowing one to view things as they are rather than how we desire them to be. All trainings are mutually implicated, ongoing, and contextually provisional. The question of the relation between ethical training and karma still remains, however. Does ethical training simply function as a tactic of restraint, that is to say, function negatively? In the classical Indian traditions, especially Samkhya and Yoga, this is especially true.

Buddhism depends on an important change in view about ethical training and its relation to karma.

## **Ethics & Karma**

We are all aware of the historical fact that not only do the Vedic traditions precede Buddhism, but also that Buddhism adopts many of the concepts and practices from the Vedic traditions. Regarding ethical training and karma, however, Buddhism makes important substantive changes. In this section, I'll sketch a view of ethics and karma from the Vedic background to Buddhist thought and then I will consider two Buddhist traditions. In doing so, however, I am going to bracket two aspects of karma that appear in several Buddhist traditions (probably adopted from the Vedic world) and Action Karma Daoism:

1. karmic connection, either in kinship relations or with an ascetic/saint, and
2. ritualistic or other-powered practices that help the dying focus their minds and erase karmic obstacles to a salutary rebirth.

In the Vedic traditions<sup>3</sup> ethical training functions primarily to help students gain control of their senses. Ethical training is the practice of restraining the senses through negative restraints or yamas (—non-violence, non-lying, non-stealing, non-craving for sexual pleasure and nonpossessiveness), in order to stabilize the mind (Malhotra 2001, 38). Recall the second aphorism of Patanjali's Yoga Sutras: —Yoga is the stilling of all mental fluctuations. Ethical training in yogic traditions attempts to guide the psychophysical self's shift from an evolutionary entanglement with nature to an involitional disentanglement from nature. Once the mind is calm, concentration deepens and wisdom emerges.

Thus, ethical training serves a limited function, albeit a necessary one. In the works of Vedantists, the place of ethics is strictly tied to karma and reincarnation. Yet, Vedantists from Shankara forward developed the idea of karma beyond the individual moral benefits of controlling the senses. Sarvepalli Radhakrishnan writes that —all acts [or karma] produce their effects which are recorded both in the organism and the environment<sup>||</sup> (1932, 218). Thus, karma, in the Vedantist account, is both natural and unnatural. Natural karma is sedimented into the evolutionary history of the organism and environment while unnatural or moral effects, *sanskara*, —are worked into the character of the self<sup>||</sup> (218). *Sanskara* are —impressions [or] deposits of previous experiences and become the most important factors in determining the course of present and future experience. The mind is constantly creating and gathering such impressions in the course of its experiences<sup>||</sup> (Baba 1987, 32). Ethical training, then, serves the practice of renunciation: Renunciation may be external or internal. External, or physical, renunciation consists in giving up everything to which the mind is attached — home, parents, marriage, children, friends, wealth, comforts, and gross enjoyments. Internal, or mental, renunciation consists in giving up all cravings, particularly the craving for sensual objects.

Ethical training and its relation to karma, therefore, —is not so much a principle of retribution as one of continuity (Radhakrishnan 1932, 218). Rejecting a simplistic position, the Vedantists neither accept a doctrine of predestination nor suggest that karma is deterministic. They insist on —continuity with the past and creative freedom of the self (219). While unnatural karma can be erased by ethical training, natural karma is near impossible for human beings to erase. Natural karma must either fade through evolutionary development or by the compassionate intervention on the part of a *sadguru* or —perfect master.<sup>||</sup> As the Buddhist traditions that developed after the

Buddha's passing converge into what I call the Classical Theravada tradition, some elements of the Vedic view of ethics and karma persisted in somewhat altered form. Perhaps the most significant emendation of Vedic theories of ethical training and its relation to karma is the elimination of the distinction between natural and unnatural karma. Instead, karma falls under the skandhas and specifically the aggregate of mental formations. As Walpola Rahula points out, the group of mental formations, encompassing –52 such mental activities, includes –all volitional activities both good and bad [my emphasis] (1974, 22–23). This last phrase is especially important given popular accounts of karma. While a limited and highly qualified distinction can be made between –good and –bad karma, all karma leads to eventualities or outcomes that continue to bind the individual to suffering.

Furthermore, Rahula is insistent that karma is not an effect; rather, actions that are akusala (–bad) produce bad effects and actions that are kusala (–good) produce good effects. This is to say that karma is the binding and not the effects. At our peril and in our ignorance, we judge the effects –good or –bad. In the habitual and habituating pattern of suffering, we cannot control the effects and so it can only be a matter of chance that things turn out well. The goal of karmic ethical training is to generate outcomes that escape the samasara continuity of ironic consequences. Buddhism construes ethics or morality (sila) as founded on loving kindness and compassion for all sentient beings – another difference from the Vedic traditions, especially Brahmanic ritualism, which slaughtered animals in order to bring about beneficial relations with a particular deity or deities. Ethical training, Rahula writes, –aims at promoting a happy and harmonious life both for the individual and for society. This moral conduct is considered as the indispensable foundation for all higher spiritual attainments. No spiritual development is possible without this moral basis (1974, 47). Key to such spiritual development in the Buddhist traditions is the doctrine of anatman or non-essentiality. From a Buddhist point of view, ideational, sensual, perceptual, and corporeal constructions of self, the self of the five aggregates, is the ultimate hindrance to liberation.

With the development of the Mahayana traditions, the emphasis of ethical training shifted from the individual and society (the emphasis on the social dimension of Classical Theravada thought as enunciated in the Pali canon focuses heavily on the workings of statecraft and the appropriate orientation of rulership) to an ideal of personhood, entailing actions that benefit all sentient beings; hence, the figure of the bodhisattva takes center stage in much of the Mahayana traditions' discourse on ethics and karma.<sup>4</sup> To develop the capacity of a bodhisattva, however, one must penetrate to the deepest levels of awareness in order to understand the –complete equality among all sentient beings (Tsering 2005, 26).

Furthermore, what distinguishes the bodhisattva<sup>5</sup> from the arhat of Classical Theravada is the bodhisattva's penetration of the emptiness of all things. It is the bodhisattva's grasp of emptiness that generates compassion. Ethical training is not an end in itself, i.e. nirvana, but a means of developing a one-pointed mind. This leads to wisdom on which the individual may act without ironic consequences, thereby benefiting all sentient beings. Geshe Tashi Tsering observes, –Living ethically by practicing [right speech, right action, and right livelihood] definitely gives us the foundation to do the other practices, whereas living without them, in an undisciplined way, causes all sorts of obstacles to developing concentration or wisdom (130). Ethical training, then, is tied in the Madhyamaka tradition to higher practices that will eventually lead to one's birth as a bodhisattva. From the perspective of the Madhyamaka tradition of Vajrayana Buddhism, such training takes place across kalpas of countless rebirths.

Among the profusion of Buddhist perspectives, the Vajrayana Traditions go farthest in offering a phenomenology of the aggregate of mental formations by which mind grasps phenomena and establishes itself in ignorance. Gen Lamrimpa explains that conceptualizing and then forgetting we have done so leads to reification. It is –an erroneous mental process in which –the object itself appears in a mistaken way (1999, 49). He writes, –that mind that mistakenly grasps onto phenomena is called ignorance. Ignorance always entails reification. In this way we grasp onto the true existence of ourselves, and similarly, when focusing on an adversary, we grasp onto that person as truly existent. This is how attachment and aversion arise automatically (49). Phenomena grasped in ignorance lead to suffering if mental actions are agitated by mental afflictions, which are forms of conceptualization: Mental afflictions are primary, for in their absence, karma does not ensue. There are a variety of mental afflictions – including pride, attachment, anger, competitiveness, and jealousy – but the one root for all of them is ignorance. If we eliminate this ignorance, the other mental afflictions will vanish. In order to cut ignorance, or ‘non-awareness,’ at its very root, the Three Higher Trainings are taught, namely, ethical discipline, meditative concentration, and wisdom.

### **Hershock’s Ch’an View of Ethical Training & Karma**

Since the 1990s, Peter Hershock, coordinator of the Asian Studies Development Program at the East–West Center in Honolulu, Hawai\_i, has been developing a Ch’an Buddhist response to important elements of contemporary life in an increasingly interdependent world. In works such as *Liberating Intimacy* (1996), *Reinventing the Wheel* (1999), his edited volume *Changing Education* (2008), and various essays published in the *Journal of Buddhist Ethics and Philosophy East and West*, Hershock, true to both his Buddhist and Western philosophical trainings, has addressed the pressing issues of technology, education, ecology, globalization, and authority. His primary purpose has been not only to engage in creative and interpretative crosscultural philosophizing but also to show how we can respond to suffering by availing ourselves of the ancient teachings of Buddhism. Hershock shows how the Buddhist themes of interdependence, critical engagement, complex relationality, virtuosic performativity, and impermanence are directly relevant today. Complex interdependence, however, calls for complex treatment. Hershock’s approach is to –clarify the values, intentions, and practices animating prevailing ways of thinking about and responding to these emergent realities and reflecting on what it would mean to endanger a value coordinating redirection of the interdependencies constitutive of both the public sphere and of our lived experiences within it.

In one sense, Hershock’s work represents the patterns of accommodation and advocacy that typically occur when a thought pattern recurs in a new setting. His understanding is both consistent with traditional Theravāden and Mahayana views of ethical training and karma and inconsistent with classical texts and meanings insofar as the time and place of his work is different. In his most recent work, *Buddhism in the Public Sphere*, Hershock is careful to note that the global challenges facing us today also pose challenges to Buddhist practitioners.

Hershock observes that there are –no traditional Buddhist discourses on environmental protection, institutional health care, technological change, media ethics, global economics, human rights, or the privatization and commoditization of education.

His task, then, is a hermeneutic one: improvisational and creative interpretation of ancient Buddhist texts in light of contemporary situations. By creatively inventing concepts in a Buddhist

key such as improvisational virtuosity, effective relationality, live engagement, and dramatic maturity, Hershock interprets urgent questions in national and international public life and proposes a Ch'an point of view given Ch'an's emphasis on impermanence, emptiness, and interdependence. An important element of his project is rethinking karma.

Instead of simply reducing karma to a pattern of causality obtained in mind-body activity, Hershock shows how karma is a complex interaction among our values, intentions, and actions. He notes that –most Western Buddhists (and many contemporary Buddhists outside the West) do not take karma with the seriousness it deserves (2006, 9). The focus on karma as a mechanism of change is the strength of this work. Whether he is writing about the environment, trade, development, governance, or education, Hershock shows that subtle shifts in our karma can make an enormous difference in the way we relate to others and the world. On this basis, we can conclude that interdependence is both a coordinated and coordinating relationality based not on sameness but on difference. By contrast, Enlightenment virtues of tolerance and cooperation, insist – however inadvertently or ironically – on a degree of homogeneity. –In a karmically ordered world, Hershock explains, –importantly and fundamentally shaped by values and intentions, no situation – regardless of appearances to the contrary – shaped by karma are continuously open to meaningful revision. Indeed, in such a world, it is the differences in our karma that enable us each to make a difference (2006, 9). Such a view of karma is both empowering and challenging. It encourages each of us to make a difference that truly makes a difference. What is notable in Hershock's conception of karma is the insistence upon individual values, intentions, and actions as well as the interplay with the socio-political settings in which we inevitably find ourselves. Hershock extends the concept of karma into both the private and public domains. He observes: We live in a karmic world in which our interdependence is irreducibly meaningful and in which responding effectively to experienced troubles or difficulties – whether in the realm of the private or the public – ultimately entails recognizing their roots in competing or conflicting values, intentions, and practices. Succinctly stated: seeing our world as karmic is seeing that all experienced eventualities arise as outcomes/opportunities that are meticulously consonant with patterns of our own values-intentions-actions.

Karmic liberation, then, need not be the Vedic moksa or kaivalya or the pre-Mahayana arhat's attainment of nirvana or tantric reincarnation. It can be considered an attainable eventuality in which no situation is intractable.

While he does not eschew the traditional role of ethics as a coordinating practice foundational to higher order awareness, Hershock emphasizes the importance of developing skillful means (upaya) of carrying out our lives. On Hershock's account, our world and our life is –a world and a life shaped by karma [that is] continuously open to meaningful revision. To add value to one's life and the world takes skill, nuance, and exibility that conventional ethics training is not designed to foster. Hershock comments from a Ch'an viewpoint on general tendencies in both Western and Eastern ethics when he observes that –ethics is not a matter of realizing predetermined ends but rather one of creatively revising the quality and meaning (direction) of our situation as it has come to be. It is not grounded on the exercise of duty or appeals to fixed standards but rather on liberating appreciation.

Hershock effectively connects ethics and karma when he notes that –karmic opportunity includes refraining –from conduct in accord with the values- intentions-actions that led to the occurrence of the present, intensifying –existing karma or pattern[s] of values-intentions-actions, and developing

or improvising — karma that will lead to new kinds of relationship. In this sense, then, ethics become part of karma as — karmic opportunity and not simply a foundation or ancillary component of a wider path. If one is to both appreciate and contribute to others and the world we live in, one must not only be good, one must create opportunities without ironic consequences.

## **ṚTA**

ṚTA (Skt., "cosmic order") represents the Vedic notion of an impersonal and powerful force upon which the ethical and physical worlds are based, through which they are inextricably united, and by which they are maintained. Ṛta is the universal truth that gives effective strength to Vedic ritual practices, that serves as the foundation for proper social organization, and that preexists even the Vedic gods themselves, who find in it the very source and essence of their power. In many ways, ṛta stands as the Vedic antecedent for the notion of dharma (the established order of things, proper behavior, fitting truth), a concept of central importance not only to the various forms of Hinduism but also to the teachings of Buddhism, Jainism, and other South Asian religious systems.

The term ṛta is based on the Sanskrit verbal root ṛ ("go, move"), which itself reflects the Indo-European verbal root \*ar ("fit together properly").

Thus ṛta signifies the cosmic law that allows the universe to run smoothly, the dynamic structure in which every object and all actions have their proper place and in which all parts support and strengthen the whole in a flowing symbiosis. The word is related through \*ar to the Greek *harmos*, from which the English *harmony* derives, and to the Latin *ars* ("skill, craft"), the source of the English *art* and *artist*. Accordingly, the term ṛta connotes the experience of a "finely tuned" universe whose laws can give creative power to those gods and cultic specialists who understand its structures.

The Ṛgveda (c. 1200 bce) commonly assigns to the gods such epithets as "he who possesses ṛta," "he who grows according to ṛta," or "he who is born of ṛta," descriptions representing the Vedic notion that the gods derive their strength from their adherence to cosmic law. If they—or humans, for that matter—were to go against the structures of ṛta, they would then be said to be *anṛta*, a common synonym for *vṛjina* ("crooked, wrong") and even *asatya* ("untrue"). Thus even the gods must obey the laws of ṛta. The principles of ṛta (like those of the Zand Avestan *asha*, a Zoroastrian notion to which ṛta is linguistically and conceptually related) function in eternal opposition to any principle of disjunctive or disintegrative power (*druh* ; Av., *druj* ) as well as to those personal demons and humans who seek to disrupt impersonal cosmic order by means of harmful magical practices (*yātu*).

Throughout the Vedic period ṛta was understood to be an impersonal law and was never personified or hypostatized into a deity. Characteristically, the primary agent or guardian of the laws of ṛta is the god *Varuna*, who—in Vedic times at least—was an ethical sky god whose omniscient judgment the Vedic cult admired and feared.

As the impersonal source of cosmic and ethical order, ṛta includes important creative aspects. The gods find their ability to create the world precisely in their ability to recognize the principles of ṛta. These creative dimensions appear frequently in Vedic salutatory depictions of natural processes. Thus the wonderful facts that the sun rises in the east every morning and that water runs downhill

are trustworthy cosmic events because they reflect the truth of cosmic harmony (see Ṛgveda 1.105.12). Furthermore, Vedic tradition held that the very structures of ṛta allow the human community access to the powers that drive the universe itself. This is most apparent in the performance of the ritual: since proper cultic activity embodies the structures and processes of cosmic law, the incorrect performance of the ritual would signal the collapse of cosmic order and would be devastating to the Vedic community as it would be if the sun were not to rise or rivers not to flow.

### **Ṛta Reference**

Terms ṛta and satya are closely connected with the forms of dharma. The word ṛta has been profusely used in the Ṛgveda and the Kṛṣṇa Yajurveda. The word form Ṛta indicates a straight or direct line followed according to the universal laws of nature. It denotes a straight conduct-based truth referred as dharma morally.

### **Satya Reference**

Dharma denotes inner awareness which means truth. It is based on the scriptural teachings and the duties performed by a person. When this awareness and duties express itself through words and actions, it becomes satya.

### **Rta: The Eternal Cosmic Order, The Path to Truth**

The word 'ṛta' has been used in Vedas quite frequently, but in later scriptures its use dwindled. In its place words like 'satya', truth, and 'dharma' have been used more frequently, often carrying the same connotation as 'ṛta'.

'Ṛta' has, of course, been also used in the Vedas to convey many different ideas. The word 'ṛta' is derived from the root 'ṛ'— its meaning in the Rig Veda being 'to go the right way, be pious or virtuous'; so 'ṛta' means 'fixed or settled order, law, rule' or 'the cosmic order'. In the Mahabharata, the Bhagavata, and some other sacred texts 'ṛta' means 'true', and at times 'truth personified'.

In the Panchatantra and again in the Mahabharata, 'ṛta' is used to mean truth in general, and also righteousness. In the Manu Samhita the term is used to mean the right means of livelihood for a brahmana, as opposed to, for example, agriculture which is anṛta for him. Sayanacharya explains the term रतय दीदददवम (Rig Ved 1.1.8) as "avaśyam̐bhāvinafi karmaphalasya", which means that 'ṛta' is something that would always produce results.

This production of results by 'ṛta' is not like the inevitable cause-and-effect relationship of the material world, according to which every cause would definitely produce an effect, but it is more like the successful harvest of a crop in which the farmer obtains the full yield instead of any other result.

The Nighantu — defines satya as having six synonyms, one of which is 'ṛta'. According to this, 'ṛta' is truth and 'anṛta' is the opposite, as in the mantra :

सत्यदमद वा उ तं वयदमन्द्रं सतवाम नात्र्तम~ (Rig Ved 8.62.12) "let us extol Indra who is in truth, and not in untruth " In the Vedas 'ṛta' has also been used to mean 'yajña', sacrifice, 'satya', truth, and 'dharma', moral code. Many scholars believe that these terms originally referred to one and the same concept—a belief that continues till today. This has made many general readers translate ṛta

as truth, which is not always correct, as can be seen in the following Vedic mantra :

सत्यं बृहद ऋतं उग्रं दीक्षा तपो ब्रह्म यज्ञः पृथर्वी धारयन्तन्त ~ (Atharva Ved 12.1.1)

These are the virtues that nourish and sustain this world : सत्यं बृहद, the great truth ; ऋतं उग्रं, formidable order; दीक्षा, consecration, initiation ; tapas, austerity; ब्रह्म, prayer, spiritual exaltation; and यज्ञः, sacrifice.

The distinct use of 'satya' and 'ṛta' in the above mantra shows that Vedic sages gave different connotations to these two terms. Therefore , 'satya' and 'ṛta' do not imply the same thing in all contexts. The same principle applies to the triad of 'yajña', 'dharma', and 'ṛta'—they do not refer to the same concept, as can be verified from the following examples.

श्रद्धया सत्यमाप्यते ; ~ (Yajur Ved 19.30)  
" one attains the truth through faith. "

This attainment of truth through 'śraddhā' is a unique concept never ascribed to 'ṛta'.

रतं च सत्यं चाभीद्धात तपसोऽध्यजायत । ~ (Rig Ved 10.190.1)

" from the blazing tapas was born ṛtam, eternal order, and truth. "

In a shanti mantra of the Taittiriya Upanishad we come across 'ṛtam vadiṣyāmi, satyam vadiṣyāmi; I shall call you righteousness, I shall call you truth'. Here also satya and ṛta are not one and the same. While commenting on this, Acharya Shankara differentiates the two by explaining that ṛta is an idea fully ascertained by the intellect in accordance with the scriptures and in conformity with practice', and satya 'is that which is reduced to practice through speech and bodily action'.

According to this explanation, ṛta is an ideal state, whereas satya is the state of actuality. The concept of ṛta as the eternal law, that deserved utmost respect, was so ingrained in the Vedic sages that they thought of two gods as its custodians.

The sages believed that wherever ṛta is successfully observed, it is due to the sternness of the twin gods Mitra and Varuna: 'mitrafi satyo varuṇo dharmapatīnām; Mitra for true-speaking (satya), Varuna for the sway of law's (dharma's) protectors.'

In this mantra, truth and dharma have been entrusted separately to Mitra and Varuna, who otherwise are together responsible for ṛta. This indicates that in the Vedas ṛta is conceived from truth and dharma conjointly. The importance of yajna, sacrifice, and its close connection with ṛta and satya is hinted in this shloka :

सत्यं च मे श्रद्धा च मे जगच्च मे धनं च मे दक्ष च  
मे महेश्च मे क्रीडा च मे मोदश्च मे जातं  
च मे जदनष्यमाणं च मे सून्त च मे  
सुकुतं च मे यज्ञेन कल्पन्ताम् ~ (Yajur Ved 18.5)

" May my truth and my faith, and my activities and my wealth, and my world and my glory, and my play and my enjoyment, and my children and my future children, and my hymns and my pious acts prosper through sacrifice. "

The power of truth and ṛta increases in the world through the practice of sacrifices. In the 'Purusha Sukta' the very act of Creation has been described as ayajna performed by the devas and in which Purusha, God, himself is sacrificed.

This shloka also suggests that though these three terms— ṛta, satya, and yajña— are closely connected, by all means they are not the same.

'Ṛta' has also been used quite often to denote what today is understood by dharma. In fact, later scriptures replaced 'ṛta' with dharma. Let us see some examples.

परर दचन मतो दरदवणं ममन्याद रतय पथा नमसादववासेत । ~ (Rig Ved 10.31.2)

" let a man think well on wealth and strive to win it by the path of law / truth and worship. "

रतय पन्ां न तरन्तन्त दुष्क तः ॥ ~ (Rig Ved 9.73.6)

" the evil doers do not travel on the path of the eternal law "

रतवाके न सत्येन शरद्धया तपसा सुत इन्द्रायेन्दो परर सरव ॥ ~ (Rig Ved 9.113.2)

" pressed with words of law and truth, with faith and devotion, O Indu, flow towards Indra. "

रतं शंसन्त रजु दीध्याना ~ (Rig Ved 9.113.2)

" praising the eternal law, thinking straight (the sons of Angirasa held the rank of sages). "

As we shall see later, there is a close link between 'ṛta' and 'dharma', though they are not precisely the same.

### **Ṛta: The Eternal Law that Regulates Everything :**

Coming closer to understanding ṛta, we find that the Vedas use the term to mean the divine law that makes everything in the universe behave the way it should :

रतय रन्तिमनुयच्छमाना भद्रम-भद्रं करतुमस्मासु धेदह । ~ (Rig Ved 1.123.13)

"obedient to the rein of the law eternal, give us every blissful thought".

The eternal law, in producing the cosmic order, also produces beauty, symmetry, and symphony. Living beings and the world of matter participate in a beautiful orderly life through the power of the eternal and sacred law, ṛta, working in and through them.

Rig Ved 4.23.8-10 :

रतय दह शुरुधः सन्तत पूवीर रतय धीदतर वदजनादन हन्तत ।  
रतय शलोको बधरा ततद कणा बुधानः शुचमान आयोः ॥

" The eternal law has varied food that strengthens ; thought of the eternal law removes transgressions.The praise-hymn of the eternal law, arousing, glowing,has opened the deaf ears of the living. "

रतय दग्ढहा धरुणादन सन्तत पुरुदण चद्रा वपुषे वपूंदष ।  
रतेन दीरम् इषणन्त पक्ष रतेन गाव रतम आ दववेशुः ॥

" Firm-seated are the eternal law's foundations ; In its fair form are many splendid beauties. By the sacred law long lasting food they bring us ; by the sacred law have cows come to our worship. "

रतं येमान रतम इद वनोत्य रतय शुष्मस तुरया उ गवुः ।  
रताय पथ्वी बहुले गभीरे रताय धेनू परमे दुहाते ॥

" Fixing the eternal law he, too, upholds it; Swift moves the might of law and wins the booty.To the law belong the vast deep earth and yonder sky : milch cow supreme, to the law their milk they render. "

मधु वाता रतायते मधु कषरन्तन्त दसन्धवः ।  
माध्वीनः सन्वोषधीः ॥

~ (Rig Ved 1.90.6)

" The winds waft nectar, the rivers pour nectar for the person who keeps the law :so may the plants be honeyed for us. "

As mentioned earlier, Mitra and Varuna are held jointly responsible for the upkeep of ṛta, for which they are praised by the sages. It is further stressed that both individuals and society gather strength by adjusting to ṛta, the divine law:

ता वां दक्ष्य गोपा देवा देवेषु यदज्ञ ।  
रतावाना यजसे पुतदक्षसा ॥

~ (Rig Ved 8.25.1)

" I worship you—devas, holiest among the devas—who guard this all ; you, faithful to the law, whose power is sanctified. "

रतावाना दन षेदतुः साम्राज्याय सुक्रतू ।  
धतव्रता कषदिया कषिमशतुः ॥

~ (Rig Ved 8.25.8)

" They, true to the law, exceeding strong, have set themselves down for sovereignty; valiant heroes, whose laws stand fast, they have obtained their sway."

रतय देवा अनु वरता गुभवत पररदियौन भूम ।  
वधन्तीमापः पन्वा सुदशदशवं रतय योना गभे सुजातम ॥

~(Rig Ved 1.65.2)

" The Devas follow after him the law of the workings of Order. He stands encompassing all as heaven the earth. The Waters make him grow increasing in his bulk by their toil, [Or, by their chant,] the Flame well-born in their womb, in the abode of the Law / Truth. "

सोमो न वेधा रतप्रजातः पशुन दशक्षा दवभुदूरेभाः ॥ ~ (Rig Ved 1.65.5)

" He is like the sage Soma, born of the eternal Order and a creator. He is like a cow with her newborn. He is wide-spreading and his light is seen from afar.

रतय परेषा रतय धीदतदवक्षायुदवक्षे अपांस चक्रुः । ~ (Rig Ved 1.68.3)

" He is the urgings of the Law, the thinking of the Law, the universal life by whom all do the works. " Here it is stressed that strength comes to one who is true to the law. And the same applies to social laws, which the king is the guardian of. What Mitra and Varuna are to the divine law, the king or the government is to society. If it is important to observe the commands of religion, it is equally important to follow the social code of conduct as set by the community. To gain worldly prosperity and also spiritual well-being one has to hold on to the law, both divine and social, which are but aspects of ṛta. Ṛta has also been perceived as the supreme Reality in the form of ṛta-sat—dweller in ṛta :

नषद वरसद रतसद वयोमसद अब्जा गोजा रतजा अद्रजा रतम ॥ ~ (Yajur Ved 10.24 and Rig Ved 4.40.5)

God and his laws are inseparable, and by observing the injunctions of the scriptures one follows God's commands. This identity of the law and the law-giver can be further seen in the following mantra:

अयमन्तस्म जररतः पश्य मेह दवक्षा जातान्यभ्यन्तस्म मन्वा ।  
रतय मा परददशो वधयन्त्यादददरो भुवना ददरीदम ॥ ~ (Rig Ved 8.100.4)

" Indra says: 'I exist, O singer! Look upon me here; all that exists I surpass in splendour. The eternal law's commandments make me mighty. When I rend, I rend asunder the worlds. "

This mantra depicts the sage filled with the realization of the Divine—here Indra stands for the Divine—in the form of splendour and ṛta; while later spiritual aspirants had the vision of the Divine in anthropomorphic forms.

Another interesting shloka hints that God himself reveals the mantras in the hearts of the sages, and that ṛta—here it might mean 'rites'—can be born anew. It seems that there is no end to the discovery of new laws pervading the universe :

वयूणोदत हदा मदतं नवो जायतां रतं ~ (Rig Ved 1.105.14)

" he reveals the hymn in the heart, let ṛta be born anew."

इन्द्राग्नी अपसस पयप पर यन्त धीतयः ।  
रतय पथ्या अनु ॥ ~ (Rig Ved 3.12.7)

" To Indra-Agni reverent thoughts go forward from the sacred duty. Along the path of sacred Law."

रतं ददकव रतम इच ददकव्य रतय धारा अनु तन्ध पूवीः । ~ (Rig Ved 5.12.2)

" Mark the Law, you who know, yes, observe it : send forth the full streams of eternal order. "

य ई ददके त गुहा भवन्तमा यः ससाद धारां रतय ।  
द्व ये चतस्य रता सपन्त आददद वसूदन पर ववाचास्मै ॥ ~ (Rig Ved 1.67.4)

" He who has perceived him when he is in the secret cave, he who has come to the stream of the Truth, those who touch the things of the Truth and kindle him, - to such a one he gives word of the Riches. "

राजन्तमध्वराणां गोपां रतय दीदददवम । ~ (Rig Ved 1.1.8)

" To Agni, protector of sacrifices, luminous guardian of the Order; "

रतय पन्म अन्व एदत साधु परजानतीव न ददशो दमनादत ॥ ~ (Rig Ved 5.80.4)

" Her color changing, she doubly brilliant, displays her body from the east, And follows to perfection the path of Rita, and, as one who knows all, strays not from the quarters. "

It is the Divine that reveals the law to the sages, and when these revelations are recorded and handed over from generation to generation they become known as scriptures. Therefore, the rishis have emphasized the need to live up to the words and spirit of the scriptures for individual and social upliftment, both material and spiritual.

And since everything in the universe is regulated by this principle of 'ṛta', it is the duty of Dharma to keep an eye on the proper flow of the world order. Whenever something is done against this universal rhythm it is considered 'anṛta', opposite to the natural law. This violation of 'ṛta' destabilizes the inner order of things.

According to Vedanta, tattva is 'that which is'; satya has the same meaning too; whereas dharma means 'that which holds'. Conversely, the nature of ṛta is connected with 'is-ness' and with 'holding together' as well. This means that in essence ṛta is one with satya and dharma taken together. In a wider sense tattva, satya, dharma, and ṛta are intrinsically interconnected, though their applied connotations are different. As we have seen, in the Vedas ṛta has been identified with different ideas according to context.

These different connotations are not contradictory but complementary in nature. Material sciences attempt to access ṛta from the perspective of the physical universe; the science of yajna is a similar pursuit from the perspective of religion; ṛta translated into social conduct is considered dharma; and the philosophical dimension of ṛta is called satya. Creation is brought about through certain principles, although the Creator itself is beyond these principles.

The fundamental principles underling this Creation, and also permeating it, are collectively called ṛta, which is one with the Divine. As quoted earlier, the way to power, peace, and goodness lies in

abiding by ṛta, in observing those fundamental principles experienced by the sages and later recorded in the scriptures.

## Satya

Satya is a Sanskrit word that describes a virtue present in many different Indian religions. When translated to English, it means "truth."

Satya is used in a religious context to denote being honest and truthful in actions, speech and thought. This is one of the five yamas, or rules for living in an ethical manner, according to the yogic philosophy outlined by Patanjali in the Yoga Sutras.

## Explanation Satya

Satya is considered essential for a balanced and harmonious existence in the universe. When truthfulness is present, the universe operates in the way that it should. Everything in the world depends on satya to function correctly.

Opening one's mind during sessions of yoga is a wonderful way to embrace the eternal wisdom of satya and the power of truthfulness. In spiritual yoga practice, satya is one of the yamas that the practitioner should abide by. In addition to being truthful to the world and to others, a yogi must also be truthful to him/herself. This requires honoring the body and its limitations during physical practice. Practicing yoga may also bring the individual closer to the ultimate Truth.

## Satya Reference

Dharma denotes inner awareness which means truth. It is based on the scriptural teachings and the duties performed by a person. When this awareness and duties express itself through words and actions, it becomes satya.

## Ashtanga yoga

In Sanskrit "Ashta + anga" is ashtanga. "Ashta" means Eight and "Anga" is limbs so it means Eight Limb path, Ashtanga yoga is based on Yoga Philosophy of Patanjali. The asanas, Pranayamas or the dharana which we have studied earlier or the yama and niyama are based on the Yoga Sutras of Patanjali. Hence, we will acquaint ourselves with the fundamentals as stated by Patanjali first.

## HISTORY OF ASHTANGA YOGA

Yoga has its roots about 5000 years BC as described in Vedic Philosophy and Tantras. Patanjali , great sage composed this path into a Darshan(Philosophy) in his Book Patanjali Yoga Sutra. In which he has formulated Yoga as a Eight Limbs or Eight Fold path.

## EIGHT LIMBS OF ASHTANGA YOGA

1. Yama (Principles or moral code)
  - Ahimsa - A principle of non-violence
  - Satya - A principle of Truthfulness
  - Asteya - A principle of non stealing
  - Brahmacharya - Continence / Celibacy
  - Aparigraha - A principle of non-hoarding or non possessiveness
2. Niyama (Personal Disciplines)
  - Shoucha - Purity
  - Santosh - Contentment
  - Tapa - Endurance
  - Swadhyaya - Self study
  - Eshwar Pranidhan – Dedication
3. Asana (Yoga Positions or Yogic Postures)  
A stable and comfortable posture which helps attain mental equilibrium.
4. Pranayama (Yogic Breathing)  
Extension and control of breath.
5. Pratyahara (Withdrawal of Senses)  
A mental preparation to increase the power of mind.
6. Dharana (Concentration on Object)  
Concentration of mind on one object and its field.
7. Dhyana (Meditation)  
With drawing mind from all external objects and Focusing it on one point and meditating on it.
8. Samadhi (Salvation)  
State of Super bliss, joy and merging individual consciousness in to universal consciousness.  
Union between Jivatman and Paramatman. Union of Shiva and

Shakti in Sahasrar Chakra (the top of the head). Realizing the Bramhan (pure consciousness) or Realization of God is the ultimate achievement of Human Birth.

## Jainism

Jainism is an ancient religion from India that teaches that the way to liberation and bliss is to live lives of harmlessness and renunciation.

The essence of Jainism is concern for the welfare of every being in the **universe** and for the health

of the universe itself.

- Jains believe that animals and plants, as well as human beings, contain living souls. Each of these souls is considered of equal value and should be treated with respect and compassion.
- Jains are strict vegetarians and live in a way that minimises their use of the **world's resources**.
- Jains believe in **reincarnation** and seek to attain ultimate liberation - which means escaping the continuous cycle of birth, death and rebirth so that their immortal soul lives for ever in a state of bliss.
- Liberation is achieved by eliminating all **karma from the soul**.
- Jainism is a religion of self-help.
- There are no **gods** or spiritual beings that will help human beings.
- The three guiding principles of Jainism, the '**three jewels**', are right belief, right knowledge and right conduct.
- The supreme principle of Jain living is non violence (**ahimsa**)
- This is one of the **5 mahavratas** (the 5 great vows). The other mahavratas are non-attachment to possessions, not lying, not stealing, and **sexual restraint** (with celibacy as the ideal).
- **Mahavira** is regarded as the man who gave Jainism its present-day form.
- The texts containing the teachings of Mahavira are called the **Agamas**.
- Jains are divided into **two major sects**; the Digambara (meaning "sky clad") sect and the Svetambara (meaning "white clad") sect.
- Jainism has no priests. Its professional religious people are **monks and nuns**, who lead strict and ascetic lives.

Most Jains live in India, and according to the 2001 Census of India there are around 4.2 million living there. However, the Oxford Handbook of Global Religions, published in 2006, suggests that census figures may provide lower than the true number of followers as many Jains identify themselves as Hindu. The Handbook also states that there are around 25,000 Jains in Britain.

**Jainism**, along with **Buddhism** and **Charvaka**, is considered part of the heterodox systems (also referred to as heresies) of Indian **philosophy**. Its philosophy is grounded in the doctrine of the Yajur-**Veda** but it was systematized by **Vardhamana** (also known as **Mahavira**) who substituted the authority of **the Vedas** with logic and experience and also reinterpreted most of the key ideas available in Indian philosophy at that time.

Vardhamana was born into the Kshatriyas caste (the warrior rulers caste) in northeastern **India** in about the 6th century BCE, a time of profound political and social change. Tradition says Vardhamana was born as a prince, the second son of the king, and lived a life of luxury and wealth but from an early age he was interested in spiritual matters and soon became dissatisfied with the life that surrounded him: increasing inequalities, **warfare** and social conflict. Around the age of 30, when his parents died, he gave up his kingdom and royal privileges and for the next 12 years he wandered around as an ascetic, someone who denies himself physical pleasures in a quest for spiritual progress mainly through fasting and meditation. At the age of 42, Vardhamana gained full enlightenment and became a Jaina, "conqueror", and he was known as Mahavira, a title meaning "the great hero", and became the leader of Jainism.

According to Jain tradition, Vardhamana was the 24th and the last Tirthankara, "ford-finder". Jains see the world as a river of suffering and misery and ford-finders find a way to cross it: they do not

build the bridge, they simply get across it and the rest have to follow the path. The word Jain means "a follower of the Jainas". During the rest of his life, Vardhamana taught others about what he had learned. He accepted the doctrine of samsara (reincarnation), but with a small change, which, nevertheless, made a big difference to his approach to life. It was widely accepted by Indian society that animals, humans and gods had a soul, but Vardhamana went even further, claiming that nearly everything is alive.

Everything is made up of Jiva "living intelligence", trapped in matter. Living beings (almost everything, according to Vardhamana's view) were divided into different categories.

- Beings with five senses, including humans and major animals.
- Beings with four senses, they cannot hear (wasps, flies, butterflies)
- Beings with three senses, they can neither hear nor see (ants, moths, fleas)
- Beings with two senses, they can only taste and touch (worms, leeches, shellfish)
- Beings with only one sense, they only have the sense of touch (plants, microscopic organisms, wind, fire, water)

This last category is the largest and what all these beings have in common is that they can all feel pain: their entire existence is to be able to feel pain. This view on living beings could be summarized with the words of an Indian scholar:

Thus the whole world is alive. In every stone on the highway a soul is locked, so tightly enchained by matter that it cannot escape the careless foot that kicks it or cry out in pain, but capable of suffering nevertheless. When a match is struck a fire being, with a soul which may one day be reborn in a human body, is born, only to die a few moments afterwards. In every drop of rain, in every breath of wind, in every lump of clay, is a living soul. (Pruthi, p.50)

An ancient Jain document invites us to imagine the infinite number of times that we were hunted as deer, gutted as fish, beaten again and again when we were iron and chopped into pieces when we were trees. Jainism believes in an infinite number of eternal souls, caught in this eternal cycle of agony and misery. There was a way out of this cycle according to Vardhamana, and this was explained through his vision of **karma** (cosmic justice) and moksha (liberation). Karma was almost a material quality: cruel actions and thoughts attracted heavy karma, while kind acts made the soul lighter, so it could move up the ladder of existence.

By not causing suffering, one's soul could eventually be free from samsara. It is interesting to note that Vardhamana came from the warrior caste, where there was always the element of military and political **conquest**. Instead, Vardhamana proposes spiritual conquest through arduous discipline and commitment.

Jainism attempts to be rational and consistent: the metaphysics leads to the ethics. In other words, if it is believed that the whole world is alive and nearly everything is capable of feeling pain, then the Jain way of living makes sense. Vardhamana would allow mosquitoes to feed on his blood and while other ascetics would carry sticks with them to scare off the dogs, Vardhamana would allow the dogs to bite him. This principle of extreme non-violence is known in Jainism as Ahimsa "non-violence", a key term in this tradition. Vardhamana takes this principle so far that in time he decides to wear no clothes since during its manufacturing process a number of beings had to suffer. Large, bad karma comes when large animals are eaten, small karma comes when small

animals are eaten and no karma comes when nothing at all is eaten. At the age of 72, consistent with his ideas, Vardhamana took the Ahimsa doctrine to the extreme, finally starved himself to death and achieved nirvana (liberation).

Jainism has a set of five vows: nonviolence, truth-speaking, non-stealing, no sexual immorality and non-attachment to worldly things. Self-denial, self-mortification and austerity are the ways by which the karma of all past actions is exhausted and one can get into nirvana after death. This is explained in a Jain text:

As a large pond, when its influx of water has been blocked, dries up gradually through consumption of water and evaporation, so the karmic matter of a monk, which has been acquired through millions of births, is annihilated by austerity—provided there is no further influx. (Campbell, p.234)

Jainism may be considered extreme, but this extremism is directed to one's self and not to others. We sometimes come across traditions where devotion is shown by killing other people or persecuting them in the name of god. The devotion in Jainism is directed only to one's self.

In the Jain tradition there is a philosophical critique on ordinary epistemology. There are a number of Jain philosophers that have done a lot of analysis concerning this issue and they developed the idea of "many sidedness", which acknowledges that the world is complex, and there are multiple viewpoints possible, each of them partially valid, within a particular context. Truths are relative to a certain standpoint. All judgments are tentative. Reality cannot be comprehended from a single perspective. Human understanding is merely probable and partial, and all predictions are relative because reality is multiple. Nothing is true in the strict sense of the word, except from one point of view.

Vardhamana is credited with a famous story that illustrates this idea: Six blind men laid hands on different parts of an elephant; he who held the ear thought that the elephant was a great winnowing fan; he who held the leg said the animal was a big, round pillar and so on.

According to Jainism, there are no gods. It is not necessary to assume a Creator or First Cause - for then who created the creator or what caused the first cause? This view states that it is more logical to believe the universe has always existed, and that it has undergone an infinite number of changes. These changes are driven not by the influence of a deity but rather by nature itself. As a result of a sky empty of gods, Jainism did not have any type of creation stories.

There are essentially two paths in Jainism in order to achieve nirvana. The ordinary path, which seeks to reduce as much as possible the bad karma by living a good life and move up gradually. There is also the extraordinary path (the one a monk or a nun would take), which seeks to end the samsara in this life by taking the Ahimsa principle and the Jain vows to the extreme: no family, celibacy, no attachment to a place, they beg for food, they usually wear no clothes, they suffer insults without response and they may choose to starve to death. Because Vardhamana did not believe in the concept of Brahman (World Soul or Infinite Being) the Jain interpretation of the state of nirvana (liberation) is different from the traditional view in the orthodox Indian traditions. In Jainism, nirvana is a state in which the soul, released from samsara, has four attributes: infinite knowledge, infinite perception, infinite energy and infinite bliss.

## Samvara:

It is seen in the foregoing discussions that āsrava and bandha are the cause of bondage of the jīva. Because of these two the self comes under the cycle of birth and death. The self does not attain the ultimate aim of life, i.e., liberation, because the self is affected by the karma-matter. Attainment of liberation is not possible as long as the karma-particles exist in the self. When the influx of karmamatter stops, then the self attains liberation. So, for the attainment of liberation, it is necessary to stop the influx of karma-matter into the self.

Prabhācandra holds that for the attainment of liberation, the influx of new karma-matter into the self must be stopped. The new karma-matter enters into the self through āsrava or influx. This stoppage of the influx of karma-matter is called samvara.

Samvara is also of two kinds, viz., (i) bhāvasamvara or subjective stoppage and (ii) dravyasamvara or objective stoppage. The checking of the modifications of consciousness of the self which is the cause of the influx of karma-matter is known as bhāvasamvara, while dravyasamvara means that state where the influx of karmamatter is stopped. Thus, bhāvasamvara is the cause of dravyasamvara.

According to Prabhācandra, bhāvasamvara is again divided into six categories, viz.,

- samiti i.e. carefulness;
- gupti i.e. restraint;
- dharma i.e. observance;
- anuprekṣā i.e. thought;
- parīṣahajaya i.e. victory over troubles and
- cāritra i.e. conduct.

Each of these is again divided into various sub-classes. These are the steps of stopping the influx of karma-matter.

The first way of stopping the influx of karma-matter refers to outward behavior, which is known as samiti. It means that people must be careful about their conduct in order to avoid injury to all the living beings in this world. It is of five kinds, viz.,

- (i) ṛyā-samiti i.e. observance of the greatest care about the rules of walking;
- (ii) bhāṣā-samiti i.e. to be careful about the rules of speech;
- (iii) eṣaṇāsamiti i.e. to be careful about the rules of eating;
- (iv) ādānanikṣepaṇa-samiti i.e. to be careful about the rules of keeping some portion of the alms for the performance of religious duties and
- (v) utsarga-samiti i.e. observance of carefulness about the rules of performing bodily evacuations in a spot.

Gupti or restraint is the second way of stopping the influx of karma-matter. Gupti means the rules for controlling yoga of the mind, body and speech. So it is of three kinds, viz.,

- (i) kāya-guṭṭi i.e. bodily restraint;
- (ii) vāg-guṭṭi i.e. verbal restraint and
- (iii) mana-guṭṭi i.e. mental restraint.

By the observance of ten kinds of dharma, the influx of karma-pudgala must be stopped. That means, by the performing of dharmas, the jīva becomes free from all kinds of sorrows and attain excellent pleasure. These are:

- (i) uttama-kṣamā (excellent forgiveness);
- (ii) uttama-mārdava (excellent humility);
- (iii) uttamaārjava (excellent simplicity);
- (iv) uttama-śauca (excellent cleanliness);
- (v) uttamasaṭya (excellent truth);
- (vi) uttama-saṃyama (excellent restraint);
- (vii) uttamatapasa (excellent penance);
- (viii) uttama-tyāga (excellent renunciation);
- (ix) uttamaākiñcana (excellent indifference) and
- (x) uttama-brahmacarya (excellent sex-control).

The influx of karma-matter can also be stopped by keeping the twelve kinds of thoughts or anuprekṣā. One should always bear these twelve kinds of thoughts in mind for the stoppage of karma-pudgala into the self. These are:

- (i) anityānuprekṣā,
- (ii) aśaraṇānuprekṣā,
- (iii) saṃsārānuprekṣā,
- (iv) ekatvānuprekṣā,
- (v) anyatvānuprekṣā,
- (vi) aśucitvānuprekṣā,
- (vii) āsravānuprekṣā,
- (viii) samvarānuprekṣā,
- (ix) nirjarānuprekṣā,
- (x) lokānuprekṣā,
- (xi) bodhidurlabhānuprekṣā and
- (xii) dharmānuprekṣā.

Anityānuprekṣā is thinking that everything is transient. Aśaraṇānuprekṣā means that there is no shelter except truth. Saṃsārānuprekṣā means about the cycle of birth and death. Ekatvānuprekṣā means that one is responsible for his own deeds. Anyatvānuprekṣā means that the self is separate from the body. Aśucitvānuprekṣā is thinking that the body and its relation to everything are impure. Āsravānuprekṣā is about the influx of karman. Samvarānuprekṣā is about the stoppage of influx of karma-matter. Nirjarānuprekṣā is about the destruction of influx of karma-matter that has already entered into the body of the self. Lokānuprekṣā means about the self, the matter and the substances of the world. Bodhidurlabhānuprekṣā means about the difficulty of attaining true vision-knowledge-conduct. Dharmānuprekṣā means about the essential principles of this world.

For the stoppage of the influx of karma-matter and the attainment of liberation, one has to follow pariśahajaya i.e. victory over hardships or troubles. The twenty-two hardships are:

- the feeling of hunger (kṣudhā),
  - the feeling of thirst (pipāsā),
  - the feeling of cold (śīta),
  - the feeling of heat (uṣṇa),
  - troubles by mosquito (daṃśamaśakā),
- (i) the feeling of shame for nakedness (nagna),
  - (ii) the feeling of dissatisfaction through hunger, thirst, cold, heat etc.(arati),
  - (iii) the feeling of emotions caused by women (strīṭ),
  - (iv) the feeling of tiredness for journey (caryā),
  - (v) the desire of moving from a fixed posture in meditation (niṣadyā),
  - (vi) the desire to have a bed for take some rest (śayyā),
  - (vii) the feeling of anger when insulted (ākrośa), the feeling of fight against an enemy who comes to kill (vadha),
  - (viii) the desire of asking anything in great need (yācnā)
  - (ix) the feeling of satisfaction (alābha),
  - (x) the feeling of pain caused by a disease (roga),
  - (xi) the feeling of pain caused by some thorns (tṛṇasparśa),
  - (xii) the feeling of displeasure for dirtiness (mala),
  - (xiii) the desire to get some reward or honour (satkāra-puraskāra),
  - (xiv) the feeling of pride for one's learning (prajñā),
  - (xv) the feeling of despair for failure to obtain knowledge (ajñāna)and
  - (xvi) the feeling of despair for failure to attain something (adarśana).

One who controls over these hardships or troubles becomes free from all kinds of sorrows. One should also observe five kinds of cāritra or conduct for stopping theinflux of karma-pudgala. These are:

- (i) sāmāyika,
- (ii) cchedopasthāpanā,
- (iii) parihāraśuddhi,
- (iv) sūkṣmasaṃparāya and
- (v) yathākhyāta.

- Sāmāyika means one should always give up bad deeds and take up gooddeeds.
- Cchedopasthāpanā means repentance for doing all kinds of wrong deeds in front of the preceptor.
- Parihāraśuddhi means one should obtain purity by abstention from injuryto living being.
- Sūkṣmasaṃparāya means one should control of the subtle from ofpassions.
- Yathākhyāta means thinking for liberation after the control of all thepassions.

Moreover, the influx of karma-pudgala can also be stopped out by vow. It is offive kinds, viz.,

- ahiṃsā i.e. abstention from injury;
- anṛta i.e. abstention from falsehood;
- asteya i.e. abstention from stealing;
- brahmacarya i.e. abstention from sexual pleasure and
- aparigraha i.e. abstention from worldly things.

All of these are the ways of stopping the influx of new karma-pudgala into the self. When all of these ways are successfully followed, then the influx of karma-pudgala is stopped.

### **Nirjarā:**

The destruction of old karma-pudgala is called nirjarā. Samvara stops the influx of fresh karmans. But the self is not free from the karma-pudgalas which have already entered into the self. So, Prabhācandra holds that for the attainment of liberation, it is also necessary to destroy the karma-matters that have already entered into the body of the self. This destruction is only possible through nirjarā i.e. it consists in the annihilation of already entered karmans. Prabhācandra says that it is of two types, viz.,

- upakrama-nirjarā and
- anupakrama-nirjarā. Upakramanirjarā is destroyed through twelve kinds of penances, while the anupakramanirjarā is destroyed in proper time after the fruits of such karman are enjoyed.

According to another view, nirjarā is of two kinds, viz.,

- bhāva-nirjarā and
- dravya-nirjarā.

Bhāva-nirjarā is again of two types, viz.,

- savipāka and
- avipāka.

The natures of savipāka-nirjarā and avipāka-nirjarā are the same with the natures of anupakrama-nirjarā and upakrama-nirjarā.

By the twelve kinds of penances, the karma-matters are destroyed. Of them, the six are external penances and the remaining six are internal ones. The six external penances are: anaśana (fasting); uṇadaṛī (less eating); vṛttiparisamkṣepa (limiting quantity of food); rasa-tyagā (abstaining from eating ghee, sweet etc.); kāya- kleśa (torturing the body) and saṃlinatā (avoidance of temptation by control the senses, mind etc.). On the other hand, the six internal penances are: prāyaścitta (confession of crime and performance of penances for its atonement); vinaya (respect to the ascetics); vaiyāvacca (service to the ascetics, the poor etc.); svādhyāya (study of scriptures); vyutsarga (giving up all the internal and external things of the mundane world) and dhyāna (meditation). All of these are the means of destroying the karma-pudgalas that have already entered into the self.

Thus, from the above point of discussion it has been seen that the self comes under the bondage

of karma-pudgala because of āsrava and bandha. So, it becomes impure and cannot attain liberation. The self becomes free from all of the karma-pudgalas through samvara and nirjarā. So, after the destruction of all the karma-pudgalas, the self becomes fit for liberation.

### **The Three Jewels of Jainism**

The three jewels of Jainism are also known as three gems and three refuges. They are different from the three jewels of Buddhism. They constitute the core practice of Jainism for both the ascetics and the laity. The three jewels are interdependent and yet independent. They prepare the followers to practice the vows they have to undertake as a part of their religious obligation.

Jainism is a very austere religion, which demands a high degree of commitment from its followers, in which one has to be willing to forego everything to achieve liberation, including one's life. While the laity is given some freedom to practice the law, no lenience is given to those who have chosen to become the ascetics and follow the path in letter and spirit. The three jewels which are common for both groups are cultivation of 1. Right perception (samyak darshana), 2. Right knowledge (samyak jnana) and 3. Right conduct (samyak charitra). These three jewels are discussed in detail below.

### **Right Perception (Samyak Darsana) (Tri-ratna)**

Right Perception (samyak charitra) is also translated into English as right vision, and right view. It is actually all these and even more. Perception is not a mere physical act. There is a mental process behind it and it is very much influenced by the attitude and the background of the preceptor. Right Perception comes with the ability to discriminate correctly between right and wrong, good and bad, right belief and wrong belief, right knowledge and wrong knowledge, and between truth and untruth.

Right Perception comes from right thoughts, right insight, right knowledge, right understanding, right faith, right relationships and right attitude. In a traditional sense, right perception comes from having right beliefs and right thinking about the thirthankaras and their teachings, and by knowing the difference between the Jiva, the embodied soul and Ajiva, the inert matter. In a negative sense, right perception also means not having the wrong perception, which is acquired by not believing in false prophets, not following wrong scriptures, not believing in the wrong knowledge and not indulging in wrong practices.

Right perception leads to contentment (prasanna), detachment (nirveda), spiritual yearning for liberating, (samvega), kindness (anukampa) and faith in the path (astikaya). It also results in freedom from eight kinds of pride, namely pride in family, physical strength, beauty, knowledge, wealth, authority, relationships and spiritual progress. Cultivation of right perception requires a great deal of inner discipline and assiduous practice which demands the following requirements.

- Faith without doubts,
- Complete renunciation of desire for worldly comforts,
- Respect for believers on the path,
- Absence of likes and dislikes,
- Disinterest in wrong paths,
- Bringing non-believers to the path,
- Cultivation of right faith, and

- Spreading the knowledge Jainism

### **Right knowledge (Samyak Jnana)**

Right knowledge (samyak jnan) comes with right perception, right understanding, right discrimination and by knowing the true doctrine. Knowledge that is gained through external agencies is liable to error whereas knowledge gained directly through the faculties of the soul cannot be wrong. The true test of right knowledge lies in its ability to help us in getting what is good for us and in avoiding what is sinful. Right knowledge is useful and reliable because it is a true representation of what is.

Jainism acknowledges eight types of knowledge. Of them five constitute right knowledge. They are mati (mental knowledge), sruti (acquired knowledge), avadhi (distant knowledge), manahparyaya (paranormal knowledge) and kevala (absolute knowledge). The remaining three types of knowledge constitute false knowledge (mithya jnan). They are invalid knowledge, erroneous knowledge and wrong knowledge.

Mati jnana (mental knowledge) is ordinary perception obtained through the normal faculties of the mind such as perception, cognition, analysis and memory. It is further divided into smriti (remembrance), pratyabhijna or samjna (recognition), curita or tarka (inductive logic) and abhinibodha or anumana (deductive logic). According to another classification, it is divided into upalabdhi (end result), bhavana (feelings and emotion) and upayoga (usefulness). Matijnana comes to us mainly through the sense organs (indriyas). So sensory knowledge always precedes mental knowledge. Sruti jnana is verbal and non verbal knowledge acquired through signs, symbols and words. Study and hearing are the usual methods of obtaining srutijnana.

While matijnana is acquired through primary contact srutijnana is acquired through secondary contact or another source. Srutijnana is of four types depending upon how it is acquired: labdhi (contact), bhavana (attention), upayoga (utility) and naya (perspective). The difference between sruti and mati is very subtle because in case of srutijnana also perception, cognition and understanding play an important role. Matijnana is the raw material from which comes srutijnana as a finished product. The former is based on personal experiences and perceptions while the latter is based on other people's knowledge and experiences that has been borrowed through communication.

Avadhi jnana is clairvoyance or knowledge of distant and remote things acquired through higher faculties, without the use of the senses or study. It comes either from birth (bhava) because of previous karma or from virtues (gunas) acquired by doing good karma and destroying bad karma.

Manahparyaya jnana is the knowledge acquired psychically through other people's minds using the paranormal faculty of mind reading or telepathy. People endowed with this faculty have the ability to actually see the thought forms and mental impressions of other people and know instantly what they are thinking. Manahparyaya jnana is acquired because of previous good karma or virtue acquired in the present life by removing impure karma. Manahparyaya is a kind of avadhijnana but it is limited to the extent of other people's minds and what is going on in them. In comparison, avadhijnana extends to every thing and everywhere. Secondly both human beings and others can acquire avadhijnana, but manahparyaya is possible only in case of humans.

Kevala jnana is the "Only" knowledge or the absolute knowledge. It is also described as the perfect knowledge and the ultimate knowledge. Kevalajnana is not subject to standpoints or perspectives because it contains all view points and perspectives simultaneously. It is omniscient, omnipresent, indescribable, unlimited, eternal and transcendental to which the limitations of space and time do not apply. It is acquired only when a person has achieved nirvana.

Knowledge obtained by these five means is divided into both direct knowledge (pratyaksha) and indirect knowledge (paroksha). Direct knowledge is that knowledge which is acquired directly without the intervention of an external agency. Of the five types of knowledge, the first two are considered indirect and hence reliable while the last three are direct and more reliable. Indirect knowledge is susceptible to error, invalid conclusions, and falsehood, whereas direct knowledge is perfect.

From right perception comes right knowledge. From right knowledge comes right conduct and the power of discrimination. As karma is gradually removed from the embodied self, it begins to acquire different types of right knowledge. First comes perceptual knowledge. From it arises the desire to study and acquire the sruti knowledge. From the study of the doctrine and its practice comes clairvoyance or knowledge of distant objects and telepathy. These extraordinary powers enable the jiva to come into contact with higher beings from whom it gains more knowledge leading to its further purification. As the Jiva becomes adept in different types of knowledge, it gradually moves on the path of liberation and achieves kevala jnana or the highest knowledge. Ultimately, in the transcendental state, the Jiva gains perfect knowledge and becomes complete.

### **Right conduct (Samyak Charitra)**

The three jewels are interconnected and work in tandem. One cannot have right conduct without right knowledge and one cannot have right knowledge without right perception. Right conduct comes from the awareness of what is right and what is wrong and by doing what is right. It is practicing right knowledge as revealed by the thirthankaras and the jinas. At the core of their teachings is the practice of non-violence as a solution to the problem of karma. However ahimsa has to be practiced in conjunction with other teachings. A follower of Jainism should not have any doubt about the teachings of the Jinas. From faith comes the conviction and the resolve to remain committed to the path. Faith in the doctrine is therefore the first commitment expected of each follower. The conviction is further cemented by the 12 vows or vratas, which each initiate into Jainism has to undertake to begin his or her journey on the path. Of the 12 vows five are main vows or maha vratas and the rest are supplementary vows or anuvratas. Jain scriptures provide ancillary information on how to practice each of the main vows.

### **Five vows (Mahavratas)( Panch-vrata)**

In Jainism, the five main vows are an important part of spiritual practice to achieve liberation. They are meant for both lay followers and ascetics. The five main vows are stated below.

**Ahimsa- non-injury** or non-violence, to be practiced by not piercing, not binding, not overloading, not causing pain and not starving beings. Ahimsa should be practiced positively by practicing non-violence and negatively by refraining from violence

**Satya - truthfulness**, to be practiced by not spreading false doctrine, not back-biting, not doing forgery, not betraying secrets and not breaking promises. Satya should be practiced positively by

practicing truthfulness and negatively by not speaking lies

**Asteya - not to steal**, to be practiced by not encouraging others to steal, not receiving stolen property, not acquiring things against law, not adulterating and not using false weights or measurements, use or what is obtained legitimately and not to take what is not given. Asteya should be practiced positively by using what one has and negatively by not taking what has not been given.

**Brahmacharya - chastity** or celibacy, to be practiced by not indulging in extramarital relationships, not indulging in unnatural sex, not indulging in lewd behavior, not showing excessive passion for one's spouse and not associating with sexually immoral people. Brahmacharya should be practiced positively by observing celibacy and negatively by refraining from sensual pleasure.

**Aparigriha - renunciation** or detachment, to be practiced by limiting one's possessions through three progressive levels of reduction: at a level higher than what one has, at a level equal to what one actually has and at a level less than what one has. Aparigriha should be practiced positively by giving away and negatively by not seeking worldly things.

The five vows are called mahavrata or great vows when they are practiced rigidly. In case of ordinary people who may not be able to practice them strictly, they are called anuvratas or minor vows. Those who have taken to asceticism are expected to observe them all the time mentally, verbally and physically. For example, the vow of ahimsa should be practiced by not injuring others mentally, verbally and physically. The laity are also advised to refrain from associating themselves with people who are not sincere on the path and who violate the vows habitually. Ascetics are advised to keep a vigil over themselves all the time while practicing the vows with firm resolve, cultivating 10 more virtues, namely kshama (forgiveness), mardava (humility), arjava (honesty), satya (truth), soucha (purity), samyam (self-restraint), tapas (penance), tyaga (sacrifice), akinchanya (non-attachment) and brahmacharya (celibacy).

## **Buddhism**

Buddhism is a path of practice and spiritual development leading to insight into the true nature of reality. Buddhist practices like **meditation** are means of changing yourself in order to develop the qualities of awareness, kindness, and wisdom. The experience developed within the Buddhist tradition over thousands of years has created an incomparable resource for all those who wish to follow a path — a path which ultimately culminates in Enlightenment or Buddhahood. An enlightened being sees the nature of reality absolutely clearly, just as it is, and lives fully and naturally in accordance with that vision. This is the goal of the Buddhist spiritual life, representing the end of suffering for anyone who attains it.

Because Buddhism does not include the idea of worshipping a creator god, some people do not see it as a religion in the normal, Western sense. The basic tenets of Buddhist teaching are straightforward and practical: nothing is fixed or permanent; actions have consequences; change is possible. So Buddhism addresses itself to all people irrespective of race, nationality, caste, sexuality, or gender. It teaches practical methods which enable people to realise and use its teachings in order to transform their experience, to be fully responsible for their lives.

Buddhism is a faith that was founded by Siddhartha Gautama ("the Buddha") more than 2,500 years ago in India. With about 470 million followers, scholars consider Buddhism one of the major world religions. Its practice has historically been most prominent in East and Southeast Asia, but its influence is growing in the West. Many Buddhist ideas and philosophies overlap with those of other faiths.

## **Buddhism Beliefs**

Some key Buddhism beliefs include:

- Followers of Buddhism don't acknowledge a supreme god or deity. They instead focus on achieving enlightenment—a state of inner peace and wisdom. When followers reach this spiritual echelon, they're said to have experienced nirvana.
- The religion's founder, Buddha, is considered an extraordinary man, but not a god. The word Buddha means "enlightened."
- The path to enlightenment is attained by utilizing morality, meditation and wisdom. Buddhists often meditate because they believe it helps awaken truth.
- There are many philosophies and interpretations within Buddhism, making it a tolerant and evolving religion.
- Some scholars don't recognize Buddhism as an organized religion, but rather, a "way of life" or a "spiritual tradition."
- Buddhism encourages its people to avoid self-indulgence but also self-denial.
- Buddha's most important teachings, known as The Four Noble Truths, are essential to understanding the religion.
- Buddhists embrace the concepts of karma (the law of cause and effect) and reincarnation (the continuous cycle of rebirth).
- Followers of Buddhism can worship in temples or in their own homes.
- Buddhist monks, or bhikkhus, follow a strict code of conduct, which includes celibacy.
- There is no single Buddhist symbol, but a number of images have evolved that represent Buddhist beliefs, including the lotus flower, the eight-spoked dharma wheel, the Bodhi tree and the swastika (an ancient symbol whose name means "well-being" or "good fortune" in Sanskrit).

## **Founder of Buddhism**

Siddhartha Gautama, the founder of Buddhism who later became known as "the Buddha," lived during the 5th century B.C.

Gautama was born into a wealthy family as a prince in present-day Nepal. Although he had an easy life, Gautama was moved by suffering in the world.

He decided to give up his lavish lifestyle and endure poverty. When this didn't fulfill him, he promoted the idea of the "Middle Way," which means existing between two extremes. Thus, he sought a life without social indulgences but also without deprivation.

After six years of searching, Buddhists believe Gautama found enlightenment while meditating under a Bodhi tree. He spent the rest of his life teaching others about how to achieve this spiritual state.

## Buddhism History

When Gautama passed away around 483 B.C., his followers began to organize a religious movement. Buddha's teachings became the foundation for what would develop into Buddhism.

In the 3rd century B.C., Ashoka the Great, the Mauryan Indian emperor, made Buddhism the state religion of India. Buddhist monasteries were built, and missionary work was encouraged. Over the next few centuries, Buddhism began to spread beyond India. The thoughts and philosophies of Buddhists became diverse, with some followers interpreting ideas differently than others.

In the sixth century, the Huns invaded India and destroyed hundreds of Buddhist monasteries, but the intruders were eventually driven out of the country.

Islam began to spread quickly in the region during the Middle Ages, forcing Buddhism into the background.

## Types of Buddhism

Today, many forms of Buddhism exist around the world. The three main types that represent specific geographical areas include:

- **Theravada Buddhism:** Prevalent in Thailand, Sri Lanka, Cambodia, Laos and Burma
- **Mahayana Buddhism:** Prevalent in China, Japan, Taiwan, Korea, Singapore and Vietnam
- **Tibetan Buddhism:** Prevalent in Tibet, Nepal, Mongolia, Bhutan, and parts of Russia and northern India

Each of these types reveres certain texts and has slightly different interpretations of Buddha's teachings. There are also several subsets of Buddhism, including Zen Buddhism and Nirvana Buddhism.

Some forms of Buddhism incorporate ideas of other religions and philosophies, such as Taoism and Bon.

## Dharma

Buddha's teachings are known as "dharma." He taught that wisdom, kindness, patience, generosity and compassion were important virtues.

Specifically, all Buddhists live by five moral precepts, which prohibit:

- Killing living things
  - Taking what is not given
  - Sexual misconduct
  - Lying
  - Using drugs or alcohol
- Four Noble Truths

The Four Noble Truths, which Buddha taught, are:

- The truth of suffering (dukkha)
- The truth of the cause of suffering (samudaya)
- The truth of the end of suffering (nirhodha)
- The truth of the path that frees us from suffering (magga)

## Eightfold Path

The Buddha taught his followers that the end of suffering, as described in the fourth Noble Truths, could be achieved by following an Eightfold Path.

In no particular order, the Eightfold Path of Buddhism teaches the following ideals for ethical conduct, mental discipline and achieving wisdom:

- Right understanding (Samma ditthi)
- Right thought (Samma sankappa)
- Right speech (Samma vaca)
- Right action (Samma kammanta)
- Right livelihood (Samma ajiva)
- Right effort (Samma vayama)
- Right mindfulness (Samma sati)
- Right concentration (Samma samadhi)

## Buddhist Holy Book

Buddhists revere many sacred texts and scriptures. Some of the most important are:

- **Tipitaka:** These texts, known as the “three baskets,” are thought to be the earliest collection of Buddhist writings.
- **Sutras:** There are more than 2,000 sutras, which are sacred teachings embraced mainly by Mahayana Buddhists.
- **The Book of the Dead:** This Tibetan text describes the stages of death in detail.

## Dalai Lama

The Dalai Lama is the leading monk in Tibetan Buddhism. Followers of the religion believe the Dalai Lama is a reincarnation of a past lama that has agreed to be born again to help humanity. There have been 14 Dalai Lamas throughout history.

The Dalai Lama also governed Tibet until the Chinese took control in 1959. The current Dalai Lama, Lhamo Thondup, was born in 1935.

## Upaya

*Upaya* is a Sanskrit term referring to limitless possibilities. It is often used with *upaya-kausalya*, meaning “skillful means.” *Upaya* finds mention in Mahayana Buddhism as an aspect of guidance that recommends practitioners to follow their own specific techniques according to a prevailing situation in order to achieve enlightenment.

Using skillful means is considered as one of the attributes of a *bodhisattva*, which refers to those who tread the path toward achieving *Buddhahood*.

## Explanation Upaya

To put it simply, *upaya* is starting from where you are and working with what you have in order to start creating. *Upaya* can involve unconventional methods that do not find mention in Buddhist doctrines, the only rule being that the action must involve compassion and wisdom. It is also essential that the action is the need of the moment.

"Lotus Sutra," which is considered one of the most influential texts of Buddhism, elaborates on the importance of upaya. The second chapter in the text highlights the importance of upaya, while in the third chapter, Buddha explains upaya with the following illustration: "A man returns home to find his house in flames with his children inside playing happily, not realizing the consequences of the fire. The man calls his children to come out, but being involved in their game, the children refuse to do so. With no other option to bring them out, the father tells them that he has brought them beautiful carts that are drawn by goats, deer and bullock. His statement made the children come out immediately, but only to find nothing their father had promised. However, the relieved father soon got them more than what he had told them to make them get out of the house on fire." Buddha tells his disciples that though the father uttered a false statement, it cannot be considered faulty as it was his earnest attempt to save his children. The father had applied upaya that fit the situation to bring his children out of danger.

### **Upāya-Kaushal**

The concept of 'skilful means' is one of the leading ideas of Mahayana Buddhism and was first used extensively in The Lotus Sutra and other writings treated below. In Mahayana Buddhism the various forms of Buddhist teaching and practice are declared to be provisional means, all skilfully set up by the Buddha for the benefit of the unenlightened. A Buddhist who makes progress himself comes to recognise this provisional quality in the forms of his religion, and though using the means provided for him he has to learn not to be wrongly attached to them. He leaves them behind, like a raft left lying on the bank by a man who has crossed a stream and needs it no more. An advanced follower of Buddhism, usually named by Mahayana Buddhists a bodhisattva, continues to use such provisional means in order to lead other living things towards nirvana.

A bodhisattva is skilled in allowing the Buddhist religion to be spelled out in all its detail, while not being ensnared by the false discriminations of the unenlightened. 'Skilful means' is a conflated term which is based on Chinese and Japanese usage, as explained later, and which refers to the overall spectrum of meanings with which we are concerned. Since 'skilful means' is about the way in which the goal, the intention, or the meaning of Buddhism is correlated with the unenlightened condition of living beings, it brings out particularly clearly how Mahayanists thought Buddhism, as a system, is supposed to be understood.

Once established, the term continued to be used down to the present day, admittedly with some vagaries. It is fair to say that the method of thought and practice summed up by the concept of skilful means is one of the fundamental principles of Buddhism as a working religion. Indeed a Japanese writer has claimed that it is hardly possible to discuss Mahayana Buddhism at all without reference to it.

Strangely enough the matter has never been the subject of extended study in the west. 'Nirvana', 'bodhisattva', 'emptiness' (Skt. *śūnyatā*) and so on have all been considered in this way and that, but apart from occasional references and brief definitions 'skilful means' has scarcely been attended to at all.

A concept which has been used to explain the very existence of Buddhism as a functioning religious system demands closer attention. Even in the east there do not seem to have been any extended studies, and this may be partly due to the fact that Mahayanists have rather tended to take

'skilful means' for granted as a natural principle with which to regulate their religion. In recent times there have been a few shorter articles in Japanese, which have been quite useful to the present writer.

However even the Japanese have rather tended to deal with it en passant in their voluminous commentaries, and this has prevented the concept from emerging as one of central importance to Buddhist thought, in its own right. When some years ago the writer visited the splendid headquarters of one of the lively new religions of modern Japan he was duly impressed with the architecture, the furnishings and the technology, the constant flow of people for counselling and devotions, the accessory organisations and the managerial efficiency, the obvious emphasis on cheerful prosperity and on daily personal well-being. It was radically unlike the dimly lit temples in the old style, their cemeteries crowded and overgrown, their mournful bells echoing the half-understood and half-forgotten secrets of traditional Buddhism.

These notes of transience and quiescence were far from the minds of the coachloads of well-dressed and optimistically chattering housewives attending their modern mecca in central Tokyo. Their concern was rather with family affairs, schooling, cultural and leisure pursuits, and the elimination of factors inconsistent with well-being. Nevertheless beneath all the usual appurtenances of a modern religion this particular movement was concerned, my guide explained, to teach 'true Buddhism'. In reality there was here, he went on, no so-called 'new' religion at all, but an ancient one. Then how was the coexistence of these seemingly diverse directions to be understood? That, it was explained, is a matter of skilful means.

This account was no modern simplification or sectarian perversion. The Lotus Sutra, a Mahayana Buddhist text dating from about two thousand years ago, explained that the Buddha himself uses 'innumerable devices' to lead living beings along and to separate them from their attachments.

Such devices are formulated in terms of the relative ignorance and the passionate attachments of those who need them, but they turn and dissolve into the Buddhist attainment of release. Similarly the great celestial bodhisattvas or buddhas-to-be are characterised not only by their penetrating insight into the true nature of reality but also by a great compassion for suffering beings. They too deploy a range of methods for the salvation of the multitude, skilfully tuning them to a variety of needs yet consistently intimating the intention of nirvana.

The release of all sentient beings is guaranteed in the nirvana of any one bodhisattva, a nirvana postponed and yet assured. For one thing the great vow of a bodhisattva bears all suffering beings along with him. For another thing, to imagine that one being or some beings could attain nirvana, and not others, would fall some way short of the radical teaching that all phenomena are equally void of persistent ontological status, or that, as The Lotus Sutra puts it, all things are nirvanic from the beginning.

The path of a bodhisattva is to know this, and at the same time to keep on playing the game of skilful means to save people from themselves. This style of thinking, in which insight (Skt. prajñā) and means (Skt. upāya) are inextricably related, is the key to understanding the proliferation of new forms which the Mahayana has woven across half Asia. It is also possible to look at skilful means not from the side of the Buddhas and bodhisattvas who invent them, but from the side of the sentient beings who need them, that is, from the point of view of human beings ignorantly entangled in the apparently ceaseless round of birth and death (Skt. saṃsāra). Indeed Sawada

Kenshd reflected a common Japanese assumption about the matter when he concluded in a short article that there are two basic meanings to be remembered.

- The first is skilful means as invented by the Buddha for the benefit of sentient beings.
- The second is skilful means as used by sentient beings for the attainment of nirvana or release. The means themselves are the same, of course, whichever idea is uppermost. Whether considered as working downwards or upwards the skilful means are above all provisional. They not only need to be established from above but also to be superseded from below. As the beneficiaries become enlightened the expedients become redundant. This process may be a rather rough dismantling and debunking as in some corridors of the Zen tradition, or it may be a smooth transference from one level of meaning to another. Since the skilful means are initially tuned in to the needs of beings entangled in ignorance and samsara, it is quite natural that release from these involves a subtle change in the significance or status of the very means which bring it about.

In this sense the concept of skilful means involves the paradox that Mahayana Buddhism elaborates and proliferates itself without end as a religion of salvation and at the same time it tends towards its own dissolution. Indeed the Mahayanists claim, and not without some justice, that 'skilful means' is the key to the understanding of Buddhism in general. Perhaps the most suggestive passages in this connection are those which narrate the Buddha's initial decision to teach at all. Without this decision the Buddhist religion would never have developed any articulate form whatever. It is therefore of great importance that Mahayanists interpret it in terms of the Buddha's skilful means. For them this key concept is the appropriate way in which to understand any phase of Buddhism which is supposed to derive from the Buddha's initiative, whether it be abstractedly conceptual, concretely narrative, or expressed as meditational practice.

The 'answers' which Buddhism apparently offers, such as the teaching of cessation (Skt. *nirodha*) or nirvana, are devised entirely in terms of the problem and they are not intended to have any particular meaning beyond the attainment of the solution. Thus 'Buddhism', as a specific religion identifiable in human history, is a skilful means.

## **Brahma-vihāra**

The *brahma-viharas*, or "sublime attitudes," are the Buddha's primary heart teachings—the ones that connect most directly with our desire for true happiness. The term "brahma-vihara" literally means "dwelling place of brahmas." Brahmas are gods who live in the higher heavens, dwelling in an attitude of unlimited goodwill, unlimited compassion, unlimited empathetic joy, and unlimited equanimity. These unlimited attitudes can be developed from the more limited versions of these emotions that we experience in the human heart.

In Buddhism, there are *four states of mind* called the "Brahma-vihara" or "four divine states of dwelling." Buddha taught these values to monks. The four divine states are also known as the "Four Immeasurables" or the "Four Perfect Virtues." In many Buddhist traditions the four states are cultivated through *meditation*. They are also interrelated and support one another.

### **The four states are:**

- *metta* (loving kindness)
- *karuna* (compassion)

- *mudita* (sympathetic joy or empathy)
- and *upekkha* (equanimity).

It's important to understand that these mental states are not emotions. It takes practice and dedication to establish these states of mind, and even then it's a constant journey. One cannot simply make up in your mind that you will be loving, compassionate, empathetic and balanced at the flick of a switch. These four states requires intentional dwelling and altering how you experience and perceive yourself and others. Becoming aware of and loosening the bonds of the ego are especially important in this practice.

## **Metta (Loving Kindness)**

Metta is the practice of cultivating *universal* love, friendliness, or lovingkindness. Metta is benevolence toward all beings, without discrimination or selfish attachment. Metta can be compared to the *unconditional love* that a mother would have for her children. This love does not discriminate between benevolent people and malicious people. It is a love in which "I" and "you" disappear, and where there is no possessor and nothing to possess. By practicing Metta, one can overcome anger, ill will, hatred and aversion.

The practice progresses in **five stages**. As we use Metta during meditation, **we cultivate Metta for:**

- Ourselves
- A good friend
- A "neutral" person – someone we don't have any strong feelings for
- A "difficult" person – someone we have conflicts with or feelings of illwill towards
- All sentient beings

In your practice, you can access Metta through meditation and identifying someone at each of the stages. Learning to accept all for how they are will give you the freedom to love and forgive.

## **Karuna (Compassion)**

Karuna is active sympathy extended to all sentient beings. Karuna is combined with *prajna* (wisdom), which in Mahayana Buddhism means the realization that all sentient beings exist in each other and take identity from each other (see shunyata). The terms "we are all one" is reflective in the practice of Karuna.

Theravada scholar Nyanaponika Thera said, "It is compassion that removes the heavy bar, opens the door to freedom, makes the narrow heart as wide as the world. Compassion takes away from the heart the inert weight, the paralyzing heaviness; it gives wings to those who cling to the lowlands of self."

## **Mudita (Sympathetic Joy)**

Mudita is taking sympathetic or altruistic joy in observance of the happiness of others. Mudita is the ability to take active delight in others' good fortune or good deeds as a way to develop and maintain calmness of mind. People also identify mudita with empathy. Some teachers believe the cultivation of mudita is a prerequisite for developing metta and karuna. The antithesis of mudita is jealousy and envy.

By being happy when good things happen to others, your opportunities for delight are greatly

increased. Practice Mudita when you observe the success and happiness in others.

### **Upekkha/Upeksha (Equanimity)**

Upekkha is a mind in balance, free of discrimination yet rooted in insight. In Upekkha non-attachment, non-discrimination, even-mindedness or letting go is practiced, however it does not mean that the mind is indifferent. Equanimity is a state of psychological stability and composure. The mind remains undisturbed by experience of or exposure to emotions, pain, or other phenomena that may cause others to lose the balance of their mind.

In yoga we cultivate Upekkha through the acceptance of what is and to let what is be. When we dwell on what should be or what shouldn't be, we lose this mind balance and composure. It becomes polluted with expectations and emotions.

### **Bodhisattva**

**A bodhisattva** is a Buddhist deity who has attained the highest level of enlightenment, but who delays their entry into Paradise in order to help the earthbound. The bodhisattva, known in Sanskrit as Avalokiteśvara, takes both male and female form and is associated with the qualities of mercy and compassion; its Chinese incarnation, Guanyin – who is always represented as female – translates as the 'perceiver of sounds'. Guanyin, Buddhists believe, can recognise the cries of all those who suffer on earth and guide them towards salvation.

The earliest source for the doctrines of Avalokiteśvara is in the 25th chapter of the Lotus Sutra, one of the foundation texts of Mahayana Buddhism, which originated in India around the beginning of the first century AD. Other sources claim that the sun and the moon were born of this bodhisattva's eyes. Ideas and images associated with Avalokiteśvara have been of particular influence on Chinese and Japanese literature, such as *The Tale of Genji*, written by the 11th-century noblewoman Murasaki Shikabu, which tells the romantic, picaresque story of the son of an ancient Japanese emperor. Some scholars have argued that it has claim to be the first novel.

This statue of Avalokiteśvara, now on display in the St Louis Art Museum, depicts the bodhisattva seated, with legs folded as if meditating. It is made of a single woodblock, decorated with quartz and carnelian, and was made in China at the time of the Northern Song dynasty (960-1127).

**A bodhisattva** is literally a living being (sattva) who aspires to enlightenment (bodhi) and carries out altruistic practices. The bodhisattva ideal is central to the Mahayana Buddhist tradition as the individual who seeks enlightenment both for him- or herself and for others. Compassion, an empathetic sharing of the sufferings of others, is the bodhisattva's greatest characteristic. It is shown in the following incident from the Vimalakirti Sutra which concerns a prominent lay follower of the Buddha who had fallen ill. When questioned about his illness, Vimalakirti replied, "Because the beings are ill, the bodhisattva is ill. The sickness of the bodhisattva arises from his great compassion."

It is held that the bodhisattva makes four vows expressing a determination to work for the happiness of others: "However innumerable sentient beings are, I vow to save them; however inexhaustible the passions are, I vow to master them; however limitless the teachings are, I vow to study them; however infinite the Buddha-truth is, I vow to attain it."

The vows, each of which commits the bodhisattva to the open-ended pursuit of a continually receding goal, may seem daunting. Buddhism asserts, however, that the path of the bodhisattva is not an otherworldly undertaking for people with unique gifts of compassion or wisdom. Rather, the life-condition of bodhisattva is inherent in the lives of ordinary men and women, and the purpose of Buddhist practice is to strengthen that state until compassion becomes the basis of all our actions.

In addition to compassion, the vows reflect the bodhisattva's commitment to self-mastery, to study and learning, to the attainment of wisdom. None of these, however, is pursued in a vacuum, merely to improve or adorn the self; at the base of all these efforts is always the determination to remove the sufferings of others, and to replace them with joy.

For the followers of Nichiren Buddhism, bodhisattva practice is subsumed in the twin, mutually reinforcing aspects of "practice for oneself and others." The core of practicing for oneself is the recitation of Nam-myoho-renge-kyo (the "daimoku" of the Lotus Sutra) along with key passages from the sutra. The purpose of this practice is to revolutionize one's inner life, to develop the qualities of the Buddha: courage, wisdom, compassion and abundant vitality or life-force.

While many people may at first be inspired to practice Buddhism by the desire for personal happiness, to overcome illness or some other seemingly insurmountable challenge, as their life-state expands, they naturally develop a deeper concern for the happiness of others. Perceiving the interconnectedness of all beings, they take compassionate action, including sharing with others the insights of Buddhism, so they may also tap into the same rich inner resources that lie within their lives.

Bodhisattvas are thus naturally engaged in society, actively struggling both to change themselves and make the world a better, more humane place for all people. This explains why members of the SGI strive to be valuable participants in society, and to contribute as much as possible to their family, workplace and community.

## **Hedonism**

The term "hedonism," from the Greek word ἡδονή (*hēdonē*) for pleasure, refers to several related theories about what is good for us, how we should behave, and what motivates us to behave in the way that we do. All hedonistic theories identify pleasure and pain as the only important elements of whatever phenomena they are designed to describe. If hedonistic theories identified pleasure and pain as merely two important elements, instead of the *only* important elements of what they are describing, then they would not be nearly as unpopular as they all are. However, the claim that pleasure and pain are the *only* things of ultimate importance is what makes hedonism distinctive and philosophically interesting.

Philosophical hedonists tend to focus on hedonistic theories of value, and especially of well-being (the good life for the one living it). As a theory of value, hedonism states that all and only pleasure is intrinsically valuable and all and only pain is intrinsically not valuable. Hedonists usually define pleasure and pain broadly, such that both physical and mental phenomena are included. Thus, a gentle massage and recalling a fond memory are both considered to cause pleasure and stubbing a toe and hearing about the death of a loved one are both considered to cause pain. With *pleasure* and *pain* so defined, hedonism as a theory about what is valuable for us is intuitively appealing.

Indeed, its appeal is evidenced by the fact that nearly all historical and contemporary treatments of well-being allocate at least some space for discussion of hedonism. Unfortunately for hedonism, the discussions rarely endorse it and some even deplore its focus on pleasure.

### **Hedonism of Charvaka Philosophy:**

The Carvakas reject virtue and liberation as the ends of life. They regard sensual pleasure as the supreme end. It is produced by the intercourse of the sense-organs with their objects. Pleasure arising from the embrace of a woman and other objects of enjoyment is the highest good. Sensual pleasure does not cease to be good because it is mixed with pain. Pleasure only should be enjoyed. Pain that inevitably accompanies pleasure should be avoided as far as possible. Unavoidable pain that accompanies pleasure should be experienced for the sake of pleasure.

A person should separate bones and scales from the fish to enjoy the pleasure of eating it. He should not discard it because it has scales and bones. He should take the trouble of separating the husk from the paddy to enjoy the pleasure of eating fine rice.

He should not discard rice because he has to separate it from the husk. It is foolish not to sow seeds of corns because there are wild animals, which may devour the corns. It is foolish not to cook food because beggars may pester us for a share of food.

It is improper to discard pleasure through fear of pain that inevitably accompanies it. One who rejects sentient pleasure, which is actually experienced, for fear of its accompanying pain is as stupid as a beast.

It is foolish to think that pleasure should be relinquished, which is produced by the intercourse of the senses with their objects, because it is attended with pain. Hedonistic calculus has to be employed. The maximum of sensual pleasure with the minimum of pain is the highest good. There is no supra-mundane happiness. Injunctions and prohibitions should be discarded.

Wealth is a means to pleasure. It ought to be acquired for instrumental value. Pleasure and wealth both constitute the human good. This is the view of the authors of Nitisastra and Kamasastra. It is accepted by the Carvakas, who deny the other-worldly good. Virtue consists in the enjoyment of sensual pleasure due to the gratification of desires. It is the highest virtue. Supreme happiness springs from the gratification of desires.

Rightness consists in conduciveness to sensual pleasure. Wrongness consists in conduciveness to bodily pain. An action, which gives excess of pleasure over pain, is right. An action, which gives excess of pain over pleasure, is wrong.

The Carvakas advocate gross egoistic hedonism. The Brahmanas, who are consummate in the art of fraudulence and who composed the Vedas, delude foolish people to think that certain articles of food and drink are permitted while others are forbidden.

They enjoin bodily austerities on the gullible people in the vain expectation of happiness in heaven which is never perceived. They produce in the ignorant people foolish other-worldly madness of religion.

'Eat, drink, and be merry.' The past is dead and gone, It never returns. Youth never returns, make the most of the present youth. Bodily pleasures of this world are perceptible and certain. 'The pleasures of heaven attainable through the mortification of the body are imperceptible, uncertain and illusory.

Pursuit of distant, uncertain, and supersensible heavenly happiness at the cost of certain, immediate, perceptible earthly pleasures is foolish. Penances are deprivations of pleasure. Religious rites are childish play. Enjoy all kinds of pleasures attainable from earthly objects. After death nothing remains. The body is a fortuitous combination of the material elements. There is no pre-existence nor future life nor rebirth.

The body is not due to the merits and demerits acquired in the past birth. Pleasure and pain are not due to the maturation of the merits and demerits of the past birth. They are due to the intercourse of the sense-organs with their objects. The fortuitous conjunction of the material elements is liable to destruction at any moment. The present is certain; the 'past is gone; the future is uncertain. So enjoy pleasures of the present moment disregarding the past and the future. Enjoy the maximum of bodily pleasure with the minimum of pain disregarding the next world. Thus the Carvakas advocate gross egoistic hedonism.

But Vatsyayana, the author of Kama Sutra, makes a distinction between higher pleasures and lower pleasures, rational pleasures and sensual pleasures. He regards happiness (kama), wealth (artha), and virtue (dharma) as the supreme ends of life.

Wealth and happiness should be pursued in harmony with virtue. They should not be cultivated at the sacrifice of one another. Harmony of happiness, wealth and virtue is the highest good. One who pursues the triple ends (trivarga) enjoys supreme happiness on earth and in heaven after death. Wealth is superior to happiness. Happiness is superior to virtue.

When there is a conflict among them, the former should be pursued at the sacrifice of the latter, but the latter should not be pursued at the sacrifice of the former, since the former are superior to the latter. If there is no incompatibility among the three ends, all should be pursued. This is the best course. If they are not realizable at the same time owing to their incompatibility, then two of them should be attained.

This is the middle course. If even the two ends cannot be realized simultaneously owing to their incompatibility, only one of them should be achieved. This is the worst course. Excessive charity is conducive to virtue; but it exhausts wealth, and thwarts happiness. Excessive penance sacrifices happiness, undermines health, and destroys the capacity for earning wealth. Excessive hoarding of wealth sacrifices happiness and virtue.

Excessive indulgence in sexual pleasure sacrifices, wealth and virtue. So these should be avoided. When an action is conducive to one end and repugnant to the others, its comparative merits and demerits should be considered.

Wealth, happiness and virtue should be pursued in harmony with one another; they should not be pursued as destructive of one another. There are sixty-four fine arts (kala) which yield refined pleasure. Both sensual pleasure and refined pleasure should be pursued. So Vatsyayana is an advocate of refined egoistic hedonism.

The Bhagavata Purana refers to persons who pursue the three ends of wealth, happiness and virtue (traivargika), and are averse to God, Jayamangala interprets Vatsyayana's doctrine as refined egoistic hedonism, which regards wealth and virtue as means to happiness. Vatsyayana regards happiness as the only intrinsic value, and wealth and virtue as instrumental and extrinsic values.

# MCQs

1. Which of the following are called Purusharth?

- a) Dharma
- b) Artha
- c) Karma and Moksha
- d) All the above

Answer: (d)

2. The four fold varna system became strong system became strong and rigid during the period of

- a) Early Vedic age
- b) Later vedic age
- c) Kushans
- d) Nandas

Ans: (b)

3. Which type of rna in vedic tradition can be repaid by performing yajna?

- a) Rsirna
- b) Devarna
- c) Pitrna
- d) Prthvarna

Ans: b

4. Which of the following texts assumes the process of creation in the form of yajna?

- a) Purusa Sukta
- b) Nasadiya Sukta
- c) Hiranyagarbha Sukta
- d) Taittiriya Brahmana

Ans: a

5. According to the law of karma, every karma leads to \_\_\_\_\_.

- a) Moksha
- b) Phala
- c) Dharma
- d) all these

Ans: b

6. Which one of the following is not acceptable to Jain Philosophy?

- a) Realistic and relativistic pluralism.
- b) 'Dravya' and 'Guàa' are inseparable.
- c) We can know an object in all its aspects.
- d) Keval-Jnana is unlimited and absolute knowledge.

Answer: (c)

7. Given below are Assertion (A) and Reason (R). Consider them and select the correct code given

below, in the context of Buddhism:

**Assertion (A):** There is suffering in the world.

**Reason (R):** It is not created by us.

**Code:**

- a) (A) and (R) both are true and is the correct explanation of (A).
- b) (A) and (R) both are true and is not the correct explanation of (A).
- c) (A) is false and (R) is true.
- d) (A) is true and (R) is false.

Answer: (d)

- a) Dilthey
  - b) Heidegger
  - c) Schleiermacher
  - d) Gadamer
- Answer: (C)

115. Consider List – I with List – II and select the code correctly matched:

- | List – I   | List – II (Praman) |
|------------|--------------------|
| a) Nyaya   | i. Two             |
| b) Bauddha | ii. Four           |
| c) Carvaka | iii. Three         |
| d) Samkhya | iv. One            |

Codes:

a b c d

- a) ii i iv iii
- b) iii ii iv i
- c) iv i iii ii

d) i ii iii iv

Answer: (A)

116. Brahmacharya is the means to meet

a) R.i a

b) Pit a

c) Deva a

d) Manusya na

Answer: (A)

117. According to Śa kara tattvamasi' establishes use identify of Jīva with Brahman through

a) Its primary meaning

b) Its secondary meaning

c) Both its primary and its secondary meaning

d) Neither its primary nor its secondary meaning

Answer: (B)

118. According to Rāmānuja, the individual soul is

a) Only j ātā

b) J ātā and Kartā

c) Kartā and Bhoktā

d) J ātā, Kartā and Bhoktā

Answer: (D)

119. According to the Naiyāyikas vyatirekāvyaṅgya between hetu and sādhyā obtains when

a) All cases of Hetu are cases of absence of Sādhyā.

b) Some cases of Hetu are cases of Sādhyā

c) Some cases of Sādhyā are cases of Hetu

d) All cases of absence Sādhyā are cases of absence of Hetu

Answer: (D)

120. Consider the statements of J.S. Mill given below and mark the correct code:

1. J.S. Mill's theory is Altruistic hedonism and qualitative utilitarianism.

2. Mill uses pleasure and happiness synonymously.

3. Mill regards virtue, health, love of honour and the like as intrinsic values.

Codes:

a) 1, 2 and 3 are true.

b) 1 and 2 are true.

Answer: True.

Because ethics are never relative and have to be absolute so that it means same for every individual.

245. Ethics is populism

- a) True
- b) False

Answer: False.

Because ethics is never majority opinion

246. Our understanding of right and wrong is shaped by our culture hence ethics of persons from different culture may be in conflict

- a) True
- b) False

Answer: True.

Ideally ethics should be absolute but it is our conditioning from our birth and our culture that introduces different understanding of ethics

247. When they take sannyasi vows and become

- a) a monk
- b) When they are widowed
- c) As an act of worship for Yama, Lord of the Dead
- d) To act as a guide to help a deceased loved one cross over to a favorable rebirth

Answer: a.

When they take *sannyasi* vows and become a monk.

248. Scholars date the earliest parts of the Vedas to

- a) 900 b.c.e.
- b) 1200 b.c.e.
- c) 1500 b.c.e.
- d) 1700 b.c.e.

Answer: c 1500

249. In the Bhagavad Gita, taking up the path of devotion one

- a) Offers up the fruits of one's action to God
- b) Performs worship three times a day
- c) Recites the names of Krishna
- d) Studies the scriptures with a love in one's heart

Answer: a.

Offers up the fruits of one's action to God.

250. The arati ritual involves

- a) Fanning the icon with yak tail fans
- b) Bathing the icon in auspicious substances
- c) Carrying the icon in procession
- d) Waving lamps before the icon

Answer: d. Waving lamps before the icon.

251. The Hindu holiday that encourages mischief and mayhem is called

- a) Holi
- b) Diwali
- c) Navaratri
- d) Vijaya Dashami

Answer: a. Holi

252. The Indus Valley civilization reached its peak of development around

- a) 2300 b.c.e.
- b) 1700 b.c.e.
- c) 1500 b.c.e.
- d) 1200 b.c.e.

Answer: a. 2300 b.c.e..

253. The most important of the ancient Vedic gods, such as Indra and Agni,

- a) Play no part in later Hindu mythology
- b) Continue in later Hindu myth but have a subordinate status

- c) Are conquered by the later Hindu gods
- d) Continue to dominate the Hindu pantheon today

Answer: b.

Continue in later Hindu myth but have a subordinate status.

254. The funerary practice of Zoroastrians involve

- a) Exposing the corpse atop a tower to feed birds of prey
- b) Burial in an earthen pot
- c) Burial at sea
- d) Cremation in a large clay oven

Answer: a.

Exposing the corpse atop a tower to feed birds of prey.

255. The term "Sanskritization" describes when

- a) Sacred texts in the regional language are translated into Sanskrit
- b) Ancient government policies insisted that only Sanskrit be spoken
- c) Alternate religious ideologies are appropriated and adopted into Hinduism
- d) Sanskrit-language speakers displaced Dravidian-language speakers

Answer: c. Alternate religious ideologies are appropriated and adopted into Hinduism.

256. Dayananda Saraswati (1824–1883)

- a) Rejected caste in both its forms of varna and jati
- b) Rejected the epics and puranas as eroding the purity of the Vedas
- c) Founded the Ramakrishna Math
- d) All of the above

Answer: b.

Rejected the epics and *puranas* as eroding the purity of the *Vedas*.

257. Gandhi referred to the untouchables as

- a) Harijans
- b) Dalits
- c) Great souls
- d) Freedom fighters

Answer: a. *Harijans*

258. Hindu teachings on karma and reincarnation were first presented in the

- a) Vedas
- b) Brahmanas
- c) Upanishads
- d) Bhagavad Gita

Answer: c. *Upanishads*

259. Shiva was originally

- a) A wild and frightening deity
- b) A god of ascetics
- c) Associated with healing and disease
- d) All of the above

Answer: a.

A wild and frightening deity

260. Which of the following School challenges the authority of the Vedas as well as the hegemony the Brahman priests?

- a) Charvaka Philosophy of Materialism
- b) Ajivika School
- c) Purva Mimamsa
- d) Vedanta

Ans: A

261. Which School is originally called Sanatana Dharma?

- a) Nastika School
- b) Astika School
- c) Both of the above
- d) None of the above

Ans: B

262. Which of the following statement(s) is/are correct explanation of the the term "Jiva"?

- a) It is that state in which puruṣa is bonded to prakṛti in some form.
- b) To realize the puruṣa distinct from prakṛiti.
- c) It is immutable, eternal and conscious by its very nature.
- d) It evolves from subtle to gross, and manifests the visible world.

Ans: A

263. Select the correct statement (s) related to the Yoga

- I. Yoga accepts the twenty five principles of Sankhya school along with Isvara or God as the twenty-sixth. So it is more theistic.
- II. Yoga gives the practical steps to realize the puruṣa distinct from prakṛiti.
- III. Yoga system was founded by Hiranyagarbha and later systematized and propagated by the sage Patanjali.

Code:

- a) Only I
- b) Only II
- c) Both I & II
- d) I, II & III

Ans: D

264. Consider the following statement (s) is/are related to the Nyaya School

- I. Its methodology is based on a system of logic that has subsequently been adopted by the majority of the Indian schools, in much the same way as Aristotelian logic has influenced Western philosophy.
- II. The goal is to quiet one's mind and achieve kaivalya (solitariness or detachment).

Which of the above statement (s) is/are correct?

- a) Only I
- b) Only II
- c) Both I & II

d) Neither I nor II

Ans: A

265. Which of the following School accepted perception and inference as sources of valid knowledge?

- a) Nyaya School
- b) Vaisheshika
- c) Both A & B
- d) None of the above

Ans: B

266. Which of the following School is known as Lokayata. a term means Naturalist(Sanskrit) or Worldly (Pali)?

- a) Ajivika School
- b) Astika School
- c) Charvaka school
- d) None of the above

Ans: C

267. The four main divisions of philosophy are metaphysics, epistemology, axiology, and\_.

- a) bioethics
- b) logic
- c) aesthetics
- d) categorical logic

Answer: b. logic

268. The study of reality in the broadest sense, an inquiry into the elemental nature of the universe and the things in it, is known as\_\_.

- a) metaphysics
- b) epistemology
- c) quantum physics
- d) axiology

Answer: a. metaphysics

269. Questions like "What is knowledge?" and "What is truth?" are mainstays in the branch of philosophy known as\_.

- a) logic
- b) metaphysics
- c) epistemology
- d) aesthetics

Answer: c. epistemology.

270. Who postulated "Religion began as early humans responded to the forces of nature (the sun, moon, tides, winds, etc.) by personifying them and attaching myths and rituals to them"?

- a) Max Muller
- b) Sigmund Freud
- c) Ninian Smart
- d) Peter Berger

Answer: a. Max Muller

271. Which of these scholars advocated that religion should be examined by how it handles certain archetypal notions such as the profane and sacred?

- a) Ninian Smart
- b) Mircea Eliade
- c) Emile Durkheim
- d) Paul Tillich

Answer: b

272. The visions of the Prophet Muhammad, the conversion of Paul, and the enlightenment of the Buddha are all examples of which dimension of religion?

- a) the mythic/narrative dimension
- b) the practical/ritual dimension
- c) the experiential/emotional dimension
- d) the doctrinal/philosophical dimension

Answer: c. the experiential/emotional dimension.

273. Which of these religious traditions teaches the supreme importance of harmony in the family, community, and state?

- a) Confucianism
- b) Judaism
- c) Hinduism
- d) Christianity

Answer: b

274. Who argued that "Religion arose from the early human's attempts to control nature through magic"?

- a) Karl Marx
- b) James Frazer
- c) Sigmund Freud
- d) Max Muller

Answer: b

275. Who theorized religion in this way: "People have imagined religion by projecting human desires, needs, or attributes onto imaginary deities"?

- a) Karl Marx
- b) Paul Tillich
- c) Ludwig Feuerbach
- d) Karl Barthes

Answer: c

276. Which of these is not one of the definitions for religion listed in the textbook?

- a) belief in Spiritual Beings
- b) what the individual does with his own solitariness
- c) that which is of ultimate concern
- d) belief in God

Answer: d

277. Merlin Stone did not base her claims about ancient religion on which of these?

- a) archeological evidence
- b) gods and goddesses of the oldest living religious tradition, Hinduism, in India
- c) ancient Sumerian text
- d) Wiccan traditions

Answer:d

278. Which scholar proclaimed religion is "the opium of the people"?

- a) Sigmund Freud
- b) Emile Durkheim
- c) Karl Marx
- d) Merlin Stone

Answer:c

279. Which of these best describes the noetic quality?

- a) love
- b) time
- c) knowledge
- d) emotion

Answer:c

280. William James studied which aspect of religion?

- a) religious experience
- b) religious symbolism
- c) religious myths
- d) religious rituals

Answer:a

281. The best method used by scholars to compare religions is to find

- a) similar symbols in each tradition that connote different meanings.
- b) the most similarities between two traditions and ignore the differences.
- c) common creation stories.
- d) dynamic equivalents between traditions.

Answer:d

282. Stories that are recognized by the relevant body of the faithful are considered

- a) myths.
- b) folklore.
- c) beliefs.
- d) canonical.

Answer:a

283. Which of these religious traditions teaches the supreme importance of harmony in the family, community, and state?

- a) Confucianism
- b) Judaism
- c) Hinduism

d) Christianity

Answer:a

284. Which of these is a way to study and write about religion that is considered a religious endeavor?

- a) theology
- b) moral philosophy
- c) religious studies
- d) biblical criticism

Answer:a

285. The material dimension includes which one of these?

- a) natural features of the world
- b) the doctrines of believers
- c) the act of meditation
- d) myths of creation

Answer: a. natural features of the world.

286. The Hindu Trinity does not include which of these gods?

- a) Brahma
- b) Vishnu
- c) Shiva
- d) Ganesh

Answer: d. Ganesh

287. The belief that everything (both living and inanimate) is animated by spirits is called

- a) Holy Ghost.
- b) Wicca.
- c) Animism.
- d) nature religion.

Answer: c. Animism..

288. Which of these is not one of the seven dimensions of religion?

- a) the practical dimension
- b) the emotional dimension
- c) the divine dimension
- d) the mythic dimension

Answer: c. the divine dimension.

289. The academic study of religion, called religious studies,

- a) remains neutral regarding the truth or justification of religious claims.
- b) makes claims about the veracity of each religion's ritual practices.
- c) is the same thing as theology.
- d) advocates for a secular society.

Answer: a. remains neutral regarding the truth or justification of religious claims..

290. Reasons for the spread of Buddhism included

1. Simplicity of religion

2. Special appeal for the down-trodden.
3. Missionary spirit of the religion
4. Use of local language.
5. Reinforcement of vedic spirit by philosophers.

Select the correct answer from the codes given below:

- a) 1, 2 and 3
- b) 2, 3 and 4
- c) 1, 2, 3 and 4
- d) 2, 3, 4 and 5

Answer: C

291. Who among the following was associated with formulation of the basic ideas of the Mahayan Buddhism?

- a) Nagarjuna
- b) Kashyapa Matanga
- c) Menander
- d) Kanishka

Answer: A

Solution :The fathers of the Mahayana were considered to be Nagarjuna, who lived between the first and second centuries of our era and founded what is known as the Madhyamika philosophy or philosophy of the Middle Way and Maitreyanatha who lived in the third century of our era. Maitreyanatha's philosophy was developed in the fourth century by two brothers, Asanga and Vasubandhu and was known as Yogacara or Vijñānavada philosophy.

292. In Buddhism, what does Patimokkha stand for? [2008-II]

- a) A description of Mahayana Buddhism
- b) A description of Hinayana Buddhism
- c) The rules of the Sangha
- d) The questions of King Menander

Answer: C

293. The \_\_\_\_\_ is/are at the heart of Buddha's system of teachings about the true nature of reality and how to live correctly to transcend it.

- a) Three Jewels
- b) Sixfold Path
- c) Four Baskets
- d) Four Noble Truths

Answer: d. Four Noble Truths.

294. In Buddhism, what does Patimokkha stand for? [2008-II]

- a) A description of Mahayana Buddhism
- b) A description of Hinayana Buddhism
- c) The rules of the Sangha
- d) The questions of King Menander

Answer: C

Solution :Pathnokka stands for the rules of the Sangha. Buddha Dhamma and Sangha are the three Jewels of Buddhism.

295. The \_\_\_\_\_ is/are at the heart of Buddha's system of teachings about the true nature of reality and how to live correctly to transcend it.

- a) Three Jewels
- b) Sixfold Path
- c) Four Baskets
- d) Four Noble Truths

Answer: d. Four Noble Truths.

296. Which of these is not included in the Four Noble Truths?

- a) Life is suffering.
- b) To banish suffering, banish desires.
- c) Suffering is caused by desires.
- d) Suffering is the righteous path.

Answer: d. Four Noble Truths

297. Which of these is the Second Noble Truth?

- a) The cause of suffering is selfish desire for things that we can never truly obtain.
- b) Life is suffering.
- c) Suffering is caused by karma accumulated before rebirth.
- d) The Eightfold Path is (pauses to google Eightfold Path) the heart of Buddhist practice.

Answer: d. Suffering is the righteous path..

298. Generally \_\_\_\_\_ holds that nirvana is attained through personal effort, with little or no help from Buddhas, bodhisattvas, or teachers.

- a) Mahayana
- b) Zen
- c) Theravada
- d) Koan

Answer: a. The cause of suffering is selfish desire for things that we can never truly obtain..

299. Which of these terms denotes Buddhism's core teachings systematized in the Four Noble Truths and the Noble Eightfold Path?

- a) samsara
- b) dharma
- c) moksha
- d) yoga

Answer: b. dharma.

300. The concept of 'Triratna' is the contribution of

- a) Charvaka
- b) Jainism
- c) Buddhism
- d) Nyaya

Ans: b

301. Which among the following is not a sect of Buddhism

- a) Svetambara
- b) Hinayana
- c) Mahayana
- d) Both Hinayana and Mahayana

Ans: a

302. Which among the following is a sect of Jainism

- a) a.Svetambara
- b) Digambara
- c) Both
- d) None

Ans: c

303. The liberated Soul according to Jain Philosophy is called

- a) Sarvajna
- b) Sarvatman
- c) Sarvasaktan
- d) Sarvavyapi

Ans: a

304. Which among the following is not a quality of Mukta

- a) Infinite Power
- b) Infinite Bliss
- c) Infinite Life
- d) Infinite Knowledge

Ans: c

305. Which among the following is not a way towards salvation according to Jainism

- a) Samyak Jnana
- b) Samyak Buddhi
- c) Samyak Darsana
- d) Samyak Charitra

Ans: b

306. Which among the following is not come under 'Triratna

- a) Samyak Jnana
- b) Samyak Dhyana
- c) c.Samyak Darsana
- d) Samyak Charitra

Ans: b

307. Nyaya System is

- a) Orthodox
- b) Heterodox
- c) Both
- d) None

Ans: a

308. Vaisesika System is

- a) Orthodox
- b) Heterodox
- c) Both
- d) None

Ans: a

309. The Term 'Nyaya' means

- a) Word
- b) Number
- c) Argumentation
- d) Particularity

Ans: c

310. The Term 'Vaisesika' means

- a) Vishayam
- b) Number
- c) Argumentation
- d) Particularity

Ans: d

311. Which one among the following is called 'Indian Logic'

- a) Nyaya
- b) Vaisesika
- c) Sankhya
- d) Yoga

Ans: a

312. Who among the following is the founder of Nyaya System

- a) Pathanjali
- b) Jaimini
- c) Gautama
- d) Kanada

Ans: c

313. Who among the following is the founder of Vaisesika System

- a) Pathanjali
- b) Jaimini
- c) Gautama
- d) Kanada

Ans: d

314. Who is the author of 'Nyaya Sutra'

- a) Vatsyayanan
- b) b.Prasasthpada
- c) Kapila
- d) Gautama

Ans: d

315. Who wrote 'Nyaya Bhashya'

- a) Vatsyayana
- b) b.Prasasthpada
- c) Kapila
- d) Gautama

Ans: a

316. Svadharma is advocated by

- a) Krishn.a
- b) Rāvan.a
- c) S tā
- d) All the above

Answer: (A)

317. Which one of the following is known as Triratna?

- a) Shravan. a, Manana, Nididhyāsana
- b) Darshan, J~nāna, Chāritra
- c) Maitr, Kāmnā, Muditā
- d) Sagha, Dhamma, Buddha

Answer: (B)

318. R. ta of the Vedic world was closer to

- a) Legal order
- b) Truth
- c) Karma
- d) Social order

Answer: (B)

319. Brahmavihāras include the following

- a) Maitr, Karun.ā, Vinaya, Upeks. ā
- b) Maitrī, Karun.ā,, Muditā, Upeks. ā
- c) Vinaya, Karun. a, Muditā, Upeks. ā
- d) Maitr, Muditā, Upeks. ā, Vinaya

Answer: (B)

320. The system which holds the view that scripture is stronger than perception is

- a) Jaina
- b) Bauddha
- c) Advaita Vedāntā
- d) Nyāya

Answer: (C)

321. The enjoyment of fruits of the Karma that not yet has been started is called

- a) Sa~ncītā Karma
- b) Sa~nc-iyamāna Karma
- c) Prārabdha Karma

d) Anārabdha Karma

Answer: (A)

322. Deva a can be repaid by

- a) Performing yaj~na
- b) Giving birth to a son
- c) Both (A) & (B)
- d) Neither (A) nor (B)

Answer: (A)

323. Which one of the following systems of Indian Philosophy designated Mok a as Nirvana?

- a) Jainism
- b) Buddhism
- c) Yoga
- d) Samkhya

Answer: (B)

324. Which one of the following is known as '\_\_\_triśara a' according to Buddhism?

- a) Sravana, Manana, Nididhyasana
- b) Darshana, Jnāna, Caritra
- c) Maitri, Karuna, Mudita
- d) Buddha, Dhamma, Sa gha

Answer: (D)

325. All the following orders of thePurusharthas are wrong except:

- a) Dharma, Artha, Kāma, Mok a
- b) Artha, Kāma, Mok a, Dharma
- c) Dharma, Kāma, Artha, Mok a
- d) Dharma, Mok a, Artha, Kāma

Answer: (A)

326. Hatred and attachment according toYoga School of Philosophy belong to

- a) Klesas
- b) Cittabhumis
- c) Yama
- d) Niyama

Answer: (A)

327. What is the moral criterion selectedby Charvaka?

- a) Intuitive
- b) Rationalistic
- c) Hedonistic
- d) Eudaemonistic

Answer: (C)

328. A man who seeks pleasure and fails to get it, is facing the paradox of

- a) Eudaemonism
- b) Hedonism

- c) Rigourism
- d) Altruism

Answer: (B)

329. Which one is the correct sequence of the four kinds of purusarthas?

- a) Artha, Kama, Dharma, Mok. sa
- b) Kama, Artha, Dharma, Mok. sa
- c) Dharma, Artha, Kama, Mok. sa
- d) Mok. sa, Dharma, Artha, Kama

Answer: (C)

330. The correct sequence of Asramadharmas is

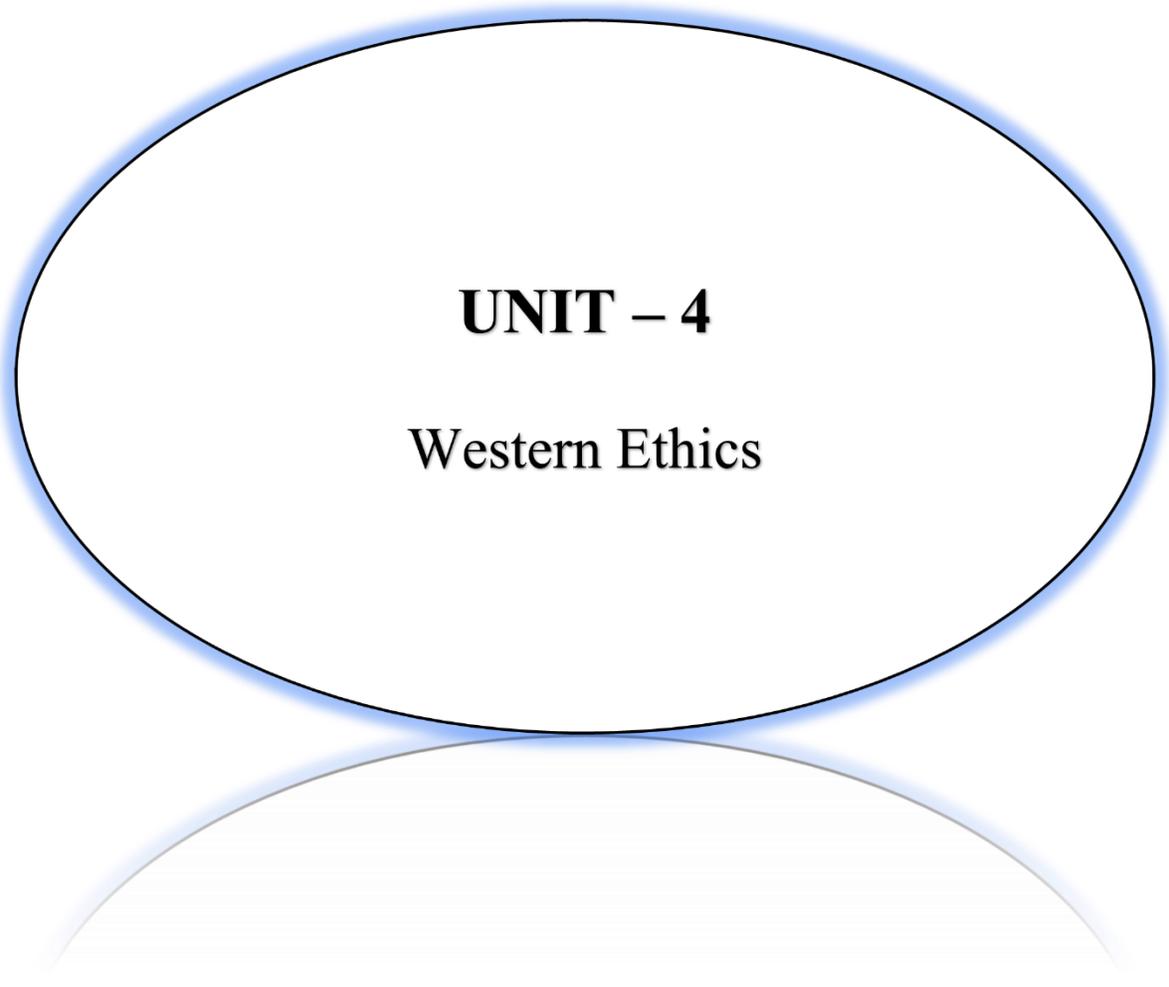

- a) Garhastha, Vanaprastha, Brahmacharya, Sannyasa
- b) Vanaprastha, Garhastha, Brahmacharya, Sannyasa
- c) Brahmacharya, Garhastha, Vanaprastha, Sannyasa
- d) Brahmacharya, Vanaprastha, Sannyasa, Garhastha

Answer: (C)

331. The notion of Brahmvihara is found in

- a) Advaita Vedanta
- b) Dvaita Vedanta
- c) Both Dvaita and Advaita Vedanta
- d) Buddhism

Answer: (D)

**UNIT - 4**

Western Ethics

## **Concept of Good**

Good is anything that fulfills a need or satisfies a desire. Good can be more than one. Certain goods such as bodily goods, economic goods, and social goods are means to some higher goods. In a hierarchy of goods, at the top is the highest good, which is the ultimate end of human activity. To G.E. Moore, Good is indefinable because it is a simple notion and has no parts. Only that which has parts is definable. In Ethics, the word good is used both as an Adjective and as a Noun.

The word 'Good' is derived from the German word 'Gut'. It means anything valuable, useful or serviceable for some end or purpose, therefore desirable. As the term 'good' is too wide signifying anything that is desirable, one may use the expression 'morally good' to signify moral qualities. Hence, in ethics the word 'good' is used to express moral qualities.

It should be stated in this connection that the word 'good' is used both as an adjective and also as a noun. Thus when one speaks of 'material and immaterial goods', 'a relative good' and 'the absolute or the highest good' one evidently uses the word 'good' as a noun. Good/ used in this way implies 'an object of desire or pursuit', 'anything that is sought', e.g., wealth, health, courage etc.

In Ethics, a distinction is drawn between good as an end and good as a means. If, for instance, happiness be good, then wealth and health as means of attaining happiness are also good. Again, if health be a good, then regular exercise, regulation of taking diet, taking of good medicine are also good as means of securing good health. It will be easy now to understand the distinction between a relative good and the absolute or the highest good of man. A 'relative good' is a kind of good as a means, i.e., it is an object which is desired, not for itself, but for the sake of an ulterior end or good which, again, may be relative to a still higher end, and so on. 'Absolute good' means "the good which is desired for its own sake, and is not subordinate to any ulterior good." In short, it is not the concept of good as a means to a higher good; it is however, the highest good- the ultimate end of human activity. Every voluntary action is relative to an end or object of desire. And among ends, there is gradation, culminating in the supreme end or the highest good which is the goal of life.

Thus, the ultimate, absolute or highest good of man is intrinsically good in the sense that the same is desired for its own sake, and not desired for the sake of anything else. In other words, absolute good is not a means to attain any higher end or good. The highest good is the absolute good i.e. the supreme end. The subordinate goods are instrumental goods or relative goods.

## **G. E. MOORE'S CONCEPT OF GOOD AS INDEFINABLE**

G.E. Moore in his book 'Principia Ethica' sharply distinguishes between two questions of Ethics viz., (I) What is good, in the sense of 'that what is good' and (II) What is good, in the sense of 'goodness'. One must be careful not to confuse 'the good' or 'the things that are good' with goodness or the property of being good.

The meaning of 'good' to G.E. Moore involves the definition of good. According to Moore, a definition "states what are the parts which invariably compose a certain whole" and in this sense 'good' cannot be defined 'because it is simple and has no parts.' It is evident that the object of definition in Moore's analysis is not the word 'good' but the extra linguistic entity 'goodness.' The word 'Good' is indefinable because the quality 'goodness' is a simple, unanalysable and non-complex property.

According to Moore, Goodness is a non-natural quality. He says, it is completely wrong to define 'good' in terms of natural quality. Moore argues that to explain the meaning of good by reference to particular modes of existence or action or supersensible things, which may be more or less good, is to commit the 'naturalistic fallacy.' Hedonists commit this fallacy because they explain the meaning of 'good' by reference to pleasure which is a particular mode of experience. Pleasure may be more or less good, but it does not enable one to know what is really meant by good. 'Good' must be distinguished from things that are good. It may be mentioned that Naturalistic fallacy consists in identifying good with some natural property of what has goodness.

It may be pointed out that when Moore uses the word 'definition,' he means 'analysis.' If something is definable then that thing is analysable. If a thing is analysable then the thing must have certain parts. But one cannot name the parts of 'good.' It is so because "good" has no parts. According to Moore, "good" is a simple notion just as 'yellow' is a simple notion. Just as one cannot explain to anyone who does not already know it, what yellow is, so one cannot explain by any manner or means what good is. Good denotes a simple and undefinable quality. Goodness has a unique meaning; it is simply goodness. Definitions are only possible when the object of notion in question is something complex. One can give definition of a horse, because a horse has many different properties and qualities, all of which one can enumerate. But 'good' is not complex. It is a 'simple' notion composed of no parts, and so unanalysable. Unanalysable things are undefinable. Hence good is undefinable. Moore says that if a person is asked the question, 'how is good to be defined' - then his answer would be that it cannot be defined, and that is all that the person would have to say about it.

According to Moore, though goodness is undefinable yet it is possible for one to say which things are good. Though yellowness is undefinable yet, it is possible for one to say which things are yellow. Moore tries to offer proof for the undefinability of 'good' by means of a dilemma. Either 'good' is undefinable, or it is not undefinable. If it is not, it must be either a complex word the correct analysis of which defies a common agreement, or the word must mean nothing at all. Moore offers a particular argument to establish that 'good' is undefinable. This argument is called the open question argument. If one tries to define good as X, then it is always possible for one to raise the further question "Is X good"? It means good remains undefinable.

Moore's argument, however, could not satisfy all moral philosophers, Goodness, according to Moore, is a simple, unanalysable, non-natural property which is known in some kind of non-sensuous intuition. But the difficulty is that if anybody says that he does not have any such unique and simple object before his mind when he thinks of good, then one cannot refute him. By relying on intuition Moore makes ethical reasoning virtually impossible. Moore's view of goodness, therefore, has not satisfied all philosophers.

## **CONCEPT OF DUTY**

The word 'duty' means what is due, i.e., what one is bound to do, or under an obligation to do. In other words, a duty means what one ought to perform as a moral being.

The term 'duty' is sometimes used in a narrower sense to mean simply what is legally binding or obligatory upon an individual, and an individual is said to do more than his duty if he does more than what he is legally bound to do. In Ethics, however, the word 'duty' is taken in a wider and higher sense to signify every right act which one ought to perform, whether determinate or indeterminate, whether legally obligatory or not. Hence, from strictly moral or ethical point of view,

an individual can never be said to do more than his duty.

Duty comes to an individual with a claim; it is a thing laid upon an individual to do whether he likes it or not. A duty may thus be defined as the obligation of an individual to satisfy a claim made upon him by the community, or some other individual member or members of that community, in the name of common good.

If taken in a wide sense, the notion of duty is essentially implied in every system of morality and every ethical theory.

In Greek Ethics, moral life for the most part is presented as a good to be realised or a type of virtue or excellence to be attained. A man must be courageous, temperate and just, because in no other way can be achieved his good or true happiness. So long as the mode of presenting the moral life prevailed, the element of duty was completely absorbed into, and subordinated to, the thought of good or achievement.

It was only when, in Stoicism, (a school of thought whose famous maxim is 'Live according to Nature') this good was conceived to be determined by, and to be realized in, obeying a cosmic law of universal reason that the notion of duty emerged into a new distinctness. It was when morality came to be regarded mainly in the light of conformity to a law that the notion of duty became prominent. The Stoics asserted that virtue alone is good and man must be virtuous not for the sake of pleasure but for the sake of duty.

Kant says that an action has no moral worth unless it is done from a sense of duty. i.e. in the consciousness of its rightness. To Kant, nothing is absolutely good in this world or out of it except a good will. A will is good when it is determined by respect for the moral law, or the consciousness of duty. An act that is done from inclination, say from self-love or even sympathy, is not moral. What a man does from inclination to-day, he may likewise from inclination refuse to do to-morrow. The commands of duty do not wait upon man's inclination, or strike a bargain with man, the Imperative of duty in Kant's terminology, is a Categorical Imperative. The categorical imperative commands categorically, unconditionally, it does not say: Do this if you would be happy or successful or perfect, but: Do it because it is your duty to do it. Thus, according to Kant, actions are right only when they are done for the sake of duty - only in so far as they are performed for the sake of their rightness. 'Duty for duty's sake is the true rule of life-Duty should be performed whatever may happen.

This law or categorical imperative is a universal and necessary law, "a-priori", inherent in reason itself. It is present in the commonest man, though he may not be clearly conscious of it; it governs his moral judgments; it is his standard or criterion of right and wrong.

### **Classification of Duties**

When the various duties are regarded in an objective way, it is natural to seek for some kind of classification. Although it is difficult to find any satisfactory scheme of division, duties may commonly be classified into three classes.

1. Duties to self or self-regarding duties.
2. Duties to others or other-regarding duties.
3. Duties to God.

Duties to self or self-regarding duties: The term 'self-regarding duties' is to be taken in the sense of duties to oneself. It includes physical, economic, intellectual, aesthetic and moral duties. Physical duty means self-preservation, care for health and recreation. One should enjoy sound health which is necessary for moral strength.

Economic duty is to treat wealth which is an economic value, as an indispensable means to the attainment of higher values. One should earn a decent living by acquiring wealth. But one should not treat wealth as an end in itself but as a means to attain higher intrinsic values.

Intellectual duty is the cultivation of the intellect and acquiring knowledge. One should not leave the intellect undeveloped, because the development of intellect is indispensable for the development of personality.

Aesthetic duty is the cultivation of aesthetic taste by appreciating and creating beauty. Moral duty is to control one's instincts, appetites, desires and passions. Self-control and self-regard constitute one's moral duty. Thus, one should treat intellectual, aesthetic and moral values as intrinsic values. These are the duties to the self. Duties to others or Other regarding duties: Other-regarding duties include duties to the family, other persons in society, country and to humanity. It also includes duties to animals and plants i.e. environment.

Duties to the family mean that one should show love and respect to parents, show love to one's children by taking care of their health, education and character. Husband and wife should love and respect each other to make a good family.

Duties to society include mainly veracity, equity and benevolence. Veracity is truthfulness. One should speak the truth. Equity means justice and fair dealing. One should respect the personality of others. One should not interfere with other's freedom and property, and should not harm others by thought, word and deed. Benevolence means showing compassion to others in times of distress. One should do one's very best to relieve their distress. These are duties to others in society.

Duties to the country are to cultivate patriotism. One should show love for the country and should try one's best to improve its condition and feel glory in its achievements.

Duties to humanity is to show love to all human beings. One should cast off narrow patriotism, colour prejudice, and racial superiority. Duties to animals include taking care of domestic animals, giving them proper food and shelter and not being cruel to them. Duties to plants include taking care of plants by watering them and giving proper nourishment.

Duties to God: Worshipping God with single minded devotion and dedicating one's action to Him. But love for God should be expressed in terms of love for mankind.

### **Conflict of Duties**

The very classification of duties into distinct classes seems to imply that they may be mutually opposed and may at times come into conflict with one another. And at such times, we are bound to be confused. For example, the duties of benevolence, justice or veracity (truthfulness). It is our duty to be just, benevolent, truthful, law-abiding, courteous. But there are occasions when it is felt that

to tell the truth will amount to treachery, or lead to murder. In fact, the various moral principles, such as justice and mercy, benevolence and veracity, may conflict with one another. Duty to the family may conflict with duty to the state, or duty to the church (or religious institutions) or duty to God. This may be called conflict of duties.

The 'conflict of duties' arise when the mind is perplexed as to 'which duty is to be done' It is sometimes difficult to resolve such a conflict. One is pulled, so to speak, in opposite directions by rival claims of different moral principles or rules. This is also called 'moral conflict' or 'perplexity of conscience'.

It may be stated in this connection that 'moral conflict' or 'perplexity of conscience' arises from various sources. It sometimes arises from the influence of passions and inclinations. If a man or a woman is not inclined to help another, he or she may question the validity of the act. In many cases, perplexity arises because one is unable to understand "the precise character of a situation or the true scope and spirit of moral principles'.

How, then, can such cases of perplexity be settled? No definite rules can be laid down with regard to this. Moral problems should be solved by reference to concrete circumstances. Under every group of circumstances which forms a field of action there is but one act which is good and obligatory. As Prof. T.H.Green remarks, "There is no such thing really as a conflict of duties. A man's duty under any particular set of circumstances is always one, though the conditions of the case may be so complicated and obscure as to make it difficult to decide what the duty really is". (Prolegomena to Ethics p-355) Rightly understood, a duty is but one under a definite set of circumstances. One should always honestly try to decide questions of duty by reference to concrete circumstances.

Whenever there seems to be a conflict of duties one should fall back upon the great fundamental moral law. The fundamental moral law is 'Realise the rational self.' The particular laws are only fragmentary aspects of this fundamental law. Self-realisation is one's supreme duty; hence it is in the light of this that one should find out what course one should follow when the rules come into conflict.

## **CONCEPT OF VIRTUE**

The English word 'virtue' is derived from Latin Vir, a man or hero. It corresponds to Latin Virtus and Sanskrit Virya, meaning manliness, bravery, power, energy or excellence. Though the word virtue was used for excellence of any kind, generally the excellence referred to is an excellence belonging to man (man includes woman as well), so that the virtues may be described as the forms of human excellence. In ethics, 'virtue' is used with two different meanings –

- (a) A virtue is a quality of character, a general disposition or inclination of the self, to adapt its action to moral law. Virtue refers to the inner character and its excellence.
- (b) A virtue is also a habit of action corresponding to the quality of character or disposition. Regarding the concept of virtue different views have been put forward by different philosophers.

They are discussed below –

Socrates Concept of Virtue: To Socrates, 'Virtue is knowledge' - If a person fully understands the nature of the good, he could not fail to pursue it. On the other hand, if a person did not fully

understand the nature of the good he could not be moral except by accident. So, unless a man knows what virtue is, unless he knows the meaning of self-control and courage and justice and piety and their opposites, he cannot be virtuous; but by knowing what virtue is, he will be virtuous. Thus, knowledge constitutes the essence of virtue, according to Socrates "No man is voluntarily bad or involuntarily good" "No man voluntarily pursues evil or that which he thinks to be evil. To prefer evil to good is not in human nature. "

To Socrates, knowledge of right and wrong was not a mere theoretical opinion but a firm practical conviction. It is a matter not only of the intellect, but of the will. The tendency of all honourable, useful and good actions is to make life painless and pleasant. To Socrates, Virtue and true happiness are identical.

**Plato's Concept of Virtue:** Like Socrates, Plato also says that 'Virtue is knowledge'. The individual is wise in whom reason rules over the other impulses of the soul. The ideal, therefore, is a well-ordered soul, one in which the higher functions rule the lower functions one which exercises the virtues of wisdom, courage, self-control and justice. A life of reason, which means a life of virtue, is the highest good. Happiness attends such a life, the just man is after all the happy man. Pleasure, however, is not an end in itself; - it is not the highest factor in the life of the soul, but the lowest.

In Plato's ethical teachings, he lays emphasis on the rational element in the soul. He believes that the irrational aspect should not only merely to be subordinated, but to be cast out. So, you have found the views of Socrates and Plato that 'Virtue is knowledge or wisdom'. This cannot however, be fully accepted. Knowledge of the good does not always lead to the choice of the good. Knowledge does not constitute virtue though it is an indispensable element of it.

**Aristotle's Concept of Virtue:** Aristotle defined virtue as a habit of choice, characteristic of which lies in the observation or of moderation of the mean relative to the abilities or circumstances of the individual concerned, as it is determined by reason or as the practically prudent man would determine it.

Many virtues stand midway between two extreme vices, one of which is an excess and the other a deficiency in the proper trait. The virtue of courage, for example, is the middle position or the "golden mean" between rashness and cowardice, and liberality is the middle position between extravagance and miserliness. Virtue does not consist in the choice of the absolute Mean, but of Mean relative to the individual's ability, temperament and circumstance.

There is a great deal of truth in Aristotle's view. The essence of Virtue lies in harmony between reason and sensibility. It lies in habit of taking the middle course. But this is a general statement. It requires modification to suit particular circumstances. Moderation under all circumstances is as much a vice as immoderation in all cases. Therefore, Virtue cannot be the golden mean.

At first sight it appears that the views of Socrates and Plato, 'Virtue is knowledge' is opposed to that of the view of Aristotle, 'Virtue is the habit of choosing and performing right actions.' But the habit of choosing and performing right actions presupposes knowledge of the good and duties in concrete situations. Socrates and Plato rightly say that Virtue is knowledge. Aristotle is also right when he says that Virtue is habit. Knowledge is meaningless if it does not express itself in actions. Again, knowledge is necessary for the performance of any action. Thus Virtue implies knowledge

or moral insight and a habit of performing duties. Prof.

John S. Mackenzie rightly observes, 'Virtue is a kind of knowledge, as well as a kind of habit.' (A Manual of Ethics, P.71). However, "Virtue is its own reward", even though there are different concepts of Virtues.

## **Cardinal Virtues**

Cardinal Virtues are the fundamental virtues on which the other virtues are based. The word 'Cardinal' is a derivative of the Latin word 'Cardo' meaning a hinge and the cardinal virtues are the virtues by which the moral life is supported by its hinges.

Plato's cardinal virtues- Plato recognised four cardinal virtues. Wisdom, Courage, Temperance and Justice. Plato, in whose 'Republic' they first definitely appear, implies that they were already traditional in his day. Plato attempts to show that these virtues are primary or 'cardinal' because they correspond to the natural constitution of the soul, and therefore form the four sides of a symmetrical character. As the soul is composed of three powers- intellect, feeling and will- so corresponding to these are the virtues of wisdom, temperance and courage. These three qualities, however, have reference more particularly to the individual life. But as man is also part of an organism, justice is conceived as the social virtue- the virtue which regulates the others.

Wisdom: Wisdom is the Virtue of the rational part of the soul. It is an all- embracing virtue. It is moral insight into the duties in a concrete situation and performing them. It is practical wisdom which is implied in all moral actions. However, in a wide sense, wisdom should include care, foresight, prudence and decisiveness of choice.

Courage: Courage is the virtue of the emotional part of the soul. Courage is the power of resisting the fear of pain and the temptation of pleasure. It is not the mere facing of pain that is virtue, but the doing of what is right in the face of pain. Courage is the special virtue of the fighting class. In a wider sense courage should include both valour and fortitude. Valour is active courage, which forges ahead and braves danger and pain. Fortitude is passive courage which endures inevitable sufferings without wavering. Courage should include perseverance.

Temperance: Temperance is the Virtue which offers resistance to the allurements of pleasure. It is self-restraint or self-control. It denotes the will to choose the higher values and to reject the lower bodily values. Temperance is not merely a negative virtue engaged in repressing the appetites. Temperance does not merely restrain passions and desires, but it takes from reason guidance as to how far these desires should be satisfied. Temperance demands a reasonable moderation or a happy blending of the domination of reason with the other tendencies of human nature. Temperance is supremely a virtue which gives beauty to the moral life.

Justice: Justice is the harmonious functioning of intellect, emotion and desire under the guidance of reason. Wisdom, courage, and temperance are primarily virtues of an individual man. Justice is primarily a virtue of a society. In a good society justice demands that the lame man, however unworthy he is morally or however little he is able to do physically for the common good, should be provided with an artificial leg. Justice is impartiality to all in the face of personal prejudice, preference or self-interest. It comprehends all social virtues. Justice is the performance of social duties. It should include honesty, fidelity, benevolence, love, courtesy, cheerfulness and good humour. Impartiality precedes benevolence. These are social virtues. All virtues are forms of

practical wisdom. Plato's cardinal virtues can be adapted to the requirements of the modern society.

## **The Concept of Rights Rights and Justice**

Rights and justice are not really distinct issues, but the use of the term "rights" emphasizes (at least at the start) a different dimension from the use of the term "justice." When we mention justice we are usually concerned with how (according to what pattern) valuable things (benefits) and their opposites (burdens) are distributed. When we talk about rights, we think first of all of entities, usually human individuals, who supposedly possess or bear those rights.

John Rawls' principles of justice concern the distribution of benefits and burdens among individuals in a society (the liberties, for instance, are benefits while having to pay taxes would be a burden).

The link between rights and justice is duties. Principles of justice prescribe the ways in which benefits and burdens should be distributed. At one level, these are duties of public officials, but they also provide guidelines for laws, which the rest of us have duties to obey. Rights, as we shall see, can be explained in terms of the duties of others to the right-holder.

## **Definition of Rights**

A right is said to be an entitlement or justified claim to a certain kind of positive and [or?] negative treatment from others, to assistance from others or non-interference from others. (Many moral philosophers would put "or" in this definition after "positive," but others, with whom I agree, would put "and." See below: "the Alleged Distinctions between Negative and Positive Rights.")

A right is described as an entitlement or justified claim to a certain kind of positive and negative treatment from others, to support from others or non-interference from others. In other words, a right is something to which every individual in the community is morally permitted, and for which that community is entitled to disrespect or compulsorily remove anything that stands in the way of even a single individual getting it. Rights belong to individuals, and no organisation has any rights not directly derived from those of its members as individuals; and, just as an individual's rights cannot extend to where they will intrude on another individual's rights, similarly the rights of any organisation whatever must yield to those of a single individual, whether inside or outside the organisation. Rights are those important conditions of social life without which no person can generally realize his best self. These are the essential conditions for health of both the individual and his society. It is only when people get and enjoy rights that they can develop their personalities and contribute their best services to the society.

In simple words, rights are the common claims of people which every cultured society recognizes as essential claims for their development, and which are therefore enforced by the state.

1. According to Laski, "Rights are those conditions of social life without which no man can seek in general, to be himself at his best."
2. T. H. Green explained that "Rights are powers necessary for the fulfilment of man's vocation as a moral being."
3. Beni Prasad stated that "Rights are nothing more nor less than those social conditions which are necessary or favourable to the development of personality"

Other moral theorists like Isaiah Berlin defines rights in terms of positive liberties and negative

freedoms. A positive right is an entitlement to; A right to free expression, for instance, entitles one to voice opinions publicly. A negative right is a freedom from; Freedom of person is a right to be free of bodily interference. Most rights are both positive and negative.

## **Main features of Rights:**

1. Rights exist only in society. These are the products of social living.
2. Rights are claims of the individuals for their development in society.
3. Rights are recognized by the society as common claims of all the people.
4. Rights are rational and moral claims that the people make on their society.
5. Since rights are here only in society, these cannot be exercised against the society.
6. Rights are to be exercised by the people for their development which really means their development in society by the promotion of social good. Rights can never be exercised against social good.
7. Rights are equally available to all the people.
8. The contents of rights keep on changing with the passage of time.
9. Rights are not absolute. These always bear limitations deemed essential for maintaining public health, security, order and morality.
10. Rights are inseparably related with duties. There is a close relationship between them "No Duties No Rights. No Rights No Duties." "If I have rights it is my duty to respect the rights of others in society".
11. Rights need enforcement and only then these can be really used by the people. These are protected and enforced by the laws of the state. It is the duty of a state to protect the rights of the people.

## **Types of Rights:**

### **1. Natural Rights:**

Many researchers have faith in natural rights. They stated that people inherit several rights from nature. Before they came to live in society and state, they used to live in a state of nature. In it, they appreciated certain natural rights, like the right to life, right to liberty and right to property. Natural rights are parts of human nature and reason. Political theory maintains that an individual enters into society with certain basic rights and that no government can deny these rights. In classical political philosophy "natural right" denotes to the objective rightness of the right things, whether the virtue of a soul, the correctness of an action, or the excellence of a regime. Aristotle stated in Politics (1323a29-33) that no one would call a man happy who was completely lacking in courage, temperance, justice, or wisdom. A man who was easily terrified, unable to restrain any impulse toward food or drink, willing to ruin his friends for a trifle, and generally senseless could not possibly lead a good life. Even though chance may occasionally prevent good actions from having their normal consequences, so that sometimes cowards fare better than brave men, courage is still objectively better than cowardice. The virtues and actions that contribute to the good life, and the activities intrinsic to the good life, are naturally right.

The modern idea of natural rights grew out of the ancient and medieval doctrines of natural law, but for other scholars, the concept of natural rights is unreal. Rights are the products of social living. These can be used only in a society. Rights have behind them the recognition of society as common claims for development, and that is why the state protects these rights. John Locke (1632–1704), the most influential political philosophers of the modern period, argued that people

have rights, such as the right to life, liberty, and property that have a foundation independent of the laws of any particular society. Locke claimed that men are naturally free and equal as part of the justification for understanding legitimate political government as the result of a social contract where people in the state of nature conditionally transfer some of their rights to the government in order to better ensure the stable, comfortable enjoyment of their lives, liberty, and property. Since governments exist by the consent of the people in order to protect the rights of the people and promote the public good, governments that fail to do so can be resisted and replaced with new governments.

## **2. Moral Rights:**

Moral Rights are based on human consciousness. They are supported by moral force of human mind. These are based on human sense of goodness and justice. These are not assisted by the force of law. Sense of goodness and public opinion are the sanctions behind moral rights.

If any person disrupts any moral right, no legal action can be taken against him. The state does not enforce these rights. Its courts do not recognize these rights. Moral Rights include rules of good conduct, courtesy and of moral behaviour. These stand for moral perfection of the people.

Moral rights were first acknowledged in France and Germany, before they were included in the Berne Convention for the Protection of Literary and Artistic Works in 1928. Canada recognized moral rights in its Copyright Act. The United States became a signatory to the convention in 1989, and incorporated a version of moral rights under its copyright law under Title 17 of the U.S. Code. There are two major moral rights under the U.S. Copyright Act. These are the right of attribution, also called the right of paternity and the right of integrity.

## **Legal Rights:**

Legal rights are those rights which are accepted and enforced by the state. Any defilement of any legal right is punished by law. Law courts of the state enforce legal rights. These rights can be enforced against individuals and also against the government. In this way, legal rights are different from moral rights. Legal rights are equally available to all the citizens. All citizens follow legal rights without any discrimination. They can go to the courts for getting their legal rights enforced. Legal Rights are of three types:

### **1. Civil Rights:**

Civil rights are those rights which provide opportunity to each person to lead a civilized social life. These fulfil basic needs of human life in society. Right to life, liberty and equality are civil rights. Civil rights are protected by the state.

### **2. Political Rights:**

Political rights are those rights by virtue of which inhabitants get a share in the political process. These allow them to take an active part in the political process. These rights include right to vote, right to get elected, right to hold public office and right to criticise and oppose the government. Political rights are really available to the people in a democratic state.

### **3. Economic Rights:**

Economic rights are those rights which provide economic security to the people. These empower all citizens to make proper use of their civil and political rights. The basic needs of every person

are related to his food, clothing, shelter, and medical treatment. Without the fulfillment of these no person can really enjoy his civil and political rights. It is therefore essential, that every person must get the right to work, right to adequate wages, right to leisure and rest, and right to social security in case of illness, physical disability and old age.

### **Human and Legal Rights:**

There is some difference between moral or human rights and legal rights. Legal rights require for their justification an existing system of law. Legal rights are, roughly, what the law says they are, at least insofar as the law is enforced. Legal rights gain their force first of all through legislation or decree by a legally authorized authority. Those who support adoption of laws establishing legal rights often appeal to a notion of human rights. Laws against theft might appeal to notions of a moral right to own property. But human or moral rights must gain their validity through some other source other than legal rights, since people can appeal to human or moral rights to criticize the law or advocate changes in the law (or legal rights), and people could not do this if moral rights were based upon the law.

### **Contractual Rights**

Apart from human rights and basic legal rights there are contractual rights. Contractual rights derive from the practice of promise-keeping. They apply to particular individuals to whom contractual promises have been made. Contractual rights arise from specific acts of contract making. They normally come into being when the contract is made, and they reflect the contractual duty that another party has acquired at the same time. As a result of a contract, party A has a contractual duty, say, to deliver some good or service to party B, who has a contractual right to the good or service. (Contractual rights may be upheld by the law, and in that sense can rest upon legal rights, but it is possible to conceive of contracts made outside of a legal framework and to rest purely upon moral principles; however, such contracts are less secure than contracts made within a legal framework, for obvious reasons.)

### **A Fuller Understanding of Human or Moral Rights** Rights correspond to duties in three ways:

- a. Individual duties of forbearance (non-interference)
- b. institutional duties of assistance
- c. individual duties of assistance

Consider the right to property, conceived primarily as the right not to have one's personal property taken without one's consent. This implies that

- a. other individuals have a duty to forbear from taking a person's possessions without his or her consent.
- b. institutions, such as governments, should establish and enforce laws against theft and should do so in all neighborhoods where theft is a possibility.
- c. officials in the government have an individual duty, as officials, to support such laws and or enforce them.

The individual duties of assistance come into play in several ways: If the government were lax in this area, citizens might have a positive duty to pressure government to pass an appropriate law if one were missing or to enforce already existing laws.

Beyond that, individual citizens who are aware of persons with sticky fingers, as it were, have an obligation, where it could be done at reasonable cost to themselves, to thwart acts of theft.

### **Characteristics of human rights:**

1. Human Rights are Inalienable: Human rights are deliberated on an individual due to the very nature of his existence. They are innate in all individuals irrespective of their caste, creed, religion, sex and nationality. Human rights are conferred to an individual even after his death. The different rituals in different religions bear testimony to this fact.

2. Human Rights are essential and necessary: Human rights are needed to maintain the moral, physical, social and spiritual welfare of an individual. Human rights are also essential as they provide suitable conditions for material and moral upliftment of the people.

3. Human Rights are associated with human dignity: To treat another individual with dignity regardless of the fact that the person is a male or female, rich or poor is concerned with human dignity.

4. Human Rights are Irrevocable: Human rights are irrevocable as they cannot be taken away by any power or authority because these rights originate with the social nature of man in the society of human beings and they belong to a person simply because he is a human being. As such human rights have similarities to moral rights.

5. Human Rights are essential for the fulfilment of purpose of life: Human life has a purpose. The phrase "human right" is applied to those conditions which are essential for the fulfilment of this purpose. No government has the power to curtail or take away the rights which are sacrosanct, inviolable and immutable.

6. Human Rights are Universal: Human rights are not a domination of any privileged class of people. Human rights are universal in nature, without consideration and without exception. The values such as divinity, dignity and equality which form the basis of these rights are inherent in human nature.

7. Human Rights are never absolute: Man is a social animal and he lives in a civic society, which always put certain limitations on the enjoyment of his rights and freedoms. Human rights as such are those limited powers or claims, which are contributory to the common good and which are recognized and guaranteed by the State, through its laws to the individuals. As such each right has certain limitations.

8. Human Rights are Dynamic: Human rights are not stationary, they are dynamic. Human rights go on expanding with socio-economic and political developments within the State. Judges have to construe laws in such ways as are in tune with the changed social values.

9. Rights as limits to state power: Human rights infer that every individual has legitimate claims upon his or her society for certain freedom and benefits. So human rights limit the state's power. These may be in the form of negative restrictions, on the powers of the State, from violating the inalienable freedoms of the individuals, or in the nature of demands on the State, i.e. positive

obligations of the State.

### **Principles of human rights:**

- Universality
- Inviolable
- Inalienable
- Indivisible
- Interdependent
- Inter-related
- Universality
- Inviolable
- Inalienable
- Indivisible
- Interdependent
- Inter-related
- Equality
- Non-discriminatory

### **The Alleged Distinctions Between Negative and Positive Rights**

Many authors distinguish between negative rights and positive rights. Negative rights would correspond to duties of forbearance: if X has a negative right to V, then other's have a non-interference duty in relation to X's enjoyment of V.

Positive rights would correspond to duties of assistance: if X has a positive right to V, then others (perhaps government) have a (positive) duty to provide X with V.

It is frequently thought that the right not to be killed, not to be assaulted, not to be raped or kidnapped, and the right not to have one's property taken without one's consent are negative rights and not positive rights.

But this may be a mistake. We have seen that the right not to have one's property stolen corresponds both to negative and to positive duties, and the same would be true of other rights that people have supposed were purely negative.

### **The Basis of Rights**

There are several, mutually reinforcing ways that one can defend the existence of rights. One way is inspired by Immanuel Kant. Kant proposes that the essence of morality is captured by what has been called the Categorical Imperative. In a slight paraphrase, this reads: Act only on those rules of action that you could will to be universal laws.

The Categorical Imperative is a rule for testing rules of conduct. It will exclude as immoral any rule of conduct that implies that one person may do something but another, in relevantly similar circumstances, may not. In other words, it demands consistency. What's all right for me is all right for you if our relevant circumstances are similar. If I may throw my toxic waste into the river to save money for myself, then you may do so likewise. But of course I would not want you to do that, so it would be wrong for me.

This is relevant to human rights, because we think of human rights as universally applicable to human beings. And Kant says that what is morally permissible applies to all rational beings. It is also relevant that this test tends to endorse rules of action that protect our most basic interests, just the sorts of things that rights protect.

We could not endorse a rule that outlaws a particular religion because, if the rule were generalized, the religion we favor could be outlawed as well.

A second formulation of the Categorical Imperative is also important: "Always act so as to treat humanity (rational beings) as an end, never as a means only."

The point is that human beings, understood as beings capable of reasoning about their choices, are inherently valuable and worthy of respect for this reason. This sets strict limits upon what we are morally permitted to do to them, at least under normal circumstances.

It can also be used to defend securing for human beings what they need in order to function as rational beings.

Brian Orend, a Canadian philosopher, in his *Human Rights: Concept and Context*, develops this idea in the direction of human rights as follows: To respect human beings as an end is to respect their interests in being protected against grievous harm. (Harm is understood as loss or non-possession of the goods that fulfill vital human needs.)

Orend lists five vital needs that, he claims, are common to all human beings. If these needs were not met at a basic level, we could not function as rational beings. They are

- security,
- subsistence,
- freedom,
- equality, and
- recognition.

It would be interesting to compare this list with Martha Nussbaum's list of basic capabilities in her account of the things to which human rights entitle us.

Human rights, in a nutshell, are the entitlements we have in these five areas. Orend's approach helps explain the list of human rights found in the Universal Declaration of Human Rights, adopted by the United Nations (including the United States) in the late 1940's. The list of human rights in the Universal Declaration is much larger than five, but most of those rights can be derived by further specification from Orend's basic five.

Orend's approach fits well with the idea that you cannot distinguish sharply between negative rights and positive rights because even the so-called negative rights (for example, the right not to be killed) are positive in the sense that they call upon institutions to aid potential victims and bystanders to do what they can, at least if the cost to themselves is absorbable.

### **Categories of Rights:**

Human rights can be grouped into following categories:

- Civil Human Rights
- Political Human Rights

- Economic Human Rights
- Social and Cultural Human Rights
- Development Oriented Human Rights

1. In the era of the seventeenth, eighteenth and nineteenth centuries, the civil and political rights, were strengthened which assured civil and political liberties. The Civil and Political Human Rights are collectively known as 'Liberty Oriented Human Rights' because they provide, protect and guarantee individual liberty to an individual against the State and its agencies. Liberty rights also referred to as Blue Rights are the First Generation of Human Rights.

2. In the twentieth century, economic, social and cultural rights and the rights of minorities as well developed. The intent of these rights to promote the economic and social security through economic and social upliftment of the weaker sections of the society. These rights are essential for dignity of personhood as well as for the full and free development of human personality in all possible directions. These rights guarantee a minimum of economic welfare of the masses and their basic material needs, recognized by the society as essential to cultured living.

The economic, social and cultural rights, including the rights of the minorities are together called the "Security Oriented Human Rights" because these rights jointly provide and guarantee the essential security in the life of an individual. In the absence of these rights, the very existence of human beings would be in danger. These are also known as the "Second Generation of Human Rights". They are also called as Red Rights or also as positive rights. These rights along with the Civil and Political Rights were declared by the Universal Declaration of Human Rights and later were recognized by the Covenant on Civil and Political Rights and the Covenant on Economic, Social and Cultural Rights in December 1966.

3. The Development Oriented Human Rights were originated in the late twentieth century. These rights empower an individual to partake in the process of overall development and include environmental rights that enable an individual to enjoy the absolutely resources of nature, such as air, water, food and natural resources, free from pollution and contamination. These are known as the Third Generation of Human Rights or Green Rights. They are also called as Solidarity Rights, because their implementation depends upon international cooperation.

Solidarity rights have immense importance in developing countries, because these countries want the creation of an international order that will guarantee to them the right to development, the right to disaster relief assistance, the right to peace and the right to good government.

Brian Orend, a Canadian philosopher, in his Human Rights: Concept and Context, develops this idea in the direction of human rights as follows: To respect human beings as an end is to respect their interests in being protected against grievous harm.

Orend lists five vital needs that, he claims, are common to all human beings. If these needs were not met at a basic level, we could not function as rational beings. They are security, subsistence, freedom, equality, and recognition. It would be interesting to compare this list with Martha Nussbaum's list of basic capabilities in her account of the things to which human rights entitle us.

## **Human rights in India:**

Human rights are vital for all round development of individuals. The Constitution of India makes provisions for basic rights also known as Fundamental Rights for its citizens as well as for aliens. The Supreme Court of India is the guarantor of the rights according to the Constitution. The court takes into account fundamental duties while interpreting the constitutional right. In Indian constitution, Rights are classified mainly in three broad categories: (a) Civil (b) Political (c) Economic and Social. Fundamental Rights in India recognize certain civil rights. Certain Political and Economic and Social rights are recognized by other provisions in the Constitution. The Supreme Court of India recognizes Fundamental Right as "natural right" In Indian constitution, the Fundamental Rights are defined as the basic human rights of all citizens. These rights are defined in Part III of the Constitution regardless of race, place of birth, religion, caste, creed or sex.

Guha quoted that "The demand for a declaration of fundamental rights arose from four factors:

- Lack of civil liberty in India during the British rule.
- Deplorable social conditions, particularly affecting the untouchables and women.
- Existence of different religious, linguistic, and ethnic groups encouraged and exploited by the Britishers.
- Exploitation of the tenants by the landlords.

### **Fundamental Rights includes:-Right to Equality:**

The Right to Equality is one of the chief guarantees of the Constitution of India. Articles 14–18 of Constitution highlights the right to equality. It refers to the equality in the eyes of law irrespective of caste, race, and religion, place of birth or sex. When appraising Indian constitutional law, it can be stated that Article 14 guarantees equality before law as well as equal protection of the law to not only citizen of India but also to all the people within the territory of India. This includes the equal subjection of all persons to the authority of law, as well as equal treatment of persons in similar circumstances. The State cannot refuse this right. But no persons or group of persons can demand for any special treatment or any special privilege.

**Article 15** forbids discrimination on the basis of religion, race, caste, sex, place of birth, or any of them. This right applies only to inhabitants of India and can be enforced against the State as well as private individuals, individuals, regarding free access to places of public entertainment or places of public resort maintained partly or wholly out of State funds. The State has the right to make special treatment for women, children and for the development of backward class, scheduled caste or scheduled tribe people.

**Article 16** promises equality of opportunity in matters of public employment. It prevents the State from discriminating against anyone in respect of employment on the grounds of religion, race, caste, sex, descent, and place of birth or place of residence. However, the State may provide special reservation to the people of backward classes, scheduled castes or scheduled tribes for the upliftment of the weaker sections as well as for a person professing that particular religion in case of religious institution.

**Article 17** abolishes the practice of untouchability. It has been declared an offence punishable by law. The Protection of Civil Rights Act, 1955 has been enacted by the Parliament which states punishments for not allowing a person to enter the place of worship and from taking water from a well or tank.

**Article 18** prohibits the State from granting any titles other than military or academic distinctions, distinctions, and even the citizens of India cannot accept titles from a foreign state. Thus, Indian aristocratic titles and titles of nobility given by the British have been abolished.

**Right to Freedom:**

The Right to Freedom is mentioned in Articles 19–22, with the view of guaranteeing individual rights. But some of the rights are subject to security of the State, friendly relation with foreign countries, public order, decency or morality and for which certain restrictions may be imposed by the State on individual liberty under specified condition.

**Article 19** assures the citizens of India the following six fundamental freedoms subject to certain restrictions:

- Freedom of Speech and Expression
- Freedom of Assembly
- Freedom of form Associations
- Freedom of Movement
- Freedom of Residence and Settlement
- Freedom of Profession, Occupation, Trade and Business.

**Article 20** provides protection from conviction for offences in certain respects, respects, including the rights against ex post facto laws, double danger and freedom from self-incrimination.

**Article 21** averts the encroachment /protection of life or personal liberty by the State. No person shall be deprived of his life or personal liberty except according to procedure established by law.

**Article 22** offers specific rights to arrested and detained persons, i.e., the rights to be informed of the grounds of arrest, arrest, consult a lawyer of one's own choice, be produced before a magistrate within 24 hours of the arrest, and the freedom not to be detained beyond that period without an order of the magistrate. Article 22 also provides that when a person is detained under any law of preventive detention, the State can detain such person without trial for only three months, months, and any detention for a longer period must be authorised by an Advisory Board. The person being detained, has the right to be informed about the grounds of detention, and be permitted to make a representation against it, at the earliest opportunity.

Right against Exploitation: The Right against Exploitation, contained in Articles 23–24, lays down certain provisions to prevent exploitation of the weaker sections of the society by individuals or the State. Child labour and Begar is forbidden under the Right against Exploitation.

**Article 23** prohibits human trafficking and forced labour or any act of compelling a person to work without wages where he was legally entitled not to work or to receive remuneration for it. Any contravention leads to an offence. However, it permits the State to impose compulsory service for public purposes, including conscription and community service. The Bonded Labour system (Abolition) Act, 1976, has been enacted by Parliament to give effect to this Article.

**Article 24** prohibits the employment of children below the age of 14 years in factories, mines and other hazardous jobs. Parliament has enacted the Child Labour (Prohibition (Prohibition and Regulation) Regulation) Act, 1986, providing regulations for the abolition of, and penalties for

employing, child labour, as well as provisions for rehabilitation of former child labourers. The Employment of Children Act, 1938 was the first act to prevent Child Labour.

### **Right to Freedom of Religion:**

The Right to Freedom of Religion, enclosed in **Articles 25–28**, provides religious freedom to all citizens and ensures a secular state in India. According to the Constitution, there is no official State religion, and the State is required to treat all religions impartially and neutrally.

**Article 25** promises all persons the freedom of conscience and the right to preach, practice and propagate any religion of their choice. This right is, however, subject to public order, morality and health, and the power of the State to take measures for social welfare and reform. The right in this article shall not affect the operation of any existing law or prevent the State from making new law.

**Article 26** guarantees all religious denominations or any sections, subject to public order, morality and health; to manage their own affairs in matters of religion, religion, set up or manage institutions of their own for charitable or religious purposes, and own, acquire and manage property in accordance with law. These provisions do not derogate/deviate from the State's power to acquire property belonging to a religious denomination.

**Article 27** guarantees freedom for payment of taxes. No person can be compelled to pay taxes for the promotion or maintenance of any particular religion or religious institution.

**Article 28** forbids religious instruction in a wholly State-funded educational institution, and educational institutions receiving aid from the State cannot compel any of their members to receive religious instruction or attend religious worship without their consent or their guardian's consent in case of minor.

**Cultural and Educational Rights:** The Cultural and Educational rights stated in Articles 29 and 30, are measures to protect the rights of cultural, linguistic and religious minorities, by enabling them to conserve their heritage and protecting them against discrimination.

**Article 29** grants any section of citizens having a distinct language, script culture of its own, and the right to conserve and develop the same, and thus defences the rights or interest of minorities by preventing the State from imposing any external culture on them. It also prohibits discrimination against any citizen for admission into any educational institutions maintained or aided by the State, on the basis of religion, race, caste, language or any of them. Nonetheless, this is subject to reservation by the State for socially and educationally backward classes, as well as reservation of up to 50 percent of seats in any educational institution run by a minority community for citizens belonging to that community.

**Article 30** promises the right of minorities to set up and administer educational institutions of their choice in order to preserve and develop their own culture, and prohibits the State, while granting aid, from discriminating against any institution on the basis of the fact that it is administered or managed by a religious or cultural minority.

### **Right to constitutional remedies:**

The Right to Constitutional Remedies is covered in Article 32. It empowers inhabitants to approach the Supreme Court of India to seek enforcement, enforcement, or protection against infringement,

of their Fundamental Rights. Article 32 provides a guaranteed remedy for enforcement of all the other Fundamental Rights, and the Supreme Court is designated as the protector of these rights by the Constitution. The Supreme Court has been empowered to issue writs, namely habeas corpus, mandamus, prohibition, and quo warrant, for the enforcement of the Fundamental Rights, while the High Courts have been empowered under Article 226 - which is not a Fundamental Right in itself.

## **The concept of justice**

The concept of justice has generated serious controversies in the realm of political philosophy because of the complexities and intricacies involved within the concept itself. Indeed, among all the evocative ideas, that of justice appears to be one of the most eminent and the most hopelessly confused. The very attempt to define justice has become a very risky venture partly because of the ambiguity inherent in the concept itself and partly because of the various interpretations of the concept by different philosophers at different times. From the time of Plato down to the present day no consensus and no satisfactory definition of justice could emerge due to its abstract, universal and all pervasive characteristics. In all the normative disciplines which directly or indirectly govern action in regard to others -whether it be law or political philosophy, ethics or religion, justice constitutes a central value.

### **Justice: Meaning & Definition:**

Justice is a complex concept and touches almost every aspect of human life. The word Justice has been derived from the Latin word *Jungere* meaning 'to bind or tie together'. The word 'Jus' also means 'Tie' or 'Bond'. In this way Justice can be defined as a system in which men are tied or joined in a close relationship. Justice seeks to harmonise different values and to organise upon it all human relations. As such, Justice means bonding or joining or organising people together into a right or fair order of relationships.

### **Some popular definitions of Justice:**

"Justice means to distribute the due share to everybody." -Salmond

"Justice protects the rights of the individual as well as the order of society." -Dr. Raphael

"Justice consists in a system of understandings and a procedure through which each is accorded what is agreed upon as fair." -C.E. Merriam

In other words, Justice means securing and protecting of rights of all in a fair way. It stands for harmony among all the people, orderly living and securing of rights of all in a just and fair way.

## **ORIGIN OF THE CONCEPT OF JUSTICE**

There is wide divergence in the prevalent notions of justice. Philosophers like **Plato** and **Aristotle** regard justice as a supreme virtue, the source of all others and encompassing within itself the whole of morality. For **Kant** and **Rawls** justice is a very important aspect of human existence, the first virtue of society. Hume, and Marx and Engels denigrate the concept of justice; and for them it is unnecessary if not entirely irrelevant. Nonetheless, the very charge of inadequacy or redundancy or superfluity against justice presupposes its meaningfulness and worth otherwise, all the charges would be irrelevant.

Common usage continues to treat justice, despite all its inadequacies and limitations, as denoting some of the greatest human needs. Man's longing for justice is explained as the active process of preventing or remedying what would arouse the sense of injustice.

This consciousness of injustice arises in society in the context of a prevailing system of human relationship. The origin of justice therefore, is traced to man's consciousness of injustice in society and consequently to his urge for change in the situation towards a better and desirable one. In other words man's craving for what is good and what ought to be is the perennial experience that gives rise to the concern for justice.

Justice presupposes the existence of conflict and it is called upon to harmonise antinomies. It is only in the realm of moral that the synthesis and perfect harmony between personal and transpersonal values is possible, but in actual world they are in intense conflict. And it is precisely this hiatus between the harmony of the moral ideal and the disharmony of reality that gives rise to the problem of justice. Justice harmonises the conflicting interests and tends to bring out a balance. Justice in its true and proper sense is a principle of coordination between subjective beings and the idea of justice only manifests and can manifest itself in relation to persons but not between objects of any kind. Justice and injustice are meaningful and relevant only in context of a society i.e., justice and civil society can be said to go together.

Hence, justice primarily, is a social concept which has its origin in man's life in society. Justice being social is not a static and abstract concept, rather it is a concrete and dynamic one to be understood in terms of the changing social relation of man. It implies an idea of interpreting social relation of man in relation to ethics. R. W. Baldwin remarks that justice being essentially a quality of the behaviour of one man to another, that is of man in society, all justice is social justice and the adjective is otiose.<sup>3</sup> Morris Ginsberg also subscribes to the same view and repudiates the metaphysical deduction of justice from the concept of self-consciousness only.<sup>4</sup> Justice, thus involves an element of desirability or goodness in social life through alleviating some of the gross injustice of a society.

## **Principles of Justice Introduction**

**Selecting Principles of Justice.** Different principles of distributive justice are proposed by different philosophers. Does that mean that we may choose any one of them with equal justification? A "yes" answer to this question would make disputes about fairness impossible to settle. To avoid this, we must find some non-arbitrary method of selecting among proposed principles of justice.

**The Uses of Tradition.** One method for resolving this issue might be to follow the traditions of various practices that have grown up over time. For example, the practice of grading students for their performance in academic courses now includes a merit principle for determining most grades: the grade a student receives should reflect the quantity and quality of her work. It might be said in defense of such traditions that they have survived because they have proven more satisfactory to the parties affected, considered collectively, than other conceivable alternatives, such as giving everyone the same grade or handing out grades in accordance with the student's ability to pay. To argue this way would be to reinforce the argument from tradition ("we've done it that way for a long time") by a kind of Utilitarian argument ("let's optimize society's satisfaction").

**The Problem of Radically Unjust Traditions.** But traditions can be oppressive and unjust. Activities that take place within unjust social systems can themselves be unjust, in spite of their traditional

nature. Thus a practice of giving a person that which is "his" can be unjust. Suppose this rule is included within a system of slave property, the "property" in question is a slave, and the practice would require someone meeting an escaped slave to return the slave to his or her master. The fact that the slave system is unjust raises doubts about the justice of activities that occur within that system, such as returning escaped "property" to its "owners." What is needed is a way to determine when social systems, or the rules of justice that govern society as a whole, are just: Such an approach to the selection of rules of distributive justice is provided by John Rawls. Rawls' approach is not Utilitarian and it does not rely heavily on arguments from tradition.

## **John Rawls' Method**

We are to imagine ourselves in what Rawls calls the Original Position. We are all self-interested rational persons and we stand behind "the Veil of Ignorance." To say that we are self-interested rational persons is to say that we are motivated to select, in an informed and enlightened way, whatever seems advantageous for ourselves.

To say that we are behind a Veil of Ignorance is to say we do not know the following sorts of things: our sex, race, physical handicaps, generation, social class of our parents, etc. But self-interested rational persons are not ignorant of (1) the general types of possible situations in which humans can find themselves; (2) general facts about human psychology and "human nature". Self-interested rational persons behind the Veil of Ignorance are given the task of choosing the principles that shall govern actual world. Rawls believes that he has set up an inherently fair procedure here. Because of the fairness of the procedure Rawls has described, he says, the principles that would be chosen by means of this procedure would be fair principles.

A self-interested rational person behind the Veil of Ignorance would not want to belong to a race or gender or sexual orientation that turns out to be discriminated-against. Such a person would not wish to be a handicapped person in a society where handicapped are treated without respect. So principles would be adopted that oppose discrimination.

Likewise, a self-interested rational person would not want to belong to a generation which has been allocated a lower than average quantity of resources. So (s)he would endorse the principle: "Each generation should have roughly equal resources" or "Each generation should leave to the next at least as many resources as they possessed at the start."

The corollary of this, in rights terms, is that all generations have the same rights to resources, future as well as present.

## **John Rawls' principles of justice.**

Rawls argues that self-interested rational persons behind the veil of ignorance would choose two general principles of justice to structure society in the real world:

1. **Principle of Equal Liberty:** Each person has an equal right to the most extensive liberties compatible with similar liberties for all. (Egalitarian.)
2. **Difference Principle:** Social and economic inequalities should be arranged so that they are both (a) to the greatest benefit of the least advantaged persons, and (b) attached to offices and positions open to all under conditions of equality of opportunity.

- is egalitarian, since it distributes extensive liberties equally to all persons.

(2b) is also quite egalitarian, since it distributes opportunities to be considered for offices and positions in an equal manner.

(2a) is not egalitarian but makes benefit for some (those with greater talents, training, etc.) proportionate to their contribution toward benefiting the least advantaged persons.

(1) obviously echoes, without exactly duplicating, libertarianism in its commitment to extensive liberties. What does the Difference Principle mean? It means that society may undertake projects that require giving some persons more power, income, status, etc. than others, e.g., paying accountants and upper-level managers more than assembly-line operatives, provided that the following conditions are met:

(a) the project will make life better off for the people who are now worst off, for example, by raising the living standards of everyone in the community and empowering the least advantaged persons to the extent consistent with their well-being, and

(b) access to the privileged positions is not blocked by discrimination according to irrelevant criteria.

The Difference Principle has elements of other familiar ethical theories. The "socialist" idea that responsibilities or burdens should be distributed according to ability and benefits according to need is partly contained within the Difference Principle. We may reasonably assume that the "least advantaged" have the greatest needs and that those who receive special powers (hinted at under "social inequalities") also have special responsibilities or burdens. However, the merit principle that the use of special skills should be rewarded is also included in the Difference Principle.

What (2a) does not permit is a change in social and economic institutions that makes life better for those who are already well off but does nothing for those who are already disadvantaged, or makes their life worse.

Example: policies that permit nuclear power plants which degrade the environment for nearby family farmers but provide jobs for already well-paid professionals who come in from the big cities.

## **Beyond Rawls**

Rawls' theory of justice was set forth in his book *A Theory of Justice* (Harvard University Press, 1971). Since then it has been much discussed, and attempts have been made to improve and clarify it, not least by Rawls himself. One of those attempts at improvement is that of Martha C. Nussbaum (*Women and Human Development*), who has reinterpreted Rawls' argument from the perspective of Substantial Freedom, an idea she gets from Amartya Sen.

For Nussbaum the liberties mentioned in the Principle of Equal Liberty, if they are to be meaningful at all, are capabilities or substantial freedoms, real opportunities based on natural and developed potentialities as well as the presence of governmentally supported institutions, to engage in political deliberation and planning over one's own life.

Likewise, for Nussbaum, the concern of the Difference Principle to raise up those who are least advantaged must be clarified in light of substantial freedoms. What is needed, in her view, is a commitment by citizens and governments to a threshold of real opportunities below which no human being should fall if she is able to rise above it.

## **Kinds of Justice**

The concept of justice and its administration can be of the following types:

### **1) Public justice and Private justice**

Public justice is basically that kind of justice which the state administers through its tribunals and courts. It explains the relationship between courts and citizens of a state. Courts usually enforce laws that the states make under public justice.

On the other hand, private justice regulates the legal relationship between individuals. It is limited to people enforcing concepts of justice amongst each other without approaching courts. For example, let's imagine that A and B entered into a business transaction in which A paid money to B as promised. B, instead of selling goods to A for the money, refused to fulfill his obligation. If A and B decide to settle their dispute through means of arbitration or negotiation, it is private justice. However, if A approaches a court and sues B, we refer to that as public justice.

### **2) Civil justice and Criminal justice**

In terms of the subject matters of justice, we can categorize it as civil and criminal. Civil justice generally refers to private wrongs that affect specific people or entities.

For example, breach of a contract between two parties will affect only one of them. Trespassing of property is another example. The remedy of such civil wrongs is generally to approach civil courts. Criminal justice, on the other hand, affects society in general even if specific people are victims. For example, the murder affects specific victims only but the law treats it as a crime against society.

Another feature of criminal justice is that it relates to laws made by a legislature. Only acts that are defined as crimes can be the subject matter of criminal justice.

## **Social Justice:**

In contemporary times a large number of scholars use prefer to describe the concept of Justice as Social Justice. Social Justice is taken to mean that all the people in a society are to be equal and there is be no discrimination on the basis of religion, caste, creed, colour, sex or status.

However, various scholars explain the concept of Social Justice in different ways. Some hold that social justice is to allot to each individual his or her due share in the social sphere. According to some others, distribution of social facilities and rights on the basis of law and justice constitutes social justice.

## **What is Social Justice?**

"Social justice is another name for equal social rights." "Social Justice aims to provide equal opportunities to every individual to develop his inherent qualities."- Barker

"By social justice we mean ending all kinds of social inequalities and then to provide equal

opportunities to everyone.”-C.JP.B. Gajendragadkar

Social democrats and modern liberal thinkers define social justice as the attempt to reconstruct the social order in accordance with moral principles. Attempts are to be continuously made to rectify social injustice. It also stands for a morally just and defensible system of distribution of reward and obligations in society without any discrimination or injustice against any person or class of persons.

In the Indian Constitution several provisions have been provided with a view to secure social economic and political justice. Untouchability has been constitutionally abolished. Every citizen has been granted an equal right of access to any public place, place of worship and use of places of entertainment.

The state cannot discriminate between citizens on the basis of birth, caste, colour, creed, sex, faith or title or status or any of these. Untouchability and apartheid are against the spirit of social justice. Absence of privileged classes in society is an essential attribute of social justice.

## **2. Economic Justice:**

Economic Justice is indeed closely related to social justice because economic system is always an integral part of the social system. Economic rights and opportunities available to an individual are always a part of the entire social system.

Economic justice demands that all citizens should have adequate opportunities to earn their livelihood and get fair wages as can enable them to satisfy their basic needs and help them to develop further. The state should provide them economic security during illness, old age and in the event of a disability.

No person or group or class should be in a position to exploit others, nor get exploited. There should be fair and equitable distribution of wealth and resources among all the people. The gap between the rich and the poor should not be glaring. The fruits of prosperity must reach all the people.

There are present several different views regarding the meaning of economic justice. The liberals consider open competition as just and they support private property. On the other hand, the socialists seek to establish complete control of society upon the entire economic system. They oppose private property. Whatever be the ideology or the system, one thing is clear and that is that all citizens must be provided with basic necessities of life. All citizens must have their basic needs of life fulfilled (Food, clothing, shelter, education, health and so on).

## **3. Political Justice:**

Political justice means giving equal political rights and opportunities to all citizens to take part in the administration of the country. Citizens should have the right to vote without any discrimination on the basis of religion, colour, caste, creed, sex, birth or status. Every citizen should have an equal right to vote and to contest elections.

Legal justice has two dimensions-the formulation of just laws and then to do justice according to the laws. While making laws, the will of the rulers is not to be imposed upon the ruled. Laws should be based on public opinion and public needs. Social values, morality, conventions, the idea of just

and unjust must be always kept in view.

When the laws do not meet the social values and rules of morality, citizens neither really accept nor abide by laws. In this situation, the enforcement of laws becomes a problem. Laws are just only when these are accepted not out of fear of external power but when inspired by internal feeling for the laws being good, just and reasonable.

Legal Justice means rule of law and not rule of any person. It includes two things: that all men are equal before law, and that law is equally applicable to all. It provides legal security to all. Law does not discriminate between the rich and the poor. Objective and due dispensation of justice by the courts of law is an essential ingredient of legal justice.

The legal procedure has to be simple, quick, fair, inexpensive and efficient. There should be effective machinery for preventing unlawful actions. "The aim of law is the establishment of what is legitimate; provide legal security, and prevention of unjust actions. -Salmond'.

Thus, Justice has four major dimensions: Social Justice, Economic Justice, Political Justice and Legal Justice. All these forms are totally inter-related and inter-dependent. Justice is real only when it exists in all these four dimensions. Without Social and Economic Justice there can be no real Political and Legal Justice.

Presence of social and economic inequalities always leads to a denial of political and equal justice. An oppressed and poor person is virtually unable to participate in the political process or to seek the protection of law and law courts. Likewise, without political rights and equal protection of law no person can really get his social and economic rights and freedoms protected. Further, Justice needs the presence of rights, liberty and equality in society and only then can it really characterise life in society.

### **Key Features of Justice:**

- Justice is related to mutual relationships of persons living in society.
- Justice is based on values and traditions of society.
- Justice is related to all aspects of human behaviour in society. Laws are made and courts are set up with this aim in view.
- Aim of Justice is to provide equal rights, opportunities and facilities to all in a fair way.
- The function of Justice is to harmonise individual interests with the interests of society.
- Justice is a primary value and it is inseparably related to other values like Liberty, Equality and Property.
- Justice is the principle of balancing or reconciling human relations in society in such a way as enables each one to get his due rights, towards and punishments.
- Justice has several dimensions: Social Justice, Economic Justice, Political Justice and Legal Justice.

### **The concept of obligation**

The conceptual foundation of obligation traces as far back to ancient Roman law which defines obligation as a means of an undertaking or legally binding relationships where one party promises

the other party to perform some acts or to do something. Ancient well-known Roman lawyers defined obligations based on their personal opinion, which as a result has developed the concept of obligation.

Year Gay, a Roman jurist, defines obligation as 'a means of personal claim brought against another in order to force him before us to give us so as to we are able to enforce our rights. Gay also classifies obligation in terms of contract, quasi- contract, delict, and quasi-delict Pavel year also understood obligation as an undertaking not by Roman citizens to perform some acts or to do or to give or to render rights to non-roman citizens regarding to give, to do, or to render some rights to roman citizens.

The concept of obligation by both classical legal scholars was unilateral in character and discriminatory in nature since it imposes obligation to do, to give or to render rights only on non-roman citizens not the Romans.

However, the institute of Justinian defines obligation as a legally binding relations when Roman citizens undertake to perform certain acts or to do something in accordance with the Roman law.

Obligation defined in the institute of Justinian, differed from the obligations defined in the classical Roman jurists in that the institute defines obligation in the aspect that Roman citizens to carry out. In general the concept of obligation can clearly be expressed as;

- a. Obligation to give or not to give
- b. Obligation to do or not to do
- c. Obligation to render rights to others to do something.

### **Definition of Obligations**

Black's law dictionary defines obligation as 'a legal duty or moral duty to do or not to do something'. Common-law scholars such as Fredrick Pollock defines obligation in its popular sense as merely synonym for 'duty'. In its legal sense derived from roman laws 'an obligation is the bond of legal necessity or *vinculum juris* which binds together two or more determinate individuals'.

John Salmond (year) defined obligation in its more general acceptance as 'something the law or morals command a person to do a command that is made effective by the imposition of sanction if a person failed to comply such a command' In the modern legal systems and currently existing legal materials, there is no exact or single whole definition of obligation. However, some scholars define it based on their own legal system For instance French judges define the term obligation as a legally binding relations to another party is obliged to give or to do or not to do something.

Likewise the Ethiopian civil code, in the book IV of the code uses the term obligations without defining what it means. However, like French judges who define obligations indirectly from article 1101 of the French civil code of the term contract as an agreement whereby two or more persons as between themselves create, vary or extinguish obligations of proprietary nature.

### **Sources of obligations**

According to Gay, Roman jurist, the fundamental source of obligation can be classified into two:

- a. Contract

## b. Beyond the contract

Those obligations, which arise beyond the contract, are divided into unjust enrichment (quasi-contract), unlawful acts (delict) and causing physical injury to the person or causing damage to property of person (quasi-delict).

In modern time, the laws of different countries clearly express the sources of obligation. For instance, French civil code classifies the source of obligation as;

- Obligation that arises from contract
- Obligations that arise beyond the contract
- Obligation that arises from the unlawful acts
- Obligations that arise from the causing of physical injury or causing material damage
- Obligations arising from law

In Ethiopian legal system, there are no clearly stated classifications of sources of obligations. But Art.1675 of Ethiopian civil code generally expresses obligations as arising from contractual agreements.

However, the close readings of the provisions of the civil code show that there are other sources of obligations-like those arising from non-contractual relationships (from Art.2027-2178), obligations arising from unlawful acts or obligation that arises from the causing of physical injury or obligation arising from the causing of material damage (from Art.2027-2161) and finally, obligations arising from unjust enrichment (from Art.2162-2178).

In so far as an obligation arising from the law is concerned, it happens in situations when law imposes obligations on persons to give or not to give, to do or not to do some acts recognized in almost all-legal systems.

Obligation arising from the law is a unilateral obligation imposed on citizens or contracting parties without their consent. It includes among other things

- Obligation to pay income taxes
- Obligation to render military services
- Obligations of creditors
- Obligation of debtors
- Obligations of families to their children, etc.

## **Types of Obligations**

Obligations can be classified based on the nature of activities, and the number of parties legally bound by the obligation. Accordingly, they can be classified into:

### **1) Divisible obligation**

This is one whereby a party undertakes to perform its obligations by dividing into parties. For instance, if A and B owed C 1,000 BIRR such parties to the obligation perform or discharge the obligations by paying half (part) of the debt to C, which is 500 each.

## **2) Indivisible obligations**

In this type of obligation, the performance of the obligation undertaken cannot be divided into parts. Hence, in this type of obligation partial performance is impossible given the conditions and circumstances of its formation, which does not allow the performance of obligation by dividing into parts.

## **3) Positive obligation**

This is a situation where a person's obligation is to do or to give some thing to another. It requires an action from the debtor.

## **4) Negative obligation.**

This is a situation where a person's obligation does not to do some thing or it refrains from doing some thing. Such obligations are also called obligations not todo.

**Example,** company A may agree with company B in which company A under takes an obligation not to produce or sell certain goods in the same market.

Based on the number of parties legally bound, obligations can be classified into unilateral, bilateral, and multilateral obligations.

- a. Unilateral obligation arises from contract in which two parties are participate. However, only one of the parties is legally bound by the contract for the benefit of the other contracting party. Example, donations
- b. Bilateral obligation arises from a contract entered into by two parties in which these contracting parties are bound legally to each other on equal terms. Accordingly, there are two promisors and two promises.
- c. Multilateral obligation. This is a case where more than two persons undertake to perform an obligation. Such obligations can be classified into three:
  - 1) Simple joint obligation
  - 2) Joint obligations
  - 3) Several and joint obligations

### **1) Simple joint obligation**

In this type's obligation, parties who are bound by such obligation are not jointly liable for the total debts, but each debtor is liable for its own share with the exception of Art.1917 of the Ethiopian civil code

### **2) Joint obligations**

It arises from the contractual obligation in which more than two parties participate and debtors are jointly liable for the debt secured as a result of the obligation entered into with the creditor or creditors.

### **3) Several and joint obligations**

In this kinds obligations the co-debtors shall be jointly and severally liable unlike joint obligation where the debtors are jointly obliged to undertake a given obligation, in the several and joint obligation, the creditor may require all the debtors or one of them to discharge the obligation in

whole or in part.

## Eudaimonism

**Eudaimonism** (or **Eudaemonism** or **Eudaimonia**) is a moral philosophy that defines right action as that which leads to the "**well-being**" of the individual, thus holding "well-being" as having essential value. It makes up part of the system of Virtue Ethics propounded by the ancient Greek philosophers, in which a lifetime of practicing the **virtues** ("arête") in one's everyday activities, subject to the exercise of practical wisdom ("phronesis") to resolve any conflicts or **dilemmas** which might arise, will allow the individual to flourish and live the good life ("eudaimonia").

The **term** "eudaimonia" is a classical Greek word, commonly translated as "**happiness**", but perhaps better described as "**well-being**" or "**human flourishing**" or "**good life**". More **literally** it means "having a good guardian spirit". Eudaimonia as the ultimate goal is an objective, not a subjective, state, and it characterizes the well-lived life, irrespective of the emotional state of the person experiencing it.

In more general terms, Eudaimonism can be thought of as any theory that puts personal happiness and the complete life of the individual at the center of ethical concern. It can therefore be associated with ethical Individualism and Egoism.

*Eudaimonia* is often translated as "happiness," but that's a bit misleading. Eudaimonia comes from two Greek words:

*Eu-*: good

*Daimon*: soul or "self." A difficult word to translate into English.

In Greek philosophy, Eudaimonia means achieving the best conditions possible for a human being, in every sense—not only happiness, but also virtue, morality, and a meaningful life. It was the ultimate goal of philosophy: to become better people—to fulfill our unique potential as human beings. Aristotle wrote about the idea the most, and it was important to many Greek philosophers, from Socrates, the father of Greek philosophy, through to Stoicism, a late-Greek philosophy.

You can achieve Eudaimonia, Aristotle argued, by working hard, cultivating your virtues, and excelling at whatever tasks nature and circumstances come to you. However, Aristotle also wrote that living in the right kind of place and balancing your activities with wisdom are essential to achieving Eudaimonia as well.

## History of Eudaimonism

The concept came to fruition in Aristotle's "*Nicomachean Ethics*", which dates from the 4<sup>th</sup> Century B.C., although the earlier thinkers Democritus, Socrates and Plato described a very similar idea. Socrates, as represented in Plato's early dialogues, held that **virtue** is a sort of **knowledge** (the knowledge of good and evil) that is required to reach the ultimate good, or eudaimonia, which is what all human desires and actions aim to achieve.

Plato noted that even "evil" people feel **guilt** at doing something which is clearly wrong, and, even when there is no fear of punishment, doing what is wrong simply makes people **miserable**. He further **refined** the idea of eudaimonia, claiming that the **rational** part of the soul or mind must

govern the **spirited, emotional** and **appetitive** parts in order to lead all desires and actions to eudaimonia, the principal constituent of which is **virtue**.

According to Aristotle, eudaimonia is constituted, not by honor, wealth or power, but by **rational activity** in accordance with **virtue** over a complete life, what might be described today as **productive self-actualization**. This rational activity, Aristotle judged, should manifest as **honesty, pride, friendliness, wittiness, rationality** in judgment; mutually beneficial friendships and scientific knowledge.

Epicurus (and subsequent Hedonists) agreed with Aristotle that happiness, or eudaimonia, is the highest good, but he identified this with **pleasure**, on the grounds that pleasure is the only thing that people **value for its own sake**, and that its presence or absence is something which is **immediately apparent** to everyone. He also noted that it may be necessary to forgo **short-term** pleasure if that will ultimately lead to greater pleasure in the **long-term**.

The Stoics also believed to some extent that eudaimonia was the highest good, although for them virtue and well-being consist of living according to Nature and, even if perfect virtue is actually **unachievable**, the least we can do to is to act "**befittingly**", in the hope of approaching or **approximating** eudaimonia.

St. Augustine of Hippo later adopted the concept as "**beatitudo**", and St. Thomas Aquinas worked it out into a **Christian** ethical scheme, where eudaimonia is found ultimately in a direct perception of God, or complete blessedness.

Immanuel Kant was an important **opponent** of Eudaimonism. He **rejected** the view that happiness is the highest good, and insisted that happiness can be an **ingredient** of the highest good, but only if it is deserved. Still later, Existentialism rejected Eudaimonism on the grounds that happiness is just a bourgeois fantasy.

## **Socrates on Eudaimonia**

Socrates, like Plato, believed that *virtue* (or *arête*, the very idea of virtue) was a form of knowledge—specifically, a knowledge of good and evil (Bobonich, 2010). That is, he saw numerous **virtues**—justice, piety, courage as united. That is, all were one, and they were all knowledge.

Socrates viewed this knowledge as required for us as humans to achieve the 'ultimate good', which was eudaimonia. And by 'us', Socrates meant the individual (Waterman, 1993; Deci & Ryan, 2006).

## **Plato and Eudaimonism**

In a somewhat similar vein, Plato believed that individuals naturally feel unhappiness when they do something they know and acknowledge to be wrong (Price, 2011). Eudaimonia, according to Plato, was the highest and ultimate aim of both moral thought and behavior.

Nonetheless, while Plato was believed somewhat to have refined the concept, he offered no direct definition for it. As with Socrates, he saw virtue as integral to **eudaimonia**.

One thing is worth noting at this point. If this idea of an 'ultimate goal' for individuals is beginning to sound familiar, rest assured that there is good reason for thinking so. The similarities between eudaimonia and concepts such as Maslow's **self-actualization** (1968) are indeed widely accepted

in the psychological literature (Heintzelman, 2018). We know Plato mentored Aristotle

## **Aristotlean Eudaimonia**

Numerous interpretations have been offered for Aristotle's eudaimonia, with a general consensus on the idea that eudaimonia reflects "*pursuit of virtue, excellence, and the best within us*" (Huta & Waterman, 2014: 1426). That is, he believed eudaimonia was rational activity aimed at pursuing 'what is worthwhile in life'.

Where Aristotle diverged from Plato and some other thinkers is in his belief about what is 'enough' (roughly) for eudaimonia. For the latter, virtue was enough for the ultimate good that is eudaimonia. For Aristotle, virtue was required, but not sufficient (Annas, 1993). In layperson's terms, we can't just act with virtuous, but we have also to intend to be virtuous, too.

I will return to this a little later when looking at Aristotle's ethics. But for now, he believes that happiness and well-being come from how we live our lives. And that's not in pursuit of material wealth, power, or honor. Rather, eudaimonic happiness is about lives lived and actions taken in pursuit of eudaimonia.

Also at this point, you probably understand why some translations are argued to fall a little flat when it comes to describing Aristotle's philosophical concept. Where rational activity is required to pursue an ultimate goal, beings such as plants—which do 'flourish'—don't qualify.

Where these **rational activities** include "*pride, wittiness, friendships that are mutually beneficial, pride and honesty among others*", neither do lots of other creatures (Hursthouse, 1999).

## **A Look at Aristotle's Concept of Happiness and Well-Being**

If you could ask Aristotle himself what happiness is, this is exactly what he'd say:

*"...Some identify happiness with virtue, some with practical wisdom, others with a kind of philosophic wisdom, others with these, or one of these, accompanied by pleasure or not without pleasure; while others include also external prosperity...it is not probable that...these should be entirely mistaken, but rather that they should be right in at least some one respect or even in most respects."* Aristotle, Nichomacean Ethics, Book I,

Happily, we also have more concise and straightforward excerpts that reveal how we go about it.

## **Happy Life According to Aristotle**

To be honest, a lot of Nichomacean Ethics is about what happiness *isn't*. 'Satisfying appetites', Ryan and Singer argue is akin to "life suitable to beasts", according to the philosopher (2006: 16). The pursuit of political power, material wealth, even fun and leisure, he saw as "laughable things", inferior to "serious things".

Instead, happiness is an 'intermediate', or a 'golden mean' between deficiency and excess (Ryff & Singer, 2008). One example of virtue as a mean between two extremes is *courage* – as a virtue, it's halfway between recklessness and cowardice (Kings College London, 2012).

Here, we see the 'rational activity' aspect of eudaimonia coming back to the fore. When we are faced with situations, therefore, it can be argued that Aristotle isn't giving prescriptive advice. He is, however, telling us how he believes the rational, virtuous pursuit of eudaimonia might look in an

everyday setting.

## **Role of Externalities**

So, what if you're very, very unlucky? If you've read Nichomacean Ethics (maybe only skimmed partway through), this question is not an unreasonable one. After all, Aristotle argued:

*"He is happy who lives in accordance with complete virtue and is sufficiently equipped with external goods, not for some chance period but throughout a complete life."* – Aristotle, Nichomacean Ethics, Book I, Chapter 10 (excerpt from Nothingistic.org, 2019).

Basically, yes, Aristotle acknowledged that fate or luck can play a role in our happiness. Nonetheless, he also believed that this task of 'individual self-realization' is how we go about it with our 'own disposition and talent' (Ryff & Singer, 2008: 17).

This excerpt also suggests that we should be aiming for 'all of the virtues', so it's worthwhile considering Aristotle's stance on being **virtuous**.

## **The Philosophy Behind Aristotle's Ethics**

As we can now see, Aristotle's eudaimonia is a moral happiness concept. It is very much about living a life in accordance with virtues (Hursthouse, 1999).

But what are these virtues, then?

Of course, there is a large subjective element to what 'virtue' is. What one person holds to be virtuous isn't always going to ring with that of others. Ancient and Medieval Philosophy Professor Peter Adamson gives some brilliant examples in this Kings College London video:

One of these is 'piety', which was mentioned in the earlier look at Socrates. For example, can you be too pious? Some would argue yes, others, no.

From what we've already discussed, however, we know Aristotle believes happiness is not about pursuing eudaimonia through various means in order to be happy. This is, he argues, is founded in instrumentality. Happiness, he might be seen as arguing, is once again the *rational activity in pursuit of virtue* itself.

These virtues won't necessarily be cut in stone. But, if we ask ourselves what we believe is good, or how we should live our lives, virtue ethics would argue that we have at least some starting points (Hursthouse, 1999).

## **Modern Psychology and Eudaimonia**

So far, we've looked a little bit at subjectivity, flourishing, happiness, wellbeing, and actualization. All in a philosophical context. Hopefully, it provided some context. Because, naturally, eudaimonia thus has myriad implications for psychologists with an interest in subjective wellbeing (SWB), and psychological wellbeing (PWB). And positive psychology is all about human flourishing and **happiness**.

## **Overview of Psychological Research on Eudaimonia**

As a very concise overview of how the concept appears within psychology, here are some aspects

that have been studied:

- Definition – not only conceptualizing the idea of eudaimonia in terms of psychology, wellbeing, and happiness, but also trying to operationalize the concept (e.g. Waterman, 1993; Ryan & Deci, 2001; Keyes, 2002; Bauer et al., 2008; Ryff & Singer, 2008; Waterman et al. 2008);
- Measurement – lots of these attempts at operationalization are a preliminary step to measuring human experiences of eudaimonia.
- There are actually a fair few of these scales. The best-known actually measures a similar concept of psychological wellbeing (PWB), made famous by Professor Ryff (1989);
- Distinctiveness and relation to other happiness/wellbeing concepts – with the most popular earlier studies looking at eudaimonia alongside hedonia (Ryan & Deci, 2001; Huta & Waterman, 2014);
- This was accompanied by empirical and statistical analyses of the same (Chen et al., 2013); and
- Studies have also looked at how eudaimonia is related (or not) to PWB and SWB (e.g. Chen et al., 2013).
- Of course, this is far from an exhaustive list, and as interdisciplinary interest grows, we can expect the same from the broader body of research.

### **Plato on Eudaimonia**

As mentioned above, Plato never distinctly referred to eudaimonia by that term. A lot of what we know about his stance on the same comes from *Republic (Amazon)*, his work on justice. In it, he writes of three friends who talk about what a 'just' republic would look like, and he premised four virtues (Bhandari, 1999; VanderWeele, 2017):

- Temperance (moderation) – or self-regulation, to avoid the vices and corruption caused by excess;
- Courage (or fortitude) – to stand up for what we believe is right and good;
- Justice – a social consciousness that plays a key part in maintaining societal order; and
- Wisdom (practical wisdom, or prudence) – the pursuit of knowledge.

He believed that happiness was about living in pursuit of these virtues, and thus virtue is central to flourishing.

### **Socrates and Eudaimonia**

Socrates, as discussed, saw eudaimonia as an 'ultimate' goal. Like Aristotle after him, Socrates emphasized the role and importance of *arête* very heavily—in fact, he believed it was both a means and an end to human happiness. In pursuit of what we now commonly refer to as 'flourishing', he encouraged people to ask themselves, and others, what was 'good' for our souls (Cooper, 1996).

He believed, it is argued, that eudaimonia was 'justly living well', and that in doing so, we seek not experiential pleasure or 'honor' in isolation, but a good and happy life, guided by our virtues (Cooper, 1997; Bobonich, 2010; Brown, 2012).

### **3 Examples of Eudaimonic Well-Being**

A couple of millennia later, the teachings of Socrates, Plato, and Aristotle continue to shape how we study flourishing and well-being.

Modern conceptions of Eudaimonic Well-being (EWB) are, on the whole, shaped by literature reviews, critical analyses, and empirical examinations of their texts. Coupled with modern research into quality of life and subjective well-being (SWB), we have come as far as being able to develop measures for the construct.

EWB is defined by Waterman and colleagues (2010: 41) as: *“quality of life derived from the development of a person’s best potentials and their application in the fulfillment of personally expressive, self-concordant goals (Sheldon, 2002; Waterman, 1990; 2008)”*

In their study, they give several examples of EWB (Norton, 1976; Waterman et al., 2010). Here are a few:

1. *“Knowing who you really are”* – Examples of this self-discovery might include the self-identity knowledge that comes from meditating on your core beliefs. Or, it could be a good understanding of your personal character strengths and qualities. It could even be the self-knowledge that comes from reflecting on your personal development or the values that you hold important.
2. *“Developing these unique potentials”* – Someone who scores high on EWB (according to the Questionnaire for Eudaimonic Well-being) makes a persistent, committed effort to building on this self-knowledge. A little more on the ‘how’ and the QEWB is covered very shortly.
3. *“Using those potentials to fulfill your life goals”* – Someone who is committed to this pursuit, over the long term, would be a prime example.

These describe some of the EWB concepts on which one well-known measure of EWB is based.

## **Teleological theories**

Teleological theories are a particular kind of axiological theory. As we shall see, however, authors disagree about the exact defining characteristics. Indeed, we shall uncover four different characterizations of teleological theories. Almost all (if not all) authors require that a theory maximize the good in order to be teleological. As we shall see, most impose further requirements, but some do not. Nozick and at least in certain passages, Rawls, characterizes teleological theories as theories that direct the agent to maximize the good, where the goodness in question may be that of the action’s outcome, of its anticipated outcome and the like, or even of the action itself – no matter how this is evaluated (e.g., even if it is in terms of the agent’s motives). This, then, is one way of characterizing teleological theories.

Call theories that direct the agent to maximize the good goodness maximizing. Most authors are more specific in their characterization of teleological theories. They require not merely that the theory direct the agent to maximize the good, but rather that they direct the agent to maximize the goodness of their outcomes, or of their intended, anticipated, or reasonably anticipatable outcomes.

For brevity, let us use the term ‘quasi-outcome’ as a generic name for outcomes, intended outcomes, anticipated outcomes, reasonably anticipatable outcomes, and the like. A second way of characterizing teleological theories, then, is as theories for which there is a specified kind of quasi-outcome such that an action is judged permissible just in case its specified quasi-outcome is maximally good. Let us call such theories quasi-outcome-teleological. Many authors’ are even

more specific in that they require the theory direct the agent to maximize the goodness of (objectively determined) outcomes – as opposed to the intended, anticipated, or reasonably anticipatable outcomes. Let us call such theories outcome-teleological. This, then, is a third way of characterizing theories. There is yet another condition that is sometimes, but not always, invoked in the characterization of teleological theories:

that the viewpoint from which the goodness of the outcomes is assessed be agent-invariant, i.e., the same no matter who the agent is. Classical act utilitarianism (which directs the agent to maximize the goodness of outcomes from the viewpoint of the universe as a whole) satisfies this condition, but ethical egoism (which directs the agent to maximize the goodness of outcomes from his/her viewpoint) and community utilitarianism (which directs the agent to maximize the goodness of outcomes from the viewpoint of his/her community) do not. The distinction between teleological theories for which the viewpoint of evaluation is agent-invariant and those for which it is not is a special case of a more general (and more important) distinction between theories that are agent-sensitive and those that are not.

A theory (teleological or not) is agent-sensitive just in case its permissibility conditions make an essential reference to the agent qua agent. Agent-sensitive theories may make the permissibility of actions depend in a special way on how they affect the agent and/or those bearing special relationships to the agent (e.g., friends, family, neighbors, etc.).'

Teleological theories are agent sensitive just in case their viewpoint for the evaluation of outcomes is agent invariant. As we saw above, some teleological theories are agent-sensitive (e.g., ethical egoism), and some are not (e.g., classical utilitarianism), likewise, some non-teleological theories are agent-sensitive and some are not. For example, a theory that forbids the agent to kill or allow to die any member of his/her family is agent-sensitive, whereas a theory whose sole injunction forbids killing or allowing anyone to die is not. Traditionally, agent-insensitivity has not been a defining characteristic of teleological theories. Ethical egoism (which is agent-sensitive) has generally been considered to be teleological.' Some authors, such as Thomas Nagel and Samuel Scheffler, do, however, impose the requirement of agent-sensitivity.

A fourth way, then, of characterizing teleological theories is as theories that judge an action permissible just in case its outcome is maximally good from an agent-invariant view point.

Call such theories agent-insensitive teleological. To sum up: We have seen that teleological theories have been characterized in the following four ways:

1. as goodness maximizing theories, i.e., as theories that judge an action permissible just in case it maximizes the good (no matter how this is determined);
2. as quasi-outcome-teleological theories, i.e., as theories for which there is a specified type of quasi-outcome (outcome, intended outcome, anticipated outcome, reasonably anticipatable outcome, etc.) such that the theory judges an action permissible just in case its specified quasi-outcome is maximally good;
3. as outcome-teleological theories, i.e., as theories that judge an action permissible just in case its outcome (as opposed, e.g., to its anticipated outcome) is maximally good;
4. as agent-insensitive teleological theories, i.e., as theories that judge an action permissible just in case its outcome is from an agent-invariant view point maximally good.

## Deontological theories

Act utilitarianism is a paradigm teleological theory, and The Divine Command Theory and Kant's moral theory are paradigm deontological theories. It is unclear, however, which of the many features of these theories are the defining characteristics of teleological and deontological theories respectively. In order to assess the importance of the teleological/deontological distinction, we need first to clarify the nature of the distinction. Start therefore by examining some of the different characterizations that have been given. Often authors (e.g., Rawls 2) characterize deontological theories simply as theories that are not teleological. So characterized, the nature of deontological theories depends on how teleological theories are characterized. In a later section we shall examine some of the characterizations of teleological theories. In this section we shall examine some of the characterizations of deontological theories that are in dependent of the characterization of teleological theories. It is often claimed that deontological theories – but not teleological theories – are rule-based, i.e., assess the permissibility of actions in terms of whether they conform to some specified set of rules. The problem with this characterization of deontological theories is that all theories other than those that merely specify prima facie considerations are rule-based. Act utilitarianism, for example, is rule based, since it assess the permissibility of actions in terms of whether they conform to the rule "Maximize the goodness of consequences!". Both deontological and teleological theories may be (and generally are) rule-based.

The difference between the two lies in the kinds of rules that they invoke. In a similar vein it is sometimes claimed that deontological theories, or at least one type thereof, are absolutist in that they claim that there are certain kinds of actions that are absolutely obligatory or forbidden (i.e., such that all actions of that There type are obligatory two problems or forbidden with this respectively.) claim.

First of all, without some restriction on the admissible action-types all theories are absolutist in this sense, since all theories hold that all actions of the type "is permissible" are permissible. Secondly, even if an appropriate restriction is placed on the admissible action- types to avoid this trivialization (perhaps allowing only non-normative action types). the claim is still false.

Act utilitarianism, a paradigm non-deontological theory, is absolutist in this sense. This is because any action that falls under the description "does not have consequences that contain as much happiness as is feasible" is judged forbidden – no matter what its other characteristics are.

Furthermore, Ross's intuitionist theory, a paradigm deontological theory, is non- absolutist, because it provides neither necessary nor sufficient conditions for the permissibility of action, but only prima facie considerations that must somehow be weighed together. The characterization of deontological theories as absolutist is thus inadequate. A closely related characterization of deontological theories is as theories for which there are certain kinds of actions that are always (or never) forbidden, where whether or not a given action is of the specified kinds does not depend on what its outcome is.

The distinction between theories that base the permissibility of actions on their outcomes and those that do not is an important distinction. The outcome of an action is a state of affairs that would be realized if the action were performed. It is objectively determined in that its determination is independent of what the agent, or anyone else, believes (e.g., about what would happen if the action were performed). Theories that do not base the permissibility of actions on their outcomes

generally base it on their intended, anticipated, or reasonably anticipatable outcomes.

Unlike (objective) outcomes, neither intended nor anticipated outcomes are objectively determined, since what they are depends only on the agent's mental state (what he/she intends or believes), and not on what would happen if the action were performed. And the reasonably anticipatable outcome is neither objectively determined, nor determined on the basis of the agent's mental state, but rather on the basis what it would be (inter subjectively) reasonable to anticipate happening.

Characterizing deontological theories as theories for which the permissibility of actions does not depend on their outcomes, however, is intuitively inadequate. The Ten Commandment Theory – a paradigm deontological theory, according to which an action is permissible just in case it conforms to the Ten Commandments – contains the injunction “Do not kill!”, and therefore grounds the permissibility of actions in their outcomes. Whether or not an action is a killing depends on what its outcome is, and not, for example, on what its anticipated or intended outcome is. The above characterization mistakenly classifies The Ten Commandment Theory as non-deontological. Furthermore, a form of utilitarianism that grounds the permissibility of actions in the goodness of their anticipated outcomes, a paradigm non deontological theory, does not ground the permissibility of actions in features of their outcomes, but rather in features of the agent's mental state. The above characterization of deontological theories mistakenly classifies it as deontological. Another closely related characterization of deontological theories is as theories that ground the permissibility of actions in and only in their intrinsic nature.

The problem here is that it is not clear what it might mean to say that a particular feature is part of the “intrinsic nature” of an action. One possibility is that the intrinsic nature of an action consists of its “relatively immediate” features. <sup>6</sup>There are various sorts of reasonably intuitive ways of interpreting ‘immediate’. One notion of immediacy that has received a fair amount of attention recently is that implicit in the distinction between what the agent “brings about” and what he/she merely “allows to happen”.

Roughly speaking an agent brings about a state of affairs just in case it would not have been realized, if the agent had been passive, i.e., if he/she had not intervened into the “normal course of events”. For example, under normal circumstances, if an agent pushes someone off a high cliff and the person dies, then his/her death is something that the agent brings about. On the other hand, if the agent stands by and “does nothing” as the person falls off the edge of the cliff, his/her death is something that the agent merely allows to happen. Although this is but one notion of immediacy, it seems clear that there is something to the distinction between theories that ground the permissibility of actions solely in their relatively immediate features and those that do not. This distinction does not, however, capture the intuitive deontological, non-deontological distinction.

A theory that judges an action permissible just in case its immediate outcome (however construed) is maximally good grounds the permissibility of actions solely in their immediate features, but intuitively is not a deontological theory. Furthermore, a theory that consists of the injunction “Don't bring about or allow the extinction of any species!” does not ground the permissibility of actions solely in their immediate features (since what one allows to happen in the distant future is presumably not an immediate feature), but intuitively is a deontological theory.

Similar counterexamples could, I suggest, be found for other interpretations of immediacy. Another possibility is that the intrinsic nature of an action consists of its non comparative features, i.e., those features that it has independently of the features that its alternatives have. On this interpretation the feature of being a killing is the type of feature that can be part of the intrinsic nature of an action, but the feature of having maximally good consequences is not. So interpreted, however, the characterization of deontological theories (or even one type thereof) as theories that ground the permissibility of actions in and only in their intrinsic nature is intuitively inadequate. Minimal act utilitarianism – according to which an action is permissible just in case its consequences are not bad (e.g., the net level of happiness is not negative) – grounds the permissibility of an action in and only in its non comparative features, but intuitively it is not deontological. And a theory whose sole injunction is “Don’t kill unless it is necessary to save the life of a close friend or family member!”, does ground the permissibility of an action in features of its alternatives (on whether there is an alternative that saves the life of a close friend or family member, without killing anyone else), but intuitively is deontological. So far, then, we have judged the following characterizations of deontological theories to be inadequate:

1. as rule-based,
2. as absolutist,
3. as not grounding the permissibility of actions in their outcomes,
4. as grounding the permissibility of actions in and only in their intrinsic nature, where the intrinsic nature of action is understood as
  - a. its “relatively immediate” features, or
  - b. its non-comparative features.

A feature common to all of these characterizations of deontological theories is that they do not impose any requirement concerning how the good and the right are related. Let us now examine some characterizations that do impose some such requirement.

Sometimes, deontological theories are characterized as theories for which the right is prior to the good, i.e., for which the good depends on the right. <sup>8</sup> This characterization, however, is too narrow to be adequate. Theories for which the right is prior to the good (such as Kant’s) are indeed intuitively deontological, but they are not the only theories that are deontological. There are at least two kinds of theories for which the right is not prior to the good which are intuitively deontological.

(1) Theories that make the right and the good independent of each other are generally considered to be deontological. For example, a theory that assesses the goodness of states of affairs in terms of the total amount of happiness they contain, and that judges an action permissible just in case it conforms to The Ten Commandments is intuitively deontological. It does not, however, make the right prior to the good.

(2) Theories for which the right is not prior to the good, but rather depends on considerations of goodness, but does not depend solely on such considerations are generally considered to be deontological. For example, a theory that assesses the goodness of states of affairs in terms of the total amount of happiness they contain, and which directs the agent to produce the best consequences subject to a constraint against killing is intuitively deontological. It does not, however, make the right prior to the good.

A more adequate characterization of deontological theories is as theories that do not make the right depend solely on considerations of goodness. None of the intuitive paradigms of deontological theories (e.g., Kant's theory, The Divine Command Theory, The Ten Commandment Theory, and Ross's non-absolutistic theory) ground the permissibility of actions solely in considerations of goodness. And all of the intuitive paradigms of non-deontological theories (e.g., forms of utilitarianism based on the goodness of outcomes, anticipated outcomes, or reasonably anticipatable outcomes, and minimal act utilitarianism) do ground the permissibility of actions solely in considerations of goodness. The distinction between theories that ground the permissibility of actions solely in considerations of goodness and those that do not is an important distinction.

Indeed, I shall argue that it is more important than any of the traditional teleological/non-teleological distinction. First, however, let us take a closer look at the feature of making the right depend solely on consideration of goodness. Following Michael Stocker's call such theories axiological.

### **Fundamental classificatory distinctions**

The teleological/deontological distinction is generally assumed to be the fundamental classificatory distinction for moral philosophy. Under the 'teleological/deontological distinction' title we have uncovered the axiological/deontological distinction and four teleological/non-teleological distinctions. I shall now argue that none of these distinctions is the fundamental classificatory distinction, because the presupposition that there is a unique fundamental distinction is false. There are rather several fundamental distinctions. Furthermore, I shall argue that none of the four teleological/non-teleological distinctions is even fundamental. The axiological/deontological distinction is significantly more important than any of them.

To say that a distinction is fundamental is to say that it is not significantly less important than any other distinction. Fundamental distinctions are ones that most ultimately matter. The importance of a distinction, I assume, is relative to a set of interests and purposes. Here we are concerned with the importance of distinctions relative to our interest in the assessment of moral theories. The importance of a distinction relative to these interests is determined by something like the usefulness of the role it plays, or would play on reflection, in the criticism and justification of moral theories.

The first question, then, is that of whether there is a unique fundamental classificatory distinction, i.e. a distinction that is significantly more important than any other. In order to answer this question, we need to determine whether there is a feature, the presence or absence of which is, relative to our interests in the assessment of moral theories, significantly more important than the presence or absence of any other feature.

A survey of some of the criticisms made of teleological theories supports fairly conclusively the thesis that there is no unique fundamental classificatory distinction. There are rather several distinct features that ultimately matter for theory assessment. For example, Ross<sup>21</sup> criticizes certain kinds of teleological theories for making the right depend solely on considerations of goodness. Moore replies at length to the criticism of his utilitarian theory that it bases the permissibility of actions on their outcomes, as opposed to the agent's motives (intended outcome), or the reasonably foreseeable outcome. Williams<sup>23</sup> criticizes certain kinds of teleological theories for making the permissibility of actions depend not only on what the agent

“brings about”, but also on what the agent allows to happen. Nagel criticizes certain kinds of teleological theories for being agent-insensitive. Scheffler criticizes certain kinds of teleological theories for being too demanding, in that they leave the agent too little liberty. Nozick criticizes certain kinds of teleological theories for failing to respect the separateness of persons, in that they allow the interests of one person to be traded off against those of others. Mabbott and other retributivists criticize certain kinds of teleological theories for being insensitive to the past. Each of these authors identifies a specific feature and then criticizes certain kinds of teleological theories for having (or lacking) that feature. Each holds that such teleological theories are inadequate because they have (or lack) the feature in question. Indeed, each author holds that any theory – be it teleological or not – that has (or lacks) the feature in question is inadequate. Thus, each of these features provides the basis for a classificatory distinction that is important for the assessment of moral theories. Surely, at least two (if not most, or even all) of these distinctions are fundamental, i.e. not significantly less important than any other distinction. There is, that is, no unique fundamental classificatory distinction, but rather several of them. As a minimum, then, the teleological/deontological distinction – however interpreted – has been overemphasized. Even if it is a fundamental distinction, it is not the only one. But are any of the teleological/deontological distinctions that we have identified fundamental? The above survey of some of the features that ultimately matter for the justification and criticism of moral theories strongly supports a negative answer with respect to the four teleological/non-teleological distinctions. Moral philosophers do not criticize theories simply for being (or failing to be) teleological (in any of the four senses). They criticize them for having (or failing to have) more basic features, such as those identified above. Consider, for example, the distinction between theories that are agent-insensitive teleological and those that are not. This is not a fundamental distinction, because being agent-sensitive teleological is not a feature that is invoked at the most basic level of criticism and justification of moral theories. Each of the following distinctions, for example, is significantly more important:

- (1) that between theories that are agent-sensitive and those that are not; \
- (2) that between theories that make the right depend solely on considerations of goodness and those that do not; and
- (3) that between theories that make the right depend solely on their outcomes (and not, e.g., on their anticipated outcomes) and those that do not.

For the four teleological/non-teleological distinctions, the broader the characterization of teleological theories, the more it focuses on a feature of theories that matters in an ultimate way, and the more important the corresponding teleological/non-teleological distinction is. The distinction between theories that are goodness maximizing and those that are not is the most important of the four distinctions. Even it, however, is not a fundamental distinction. Both

1. the distinction between theories that make the right depend solely on considerations of goodness and those that do not, i.e., the axiological/deontological distinction, and
2. the distinction between comparative and non-comparative theories are significantly more important.

The axiological/deontological distinction, on the other hand, is quite plausibly a fundamental distinction. As previously argued, the feature of making the right depend solely on considerations of goodness is a feature that figures in a basic way in the justification and criticism of moral theories.

## Egoism

Unlike other theories that prescribe how we ought to behave, egoism is a descriptive principle (Pollock, 2007) that does not tell us necessarily how we ought to behave, but rather why we behave the way we do. It infers that the person who acts in an egotistical manner does so because it is natural to act in this way, and therefore it is a moral action unto itself.

According to the tenets of egoism, the core reason that someone does any action is self-serving by bringing happiness or some other benefit to him- or herself. If someone performs an action that appears to be altruistic, the action was likely performed to give the actor gratification in some way. This may come in many forms; for example in the form of positive media attention, or just feeling good about oneself.

The following example may illustrate how a heroic act by law enforcement officers may be viewed differently through the lens of egoism. On June 10, 2014, Vancouver police detectives witnessed a shooting on the seawall in Yale town. A gunfight ensued in which the suspect was able to escape via bicycle. Armed and reloaded, the suspect pedaled away and was followed by one of the detectives. The suspect fired at the pursuing detective, narrowly missing her. The detective pursued the suspect while being shot at until other police officers arrived who shot the suspect in an exchange of gunfire.

Most people would look at this case and believe that the detective was selflessly trying to apprehend a dangerous suspect before anyone else was shot. While this may be true, proponents of egoism would suggest that the detective acted in her own self-interest because capturing the suspect would satisfy her happiness, that she wanted media attention, or that she thought her actions would look good to her colleagues, thereby making her happy. This is a cynical view of her actions, but may help us understand why some people act in a way that puts them in danger.

Another way to demonstrate egoism is to place yourself in a situation in which you see someone who requires help. Suppose you decide that not assisting would cause you to feel guilty, thereby troubling you. As a response, you assist the person. From an outsider's perspective, you were acting selflessly and in the interest of the person who was requiring assistance. The end result of your actions, though, was twofold:

1. Your actions assisted the person in need.
2. Your actions made you feel good, allowing you to rid yourself of that troubling feeling resulting from guilt.

### **Q. How can egoism assist law enforcement in moral dilemmas?**

Egoism does not suggest that police officers should act in their own self-interest; certainly this would not be appropriate for law enforcement personnel. Where egoism may help is to better understand why people do things that may appear selfish. This may help us develop empathy for the suspects that appear to be selfish and allow us to better understand that their actions are driven by egoism. Egoism may also assist us in understanding the motives of others, allowing us to look at these motives with more skeptically than we would otherwise.

Egoism can also provide explanations of misconduct among law enforcement officers. Officers who abuse the trust placed on them by society and abuse their authority could be said to be acting

in an egoistic state (Souryal, 2011). In this sense, law enforcement officers are acting in their own self-interest and not in the interest of their agency, the individual citizen who was the target of and officer, and society in general. Ultimately, the end result of bad behaviour by law enforcement personnel, according to Souryal (2011, p.275), is "arguably feeding one's ego."

In a broader sense, ethical egoists may also view everything we do as an extension of a desire to live at peace in a society that respects all; every positive action we take is actually selfish activity, so that we can make a better society to live in. In this way, egoists can be positive in their actions making what are apparent good and ethical decisions. However proponents of the egoist theory would suggest that the decisions are at their root self-serving, and therefore egoist in nature.

## **Criticisms of Egoism**

Egoism is an attempt at explaining how we naturally behave with our own interests as a central focus, and that we ought to behave in this way. However, it is an overly cynical perspective on how humans behave. There are plenty of examples of selfless acts that are committed every day and go without notice. While it is true that many donations are made and good deeds done with the expectation that positive publicity will be generated for the giver, this does not necessarily mean that the giver's sole purpose is to gain publicity. It is possible that publicity is a by-product of giving. Furthermore, while it is in the interests of people to make decisions that will better society, there is no evidence that everyone makes these decisions based on self-interest (Rachels, 2006). If these decisions were universalized, then the world would be a markedly poorer place to live in.

## **Importance**

Common sense and folk psychology assumes that people tend to act in their own interests. Today's culture reflects an interest in self-improvement, self-esteem, and self-gratification. The "X-generation" has also been called the "Me-generation," as rampant consumerism focuses young people on immediate gratification and reflects no example of community responsibility or consideration for others. In fact, the American market economy is founded on the assumption that self-interested, competing parties will produce the greatest good.

Yet, interestingly, our culture provides examples of both self- and other-centered paradigms. There are countless examples of people who act in the interests of others, sacrificing their own comfort and safety, to help fellow human beings, living creatures, or the physical environment. The acts of kindness, rescuing, generosity, self-sacrifice, and advocacy cover the spectrum of needs. Firefighters risked their lives, indeed some died, in the September 11, 2001, tragedy in the United States. In addition, a wave of financial gifts to victims and their families followed, as well as volunteers ready to help at the Ground Zero and Pentagon sites of devastation. Mother Teresa tended to the needs of the poor and sick in India - washing, feeding, bathing, and loving the least valued people in Calcutta's society. Princess Diana Spencer used her fame and status to advocate for the banning of land mines; she donated her clothing to raise funds for several social causes.

## **Ties to the Philanthropic Sector**

Theories of egoism attempt to explain human motivation; understanding what motivates one toward serving the interests of others is key to understanding giving and philanthropic activity. The American spirit of giving has been expressed in concrete ways over the past two hundred years. "Major universities have been founded, hospital and medical centers have been built, and social change agencies have come into being" (Russo 1991, 1). Philanthropic gifts of time, talent, and

treasure may result from complex motivations (ranging from the feeling of satisfaction that one has helped another to the tax-deduction gained from a financial contribution).

What is important to consider is that it does not have to be an either/or kind of proposition. People's behavior is not purely egoist or purely altruist. Actions can result from a blend of altruistic and egoist motives. Indeed our own American tradition has evolved from this apparent contradiction - we believe in individualism and serving the interests of self, **and** we have a tremendous history of giving to others in need.

## Key Related Ideas

**Ethics** is a field of philosophy that is concerned with morality, recommending right and wrong behavior. Egoism is a philosophical theory in ethics, which has at least three subtypes, **descriptive egoism, normative egoism** and **conditional egoism**.

*Descriptive egoism*, also known as psychological egoism, contends that people always act in self-serving ways, though they may try to disguise their selfish motives. *Normative egoism*, also termed ethical egoism, claims people should act in self-serving ways because it is morally right. Modern philosophers have added a third, conditional egoism, which asserts that egoism is morally right and acceptable if it leads to morally acceptable ends; self-motivated actions can be considered morally acceptable, if they lead to the betterment of society and the public as a whole.

Adam Smith, in *Wealth of Nations*, offers an example of conditional egoism. Borrowing ideas from Mandeville's, *Fable of the Bees*, Smith wrote:

It is not from the benevolence of the butcher, the brewer, or the baker, that we expect dinner, but from their regard to their own self-interest. We address ourselves not to their humanity but to their self-love, and never talk to them of our own necessities but of their advantages.

## Altruism

Altruism is when we act to promote someone else's welfare, even at a risk or cost to ourselves. Though some believe that humans are fundamentally self-interested, recent research suggests otherwise: Studies have found that people's first impulse is to cooperate rather than compete; that toddlers spontaneously help people in need out of a genuine concern for their welfare; and that even non-human primates display altruism.

Evolutionary scientists speculate that altruism has such deep roots in human nature because helping and cooperation promote the survival of our species. Indeed, Darwin himself argued that altruism, which he called "sympathy" or "benevolence," is "an essential part of the social instincts." Darwin's claim is supported by recent neuroscience studies, which have shown that when people behave altruistically, their brains activate in regions that signal pleasure and reward, similar to when they eat chocolate (or have sex).

This does not mean that humans are more altruistic than selfish; instead, evidence suggests we have deeply ingrained tendencies to act in either direction. Our challenge lies in finding ways to evoke the better angels of our nature.

Altruism is acting to help someone else at some cost to oneself. It can include a vast range of behaviors, from sacrificing one's life to save others, to giving money to charity or volunteering at a soup kitchen, to simply waiting a few seconds to hold the door open for a stranger. Often, people behave altruistically when they see others in challenging circumstances and feel empathy and a desire to help.

Altruism also builds social connections. For example, studies show that people who are altruistic tend to be happier, to be healthier, and to live longer.

So, while altruism leads us to do what's best for others, it also makes us feel good in the process.

### **Why Altruism Is Important?**

Altruistic urges and behaviors are an important part of the glue that binds families and social groups together, helping them to cooperate and thrive. Individuals who go out of their way to aid others often receive something in return—whether it's an intangible reward, such as admiration and respect, or material support at a later time. Altruistic impulses and the reciprocation of kind deeds help ensure all members of a tight-knit group have backup when they need it.

### **Prosocial Behavior and Altruism**

Altruism is one aspect of what social psychologists refer to as prosocial behavior. Prosocial behavior refers to any action that benefits other people, no matter what the motive or how the giver benefits from the action.<sup>3</sup> Remember, however, that pure altruism involves true selflessness.

While all altruistic acts are prosocial, not all prosocial behaviors are completely altruistic. We might help others for a variety of reasons such as guilt, obligation, duty, or even for rewards.

### **Explanations for Why Altruism Exists**

What is it that inspires people to give their time, energy, and money for the betterment of others, even when they receive nothing tangible in return? Psychologists have suggested a number of different explanations for why altruism exists.

### **Evolution**

Kin selection is an evolutionary theory that proposes that people are more likely to help those who

are blood relatives because it will increase the odds of gene transmission to future generations.<sup>2</sup> The theory suggests that altruism towards close relatives occurs in order to ensure the continuation of shared genes. The more closely the individuals are related, the more likely people are to help.

## Psychic Rewards

Altruism activates reward centers in the brain. Neurobiologists have found that when engaged in an altruistic act, the pleasure centers of the brain become active.

One 2014 study published in the journal *Social Cognitive and Affective Neuroscience* found that engaging in compassionate actions activates the areas of the brain associated with the reward system, including the dopaminergic ventral tegmental area and the ventral striatum.<sup>4</sup> The positive feelings created by compassionate actions then reinforce altruistic behaviors.

## Environment

A Stanford study suggested that interactions and relationships with others have a major influence on altruistic behavior.<sup>4</sup> Psychologists have long debated whether some people are just born with a natural tendency to help others, a theory that suggests that altruism may be largely controlled by genetics.

The study called this theory into question, finding that socialization had a serious impact on altruistic actions in one- and two-year-old children. Kids who observed simple reciprocal acts of altruism were far more likely to exhibit altruistic actions, whereas friendly but non-altruistic modeled actions did not show the same results.

Such research suggests that modeling altruistic actions can be an important way to foster prosocial and compassionate actions in children.

## Social Norms

Society's rules, norms, and expectations can also influence whether or not people engage in altruistic behavior. The norm of reciprocity, for example, is a social expectation in which we feel pressured to help others if they have already done something for us.

For example, if your friend loaned you money for lunch a few weeks ago, you'll probably feel compelled to reciprocate when they ask if you if they can borrow \$100. They did something for you, now you feel obligated to do something in return.

## Incentives

While the definition of altruism involves doing for others without reward, there may still be cognitive incentives that aren't obvious. For example, we might help others to relieve our own distress or because being kind to others upholds our view of ourselves as kind, empathetic people.<sup>2</sup> Other cognitive explanations include:

- **Empathy:** Researchers suggest that people are more likely to engage in altruistic behavior when they feel empathy for the person who is in distress, a suggestion known as the *empathy-altruism hypothesis*.<sup>4</sup> Researchers have found that children tend to become more altruistic as their sense of empathy develops.

- **Helping relieve negative feelings:** Other experts have proposed that altruistic acts help relieve the negative feelings created by observing someone else in distress, an idea referred to as the *negative-state relief model*. Essentially, seeing another person in trouble causes us to feel upset, distressed, or uncomfortable, so helping the person in trouble helps reduce these negative feelings.

## Comparing the Theories

The underlying reasons behind altruism, as well as the question of whether there is truly such a thing as "pure" altruism, are two issues hotly contested by social psychologists. Do we ever engage in helping others for truly altruistic reasons, or are there hidden benefits that guide our altruistic behaviors?

Some social psychologists believe that while people do often behave altruistically for selfish reasons, true altruism is possible. Others have instead suggested that empathy for others is often guided by a desire to help yourself. Whatever the reasons behind it, our world would be a much sadder place without altruism.

## Universalism in Ethics

One distinctive understanding of universalism in ethics is that ethical principles are principles for everybody. They prescribe obligations for everybody, define rights for everybody, list virtues for everybody. The most minimal version of ethical universalism is a claim about the form of ethical principles or standards. It is the claim that ethical principles hold for all and not merely for some, that is, for everybody without exception.

A second conception of universalism in ethics emphasizes the content as well as the form and scope of principles. Principles which hold for everybody will prescribe or recommend the same for everybody (same obligations, same rights, same virtues and so on). Advocates of universal principles see this as a merit: they see equality of requirement and entitlement as ethically important. For example, discussions of universal human rights emphasize not only that all humans have rights, but that they all have the same rights.

The charge that ethical principles which prescribe the same for all abstract from differences between cases is true, but not damaging. No principle of action - whether of universal or non-universal form, whether of cosmopolitan or lesser scope - can prescribe with total specificity; even very explicit principles abstract from many circumstances. It follows that principles of action can always be satisfied in varied ways. A principle such as "Tell the truth" does not prescribe what we must say to whom or when; a principle such as "Pay your debts" does not determine the means or manner of repayment. Principles of action, including ethical principles, constrain action or entitlements, rather than picking out a single, wholly determinate line of action. Abstract principles can therefore guide action yet allow for flexible interpretation or application that takes account of differences between cases. So an ethics of universal principles can readily avoid both barren formalism and doctrinaire rigorism.

[Some] conceptions of universalism in ethics combine views of the form, scope and sameness of content principles with ambitious claims that a single fundamental principle provides the basis for all derivative ethical principles and ultimately for ethical judgment of particular cases.

Often the proposed fundamental principle is a version of a "golden rule." Various formulated golden rules are found in Hindu and Confucian sacred texts, and in many other traditions.... One well known golden rule is Christian with Jewish antecedents "Do unto others as you would that they should do unto you". Others are prohibitions rather than injunctions, such as "Do not do unto others what you would not have them do unto you."

These would-be foundational principles have been criticized for linking ethics too closely to agents' desires or consent. Why should willingness to be on the receiving end of like action make it permissible? If masochists are willing to suffer others' sadism, would that make sadism right? More generally, can acceptance of being on the receiving end of like action legitimate anything?

### **Fundamental principles: Kantian universalizability**

An alternative conception of universalism in ethics rejects golden rules and seeks to anchor all ethical justification in a more formal fundamental universal principle, which does not refer to desires or consent to fix the content of ethics. The most famous and most ambitious attempt to go further is Kant's categorical imperative, of which the best known version runs: Act only on that maxim through which you can at the same time will that it should become a universal law ([1785] 1903: 421). Kant claims to show that all imperatives of duty can be derived from this one imperative as their principle (421). He insists that in such derivations no reference be made either to anyone's happiness or desires, consent or agreement, and that the categorical imperative is not a version of a golden rule (which he dismisses as trivial, 430, footnote). Kant's views have been influential: a German scholar recently commented that "Kant succeeded with his objection almost in invalidating the golden rule and disqualifying it from future discussion in ethics".

English language philosophy has been less convinced that Kant undermined golden rule approaches. J.S. Mill was neither the first nor the last to think that Kant's claim to derive all principles of duty from the categorical imperative was complete nonsense. He wrote of Kant when he begins to deduce from this precept any of the actual duties of morality, he fails, almost grotesquely, to show that there would be any contradiction, any logical (not to say physical) impossibility, in the adoption by all rational beings of the most outrageously immoral rules of conduct. All he shows is that the consequences of their universal adoption would be such as no one would choose to incur. (1861: 207; original emphasis)

There has been widespread scepticism about Kant's supposed claim to show that 'immoral rules of conduct' are self-contradictory. However, he in fact makes the more circumspect modal claim that we should not act on principles which we cannot simultaneously "will as universal laws". An example of such a principle is that of false promising. Kant holds that false promisers who try (incoherently) to will false promising as a universal law thereby will the destruction of the very trust on which their own attempts to promise falsely must rely. Hence when we try to act on such principles Kant holds that we in fact do not will that our maxim (principle) should become a universal law - since this is impossible for us - but rather that its opposite should remain a law universally: we only take the liberty of making an exception to it for ourselves (or even just for this once). ([1785] 1903: 424; original emphasis)

In "deriving" an "actual principle of duty" from the categorical imperative, Kant takes it that agents not only seek principles of universal form and cosmopolitan scope which prescribe the same for all, but shun any principles which cannot be "willed for all". Kantian justifications of such principles, unlike golden rule justifications, do not appeal to either the desires, the happiness or the

acceptance of those on the receiving end, nor indeed to actual or hypothetical desires of any or of all agents. The distinctive modal character of Kantian universalizability is its appeal to what can be willed for all (rather than to what actually is or hypothetically would be willed by all). It remains a matter of considerable controversy whether a strictly Kantian approach can be used to construct an account of specific principles of duty, virtue or entitlement, or whether it is indeed too formal and minimal to sustain these derivations.

## Cultural Relativism vs. Universalism

The Universalism vs. Cultural Relativism debate has existed in legal scholarship for decades, and is increasingly entering public discourse on international law and human rights. Universalism refers to the notion that human rights are universal and should apply to every human being. Cultural Relativists object, and argue that human rights are culturally dependent, and that no moral principles can be made to apply to all cultures. They argue that the principles embedded in the Universal Declaration of Human Rights (1948) are the product of Western political history. Indeed, the origins of the Universal Declaration are rooted in political landmarks in Western history, such as the Magna Carta of the United Kingdom (1215), the French Revolution (1789) and the American Bill of Rights (1791). Cultural Relativists argue that Universalism, in its attempt to extend a Western ideal to the rest of the world, is a form of cultural imperialism. As the establishments of post-conflict ad-hoc tribunals for Rwanda and the Former Yugoslavia in the 1990's and the International Criminal Court in 2002 illustrate, universalism is steadily being put into force. Cultural Relativists are critical of the validity, relevance and effect of these tribunals and of the ICC especially. Instead, Cultural Relativists are generally supportive of 'traditional' or local approaches to justice, as they believe these will contribute more to post-conflict reconciliation. This page will follow how this theoretical debate plays out in practice, through a series of case studies.

## Subjectivism

There ain't no sin and there ain't no virtue. There's just stuff people do. "John Steinbeck, *Grapes of Wrath*"

Subjectivism teaches that there are no objective moral truths out there.

- There are no objective moral facts. Therefore 'murder is wrong' can't be *objectively* true
- Many forms of subjectivism go a bit further and teach that moral statements describe how the speaker feels about a particular ethical issue.
- Moral statements are just factual statements about the attitude *the speaker* holds on a particular issue
- So if I say "Lying is wrong", all I'm doing is telling you that I disapprove of telling lies
- Some forms of subjectivism generalise this idea to come up with:
- Moral statements are just factual statements about the attitude *normal human beings* hold on a particular issue And this may ultimately lead us to this conclusion about moral truths:
- Moral judgements are dependent on the feelings and attitudes of the persons who think about such things

Subjectivism is the theory that perception (or consciousness) is reality, and that there is no underlying, true reality that exists independent of perception. It does not, however, claim that "all is illusion" or that "there is no such thing as reality", merely that the nature of reality is dependent on the consciousness of the individual. In an extreme form, it may hold that the nature and

existence of every object depends solely on someone's subjective awareness of it.

Subjectivism has its philosophical basis in the writings of René Descartes ("*Cogito Ergo Sum*"), and the Empiricism and Idealism of George Berkeley is a more extreme form of it.

It is very similar to the doctrine of Solipsism and is related in some ways to metaphysical Relativism. The antithesis of Subjectivism is Objectivism, which holds that reality exists wholly independent of the mind. Another concept related to Subjectivism is that of Panpsychism, the view that all parts of matter involve mind, that everything is sentient and that there are either many separate minds, or one single mind that unites everything that is.

## **Good points of subjectivism**

### **Reflects the subjective elements of morality**

- it reflects the close relationship between morality and people's feelings and opinions - indeed it can cope with the contradictory moral views we often find ourselves wrestling with

### **Reflects the evaluative elements of moral statements**

- moral statements in everyday life make judgements ("lying is wrong"), factual statements ("cats have fur") don't

### **Shows that moral judgements communicate dis/approval**

- it reflects the communication of approval and disapproval that seems to go along with the everyday making of moral statements

### **May clarify what people are arguing about**

- subjectivism may enable people disagreeing over the rightness or wrongness of some issue to see that the real dispute is not about objective truth but about their own preferences

### **Reflects the persuasive intentions behind ethical discussions**

- subjectivism may also enable people engaging in moral argument to realise that they are not arguing about objective truths but trying to persuade their opponent to adopt their point of view

## **Bad points of subjectivism**

The problem with subjectivism is that it seems to imply that moral statements are less significant than most people think they are - this may of course be true without rendering moral statements *insignificant*.

### **"If I approve of something, it must be good"**

- Subjectivism seems to tell us that moral statements give information only about what we feel about moral issues.
- If the simplest form of subjectivism is true then when a person who genuinely approves of telling lies says "telling lies is good" that moral statement is unarguably true. It would only be untrue if the speaker didn't approve of telling lies.
- So under this theory it seems that all the speaker has to do to prove that lying is good is to show lots of evidence that *they do indeed approve of lying* - perhaps that they tell lots of lies and feel

good about it, indeed are surprised if anyone criticises them for being a liar, and that they often praise other people for telling lies.

- Most people would find this way of approaching ethics somewhat unhelpful, and wouldn't think it reflected the way in which most people talk about ethical issues.

### **Moral statements seem more than statements about feelings**

- By and large if a person says something is wrong we usually get the message that they disapprove of that something, but most of us probably think that the other person is doing more than just telling us about their feelings.

### **How can we blame people if moral truths are always subjective?**

- If moral statements have no objective truth, then how can we blame people for behaving in a way that 'is wrong', i.e. if "murder is wrong" has no objective truth, then how can we justify punishing people for murder?
- One answer is that we can justify punishment for murder on the basis of the objective truth that most normal people in society disapprove of murder. If we do this, we should not pretend that our justification is based on anything other than the majority view.

## **Types of Subjectivism**

- Metaphysical Subjectivism is the idea (as described above) there is no underlying, true reality that exists independent of perception or consciousness.
- Ethical Subjectivism (or Moral Subjectivism) is the meta-ethical belief that ethical sentences reduce to factual statements about the attitudes and/or conventions of individual people, or that any ethical sentence implies an attitude held by someone. It is therefore a form of Moral Relativism in which the truth of moral claims is relative to the attitudes of individuals. The opposite position is that of Moral Objectivism or the more extreme Moral Absolutism.

## **Cultural relativism**

Cultural relativism refers to the idea that the values, knowledge, and behavior of people must be understood within their own cultural context. This is one of the most fundamental concepts in sociology, as it recognizes and affirms the connections between the greater social structure and trends and the everyday lives of individual people.

The Cross-Cultural Relationship is the idea that people from different cultures can have relationships that acknowledge, respect and begin to understand each others diverse lives. People with different backgrounds can help each other see possibilities that they never thought were there because of limitations, or cultural proscriptions, posed by their own traditions. Traditional practices in certain cultures can restrict opportunity because they are "wrong" according to one specific culture. Becoming aware of these new possibilities will ultimately change the people that are exposed to the new ideas. This cross-cultural relationship provides hope that new opportunities will be discovered but at the same time it is threatening. The threat is that once the relationship occurs, one can no longer claim that any single culture is the absolute truth.

Cultural relativism is the ability to understand a culture on its own terms and not to make judgments using the standards of one's own culture. The goal of this is promote understanding of cultural practices that are not typically part of one's own culture. Using the perspective of cultural

relativism leads to the view that no one culture is superior than another culture when compared to systems of morality, law, politics, etc. [11] It is a concept that cultural norms and values derive their meaning within a specific social context. This is also based on the idea that there is no absolute standard of good or evil, therefore every decision and judgment of what is right and wrong is individually decided in each society. The concept of cultural relativism also means that any opinion on ethics is subject to the perspective of each person within their particular culture. Overall, there is no right or wrong ethical system. In a holistic understanding of the term cultural relativism, it tries to promote the understanding of cultural practices that are unfamiliar to other cultures such as eating insects, genocides or genital cutting.

### **There are two different categories of cultural relativism:**

- **Absolute:** Everything that happens within a culture must and should not be questioned by outsiders. The extreme example of absolute cultural relativism would be the Nazi party's point of view justifying the Holocaust.
- **Critical:** Creates questions about cultural practices in terms of who is accepting them and why. Critical cultural relativism also recognizes power relationships.

Absolute cultural relativism is displayed in many cultures, especially Africa, that practice female genital cutting. This procedure refers to the partial or total removal of the external female genitalia or any other trauma to the female reproductive/genital organs. By allowing this procedure to happen, females are considered women and then are able to be married. FGC is practiced mainly because of culture, religion and tradition. Outside cultures such as the United States look down upon FGC, but are unable to stop this practice from happening because it is protected by its culture.

A Chinese woman with her feet unbound

Cultural relativism can be seen with the Chinese culture and their process of feet binding. Foot binding was to stop the growth of the foot and make them smaller. The process often began between four and seven years old. A ten foot bandage would be wrapped around the foot forcing the toes to go under the foot. It caused the big toe to be closer to the heel causing the foot to bow. In China, small feet were seen as beautiful and a symbol of status. The women wanted their feet to be **“three-inch golden lotuses”** It was also the only way to marry into money. Because men only wanted women with small feet, even after this practice was banned in 1912, women still continued to do it. To Western cultures the idea of feet binding might seem torturous, but for the

Chinese culture it was a symbol of beauty that has been ingrained the culture for hundreds of years. The idea of beauty differs from culture to culture.

## **Origins and Overview**

The concept of cultural relativism as we know and use it today was established as an analytic tool by German-American anthropologist Franz Boas in the early 20th century. In the context of early social science, cultural relativism became an important tool for pushing back on the ethnocentrism that often tarnished research at that time, which was mostly conducted by white, wealthy, Western men, and often focused on people of color, foreign indigenous populations, and persons of lower economic class than the researcher.

Ethnocentrism is the practice of viewing and judging someone else's culture based on the values and beliefs of one's own. From this standpoint, we might frame other cultures as weird, exotic, intriguing, and even as problems to be solved. In contrast, when we recognize that the many cultures of the world have their own beliefs, values, and practices that have developed in particular historical, political, social, material, and ecological contexts and that it makes sense that they would differ from our own and that none are necessarily right or wrong or good or bad, then we are engaging the concept of cultural relativism.

## **Examples**

Cultural relativism explains why, for example, what constitutes breakfast varies widely from place to place. What is considered a typical breakfast in Turkey, as illustrated in the above image, is quite different from what is considered a typical breakfast in the U.S. or Japan. While it might seem strange to eat fish soup or stewed vegetables for breakfast in the U.S., in other places, this is perfectly normal. Conversely, our tendency toward sugary cereals and milk or preference for egg sandwiches loaded with bacon and cheese would seem quite bizarre to other cultures.

Similarly, but perhaps of more consequence, rules that regulate nudity in public vary widely around the world. In the U.S., we tend to frame nudity in general as an inherently sexual thing, and so when people are nude in public, people may interpret this as a sexual signal. But in many other places around the world, being nude or partially nude in public is a normal part of life, be it at swimming pools, beaches, in parks, or even throughout the course of daily life (see many indigenous cultures around the world).

In these cases, being nude or partially nude is not framed as sexual but as the appropriate bodily state for engaging in a given activity. In other cases, like many cultures where Islam is the predominant faith, a more thorough coverage of the body is expected than in other cultures. Due in large part to ethnocentrism, this has become a highly politicized and volatile practice in today's world.

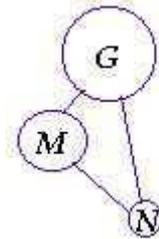

## **Why Recognizing Cultural Relativism Matters**

By acknowledging cultural relativism, we can recognize that our culture shapes what we consider to be beautiful, ugly, appealing, disgusting, virtuous, funny, and abhorrent. It shapes what we consider to be good and bad art, music, and film, as well as what we consider to be tasteful or tacky consumer goods. The work of sociologist Pierre Bourdieu features ample discussion of these phenomena, and the consequences of them. This varies not just in terms of national cultures but within a large society like the U.S. and also by cultures and subcultures organized by class, race, sexuality, region, religion, and ethnicity, among others.

**Supernaturalism:** the *theological belief* that a force or power other than man or nature is ultimate.

1. This supernatural force (God) *regulates* both man and nature, making both of them *subordinate* to it. (God as creator.)
2. Man is considered to be higher than the rest of nature.

### Consequent Spiritual Ideals:

Supernaturalism

Symbol Legend:

G=God

M=Man

N= Nature

- How human beings should act is largely a matter of knowing and *doing God's will*.
- Hence, human beings must transcend themselves and *not trust their instinct*

### Supernaturalism (God-based ethics)

This theory makes ethics depend on God. It teaches that:

- the only source of moral rules is God
- something is good because God says it is
- the way to lead a good life is to do what God wants

### Can God be the ultimate source of good?

Throughout history one puzzle has made it difficult to base ethics on God: Is a thing good because God desires it? or Does God desire a thing because it is good?

The Ancient Greek philosopher Plato concluded that God desires a thing *because it is good*. God's desire doesn't make a thing good - the thing would be good regardless of God.

If Plato is right then the supernaturalism theory is pretty unhelpful, because it doesn't reveal what makes something good or bad.

God's desire would be at best a useful way of discovering what is good and what is bad, but wouldn't tell us anything more than that.

And here's another problem:

If God desired something that everyone thinks is bad - would that make it good?

### **Atheists and supernaturalism Ethical atheists and supernaturalism**

If supernaturalism is true, how can atheists behave in a consistently moral way? If religion is the only basis of ethics, it would seem that people who have no faith can have no basis for their moral judgements, and nowhere to turn for guidance on how to live.

But atheists do behave in a consistent moral way, so where do such people get their morality from?

And since atheists and believers totally disagree on the foundations underpinning moral rules, it's surely strange that they so often agree on matters of right and wrong - since they have no common basis for moral judgements, any agreement on moral rules must be coincidence. One response the supernaturalist might offer is that the atheist does derive his or her ethics from God, even though they are unaware of it. The supernaturalist might say that not believing in God does not mean the atheist would have no awareness of a God-based ethics, and hence their agreement can be explained despite the atheist's different beliefs.

### **Constructionism devalues God-based ethics**

Some who are observant followers of a religion accept that God is a human construction and not a supernatural being.

If this is so, then God-based ethics are no different from humanly constructed ethics based on cultural traditions and rituals.

### **Different Gods leads to moral disagreement**

Since there are many different religions, with different understandings of God and different moral codes, God-based ethics is bound to produce moral disagreement.

God-based ethics provides no way of dealing with ethical conflicts between different religions.

### **Fearing God as a basis for good behaviour**

People may follow the rules of God-based ethics because they are fearful of being punished by God in this life or in some afterlife.

Many theologians teach that a fear- and power-based relationship with God is an inappropriate relationship to have with a loving God and leads to a bad spiritual life.

Many theologians and ethicists argue that such a relationship with God provides a bad model for human power and family relationships.

People may follow the rules of God-based ethics simply because they wish to behave in a way that pleases God.

This is a more helpful model for human power and family relationships.

## Discovering what is good

Even if people accept that things are good because God desires them they still face the problem of discovering what God desires. Strictly speaking this does not count against Supernaturalism as an intellectual position - it may be just beaccepted that moral truths are hard to discover - but it does highlight the difficulties.

## Discovering God's will

There are several ways in which believers try to find out God's will in ethical matters:

- reading scripture - both to see what God says, and to find relevant examples
- listening to religious teachers
- prayer and meditation
- seeing what is consistent with God's general advice on how to live
- listening to the inner, God-driven, voice
- discussion with teachers and followers of the religion concerned

Many religious people use a combination of these in their approach to moral problems. It is accepted by many believers that the ways of discovering God's will set out above don't give *direct* access to God's will, but involve working through intermediaries. Hence the information is passed through social, cultural, religious and psychological filters that can distort it.

Many hold that God's will is only directly known through revelation: God actually communicating his/her will to the person concerned. However, revelation as a source of ethics still presents a problem for certainty: how is the person to know that the revelation they have received has actually come from God?

## Ethical Realism

'Happiness is good.' 'We shouldn't punish innocents.' 'Generosity is a good character-trait.'

Ethical realists say that ethical claims such as these are objectively true: their truth does not depend on anyone's particular opinions, beliefs, preferences, or characteristics. That is, realists believe that there are right answers in ethics.

They reject relativism, according to which there are only non-objective ethical facts, and they reject nihilism, according to which there are no ethical facts (a theory sometimes called 'error theory'), and maybe even no ethical assertions of any kind (a theory sometimes called 'non-cognitivism').

Here, I first lay out several reasons in favor of ethical realism and then respond to several famous criticisms of the position.

## In Favor of Ethical Realism

Ethical realism was more-or-less taken for granted throughout most of the history of philosophy. Today, most experts agree that it's true. Consider three types of argument for realism.

### A. Common Sense or Intuition

It seems to lots of us as if suffering is bad; the claim is obvious, plausible, commonsensical, and self-evident. Arguably, everyone at-least-tacitly considers appearances to be evidence. Similarly, it seems as if stealing is wrong, even if you like to steal, and even if you trick someone into believing

that stealing isn't wrong. So there's plenty of intuitive evidence that these ethical truths are objective: their truth doesn't vary based on any particular person's situation or preferences.

### **B. Ethical Normativity and Epistemic Normativity**

If you think that moral facts are suspect in some way, then you might have to worry that facts about evidence are suspect for analogous reasons. There's a similarity between moral claims, about what we ought to do from the perspective of morality, and epistemological claims, about what we ought to do from the perspective of knowledge and evidence. Both seem normative: they're telling us that some course of action or belief is the correct one, or better than others, or that there is good evidence for something. Therefore, arguments that target normativity in general may undermine themselves. They may apply just as well, or better, to the idea that some theories are simply more objectively rational or justified or supported-by-the-evidence than other theories. And so if you reject normativity, you're rejecting the idea that your own position is justified.

### **C. Indispensability**

Arguably, much of our discourse is committed to the existence of genuinely normative properties and facts. Compare the case of mathematics, which might be a discourse about abstract objects that don't clearly have any direct causal contact with people's minds. Mathematicians continue to make progress and devise theories that can be applied to many particular projects. Maybe mathematicians are talking about nonexistent objects—numbers—and somehow, coincidentally, all this talk has paid off. But maybe mathematics is so successful because it's making true statements about numbers. Similarly, much of our discourse seems to assume the existence of ethical truths, and maybe the best explanation for this fact is that some of these truths really exist.

## **Defending Realism**

Ethical realism inspires many counter-arguments. We have space to survey three. Throughout, we should continually consider a general reply that Moorean realists have offered: that any argument against ethical realism, in order to justify us in rejecting the claim (e.g.) 'you shouldn't kill every living thing in the world, even if you want to,' will have to be such that all of its premises have more overall-evidence than 'you shouldn't kill everyone in the world, even if you want to.' One might offer this Moore-Bambrough-Huemer-style response to each of the three anti-realist arguments, but I'll also gesture at other objections.

### **A. Strangeness**

'Ethical properties would be strange.' Objections: It's not clear what strangeness is, why it should matter (given how many other things are strange), nor why ethical properties would be strange; indeed, goodness and badness seem normal and familiar.

### **B. Disagreement**

'There's too much disagreement about ethics for there to be facts about it.' Objections: Many apparently ethical disagreements are merely descriptive disagreements in disguise; just because people disagree about something, that doesn't normally mean there's no fact of the matter (compare the disagreement about whether Earth is the center of the Solar System); and such arguments run the risk of generalizing too far.

### **C. Evolutionary Debunking**

'Our ethical intuitions are the product of evolution, and are therefore a priori unlikely to

produce true beliefs.' Objections: If commonsense morality is true, then we should expect a reliable faculty of moral knowledge to be adaptive; thus the debunker at least can't assume that accurate moral beliefs are non- adaptive. In addition, if moral truths are known through reason, then it's to be expected that we would have the ability to learn these truths, even if it wasn't adaptive; compare calculus, which didn't help our ancestors survive. This argument, like others, may also prove too much.

#### **D. A Note on Epistemic Justification**

As noted, all three of these objections can also be seen to inspire arguments targeting epistemic justification in general, with the consequence that the objector must admit that her position is no more justified than its denial. And as the Moorean will argue, if, for each anti-realist argument, we are more justified in affirming 'You shouldn't kill everyone in the world, even if you want to,' then we are arguably justified in putting more confidence in ethical realism than in nihilism.

### **Intuitionism**

Intuitionism teaches three main things:

- There are real objective moral truths that are independent of human beings.
- These are fundamental truths that can't be broken down into parts or defined by reference to anything except other moral truths.
- Human beings can discover these truths by using their minds in a particular, intuitive way.

Intuitionism does not mean that all moral decisions are reached by relying on intuition. Intuition enables the discovery of the *basic* moral truths, and everyday moral decision-making then involves thinking about the choices available and making moral judgements in an ordinary sort of way. A leading UK intuitionist was the Cambridge philosopher G E Moore (1873-1954) who set out his ideas in the 1902 book *Principia Ethica*.

If I am asked, What is good? my answer is that good is good, and that is the end of the matter. Or if I am asked How is good to be defined? my answer is that it cannot be defined, and that is all I have to say about it. But disappointing as these answers may appear, they are of the very last importance.

My point is that good is a simple notion, just as yellow is a simple notion; that, just as you cannot, by any manner of means, explain to anyone who does not already know it, what yellow is, so you cannot explain what good is.

### **G E Moore, Principia Ethica**

Or to put it at its simplest: 'Good' means 'good' and that's all there is to say about it. Moore objected to something called 'the naturalistic fallacy', which states that moral truths can be analysed in terms of physical or psychological things which exist in the natural world. Moral truths were moral truths, and that was that.

Moore was a university professor, and his idea of what things were good, such as friendship and the appreciation of beauty, was limited by his quiet and academic life. His writings didn't demonstrate that his theory was likely to help deal with serious ethical dilemmas. Other leading intuitionists were H A Pritchard (1871-1947) and W D Ross (1877- 1971).

## **Bad points of intuitionism**

Philosophers object to intuitionism because:

- they don't think that objective moral truths exist
- they don't think that there is a process of moral intuition
- there's no way for a person to distinguish between something actually being right and it merely seeming right to that person
- if intuitionism worked properly, everyone would come to the same moral conclusions, but they don't

## **Objective moral truths don't exist**

Many philosophers don't think that there are such things as objective moral truths. For them, moral statements are not factual statements about how the world is.

Furthermore, it might be claimed that we could never *know* the truth, even if it existed objectively, because knowledge requires testing in a properly scientific fashion, and that is not available for moral statements.

## **Moral intuition doesn't exist**

The idea that human beings have something called moral intuition is superficially attractive, but doesn't easily stand up to inspection.

Is it another sense like sight or hearing? Probably not, since the moral truths that moral intuition should detect don't seem to be out in the physical world.

Nor is it a process of reasoning, because intuitionists usually rule that out, too. Perhaps it shows itself in moral emotions, like feelings of guilt? But although human beings certainly have such feelings, the feelings could be the result of breaking internal mental rules of conduct or breaching cultural rules, rather than of breaking objective moral rules.

## **Seeming right may not be the same as being right**

When an intuitionist ponders a problem the only things they have to work with are their feelings, thoughts and attitudes.

Working with these entirely subjective things the intuitionist arrives at moral intuitions, which he then puts forward as objective truths.

But how does the intuitionist get from the subjective to the objective?

## **People reach different ethical conclusions**

If there are real objective moral truths, then they are presumably the same for everyone. Yet different people come to different conclusions faced with the same ethical problems.

Some people say that these moral truths are 'self-evident', but this just leaves the problem of different things being self-evident to different selves.

## Intuitionism: Advantages Vs Disadvantages

Advantages	Disadvantages
<ul style="list-style-type: none"> <li>• Acknowledges cultural relativism</li> <li>• Acknowledges that morality isn't dependent on the material world.</li> <li>• Although Prichard's theory fails to establish moral guidelines to help us with moral choices; Ross's concept of 'Prima Facie' succeeds in clearing this up.</li> </ul>	<ul style="list-style-type: none"> <li>• Can we trust our intuition when there subject to individuals' own beliefs &amp; values?</li> <li>• Where does our intuition actually originate from? Is it unique to our upbringing and culture? If so, then that would mean it's not universal as they differ across societies.</li> <li>• Prichard=How can we distinguish conclusions to actions when our intuitions differ?</li> <li>• Moore=He fails to provide any empirical evidence of our innate intuition being true.</li> <li>• Ross=What if one uses the the prima facie duties inappropriately thinking it's right? I.e. If one assumes it's just to kill a murderer to better society; this is still wrong=murder; intrinsically wrong.</li> <li>• Prichard=Not everybody can use their sense of intuition-as not everyone owns the same level of</li> </ul>

intuition=subject to one's beliefs and opinions

### Evaluation

Although such weaknesses are evident within this theory it is overall a strong theory because.

### Kant's Moral Theory

Like Utilitarianism, Immanuel Kant's moral theory is grounded in a theory of intrinsic value. But where the utilitarian take happiness, conceived of as pleasure and the absence of pain to be what has intrinsic value, Kant takes the only thing to have moral worth for its own sake to be the good will. Persons, conceived of as autonomous rational moral agents, are beings that have intrinsic moral worth. This value of persons makes them deserving of moral respect. Kant's moral theory is often referred to as the "respect for persons" theory of morality.

Kant's moral theory is organized around the idea that to act morally and to act in accordance with reason are one and the same. In virtue of being a rational agent (that is, in virtue of possessing practical reason, reason which is interested and goal-directed), one is obligated to follow the moral law that practical reason prescribes. To do otherwise is to act irrationally. Because Kant places his emphasis on the duty that comes with being a rational agent who is cognizant of the moral law, Kant's theory is considered a form of deontology (*deon*— comes from the Greek for "duty" or "obligation").

Like his theoretical philosophy, Kant's practical philosophy is *a priori*, formal, and universal: the moral law is derived non-empirically from the very structure of practical reason itself (its *form*), and since all rational agents share the same practical reason, the moral law binds and obligates everyone equally. So what is this moral law that obligates all rational agents universally and *a priori*? The moral law is determined by what Kant refers to as the Categorical Imperative, which is the general principle that demands that one respect the humanity in oneself and in others, that one not make an exception for oneself when deliberating about how to act, and in general that one only act in accordance with rules that everyone could and should obey.

Although Kant insists that the moral law is equally binding for all rational agents, he also insists that the bindingness of the moral law is *self-imposed*: we *autonomously* prescribe the moral law to ourselves. Because Kant thinks that the kind of autonomy in question here is only possible under the presupposition of a transcendently free basis of moral choice, the constraint that the moral law places on an agent is not only consistent with freedom of the will, it requires it. Hence, one of the most important aspects of Kant's project is to show that we are justified in presupposing that our morally significant choices are grounded in a transcendental freedom (the very sort of freedom that Kant argued we *could not* prove through mere "theoretical" or "speculative" reason; see 2gii above).

This section aims to explain the structure and content of Kant's moral theory (5a- b), and also Kant's claims that belief in freedom, God, and the immortality of the soul are necessary "postulates" of practical reason (5c). (On the relation between Kant's moral theory and his aesthetic theory, see 7c below.)

## **A Problem for the Enlightenment**

To understand Kant's moral philosophy, it's crucial to be familiar with the issues that he, and other thinkers of his time, were dealing with. From the earliest recorded history, people's moral beliefs and practices were grounded in religion. Scriptures, such as the bible and the Quran, laid out moral rules that believers thought to be handed down from God: *Don't kill. Don't steal. Don't commit adultery*, and so on. The fact that these rules supposedly came from a divine source of wisdom gave them their authority. They were not simply somebody's arbitrary opinion, they were God's opinion, and as such, they offered humankind an objectively valid code of conduct.

Moreover, everyone had an incentive to obey these codes. If you "walked in the ways of the Lord," you would be rewarded, either in this life or the next. If you violated the commandments, you'd be punished. As a result, any sensible person brought up in such a faith would abide by the moral rules their religion taught.

With the scientific revolution of the 16th and 17th centuries that led to the great cultural movement known as the Enlightenment, these previously accepted religious doctrines were increasingly challenged as faith in God, scripture, and organized religion began to decline among the intelligentsia—that is, the educated elite. Nietzsche famously described this shift away from organized religion as "the death of God."

This new way of thinking created a problem for moral philosophers: If religion wasn't the foundation that gave moral beliefs their validity, what other foundation could there be? If there is no God—and therefore no guarantee of cosmic justice ensuring that the good guys will be rewarded and the bad guys will be punished—why should anyone bother trying to be good? Scottish moral philosopher Alisdair MacIntyre called this "the Enlightenment problem." The solution moral philosophers needed to come up with was a secular (non-religious) determination of what morality was and why we should strive to be moral.

## **Three Responses to the Enlightenment Problem**

- **Social Contract Theory**—One answer to the Enlightenment Problem was pioneered by English philosopher Thomas Hobbes (1588-1679) who argued that morality was essentially a set of rules

that human beings agreed upon amongst themselves in order to make living with one another possible. If we didn't have these rules—many of which took the form of laws enforced by the government—life would be absolutely horrific for everyone.

- **Utilitarianism**—Utilitarianism, another attempt to give morality a non-religious foundation, was pioneered by thinkers including David Hume (1711-1776) and Jeremy Bentham (1748-1742). Utilitarianism holds that pleasure and happiness have intrinsic value. They are what we all want and are the ultimate goals that all our actions aim toward. Something is good if it promotes happiness, and it is bad if it produces suffering. Our basic duty is to try to do things that add to the amount of happiness and/or reduce the amount of misery in the world.
- **Kantian Ethics**—Kant had no time for Utilitarianism. He believed in placing the emphasis on happiness the theory completely misunderstood the true nature of morality. In his view, the basis for our sense of what is good or bad, right or wrong, is our awareness that human beings are free, rational agents who should be given the respect appropriate to such beings—but what exactly does that entail?

### **The Problem With Utilitarianism**

In Kant's view, the basic problem with utilitarianism is that it judges actions by their consequences. If your action makes people happy, it's good; if it does the reverse, it's bad. But is this actually contrary to what we might call moral commonsense? Consider this question: Who is the better person, the millionaire who gives \$1,000 to charity in order to score points with his Twitter following or the minimum-wage worker who donates a day's pay to charity because she thinks it's her duty to help the needy?

If consequences are all that matter, then the millionaire's action is technically the "better" one. But that's not how the majority of people would see the situation. Most of us judge actions more for their motivation than by their consequences. The reason is obvious: the consequences of our actions are often out of our control, just as the ball is out of the pitcher's control once it's left his hand. I could save a life at the risk of my own, and the person I save could turn out to be a serial killer. Or I could accidentally kill someone in the course of robbing them, and in doing so might unwittingly save the world from a terrible tyrant.

### **The Good Will**

Kant's "Groundwork" opens with the line: "The only thing that is unconditionally good is a good will." Kant's argument for this belief is quite plausible. Consider anything you think of in terms of being "good"—health, wealth, beauty, intelligence, and so on. For each of these things, you can also likely imagine a situation in which this so-called good thing is not good after all. For instance, a person can be corrupted by their wealth. The robust health of a bully makes it easier for him to abuse his victims. A person's beauty may lead her to become vain and fail to develop emotional maturity. Even happiness is not good if it is the happiness of a sadist torturing unwilling victims.

By contrast, goodwill, says Kant, is always good—in all circumstances. What, exactly, does Kant mean by goodwill? The answer is fairly simple. A person acts out of goodwill when they do what they do because they think it is their duty—when they act from a sense of moral obligation.

### **Duty vs. Inclination**

Obviously, we don't perform every little action from a sense of obligation. Much of the time, we're

simply following our inclinations—or acting out of self-interest. There's nothing intrinsically wrong with that, however, no one deserves credit for pursuing their own interests. It comes naturally to us, just as it comes naturally to every animal.

What is remarkable about human beings, though, is that we can, and sometimes do, perform an action from purely moral motives—for example, when a soldier throws himself on a grenade, sacrificing his own life to save the lives of others. Or less dramatically, I pay back a friendly loan as promised even though payday isn't for another week and doing so will leave me temporarily short of cash.

In Kant's view, when a person freely chooses to do the right thing simply because it is the right thing to do, their action adds value to the world and lights it up, so to speak, with a brief glow of moral goodness.

## **Knowing Your Duty**

Saying that people should do their duty from a sense of duty is easy—but how are we supposed to know what our duty is? Sometimes we may find ourselves facing moral dilemmas in which it's not obvious which course of action is morally correct.

According to Kant, however, in most situations duty is obvious. If we're uncertain, we can work out the answer by reflecting on a general principle that Kant calls the "Categorical Imperative." This, he claims, is the fundamental principle of morality and all other rules and precepts can be deduced from it.

Kant offers several different versions of this categorical imperative. One runs as follows: "Act only on that maxim that you can will as a universal law."

What this means, basically, is that we should only ask ourselves, *How would it be if everyone acted the way I'm acting? Could I sincerely and consistently wish for a world in which everyone behaved this way?* According to Kant, if our action is morally wrong, the answers to those questions would be no. For instance, suppose I'm thinking of breaking a promise. Could I wish for a world in which everyone broke their promises when keeping them was inconvenient? Kant argues that I could not want this, not least because in such a world no one would make promises since everyone would know that a promise meant nothing.

## **The Ends Principle**

Another version of the Categorical Imperative that Kant offers states that one should "always treat people as ends in themselves, never merely as a means to one's own ends." This is commonly referred to as the "ends principle." While similar in a way to the Golden Rule: "Do unto others as you would have them do unto you," it puts the onus for following the rule on humankind rather than accepting the strictures of divine influence.

The key to Kant's belief regarding what makes humans moral beings is the fact that we are free and rational creatures. To treat someone as a means to your own ends or purposes is to not respect this fact about them. For instance, if I get you to agree to do something by making a false promise, I am manipulating you. Your decision to help me is based on false information (the idea that I'm going to keep my promise). In this way, I have undermined your rationality. This is even more obvious if I steal from you or kidnap you in order to claim a ransom.

Treating someone as an end, by contrast, involves always respecting the fact that they are capable of free rational choices which may be different from the choices you wish them to make. So if I want you to do something, the only moral course of action is to explain the situation, explain what I want, and let you make your own decision.

### **The Formula of Humanity as an End in Itself**

According to Kant, moral principles must be objective, meaning they must apply to all rational beings without exception (G 4:389)<sup>1</sup>. To satisfy this criterion, moral principles must be based on reason alone. This is because reason abstracts from everything that does not hold for all rational beings, such as desires or inclinations and the features of human nature. Human beings do not necessarily determine their will, or act, according to moral principles because their will is subject to the influence of reason as well as inclinations that can be contrary to reason. Kant claims that because the human will is imperfect in this way, it is subject to a formula called a “categorical imperative” which presents moral principles to it as absolutely necessary, or unconditional, requirements (G 4:413-4). There is only one categorical imperative but Kant provides several versions of it to represent the different features that a moral principle must have. The second version, the FHE, represents the end that a moral principle must have (G 4:436).

Kant defines an end as “that which serves the will as the objective ground of its selfdetermination” (G 4:427). This is commonly understood to mean that an end is something for the sake of which a rational being acts or refrain from acting (Korsgaard 185; Wood Kant’s Ethical Thought 116). For example, in going to the gym, one’s end might be health; one acts for the sake of one’s health. In refraining from going out at night, one’s end might be self-preservation; one refrains from acting for the sake of one’s self-preservation<sup>2</sup>. Before Kant identifies the end of moral principles, he claims that it must be a specific type of end called an “end in itself” (G 4:428). An end in itself is an objective end, meaning that it can be held by all rational beings because it is determined by reason alone. Kant ultimately identifies the end of moral principles, or the end in itself, to be humanity. Thus, in acting on moral principles, one must act or refrain from acting for the sake of whatever is referred to by “humanity”. The FHE represents this in the command to “act [so that] you use humanity, whether in your own person or in the person of any other, always at the same time as an end, never merely as means” (G 4:429). In the following two sections, I argue that Kant identifies the end in itself with a good will, and thus, takes “humanity” to refer to a good will.

### **Kant’s Concept of Enlightenment**

In his famous essay “What is Enlightenment?” Kant defines the principle as “man’s emancipation from his self-imposed immaturity.” What does this mean, and what does it have to do with his ethics?

The answers go back to the problem of religion no longer providing a satisfactory foundation for morality. What Kant calls humanity’s “immaturity” is the period when people did not truly think for themselves, and instead, typically accepted moral rules handed down to them by religion, tradition, or by authorities such as the church, overlord, or king. This loss of faith in previously recognized authority was viewed by many as a spiritual crisis for Western civilization. If “God is dead, how do we know what is true and what is right?”

Kant’s answer was that people simply had to work those things out for themselves. It wasn’t something to lament, but ultimately, something to celebrate. For Kant, morality was not a matter of

subjective whim set forth in the name of god or religion or law based on the principles ordained by the earthly spokespeople of those gods. Kant believed that “the moral law”—the categorical imperative and everything it implies—was something that could only be discovered through reason. It was not something imposed on us from without. Instead, it's a law that we, as rational beings, must impose on ourselves. This is why some of our deepest feelings are reflected in our reverence for the moral law, and why, when we act as we do out of respect for it—in other words, from a sense of duty—we fulfill ourselves as rational beings.

## **Kant's three postulates of morality**

### **Immortality of the Soul**

Kant states in his critique, “the belief in God and another world is so interwoven with my moral sentiment.” The postulate of immortality was that the belief in immortality has to be based on the moral disposition and not one hope of future rewards. Kant bases his first argument for immortality. As ‘nothing is purposeless’ each organ into the world has its own specific claim that human life as whole is an end not in this life but in a future life. The moral arguments for the immortality of the soul as stated by Kant:

1. The highest good is a necessary object of the will.
2. Holiness, or complete fitness of intentions to the moral law, is necessary condition of the highest good.
3. Holiness cannot be found in a sensuous rational being.
4. The highest good can be made real.

Kant also makes it clear that the postulate of immortality is that which cannot be known but can only be thought and furnish us with only practical and objective truth that can give rise to action-motives worthy of achieving highest good.

### **Freedom of the Soul**

Freedom is one of the postulates, which is considered as logically possible and practically useful and it is the key stone of the whole architecture of the system of pure reason and even speculative reason. Freedom provides a conception of ourselves which motivates us to obey the moral law. As freedom of will can't be given empirical or theoretical evidence, Kant's thought on freedom of the will can be seen to pass the following phases.

- Human actions are those that have internal rather than external causes.
- Human actions which are not dictated by deterministic laws of nature cannot be proved.
- Human freedom's existence can be proved and thereby proving that moral law applies to us.
- The freedom of will form the undeniable fact of our religion.

Kant says that freedom desires both itself and the freedom of others.

### **The existence of God**

The God postulated by Kant is not the God of religion. The postulate of God is a need or requirement of our moral consciousness or a moral necessity which is subjective and no way connected to the consciousness of our duty. The divine will is the motive to action, not ground of it. The possibility of the existence of a certain object is explained by this hypothesis explained

appropriately as a faith and indeed a faith of reason.

Kant stresses that the properties of Omnipotence, Omniscience and Omnipresence can be assigned to God to play his moral role of guaranteeing the possibility of the highest good. God is not a metaphysical concept, original being, that functions in the thinking of a moral agent and exercise a real influence on his/her actions.

## The Good Will

### Good Will, Moral Worth and Duty

Kant's analysis of commonsense ideas begins with the thought that the only thing good without qualification is a "good will". While the phrases "he's good hearted", "she's good natured" and "she means well" are common, "the good will" as Kant thinks of it is not the same as any of these ordinary notions. The idea of a good will is closer to the idea of a "good person", or, more archaically, a "person of good will". This use of the term "will" early on in analyzing ordinary moral thought prefigures later and more technical discussions concerning the nature of rational agency. Nevertheless, this idea of a good will is an important commonsense touchstone to which Kant returns throughout his works. The basic idea, as Kant describes it in the Groundwork, is that what makes a good person good is his possession of a will that is in a certain way "determined" by, or makes its decisions on the basis of, the moral law. The idea of a good will is supposed to be the idea of one who is committed only to make decisions that she holds to be morally worthy and who takes moral considerations in themselves to be conclusive reasons for guiding her behavior. This sort of disposition or character is something we all highly value, Kant thought. He believes we value it without limitation or qualification. By this, we believe, he means primarily two things.

First, unlike anything else, there is no conceivable circumstance in which we regard our own moral goodness as worth forfeiting simply in order to obtain some desirable object. By contrast, the value of all other desirable qualities, such as courage or cleverness, can be diminished, forgone, or sacrificed under certain circumstances: Courage may be laid aside if it requires injustice, and it is better not to be witty if it requires cruelty. There is no implicit restriction or qualification to the effect that a commitment to give moral considerations decisive weight is worth honoring, *but only under such and such circumstances*.

Second, possessing and maintaining a steadfast commitment to moral principles is the very condition under which anything else is worth having or pursuing. Intelligence and even pleasure are worth having only on the condition that they do not require giving up one's fundamental moral convictions. The value of a good will thus cannot be that it secures certain valuable ends, whether of our own or of others, since their value is entirely conditional on our possessing and maintaining a good will. Indeed, since a good will is good under any condition, its goodness must not depend on any particular conditions obtaining. Thus, Kant points out that a good will must then also be good *in itself* and not in virtue of its relationship to other things such as the agent's own happiness, overall welfare or any other effects it may or may not produce. A good will would still "shine like a jewel" even if it were "completely powerless to carry out its aims" (G 4:394).

In Kant's terms, a good will is a will whose decisions are wholly determined by moral demands or, as he often refers to this, by the Moral Law. Human beings inevitably feel this Law as a constraint on their natural desires, which is why such Laws, as applied to human beings, are imperatives and

duties. A human will in which the Moral Law is decisive is motivated by the thought of *duty*. A *holy* or *divine* will, if it exists, though good, would not be good because it is motivated by thoughts of duty because such a will does not have natural inclinations and so necessarily fulfills moral requirements without feeling constrained to do so. It is the presence of desires that *could* operate independently of moral demands that makes goodness in human beings a constraint, an essential element of the idea of “duty.” So in analyzing unqualified goodness as it occurs in imperfectly rational creatures such as ourselves, we are investigating the idea of being motivated by the thought that we are constrained to act in certain ways that we *might* not want to simply from the thought that we are morally required to do so.

Kant confirms this by comparing motivation by duty with other sorts of motives, in particular, with motives of self-interest, self-preservation, sympathy and happiness. He argues that a dutiful action from any of these motives, however praiseworthy it may be, does not express a good will. Assuming an action has moral worth only if it expresses a good will, such actions have no genuine “moral worth.” The conformity of one’s action to duty in such cases is only related by accident to morality. For instance, if one is motivated by happiness alone, then had conditions not conspired to align one’s duty with one’s own happiness one would not have done one’s duty. By contrast, were one to supplant any of these motivations with the motive of duty, the morality of the action would then express one’s determination to act dutifully out of respect for the moral law itself. Only then would the action have moral worth.

Kant’s views in this regard have understandably been the subject of much controversy. Many object that we do not think better of actions done for the sake of duty than actions performed out of emotional concern or sympathy for others, especially those things we do for friends and family. Worse, moral worth appears to require not only that one’s actions be motivated by duty, but also that no other motives, even love or friendship, cooperate. Yet Kant’s defenders have argued that his point is not that we do not admire or praise motivating concerns other than duty, only that from the point of view of someone deliberating about what to do, these concerns are not decisive in the way that considerations of moral duty are. What is crucial in actions that express a good will is that in conforming to duty a perfectly virtuous person always would, and so ideally we should, recognize and be moved by the thought that our conformity is morally obligatory.

The motivational structure of the agent should be arranged so that she always treats considerations of duty as sufficient reasons for conforming to those requirements. In other words, we should have a firm commitment not to perform an action if it is morally forbidden and to perform an action if it is morally required. Having a good will, in this sense, is compatible with having feelings and emotions of various kinds, and even with aiming to cultivate some of them in order to counteract desires and inclinations that tempt us to immorality. Controversy persists, however, about whether Kant’s claims about the motive of duty go beyond this basic point (Timmermann 2007; Herman 1993; Wood 1998; Baron 1995).

Suppose for the sake of argument we agree with Kant. We now need to know what distinguishes the principle that lays down our duties from these other motivating principles, and so makes motivation by it the source of unqualified value.

### **The Categorical Imperative**

If a good will is one that forms its intentions on the basis of correct principles of action, then we want to know what sort of principles these are. A principle that commands an action is called an

"imperative." Most imperatives are "hypothetical imperatives," that is, they are commands that hold only if certain conditions are met. For instance: "if you want to be a successful shopkeeper, then cultivate a reputation for honesty." Since hypothetical imperatives are conditioned on desires and the intended consequences of actions, they cannot serve as the principles that determine the intentions and volitions of an unconditionally good will. Instead, we require what Kant calls a "categorical imperative." Where hypothetical imperatives take the form, "if y is desired/intended/sought, do x," categorical imperatives simply take the form, "do x." Since a categorical imperative is stripped of all reference to the consequences of an action, it is thereby stripped of all determinate content, and hence it is purely *formal*. And since it is unconditional, it holds *universally*. Hence a categorical imperative expresses only the very form of a universally binding law: "nothing is left but the conformity of actions as such with universal law" (4:402).

To act morally, then, is to form one's intentions on the basis of the very idea of a universal principle of action.

This conception of a categorical imperative leads Kant to his first official formulation of the categorical imperative itself: "act only in accordance with that maxim through which you can at the same time will that it become a universal law" (4:421). A maxim is a general rule that can be used to determine particular courses of actions in particular circumstances. For instance, the maxim "I shall lie when it will get me out of trouble" can be used to determine the decision to lie about an adulterous liaison. The categorical imperative offers a decision procedure for determining whether a given course of action is in accordance with the moral law. After determining what maxim one would be basing the action in question on, one then asks whether it would be possible, given the power (in an imagined, hypothetical scenario), to choose that everyone act in accordance with that same maxim. If it is possible to will that everyone act according to that maxim, then the action under consideration is morally permissible. If it is not possible to will that everyone act according to that maxim, the action is morally impermissible. Lying to cover up adultery is thus immoral because one cannot will that everyone act according to the maxim, "I shall lie when it will get me out of trouble." Note that it is not simply that it would be *undesirable* for everyone to act according to that maxim. Rather, it would be *impossible*. Since everyone would know that everyone else was acting according to that maxim, there would never be the presupposition that anyone was telling the truth; the very act of lying, of course, requires such a presupposition on the part of the one being lied to. Hence, the state of affairs where everyone lies to get out of trouble can never arise, so it cannot be willed to be a universal law. It fails the test of the categorical imperative.

The point of Kant's appeal to the universal law formulation of the categorical imperative is to show that an action is morally permissible only if the maxim on which the action is based could be affirmed as a universal law that everyone obeys without exception. The mark of immorality, then, is that one makes an exception for oneself. That is, one acts in a way that they would not want everyone else to. When someone chooses to lie about an adulterous liaison, one is implicitly thinking, "in general people should tell the truth, but in this case I will be the exception to the rule." Kant's first formulation of the categorical imperative describes it in terms of the very form of universal law itself. This formal account abstracts from any specific *content* that the moral law might have for living, breathing human beings. Kant offers a second formulation to address the material side of the moral law. Since the moral law has to do with actions, and all actions are by definition teleological (that is, goal-directed), a material formulation of the categorical imperative will require an appeal to the "ends" of human activity. Some ends are merely instrumental, that is, they are sought only because they serve as "means" towards further ends. Kant argues that the

moral law must be aimed at an end that is not merely instrumental, but is rather an end *in itself*. Only rational agents, according to Kant, are ends in themselves. To act morally is thus to respect rational agents as ends in themselves. Accordingly, the categorical imperative can be reformulated as follows: "So act that you use humanity, whether in your own person or in the person of any other, always at the same time as an end, never merely as a means" (4:429). The basic idea here is that it is immoral to treat someone as a *thing* of merely instrumental value; *persons* have an intrinsic (non- instrumental) value, and the moral law demands that we respect this intrinsic value. To return to the example of the previous paragraphs, it would be wrong to lie about an adulterous liaison because by withholding the truth one is manipulating the other person to make things easier for oneself; this sort of manipulation, however, amounts to treating the other as a thing (as a mere means to the comfort of not getting in trouble), and not as a person deserving of respect and entitled to the truth.

The notion of a universal law provides the *form* of the categorical imperative and rational agents as ends in themselves provide the *matter*. These two sides of the categorical imperative are combined into yet a third formulation, which appeals to the notion of a "kingdom of ends." A kingdom of ends can be thought of as a sort of perfectly just utopian ideal in which all citizens of this kingdom freely respect the intrinsic worth of the humanity in all others because of an autonomously self-imposed recognition of the bindingness of the universal moral law for all rational agents. The third formulation of the categorical imperative is simply the idea that one should act in whatever way a member of this perfectly just society would act: "act in accordance with the maxims of a member giving universal laws for a merely possible kingdom of ends" (4:439). The idea of a kingdom of ends is an *ideal* (hence the "merely possible"). Although humanity may never be able to achieve such a perfect state of utopian coexistence, we can at least strive to approximate this state to an ever greater degree.

## **A Theory of Duty**

Some terminology to consider:

**Moral agent:** *An agent is a person who performs an action; a moral agent is a person with the capacity to act morally*

**Maxim:** *rule or principle*

**Will:** *the faculty of deciding, choosing, or acting*

Deontological theories differ from utilitarian theories in several key ways. The most notable difference is utilitarianism aims at a goal of greatest happiness (or the best consequence) and justifies any act that achieves that goal. Deontological theories hold that some acts are always wrong, even if the act leads to an admirable outcome. Actions in deontology are always judged independently of their outcome. An act can be morally bad but may unintentionally lead to a favorable outcome.

Kant is responsible for the most prominent and well-known form of deontological ethics. Kant's moral theory is based on his view of the human being as having the unique capacity for rationality. No other animal possesses such a propensity for reasoned thought and action, and it is exactly this ability that requires human beings to act in accordance with and for the sake of moral law or duty. Kant believes human inclinations, emotions and consequences should play no role in moral

action; therefore, the motivation behind an action must be based on obligation and well thought out before the action takes place. Morality should, in theory, provide people with a framework of rational rules that guide and prevent certain actions and are independent of personal intentions and desires.

According to Kant, the moral worth of an action is determined by the human will, which is the only thing in the world that can be considered good without qualification. Good will is exercised by acting according to moral duty/law. Moral law consists of a set of maxims, which are categorical in nature – we are bound by duty to act in accordance with categorical imperatives.

## **Utilitarianism**

Utilitarianism is an ethical theory that determines right from wrong by focusing on outcomes. It is a form of consequentialism.

Utilitarianism holds that the most ethical choice is the one that will produce the greatest good for the greatest number. It is the only moral framework that can be used to justify military force or war. It is also the most common approach to moral reasoning used in business because of the way in which it accounts for costs and benefits.

However, because we cannot predict the future, it's difficult to know with certainty whether the consequences of our actions will be good or bad. This is one of the limitations of utilitarianism.

Utilitarianism also has trouble accounting for values such as justice and individual rights. For example, assume a hospital has four people whose lives depend upon receiving organ transplants: a heart, lungs, a kidney, and a liver. If a healthy person wanders into the hospital, his organs could be harvested to save four lives at the expense of one life. This would arguably produce the greatest good for the greatest number. But few would consider it an acceptable course of action, let alone the most ethical one.

So, although utilitarianism is arguably the most reason-based approach to determining right and wrong, it has obvious limitations.

## **THE PRINCIPLE OF UTILITY**

I. Nature has placed mankind under the governance of two sovereign masters, pain and pleasure. It is for them alone to point out what we ought to do, as well as to determine what we shall do. On the one hand the standard of right and wrong, on the other the chain of causes and effects, are fastened to their throne. They govern us in all we do, in all we say, in all we think: every effort we can make to throw off our subjection, will serve but to demonstrate and confirm it. In words a man may pretend to abjure their empire: but in reality he will remain subject to it all the while. The principle of utility<sup>[1]</sup> recognizes this subjection, and assumes it for the foundation of that system, the object of which is to rear the fabric of felicity by the hands of reason and of law. Systems which attempt to question it, deal in sounds instead of sense, in caprice instead of reason, in darkness instead of light. But enough of metaphor and declamation: it is not by such means that moral science is to be improved.

II. The principle of utility is the foundation of the present work: it will be proper therefore at the outset to give an explicit and determinate account of what is meant by it. By the principle<sup>[2]</sup> of

utility is meant that principle which approves or disapproves of every action whatsoever. according to the tendency it appears to have to augment or diminish the happiness of the party whose interest is in question: or, what is the same thing in other words to promote or to oppose that happiness. I say of every action whatsoever, and therefore not only of every action of a private individual, but of every measure of government.

**III.** By utility is meant that property in any object, whereby it tends to produce benefit, advantage, pleasure, good, or happiness, (all this in the present case comes to the same thing) or (what comes again to the same thing) to prevent the happening of mischief, pain, evil, or unhappiness to the party whose interest is considered: if that party be the community in general, then the happiness of the community: if a particular individual, then the happiness of that individual.

**IV.** The interest of the community is one of the most general expressions that can occur in the phraseology of morals: no wonder that the meaning of it is often lost. When it has a meaning, it is this. The community is a fictitious body, composed of the individual persons who are considered as constituting as it were its members. The interest of the community then is, what is it?— the sum of the interests of the several members who compose it.

**V.** It is in vain to talk of the interest of the community, without understanding what is the interest of the individual.[3] A thing is said to promote the interest, or to be for the interest, of an individual, when it tends to add to the sum total of his pleasures: or, what comes to the same thing, to diminish the sum total of his pains.

**VI.** An action then may be said to be conformable to then principle of utility, or, for shortness sake, to utility, (meaning with respect to the community at large) when the tendency it has to augment the happiness of the community is greater than any it has to diminish it.

**VII.** ' A measure of government (which is but a particular kind of action, performed by a particular person or persons) may be said to be conformable to or dictated by the principle of utility, when in like manner the tendency which it has to augment the happiness of the community is greater than any which it has to diminish it.

**VIII.** When an action, or in particular a measure of government, is supposed by a man to be conformable to the principle of utility, it may be convenient, for the purposes of discourse, to imagine a kind of law or dictate, called a law or dictate of utility: and to speak of the action in question, as being conformable to such law or dictate.

**IX.** A man may be said to be a partizan of the principle of utility, when the approbation or disapprobation he annexes to any action, or to any measure, is determined by and proportioned to the tendency which he conceives it to have to augment or to diminish the happiness of the community: or in other words, to its conformity or unconformity to the laws or dictates of utility.

**X.** Of an action that is conformable to the principle of utility one may always say either that it is one that ought to be done, or at least that it is not one that ought not to be done. One may say also, that it is right it should be done; at least that it is not wrong it should be done: that it is a right action; at least that it is not a wrong action. When thus interpreted, the words ought, and right and wrong and others of that stamp, have a meaning: when otherwise, they have none.

**XI.** Has the rectitude of this principle been ever formally contested? It should seem that it had, by those who have not known what they have been meaning. Is it susceptible of any direct proof? it should seem not: for that which is used to prove everything else, cannot itself be proved: a chain of proofs must have their commencement somewhere. To give such proof is as impossible as it is needless.

**XII.** Not that there is or ever has been that human creature at breathing, however stupid or perverse, who has not on many, perhaps on most occasions of his life, deferred to it. By the natural constitution of the human frame, on most occasions of their lives men in general embrace this principle, without thinking of it: if not for the ordering of their own actions, yet for the trying of their own actions, as well as of those of other men. There have been, at the same time, not many perhaps, even of the most intelligent, who have been disposed to embrace it purely and without reserve. There are even few who have not taken some occasion or other to quarrel with it, either on account of their not understanding always how to apply it, or on account of some prejudice or other which they were afraid to examine into, or could not bear to part with. For such is the stuff that man is made of: in principle and in practice, in a right track and in a wrong one, the rarest of all human qualities is consistency.

**XIII.** When a man attempts to combat the principle of utility, it is with reasons drawn, without his being aware of it, from that very principle itself.[4] His arguments, if they prove any thing, prove not that the principle is wrong, but that, according to the applications he supposes to be made of it, it is misapplied. Is it possible for a man to move the earth? Yes; but he must first find out another earth to stand upon.

**XIV.** To disprove the propriety of it by arguments is impossible; but, from the causes that have been mentioned, or from some confused or partial view of it, a man may happen to be disposed not to relish it. Where this is the case, if he thinks the settling of his opinions on such a subject worth the trouble, let him take the following steps, and at length, perhaps, he may come to reconcile himself to it.

1. Let him settle with himself, whether he would wish to discard this principle altogether; if so, let him consider what it is that all his reasonings (in matters of politics especially) can amount to?
2. If he would, let him settle with himself, whether he would judge and act without any principle, or whether there is any other he would judge an act by?
3. If there be, let him examine and satisfy himself whether the principle he thinks he has found is really any separate intelligible principle; or whether it be not a mere principle in words, a kind of phrase, which at bottom expresses neither more nor less than the mere averment of his own unfounded sentiments; that is, what in another person he might be apt to call caprice?
4. If he is inclined to think that his own approbation or disapprobation, annexed to the idea of an act, without any regard to its consequences, is a sufficient foundation for him to judge and act upon, let him ask himself whether his sentiment is to be a standard of right and wrong, with respect to every other man, or whether every man's sentiment has the same privilege of being a standard to itself?
5. In the first case, let him ask himself whether his principle is not despotic, and hostile to all the rest of human race?
6. In the second case, whether it is not anarchial, and whether at this rate there are not as many different standards of right and wrong as there are men? and whether even to the same man,

the same thing, which is right today, may not (without the least change in its nature) be wrong tomorrow? and whether the same thing is not right and wrong in the same place at the same time? and in either case, whether all argument is not at an end? and whether, when two men have said, "I like this," and "I don't like it," they can (upon such a principle) have any thing more to say?

- If he should have said to himself, No: for that the sentiment which he proposes as a standard must be grounded on reflection, let him say on what particulars the reflection is to turn? if on particulars having relation to the utility of the act, then let him say whether this is not deserting his own principle, and borrowing assistance from that very one in opposition to which he sets it up: or if not on those particulars, on what other particulars?
- If he should be for compounding the matter, and adopting his own principle in part, and the principle of utility in part, let him say how far he will adopt it?
- When he has settled with himself where he will stop, then let him ask himself how he justifies to himself the adopting it so far? and why he will not adopt it any farther?
- Admitting any other principle than the principle of utility to be a right principle, a principle that it is right for a man to pursue; admitting (what is not true) that the word right can have a meaning without reference to utility, let him say whether there is any such thing as a motive that a man can have to pursue the dictates of it: if there is, let him say what that motive is, and how it is to be distinguished from those which enforce the dictates of utility: if not, then lastly let him say what it is this other principle can be good for?

## Footnotes

1. Greatest happiness or greatest felicity principle: this for shortness, instead of saying at length that principle which states the greatest happiness of all those whose interest is in question, as being the right and proper, and only right and proper and universally desirable, end of human action: of human action in every situation, and in particular in that of a functionary or set of functionaries exercising the powers of Government. The word utility does not so clearly point to the ideas of pleasure and pain as the words happiness and felicity do: nor does it lead us to the consideration of the number, of the interests affected; to the number, as being the circumstance, which contributes, in the largest proportion, to the formation of the standard here in question; the standard of right and wrong, by which alone the propriety of human conduct, in every situation, can with propriety be tried. This want of a sufficiently manifest connexion between the ideas of happiness and pleasure on the one hand, and the idea of utility on the other, I have every now and then found operating, and with but too much efficiency, as a bar to the acceptance, that might otherwise have been given, to this principle.
2. The word principle is derived from the Latin principium: which seems to be compounded of the two words primus, first, or chief, and cipium a termination which seems to be derived from capio, to take, as in mancipium, municipium; to which are analogous, auceps, forceps, and others. It is a term of very vague and very extensive signification: it is applied to any thing which is conceived to serve as a foundation or beginning to any series of operations: in some cases, of physical operations; but of mental operations in the present case. The principle here in question may be taken for an act of the mind; a sentiment; a sentiment of approbation; a sentiment which, when applied to an action, approves of its utility, as that quality of it by which the measure of approbation or disapprobation bestowed upon it ought to be governed.

3. Interest is one of those words, which not having any superior genus, cannot in the ordinary way be defined.

'The principle of utility, (I have heard it said) is a dangerous principle: it is dangerous on certain occasions to consult it.' This is as much as to say, what? that it is not consonant to utility, to consult utility: in short, that it is not consulting it, to consult it. Addition by the Author, July 1822. Not long after the publication of the Fragment on Government, anno 1776, in which, in the character of all-comprehensive and all-commanding principle, the principle of utility was brought to view, one person by whom observation to the above effect was made was Alexander Wedderburn, at that time Attorney or Solicitor General, afterwards successively Chief Justice of the Common Pleas, and Chancellor of England, under the successive titles of Lord Loughborough and Earl of Rosslyn. It was made—not indeed in my hearing, but in the hearing of a person by whom it was almost immediately communicated to me. So far from being self-contradictory, it was a shrewd and perfectly true one. By that distinguished functionary, the state of the Government was thoroughly understood: by the obscure individual, at that time not so much as supposed to be so: his disquisitions had not been as yet applied, with anything like a comprehensive view, to the field of Constitutional Law, nor therefore to those features of the English Government, by which the greatest happiness of the ruling one with or without that of a favoured few, are now so plainly seen to be the only ends to which the course of it has at any time been directed. The principle of utility was an appellative, at that time employed by me, as it had been by others, to designate that which, in a more perspicuous and instructive manner, may, as above, be designated by the name of the greatest happiness principle. 'This principle (said Wedderburn) is a dangerous one.' Saying so, he said that which, to a certain extent, is strictly true: a principle, which lays down, as the only right and justifiable end of Government, the greatest happiness of the greatest number—how can it be denied to be a dangerous one? dangerous it unquestionably is, to every government which has for its actual end or object, the greatest happiness of a certain one, with or without the addition of some comparatively small number of others, whom it is matter of pleasure or accommodation to him to admit, each of them, to a share in the concern, on the footing of so many junior partners. Dangerous it therefore really was, to the interest—the sinister interest—of all those functionaries, himself included, whose interest it was, to maximize delay, vexation, and expense, in judicial and other modes of procedure, for the sake of the profit, extractible out of the expense. In a Government which had for its end in view the greatest happiness of the greatest number, Alexander Wedderburn might have been Attorney General and then Chancellor: but he would not have been Attorney General with £15,000 a year, nor Chancellor, with a peerage with a veto upon all justice, with £25,000 a year, and with 500 sinecures at his disposal, under the name of Ecclesiastical Benefices, besides et cæteras.

- I. Pleasures then, and the avoidance of pains, are the ends that the legislator has in view; it behoves him therefore to understand their value. Pleasures and pains are the instruments he has to work with: it behoves him therefore to understand their force, which is again, in other words, their value.
- II. To a person considered by himself, the value of a pleasure or pain considered by itself, will be greater or less, according to the four following circumstances:
  1. Its intensity.
  2. Its duration.
  3. Its certainty or uncertainty.
  4. Its propinquity or remoteness.

III. These are the circumstances which are to be considered in estimating a pleasure or a pain considered each of them by itself. But when the value of any pleasure or pain is considered for the purpose of estimating the tendency of any act by which it is produced, there are two other circumstances to be taken into the account; these are,

1. Its fecundity, or the chance it has of being followed by sensations of the same kind: that is, pleasures, if it be a pleasure: pains, if it be a pain.
2. Its purity, or the chance it has of not being followed by sensations of the opposite kind: that is, pains, if it be a pleasure: pleasures, if it be a pain.

These two last, however, are in strictness scarcely to be deemed properties of the pleasure or the pain itself; they are not, therefore, in strictness to be taken into the account of the value of that pleasure or that pain. They are in strictness to be deemed properties only of the act, or other event, by which such pleasure or pain has been produced; and accordingly are only to be taken into the account of the tendency of such act or such event.

IV. To a number of persons, with reference to each of whom to the value of a pleasure or a pain is considered, it will be greater or less, according to seven circumstances: to wit, the six preceding ones; viz.,

1. Its intensity.
2. Its duration.
3. Its certainty or uncertainty.
4. Its propinquity or remoteness.
5. Its fecundity.
6. Its purity.

And one other; to wit:

Its extent; that is, the number of persons to whom it extends; or (in other words) who are affected by it.

V. To take an exact account then of the general tendency of any act, by which the interests of a community are affected, proceed as follows. Begin with any one person of those whose interests seem most immediately to be affected by it: and take an account,

1. Of the value of each distinguishable pleasure which appears to be produced by it in the first instance.
2. Of the value of each pain which appears to be produced by it in the first instance.
3. Of the value of each pleasure which appears to be produced by it after the first. This constitutes the fecundity of the first pleasure and the impurity of the first pain.
4. Of the value of each pain which appears to be produced by it after the first. This constitutes the fecundity of the first pain, and the impurity of the first pleasure.
5. Sum up all the values of all the pleasures on the one side, and those of all the pains on the other. The balance, if it be on the side of pleasure, will give the good tendency of the act upon the whole, with respect to the interests of that individual person; if on the side of pain, the bad tendency of it upon the whole.
6. Take an account of the number of persons whose interests appear to be concerned; and repeat

the above process with respect to each. Sum up the numbers expressive of the degrees of good tendency, which the act has, with respect to each individual, in regard to whom the tendency of it is good upon the whole: do this again with respect to each individual, in regard to whom the tendency of it is bad upon the whole. Take the balance which if on the side of pleasure, will give the general good tendency of the act, with respect to the total number or community of individuals concerned; if on the side of pain, the general evil tendency, with respect to the same community.

**VI.** It is not to be expected that this process should be strictly pursued previously to every moral judgment, or to every legislative or judicial operation. It may, however, be always kept in view: and as near as the process actually pursued on these occasions approaches to it, so near will such process approach to the character of an exact one.

**VII.** The same process is alike applicable to pleasure and pain, in whatever shape they appear: and by whatever denomination they are distinguished: to pleasure, whether it be called good (which is properly the cause or instrument of pleasure) or profit (which is distant pleasure, or the cause or instrument of, distant pleasure,) or convenience, or advantage, benefit, emolument, happiness, and so forth: to pain, whether it be called evil, (which corresponds to good) or mischief, or inconvenience or disadvantage, or loss, or unhappiness, and so forth.

**VIII.** Nor is this a novel and unwarranted, any more than it is a useless theory. In all this there is nothing but what the practice of mankind, wheresoever they have a clear view of their own interest, is perfectly conformable to. An article of property, an estate in land, for instance, is valuable, on what account? On account of the pleasures of all kinds which it enables a man to produce, and what comes to the same thing the pains of all kinds which it enables him to avert. But the value of such an article of property is universally understood to rise or fall according to the length or shortness of the time which a man has in it: the certainty or uncertainty of its coming into possession: and the nearness or remoteness of the time at which, if at all, it is to come into possession. As to the intensity of the pleasures which a man may derive from it, this is never thought of, because it depends upon the use which each particular person may come to make of it; which cannot be estimated till the particular pleasures he may come to derive from it, or the particular pains he may come to exclude by means of it, are brought to view. For the same reason, neither does he think of the fecundity or purity of those pleasures. Thus much for pleasure and pain, happiness and unhappiness, in general. We come now to consider the several particular kinds of pain and pleasure.

### **Sanction Utilitarianism**

So far, Mill's various claims about duty are largely consistent with direct utilitarianism, and, hence, act utilitarianism. However, Chapter V of *Utilitarianism* introduces claims about duty, justice, and rights that are hard to square with either.

For the truth is, that the idea of penal sanction, which is the essence of law, enters not only into the conception of injustice, but into that of any kind of wrong. We do not call anything wrong unless we mean to imply that a person ought to be punished in some way or other for doing it—if not by law, by the opinion of his fellow creatures; if not by opinion, by the reproaches of his own conscience. This seems the real turning point of the distinction between morality and simple expediency. (V 14)

Here Mill defines wrongness and, by implication, duty, not directly in terms of the nature of the action or its consequences but indirectly in terms of appropriate responses to it. He appears to believe that one is under an obligation or duty to do something just in case failure to do it is wrong and that an action is wrong just in case some kind of external or internal sanction—punishment, social censure, or self-reproach—ought to be applied to its performance. This test distinguishes duty from expediency (V 14, 15). Not all suboptimal or inexpedient acts are wrong, only those to which one ought to apply some sort of sanction (at least, self-reproach).

Justice is a proper part of duty. Justice involves duties that are perfect duties— that is, duties that are correlated with rights (V 15). An act is just if and only if it is not unjust, and it is unjust just in case it is wrong and violates someone's rights (V 23). Someone has a right just in case she has a claim that society ought to protect by force of law or public opinion (V 24).

Notice that these relationships among duty, justice, and rights do not yet introduce any utilitarian elements. But Mill does think that whether sanctions ought to be applied to an action—and hence whether it is wrong—and whether society ought to enforce an individual's claim—and hence whether she has a right—both depend upon the utility or expediency of doing so (V 25). He does not say precisely what standard of expediency he has in mind. In particular, he does not say whether the relevant test for whether something is wrong requires that sanctions be optimal or merely beneficial. To fix ideas, let us assume that an action is wrong if and only if it is optimal to sanction it.

Because this account of duty defines the rightness and wrongness of an act, not in terms of its utility, as act utilitarianism does, but in terms of the utility of applying sanctions to the conduct, it is an indirect form of utilitarianism. Because justice is a species of duty, it inherits this indirect character (also see Lyons 1994). Because it makes the deontic status of conduct depend upon the utility of sanctioning that conduct in some way, we might call this conception of duty, justice, and rights *sanction utilitarianism*. Because sanction utilitarianism is a species of indirect utilitarianism, it is inconsistent with act utilitarianism. The introduction of indirect utilitarian ideas in Chapter V of *Utilitarianism* into an account of utilitarianism that otherwise looks act utilitarian reveals a fundamental tension in Mill's thought about duty.

### **Act vs. Sanction Utilitarianism**

Given Mill's ambivalence between direct and indirect utilitarianism, it is natural to inquire whether one view is more plausible than the other. Some of Mill's claims in Chapter V suggest a possible advantage that sanction utilitarianism might have. In articulating sanction utilitarianism, Mill claims that it allows him to distinguish duty and expediency and claim that not all inexpedient acts are wrong; inexpedient acts are only wrong when it is good or optimal to sanction them. This suggests that sanction utilitarianism may be preferable to act utilitarianism, because it has a more plausible account of the relation among different deontic categories.

Commonsense moral thinking recognizes a familiar fourfold deontic distinction.

- a. wrong or forbidden
- b. permissible
- c. obligatory

#### d. supererogatory

The act utilitarian seems unable to account for this fourfold distinction. It implies that I do wrong every time I fail to perform the optimal act, even when these suboptimal acts are very good. Because it makes the optimal obligatory and the suboptimal wrong, it appears to expand the domain of the forbidden, collapse the distinction between the permissible and the obligatory, and make no room for the supererogatory. If the optimal is already one's duty, there appears to be no room for the supererogatory. By contrast, sanction utilitarianism does not appear to have these problems. It offers a distinct account of each category.

- a. Wrong or forbidden acts are those whose performance it is optimal to blame.
- b. Permissible acts are those whose performance it is not optimal to blame.
- c. Obligatory acts are those whose omission it is optimal to blame.
- d. Supererogatory acts are permissible acts that are especially expedient.

In this way, sanction utilitarianism appears to respect this common deontic categorization and, in particular, to make room for the supererogatory.

However, the direct utilitarian can and should distinguish between the moral assessment of an act and the moral assessment of the act of praising or blaming that act. Each should be assessed, the direct utilitarian claims, by the utility of doing so. But then it is possible for there to be wrongdoing (a suboptimal act) that is blameless or even praiseworthy. But then the direct utilitarian can appeal to the same distinctions among praiseworthiness and blameworthiness that the sanction utilitarian appeals to, while denying that her own deontic distinctions track blame and praise. So, for instance, there can be acts that are wrong, because suboptimal, that it would nonetheless be wrong to blame, because this would be suboptimal. If so, it is unclear that sanction utilitarianism enjoys any real advantage here over act utilitarianism.

Moreover, sanction utilitarianism appears to have disadvantages that act utilitarianism does not. One such problem derives from its *hybrid* structure. Sanction utilitarianism is impurely indirect. For while it provides an indirect utilitarian theory of duty, the account it provides of when sanctions should be applied to conduct is direct—it depends upon the consequences of applying sanctions. Sanction utilitarianism provides an indirect utilitarian account of the conditions under which an action—any action—is right or wrong. This general criterion is that any action is wrong to which one ought to attach sanctions. But imposing sanctions is a kind of action, and we can ask whether the imposition of a particular sanction would be right or wrong. The general criterion implies that we should answer this question about the rightness of applying sanctions in sanction-utilitarian terms, namely, by asking whether it would be right to sanction the failure to apply sanctions. This introduces a second-order sanction, whose rightness we can now ask about. We seem to be off on an infinite regress of sanctions. Sanction-utilitarianism avoids the regress because it provides a direct utilitarian answer to the question when to apply the first-order sanction. It says that a sanction should be applied iff doing so is optimal. Though this avoids a regress, it appears to render sanction utilitarianism internally inconsistent.

1. Any act is right iff and because it is optimal to apply sanctions to its omission (the indirect claim).
2. Applying sanctions is right iff and because doing so is optimal (the direct claim).

(2) is inconsistent with (1).

The different strands in Mill's utilitarian conception of duty require disentangling. In his central exposition of the utilitarian standard in Chapter II, Mill commits himself to act utilitarianism in multiple passages. In that same chapter, he focuses on the felicific tendencies of actions and assigns a significant role to rules within moral reasoning, both of which have been taken to commit him to a rule utilitarian doctrine. However, these claims are reconcilable with direct utilitarianism and so provide no good reason to depart from a traditional act utilitarian reading of that chapter. But in Chapter V Mill does introduce indirect utilitarian ideas in the doctrine of sanction utilitarianism. It is hard to reconcile these direct and indirect elements in Mill's conception of duty.

### **The Sanctions of Utility**

In Chapter III of *Utilitarianism* Mill addresses the question of the ultimate sanction of the principle of utility. He understands this alternately as a question about "the motives to obey it" and the "source of its obligation ... [or] binding force" (III 1).

Mill recognizes a potential worry about the sanctions of utilitarianism that apparently has its source in prudence or self-interest.

He [an agent] says to himself, I feel that I am bound not to rob or murder, betray or deceive; but why am I bound to promote the general happiness? If my own happiness lies in something else, why may I not give that the preference? (III 1)

But this worry about potential conflicts between the agent's own interests and utilitarian moral demands seems to arise for any conception of morality that recognizes other-regarding moral demands. For this reason, Mill seems to think that it poses no special problem for utilitarianism (III 1, 2, 3, 6).

Is Mill right that there is no special threat to utilitarianism here? One might wonder whether utilitarianism makes greater demands on agents than other moral theories. Contemporary writers have argued that utilitarianism seems to be potentially very demanding, much more so than commonsense morality. For instance, reformist utilitarians, such as Peter Singer (1972), have argued that utilitarianism entails extensive duties of mutual aid that would call for significant changes in the lifestyles of all those who are even moderately well off. And critics of utilitarianism have treated the demandingness of utilitarianism as one of its principal flaws. Rawls (1971) has argued that the sort of interpersonal sacrifice that utilitarianism requires violates the strains of commitment in a well-ordered society. And Bernard Williams (1973) has argued that the demandingness of utilitarianism threatens the sort of personal projects and partial relationships that help give our lives meaning. The common complaint here is that utilitarianism's demands threaten to offend against a requirement of *psychological realism*, according to which the demands of an acceptable moral theory must be ones that can be incorporated into a reasonable and satisfying life plan.

This worry about the demands of utilitarianism is not easy to assess. One might wonder how to interpret and whether to accept the psychological realist constraint. If the constraint is relative to people's actual psychologies, then it represents a potentially conservative constraint on moral theorizing that one might well reject. If the constraint is relative to possible or ideal psychology,

then it is not clear that even a highly revisionary moral theory need flout the constraint. Then there is a question about how demanding or revisionary utilitarianism actually is. Mill and Sidgwick thought that our knowledge of others and our causal powers to do good were limited to those near and dear and other associates with whom we have regular contact, with the result that as individuals we do better overall by focusing our energies and actions on associates of one kind or another, rather than the world at large (*U* II 19; Sidgwick, *Methods* 361–69). On this view, utilitarianism can accommodate the sort of special obligations and personal concerns to which the critics of utilitarianism appeal. But it is arguable that even if this sort of utilitarian accommodation was tenable in nineteenth century Britain, technological development and globalization have rendered utilitarian demands more revisionary. Our information about others and our causal reach are not limited as they once were. Given the high benefit-to-cost ratio of many modern relief agencies, it is hard to resist something like Singer's conclusions about the reformist demands of utilitarianism. So even if Mill was right to think that the motivational demands of utilitarianism were not so different from those of other moral theories at the time he wrote, that claim might need to be reassessed today.

## **MORAL PRINCIPLES: THEIR JUSTIFICATION**

The problem of how, if at all, we could set about justifying assertions about what we ought to do in various practical situations is one that has been the major concern of moral philosophers. Such basic questions are indeed endemic in most branches of philosophy. We ask not only if we can ever know what we ought to do but whether we can justify our claims to knowledge of an external world, how we can know the truth of statements about the past, or whether we can ever be sure of the existence of minds other than our own. But in ethics the problem seems more recalcitrant and, indeed, to many nonphilosophers at least, more real. For while skepticism about the existence of an external world or of other minds may seem difficult to refute, to most it is impossible to embrace, whereas skepticism about the possibility of claiming knowledge of any objective truths about what we ought to do is not so rare, either among men in general or those who would wish to characterize themselves as philosophers.

It is not, of course, surprising that this should be so. Ethical attitudes vary much more, from society to society and even between individuals, than do our beliefs about the external world or other people's feelings. The patent fact of ethical disagreement forces us to reexamine the bases of our moral beliefs. Furthermore, the disagreements we encounter concerning moral issues often seem to involve deep matters of principle that leave no common ground between the disputants. This is sometimes referred to as the problem of disagreement about ultimate moral principles. It is this problem—whether ultimate moral principles are susceptible of rational justification—that will be examined in this article.

Most philosophers would agree that the particular way in which a philosophical problem is formulated will make a great deal of difference to what solution is possible to it or, indeed, whether any solution is possible. It will be necessary therefore to set out in detail what is meant by a disagreement about ultimate moral principles and to defend this way of expressing the issue against certain objections before a possible solution is set out.

### **Moral Principles**

A "man of principle" is sometimes thought of, with distaste, as a man who acts in accordance with a fixed set of rules, ignoring the complexities of the situation and failing to adapt his behavior to changing circumstances. The morality of principles and rules is sometimes contrasted with the

morality of sensibility, which emphasizes such virtues as sympathy and integrity as against a rigid code of behavior. In either kind of morality, however, particular judgments will have to be made, based on a view of the situation in which the agent acts, and some factors in the situation will have to be regarded as reasons for acting in one way rather than another. There is, therefore, a more general sense of "moral principle," which can be regarded as common to both views, in which a moral principle indicates some factor that is generally relevant to what ought to be done.

Moral principles can then be regarded as statements picking out those factors of situations that can be appealed to as moral reasons. "Lying is wrong" suggests that the fact that a statement is known to be false is a reason for not making it to someone. "Adultery is wrong" suggests that the fact that someone is married is a reason for his refraining from sexual intercourse with any person who is not his spouse. And, again, "One ought to be kind" suggests that there are reasons for performing kind actions rather than unkind ones. Asserting a moral principle of this kind and denying the suggestion about reasons results in paradox. Thus, for example, if somebody says "Lying is wrong, but the fact that a statement constitutes a lie is no reason whatsoever for not making it," he seems to have taken back in the second half of his sentence what he asserted in the first.

If saying that someone ought to do something commits one to claiming that there is some fact in the situation that is a reason for doing the thing in question, then this reason must be subject to the requirement that reasons in general must satisfy: that anything that is a reason in any one case must be a reason in every case unless there are other special reasons for ignoring it. This applies to reasons generally, not just to moral reasons. For example, if the fact that it is raining is a reason for saying Smith will get wet, it is a reason for saying anyone else will unless there are some relevant differences in their cases, such as being indoors or carrying an umbrella. It is this that leads to the claim that moral principles must be universal, at least to the degree that they pick out factors that are universally relevant to what we ought to do, although not necessarily universally determining what we ought to do in every particular case. Thus it would seem that the correctness of the universal moral principle involved—or, in other words, that what is appealed to as a reason should indeed be a reason—is a necessary although not a sufficient condition of the correctness of the particular judgment about what ought to be done.

### **Justification of moral judgments**

If the correctness of universal moral principles is a condition of the correctness of particular moral judgments, then obviously the first question we must ask in investigating how our particular moral judgments can be justified is, How can we justify claiming that certain moral principles are correct? There are, however, some objections to this way of treating the problem that must be considered.

It may be pointed out that value judgments in other areas do not seem to require justification by reference to some universally relevant factors. And if we are willing to allow that in other realms of value there are judgments that do not require to be backed by universal principles, why not in morals? For example, there are very considerable difficulties in representing judgments about the value of a work of art as being backed by or dependent on principles at all. It may be impossible, when we say some work of art is good, to indicate any feature the possession of which is bound to make any other work of art good. (One might be tempted to say that beauty is such a feature. But this is unconvincing because one is using the term either narrowly, in which case there are plenty of good works of art that one would never describe as beautiful, or so widely that it means only "good

in the way that a work of art is good.") Surely, however, it must be agreed that the goodness of anything, including a work of art, depends on what qualities it has, however difficult it may be to say in a given case precisely what qualities it has that make it good. And in order to begin to justify the judgment that something is good, one must refer to its qualities; one cannot draw anyone's attention to the goodness itself. If it is proper to refer to these qualities to back one's claim that the object is good, then it is at least to the point to ask why something else, which has the same qualities, is not good. If such a question is to the point, it shows that we accept that the possession of certain qualities is being put forward as a general reason for saying that the object is good.

Even if this is correct, however, it is clear that the features by virtue of which any given work of art is judged to be good tend to be many, complicated, and organically related. Although any feature pointed to in support of a judgment that a work of art is good must also be relevant to the criticism of other works of art, there may be in every other case many other relevant factors that alter the situation completely. The same thing might be claimed for moral cases. It may be said that every human situation is infinitely complicated, so that however many relevant features one may pick out in a particular case, there will always be a host of others that can be set against them. Such considerations would lead not so much to a denial of the universality of morally relevant features as to doubt about the utility of stating the problem in terms of principles. To this there are two answers.

First, it would be against common sense to claim, for example, that the wanton murder of children is not wrong. Even where other features that are regarded as morally relevant are also present—such as that one had promised one's old mother on her deathbed to try to exterminate the Jews—few would regard them as justifying child murder. So anyone who persists in claiming that it is always possible that such actions as child murder may be justified because of the complex character of every particular human situation is, at best, someone who has an unusual moral outlook, and this means that his very claim that every situation is so complicated that no general principles can be admitted is dependent on his having a different set of moral principles from most people's. So even to consider whether this objection is correct, we still have to ask which general principles are justifiable.

Second, we have already remarked that moral principles will be a necessary but not a sufficient condition of the correctness of our particular moral judgments. Although on their own they may never be sufficient to solving all moral problems, they will certainly be necessary to our having any moral problems at all. This may be illustrated in terms of a case mentioned by Jean-Paul Sartre. A young man has a dilemma. Should he join the French Resistance, or should he stay at home and look after his aging mother? Sartre points out that no rehearsal of general principles would ever serve to solve such a problem. This is no doubt true, but it does not show that the correctness of such principles is not relevant. For why is the young man worried about only those two possibilities? There are plenty of other things he could do. He could learn tightrope walking or set up as an ice-cream vendor or enlarge his earlobes with brass rings. But these are obviously of no importance, whereas looking after the old mother and joining the resistance are important. Why is Sartre's case serious and dramatic and the other suggestions frivolous and silly? Why does it matter what the young man does, to himself or to anyone? There can surely be no problem at all unless such things as joining the resistance (defending one's country) or looking after the old mother (kindness to a dependent) are morally relevant features of the situation—unless they are things that it is reasonable to consider in deciding what to do. And if there are morally relevant

features in the situation, there are corresponding moral principles. If these principles are not correct (and, indeed, there are those who would question patriotic principles), then there is no problem, or at least not the same problem.

A different kind of objection can be disposed of very briefly. It is that as a matter of experience, we do not think in terms of principles. Rather, on particular occasions we simply know instinctively what is right. Now this may very well be true or perhaps true for a number of people. However, the question at issue is not a psychological one about the kind of process that goes on before a moral judgment is made; it is a philosophical one about how we may justify making the moral judgments we do make, by whatever psychological process we make them. Whatever goes on in the heads of mathematicians, it is still Euclid's proofs alone that can justify Euclid's theorems.

### **Ultimate Moral Principles**

Moral principles in the sense adumbrated above will be of varying degrees of generality, and some will be held to be more fundamental than others. For example, the principle that one ought not to commit adultery may be defended on the ground that adultery is inimical to the stability of the family. In terms of reasons for acting, this can be put as follows. The fact that someone is married is held to be a reason for his refraining from sexual intercourse with anyone other than his spouse. But why is this a reason? Because, it might be said, *in fact* sexual infidelity is apt to break up the unity of the family. Such an argument would, of course, presuppose that the fact that something is apt to disrupt the family is a reason for avoiding it or, in other words, that one ought not to disrupt the family. Thus the principle "One ought not to commit adultery" would be regarded as less fundamental than the principle "One ought not to disrupt the unity of the family." In the process of trying to justify particular moral judgments, we will usually find ourselves trying to show that certain necessary conditions of their correctness, our moral principles, have further necessary conditions in terms of more fundamental moral principles. The process will usually be much more complicated than I have represented it; in justifying a less fundamental moral principle, we will usually find a variety of more fundamental moral principles coming into play. But however complicated such a process may be, it is obvious that we cannot suppose it to go on forever. At some point we should reach some principles that we regard as the most fundamental. For example, we might want to say that we do not claim that one ought to be kind because this follows from some further principle; we ought to be kind because we ought, and that is an end to the matter. These we may call ultimate moral principles, and their correctness is a necessary condition of the correctness of all other moral judgments. Unless some such ultimate moral principles can be shown to be justifiable, no other moral judgments can be shown to be justifiable.

Some philosophers hold that this representation of the matter is utterly mistaken and, indeed, that it is precisely because of this "justificationist" view that so many philosophers despair of finding an answer and become ethical skeptics. If, it is argued, moral principles are regarded not as first premises from which a moral system is deduced but as conjectures that can be altered and amended by subsequent moral experience, we at least have a method of correcting our moral attitudes that will justify us in claiming that they are more or less rationally defensible. It will not be possible to do this view justice in a small space. It can only be said here that the major difficulty with this view is that the test of the moral principle is taken to be the particular judgments we are inclined to make, particular judgments that conflict with the supposed principle and thus refute it. But what is now the test of the correctness of the particular judgment? The suggested method would seem to be a way of finding out, by examining someone's particular judgments, what his moral principles are rather than a way of finding out which moral principles are correct.

Furthermore, it has not been claimed in this article that moral principles are first premises from which whole moral systems can be deduced but only that moral principles are statements of relevant moral factors. Their correctness is a necessary, not a sufficient, condition of the correctness of moral judgments.

Nevertheless, the charge is certainly well founded that this way of setting out the problem is a most plausible invitation to ethical skepticism. For it would on the face of it appear that the very statement of the problem precludes its solution. If we look on more and more general moral principles as representing a regress of necessary conditions of the correctness of moral judgments, then either this regress is viciously infinite or there is a point at which it must stop. But any attempt to justify some principle as a stopping point would appear to start the whole process off again. To acquiesce in some stopping point would be to accept an ultimate principle and, it would seem, to accept that nothing further could be said in its justification. It looks then as if this way of putting the problem makes inevitable the conclusion that ultimate principles are unjustifiable.

### **Autonomy and Objectivity of Moral Principles**

One way to put the problem is to regard it as a conflict between the autonomy and the objectivity of moral principles. The demand that ethics be regarded as autonomous originated with Immanuel Kant, in the view that an action is not moral unless it is determined by the agent's rational will rather than by something external to that will, such as a desire, or the will of another (a king, a friend, the state, God). Here the concern is with the determination of action, not directly with the determination or, rather, justification of moral judgment. The autonomy of moral principles, with which we are concerned, is not, however, entirely unconnected with Kant's sense of autonomy. It is the idea that a moral judgment can never depend for its correctness entirely on factors that are nonmoral; that is, that in the justification of any moral judgment one must have recourse to a moral principle, which must in turn be justified in terms of some more general moral principle and so on. In other words, a moral judgment or principle is never deducible from any set of premises that contain no moral judgment or principle.

The demand that morality be regarded as objective was also emphasized by Kant. A moral act for Kant was one that could be willed by an autonomous, rational will; its character as a moral act depended not on the particular nature or desires of the willing agent but on the nature of a rational will as such. For Kant a maxim is objective when it is valid for any rational being. Again, Kant's concern was with the determination of action rather than the justification of judgment. But once again our sense of objectivity is not unconnected with Kant's. When someone's judgment is stigmatized as subjective rather than objective, this means that some idiosyncratic factors such as the hopes and fears or special interests of the speaker have affected his judgment; an objective judgment, however, is one not affected by such idiosyncratic factors but one that any reasonable and unbiased person would form in the circumstances. Obviously, we can speak of objective matters only in respect of matters that are publicly determinable, where we can talk of what would be judged by any reasonable and careful observer rather than what appears to be the case to some individual because of some peculiarities of his own. Thus, we might say with Kant that objectively true judgments are those that are "valid for all rational beings" rather than what merely seems to be so to certain individuals. The demand of objectivity in ethics may then be put at its most minimal as the demand that the truth of any moral judgment shall not depend on the peculiarities of the person making it but, rather, that it shall be determinable by any rational observer who is apprised of the facts. Its truth will not depend on the fact that it is judged so by some one person

rather than another but on objective considerations.

The conflict between the demands of objectivity and autonomy is now not difficult to see. For how can ultimate principles, which cannot be based on any further considerations, be based on objective considerations? How can we claim that they are matters that are publicly determinable when it would seem that, if they were autonomous, no considerations beyond themselves would make their truth determinable at all?

Henry Sidgwick, impressed by the utilitarian moral system but despairing of the kinds of argument put forward by earlier utilitarians such as Jeremy Bentham and John Stuart Mill to justify their ultimate principle, substituted instead the doctrine of intuition, a doctrine that was accepted by many other philosophers who were very far from being utilitarians. It was thought that the problem of justification in ethics was parallel to similar problems in other fields of knowledge and that in each case one would find oneself with incorrigible starting points, truths known directly, without inference or the necessity or possibility of further justification. Thus, in our knowledge of the world we might be thought to begin with direct awareness of our experience; in mathematics, with the direct perception of mathematical relationships. In ethics we begin simply with the perception of universal ethical relationships, between what is right or fitting and certain states of affairs. Whatever the difficulties in this general epistemological theory, in ethics there is the additional difficulty that the commonsense roots of the problem of justification—the inescapable fact of disagreement on fundamental ethical matters—are untouched by the doctrine of intuitionism. The appeal to intuition in the face of this disagreement leaves no way of rationally resolving it.

## **Transcendental Arguments**

It is possible, however, that an account of the justification of ultimate principles can be given that avoids both an infinite regress of justifying principles and any arbitrary stopping point. Kant's demands for autonomy and objectivity amount to the requirement that a morally good action be rationally chosen in accord with a law that is valid for all rational beings universally and that is determined by nothing beyond itself. The difficulties in making the demands of autonomy and objectivity compatible, so that this requirement becomes a feasible one, seem capable of only one kind of solution, which was the one adopted by Kant. If moral principles cannot be justified by considerations outside themselves yet must be regarded as objectively justifiable, then it seems that certain moral principles must somehow be demanded by the formal character of morality itself; certain rules must be required by any morality that is to satisfy the two demands.

Kant's particular solution has not seemed very satisfactory, but if a solution is to be found at all, it must be in the same direction. To put the point in more contemporary language, the only kind of solution that seems possible is one that shows that certain moral principles must be regarded as correct if moral discourse is to be possible at all, at least as an autonomous and objective form of practical discourse. An argument to this effect may be called a transcendental argument. If such arguments can be constructed, it should be easy to see how they solve the problem we have been considering. For a principle can be shown to be objectively true, without appealing to factors outside itself, if it can be shown that the form of discourse of which the principle is an example is impossible without presupposing the principle. That is, by showing that no one can claim to be using a form of autonomous, practical, and objective discourse unless he at the same time accepts the principle in question.

Three arguments of this kind can be advanced to establish three ultimate principles, which we may call the principles of impartiality, rational benevolence, and liberty. It is important that throughout it should be borne in mind that these arguments are intended to establish ultimate principles—that is, factors of the most general moral relevance, which will be necessary, but by no means sufficient, to establishing any correct moral theories, rules, or particular judgments. Even given that these arguments establish the ultimate principles of impartiality, rational benevolence, and liberty, there will still remain the difficult problem of their application in practice.

## **Impartiality**

As far as we are concerned with a form of discourse in which we objectively judge actions right or wrong, so that a correct practical judgment is one that could in principle be reached by anybody, such judgments must be made in terms of features that the actions or the situations in which they are done possess and not on any other factors arbitrarily introduced by the person making the judgment. Thus, any feature picked out as relevant must be one that is always relevant unless there is some special explanation, for a feature that is relevant in one case and not in another, where there is no further difference, is one that is not relevant at all in any ordinary sense and forms no guide to action. It follows that any action that it is right or wrong for one person to do is right or wrong for every person to do unless there are some special factors present in the other cases. And from this demand of universality it follows, insofar as morality is practical, that one ought to act in accordance with it: What anyone ought to do in any given set of circumstances is what anyone else ought to do, as long as his case is not relevantly different, and anything one ought to do on any given occasion is what one ought to do on every occasion unless again there are factors present that are relevantly different. That one ought to treat similar cases similarly is obviously a general case of the particular requirement of justice toward men, that any form of treatment that is thought to be right for one man must be right for all others, unless the others are significantly different.

## **Rational benevolence**

The principle of rational benevolence is that stated by Sidgwick, that one ought in action to consider the interests of all beings in the universe. That this is a most impractical injunction is important, but not fatal, for how in practical situations we may apply any ultimate principle is another, though admittedly difficult, question.

The principle may be justified as follows. The demand of objectivity is that what is right or wrong should be determinable at least in principle by all rational beings. This requires that moral discourse should be a form of public discourse, in which the relevance and force of any consideration is dependent on its content and not on the will or status of whoever puts it forward. That is, the remark of any rational being may be relevant to the question whether some action is right or wrong. The ideal of this form of discourse therefore requires that it should be possible for any rational being to participate in it as an interlocutor; if any is excluded arbitrarily then all may be, and the form of discourse as a public institution would be impossible. This does not mean that other forms of discourse may not be constructed in which certain possible interlocutors are excluded by fiat, but this would not then be the fully rational, autonomous, and objective form of discourse we require. A parallel may be found in scientific discourse. As far as it is objective, considerations must be dealt with on their merits and not in terms of the will or status of whoever puts them forward. If any arbitrary exclusion of possible interlocutors is made, then we do not have public objective scientific discourse but a sort of game in which arbitrarily selected players alone are entitled to make certain moves and in which what is determined in the outcome is who

has won rather than what is true.

If moral discourse is to be public and objective, then it must allow for the participation of any possible rational interlocutor. Now let us define an interest as that which any rational being should seek for himself insofar as he considers the effects of his actions on himself and not on others except insofar as what affects others also affects him (for example, if it is rational for anyone to avoid pain, then it is in my interest to seek those actions that avoid pain to myself but not necessarily those that avoid pain to others except insofar as the pain of others causes pain to me or prevents my achieving some other end that it would be rational for me to choose for myself). Now it is by definition necessary that every rational being should seek his own interests as far as possible. It would be irrational for any being to participate in a form of discourse the practical effect of which would be to deny his interests; hence, it would be irrational for anyone to adopt moral discourse without further justification if from the beginning his interests were to be ruled out. But this means that anyone who wishes to adopt moral discourse must allow that any possible interlocutor must not have his interests ruled out of consideration from the beginning, and any rational being is in principle a possible interlocutor. It follows that as far as public objective moral discourse is to be possible, it is presupposed that what is determined by such means will not neglect the interests of any rational being—that is, that in deciding what I ought to do, or what anyone ought to do, the interests of all rational beings whatsoever must be taken into account.

### **liberty**

The principle of liberty is that one ought not to interfere, without special justification, in the chosen course of any rational being or impose on any rational being conditions that will prevent him from pursuing his chosen courses of action. Moral discourse is a form of discourse in which we try to guide action rationally. We try to determine action on the basis of a rational consideration of the nature of the action and its context, not by some other means such as violence. Any interference with the chosen course of a rational being is a determination of his action by force or at least a limit imposed by force on the extent to which his actions may be rationally determined. Such interference must then be presupposed as absent in public objective practical discourse in which action is determined by reason, and hence in using such discourse, in participating in it as an institution, one is presupposing that one ought not to interfere by force, but only by rational persuasion, in the chosen course of any rational being.

The arguments given for these three principles are very much oversimplified, and it could not be claimed that they have the force of demonstrations. But enough has been said to show that the type of argument they represent is at least a possible one and hence that the apparent conflict between autonomy and objectivity is not a real one and that the problem of the justification of ultimate principles may not be insoluble.

### **Completeness and application of principles**

Two important problems remain. The first we may deal with briefly. It is one that was very important to Kant, with regard to both theoretical and practical principles. How can we be sure that we have achieved completeness in any list of principles? If ultimate principles can be established only by transcendental arguments, we have at least some clue to the answer to this problem; for the rest it might be argued that the problem is not so urgent as some have thought.

A transcendental argument is one that depends on an account of what is necessary to a given

form of discourse; in ethics we are concerned with what is necessary to a form of discourse that is practical, universal, objective, and autonomous. We are, that is, dependent on a consideration of the formal characteristics of the form of discourse. This gives at least some negative criterion for deciding what principles may be justified as ultimate. Thus, it would be most implausible to suggest, for example, that "One ought not to drink alcoholic liquor on Sundays" could be justified as an ultimate moral principle. For it is reasonably obvious that no direct connection could be established between the purely formal characteristics of any form of discourse and such particular matters as are picked out by the concepts of the principle in question. Such a principle would have to be, if justifiable at all, one that would depend on matters beyond the purely formal characteristics of practical reason. It is always possible, however, though in this case surely a fantastic suggestion, that someone with sufficient ingenuity might show that some apparently low-level principle is in fact justifiable as an ultimate one by a transcendental argument. And this may disturb us, for how can we be sure that we are not failing to take account of such principles all the time? We should not, however, be much disturbed, for two reasons. First, if a principle is a necessary condition of the possibility of moral discourse, one would expect to find it as a pervasive explicit or implicit principle of most moral codes (allowing for the resources of human confusion), and this is true for the three principles— justice, benevolence, and liberty—we have mentioned. Second, when it is suggested that there is a reason for acting in one way rather than another, the suggestion requires justification, in the absence of which the suggestion may be reasonably ignored. The onus of proof is on anyone who suggests that a certain principle is correct; until such proof is at least suggested, the fear that there may be quite unknown principles, which are not generally accepted but which could, with sufficient ingenuity, be justified transcendently, is an idle one.

The second difficulty that we face at this point is of the utmost importance; indeed, one might fairly say that out of it all the really important and difficult questions of substance in ethics arise. It is the problem of the application of these principles to particular situations, both in themselves and in relation to one another. Unless it is possible to show that these principles can be rationally applied, then no amount of rational demonstration of the ultimate principles will enable us to show that the particular moral judgments we make can be rationally justified.

## **Types of utilitarianism**

Theories of right and wrong have to be about something, that is, have to have a focus. Usually, at least in recent centuries, they have focused on actions, attempting to answer the questions, 'Which actions are right?', and, 'What makes those actions right?'. The ancients also asked these questions, but were concerned also to focus on lives, characters, dispositions and virtues. Nearly all forms of utilitarianism have focused on actions, but in recent decades there has been some interest in utilitarianism as applied to motives, virtues and lives as a whole.

Utilitarianism is a form of consequentialism. But it is important to note that, since utilitarians can attach intrinsic moral importance to acts (especially, of course, the act of maximizing itself), there are problems in attempting to capture the nature of utilitarianism using the act/consequence distinction. A recent alternative has been to employ the 'agent-neutral'/'agent-relative' distinction. Agent-neutral theories give every agent the same aim (for example, that utility be maximized), whereas agent-relative theories give agents different aims (say, that *your* children be looked after). Logically, however, there is nothing to prevent a utilitarian's insisting that *your* aim should be that *you* maximize utility. Though this theory would be practically equivalent to an agent-neutral theory, its possibility suggests there may be problems with attempting to use the agent-

neutral/agent-relative distinction to capture the essence of utilitarianism.

What clearly distinguishes utilitarianism from other moral theories is what it requires and why, so we should now turn to that. The commonest, and most straightforward, version of utilitarianism is *act-utilitarianism*, according to which the criterion of an action's rightness is that it maximize utility. Act-utilitarians might offer two accounts of rightness. The objectively right action would be that which actually does maximize utility, while the subjectively right action would be that which maximizes expected utility. Agents would usually be blamed for not doing what was subjectively right.

Another distinction is between *total* and *average* forms. According to the total view, the right act is the one that produces the largest overall total of utility. The average view says that the right action is that which maximizes the average level of utility in a population. The theories are inconsistent only in cases in which the size of a population is under consideration. The most common such case occurs when one is thinking of having a child. Here, the average view has the absurd conclusion that I should not have a child, even if its life will be wonderful and there will be no detrimental effects from its existence, if its welfare will be lower than the existing average.

But the total view also runs into problems, most famously with Derek Parfit's 'repugnant conclusion' (1984), which commits the total view to the notion that if a population of people with lives barely worth living is large enough it is preferable to a smaller population with very good lives. One way out of this problem is to adopt a *person-affecting* version of utilitarianism, which restricts itself in scope to existing people. But there are problems with this view. Recently, certain writers have suggested that one way to avoid the 'repugnant conclusion' would be to argue that there are *discontinuities* in value, such that once welfare drops below a certain level the loss cannot be compensated for by quantity. There is a link here with Mill's view of the relation of higher pleasures to lower.

Imagine being an act-utilitarian, brought up in an entirely act-utilitarian society. You will have to spend much time calculating the utility values of the various actions open to you. You are quite likely to make mistakes, and, being human, to cook the books in your own favour.

For these reasons, most act-utilitarians have argued that we should not attempt to put act-utilitarianism into practice wholesale, but stick by a lot of common sense morality (see Common-sense ethics). It will save a lot of valuable time, is based on long experience, and will keep us on the straight and narrow. Act-utilitarians who recommend sole and constant application of their theory as well as those who recommend that we never consult the theory and use common sense morality can both be called *single-level* theorists, since moral thinking will be carried on only at one level. Most utilitarians have adopted a *two-level* theory, according to which we consult utilitarianism only sometimes – in particular when the principles of ordinary morality conflict with one another.

The main problem with two-level views is their psychology. If I really accept utilitarianism, how can I abide by a common sense morality I know to be a fiction? And if I really do take that common sense morality seriously, how can I just forget it when I am supposed to think as a utilitarian? The two-level response here must be that this is indeed a messy compromise, but one made to deal with a messy reality.

Act-utilitarianism is an extremely demanding theory, since it requires you to be entirely impartial between your own interests, the interests of those you love, and the interests of all. The usual example offered is famine relief. By giving up all your time, money and energy to famine relief, you will save many lives and prevent much suffering. Utilitarians often claim at this point that there are limits to human capabilities, and utilitarianism requires us only to do what we can. But the sense of 'can' here is quite obscure, since in any ordinary sense I can give up my job and spend my life campaigning for Oxfam.

The demandingness objection seems particularly serious when taken in the context of widespread non-compliance with the demands of act-utilitarian morality. Most people do little or nothing for the developing world, and this is why the moral demands on me are so great. An argument such as this has been used to advocate *rule-utilitarianism*, according to which the right action is that which is in accord with that set of rules which, if generally or universally accepted, would maximize utility. (The version of the theory which speaks of the rules that are *obeyed* is likely to collapse into act-utilitarianism; see Lyons 1965.)

Unlike act-utilitarianism, which is a *direct* theory in that the rightness and wrongness of acts depends directly on whether they fit with the maximizing principle, rule-utilitarianism is an *indirect* theory, since rightness and wrongness depend on rules, the justification for which itself rests on the utilitarian principle.

The demandingness of act-utilitarianism has not been the main reason for adopting rule-utilitarianism. Rather, the latter theory has been thought to provide support for common sense moral principles, such as those speaking against killing or lying, which appear plausible in their own right.

Rule-utilitarianism has not received as much attention as act-utilitarianism, partly because it detaches itself from the attractiveness of maximization. According to rule-utilitarianism there may be times when the right action is to bring about less than the best possible world (such as when others are not complying). But if maximization is reasonable at the level of rules, why does it not apply straightforwardly to acts?

## **Moral theories of Bentham**

At the outset of the nineteenth century, an influential group of British thinkers developed a set of basic principles for addressing social problems. Extrapolating from Hume's emphasis on the natural human interest in utility, reformer Jeremy Bentham proposed a straightforward quantification of morality by reference to utilitarian outcomes. His *An Introduction to the Principles of Morals and Legislation* (1789) offers a simple statement of the application of this ethical doctrine.

Bentham's moral theory was founded on the assumption that it is the consequences of human actions that count in evaluating their merit and that the kind of consequence that matters for human happiness is just the achievement of pleasure and avoidance of pain. He argued that the hedonistic value of any human action is easily calculated by considering how intensely its pleasure is felt, how long that pleasure lasts, how certainly and how quickly it follows upon the performance of the action, and how likely it is to produce collateral benefits and avoid collateral harms. Taking such matters into account, we arrive at a net value of each action for any human being affected by it.

All that remains, Bentham supposed, is to consider the extent of this pleasure, since the happiness of the community as a whole is nothing other than the sum of individual human interests. The principle of utility, then, defines the meaning of moral obligation by reference to the greatest happiness of the greatest number of people who are affected by performance of an action. Similarly, Bentham supposed that social policies are properly evaluated in light of their effect on the general well-being of the populations they involve. Punishing criminals is an effective way of deterring crime precisely because it pointedly alters the likely outcome of their actions, attaching the likelihood of future pain in order to outweigh the apparent gain of committing the crime. Thus, punishment must "fit" the crime by changing the likely perception of the value of committing it.

## **Moral theories of J. S. Mill**

The ethical theory of John Stuart Mill (1806-1873) is most extensively articulated in his classical text *Utilitarianism* (1861). Its goal is to justify the utilitarian principle as the foundation of morals. This principle says actions are right in proportion as they tend to promote overall human happiness. So, Mill focuses on consequences of actions and not on rights nor ethical sentiments.

### **Mill's Theory of Value and the Principle of Utility**

Mill defines "utilitarianism" as the creed that considers a particular "theory of life" as the "foundation of morals" (CW 10, 210). His view of theory of life was monistic: There is one thing, and one thing only, that is intrinsically desirable, namely pleasure. In contrast to a form of hedonism that conceives pleasure as a homogeneous matter, Mill was convinced that some types of pleasure are more valuable than others in virtue of their inherent qualities. For this reason, his position is often called "qualitative hedonism". Many philosophers hold that qualitative hedonism is no consistent position. Hedonism asserts that pleasure is the only intrinsic value. Under this assumption, the critics argue, there can be no evaluative basis for the distinction between higher and lower pleasures. Probably the first ones to raise this common objection were the British idealists F. H. Bradley (1876/1988) and T. H. Green (1883/2003).

Which inherent qualities make one kind of pleasure better than another, according to Mill? He declares that the more valuable pleasures are those which employ "higher faculties". The list of such better enjoyments includes "the pleasures of intellect, of the feelings and imagination, and of the moral sentiments". These enjoyments make use of highly developed capacities, like judgment and empathy. In one of his most famous sentences, Mill affirms that it "is better to be a human being dissatisfied than a pig satisfied; better to be Socrates dissatisfied than a fool satisfied" (CW 10, 212). This seems to be a surprising thing to say for a hedonist. However, Mill thought that we have a solid empirical basis for this view. According to him, the best obtainable evidence for value claims consists in what all or almost all people judge as valuable across a vast variety of cases and cultures. He makes the empirical assertion that all or almost all people prefer a "manner of existence" (CW 10, 211) that employs higher faculties to a manner of existence which does not. The fact that "all or almost all" who are acquainted with pleasures that employ higher faculties agree that they are preferable to the lower ones, is empirical evidence for the claim that they are indeed of higher value. Accordingly, the best human life ("manner of existence") is one in which the higher faculties play an adequate part. This partly explains why he put such great emphasis on education.

### **1. Morality as a System of Social Rules**

The fifth and final chapter of *Utilitarianism* is of unusual importance for Mill's theory of moral

obligation. Until the 1970s, the significance of the chapter had been largely overlooked. It then became one of the bridgeheads of a revisionist interpretation of Mill, which is associated with the work of David Lyons, John Skorupski and others.

Mill worked very hard to hammer the fifth chapter into shape and his success has great meaning for him. Towards the end of the book he maintains the “considerations which have now been adduced resolve, I conceive, the only real difficulty in the utilitarian theory of morals.”

At the beginning of *Utilitarianism*, Mill postulates that moral judgments presume rules. In contrast to Kant who grounds his ethical theory on *self-imposed* rules, so-called maxims, Mill thinks that morality builds on *social* rules. But what makes *social* rules *moral* rules? Mill’s answer is based on a thesis about how competent speakers use the phrase “morally right” or “morally wrong”. He maintains that we name a type of action morally wrong if we think that it should be sanctioned either through formal punishment, public disapproval (external sanctions) or through a bad conscience (internal sanctions). This is the critical difference between “morality and simple expediency” (CW 10, 246). Wrong or inexpedient actions are those that we cannot recommend to a person, like harming oneself. But in contrast to immoral actions, inexpedient actions are not worthy of being sanctioned.

Mill differentiates various spheres of action. In his *System of Logic* he names morality, prudence and aesthetics as the three departments of the “Art of Life” (CW 8, 949). The principle of utility governs not only morality, but also prudence and taste (CW 8, 951). It is not a moral principle but a meta-principle of practical reason.

There is a field of action in which moral rules obtain, and a “person may rightfully be compelled to fulfill” them (CW 10, 246). But there are also fields of action, in which sanctions for wrong behavior would be inappropriate. One of them is the sphere of self-regarding acts with which Mill deals in *On Liberty*. In this private sphere we can act at our convenience and indulge in inexpedient and utterly useless behavior as long as we do not harm others.

It is fundamental to keep in mind that Mill looks into morality as a social practice and not as autonomous self-determination by reason, like Kant. For Kantians, moral deliberation determines those actions which we have the most reason to perform. Mill disagrees; for him, it makes sense to say that “A is the right thing to do for Jeremy, but Jeremy is not morally obliged to do A.” For instance, even if Jeremy is capable of writing a brilliant book that would improve the life of millions (and deteriorate none), he is not morally obliged to do so. According to Mill, our moral obligations result from the *justified* part of the moral code of our society; and the task of moral philosophy consists in bringing the moral code of a society in better accordance with the principle of utility.

## **2. The Role of Moral Rules (Secondary Principles)**

In *Utilitarianism*, Mill designs the following model of moral deliberation. In the *first step* the actor should examine which of the rules (secondary principles) in the moral code of his or her society are pertinent in the given situation. If in a given situation moral rules (secondary principles) conflict, then (and only then) can the *second step* invoke the formula of utility (CW 10, 226) as a first principle. Pointedly one could say: the principle of utility is for Mill not a *component* of morality, but instead its *basis*. It serves the validation of rightness for our moral system and allows – as a meta-rule – the decision of conflicting norms. In the introductory chapter of *Utilitarianism*, Mill maintains that it would be “easy to show that whatever steadiness or

consistency these moral beliefs have attained, has been mainly due to the tacit influence of a standard not recognized" (CW 10, 207), namely the principle of utility. The tacit influence of the principle of utility made sure that a considerable part of the moral code of our society is justified (promotes general well-being). But other parts are clearly unjustified. One case that worried Mill deeply was the role of women in Victorian Britain. In "The Subjection of Women" (1869) he criticizes the "legal subordination of one sex to the other" (CW 21, 261) as incompatible with "all the principles involved in modern society".

Moral rules are also critical for Mill because he takes human action in essence as to be guided by dispositions. A virtuous person has the disposition to follow moral rules. In his early essay "Remarks on Bentham's Philosophy" (1833) he asserts that a "man is not really virtuous", unless the mere thought of committing certain acts is so painful that he does not even consider the possibility that they may have good consequences. He repeats this point in his *System of Logic* (1843) and *Utilitarianism*:

[T]he mind is not in a right state, not in a state conformable to Utility, not in the state most conducive to the general happiness, unless it does love virtue in this manner – as a thing desirable in itself, even although, in the individual instance, it should not produce those other desirable consequences which it tends to produce, and on account of which it is held to be virtue.

It is one thing to say that it could have optimal consequences (and thus be objectively better) to break a moral rule in a concrete singular case. Another is the question as to whether it would facilitate happiness to educate humans such that they would have the disposition to maximize situational utility. Mill answers the latter in the negative. Again, the upshot is that education matters. Humans are guided by acquired dispositions. This makes moral degeneration, but also moral progress possible.

### **Henry Sidgwick's *The Methods of Ethics***

Henry Sidgwick (1838-1900) was an English philosopher who taught at Trinity College, Cambridge from 1859-1900. His writings included *The Methods of Ethics* (1874) and *Principles of Political Economy* (1883).

*The Methods of Ethics* defines three basic methods of ethics: (1) egoistic hedonism, (2) intuitionism, and (3) universalistic hedonism. The analysis of these methods attempts to determine the extent to which they are compatible or incompatible. Sidgwick describes how each method may provide its own definition of the ultimate goal of ethical conduct. Thus, for egoistic hedonism, the private happiness of each individual is the ultimate good. For intuitionism, moral virtue or perfection is the ultimate good. For universalistic hedonism, the general happiness of all individuals is the ultimate good. Sidgwick describes how each of these methods defines rational principles of conduct, and how they each interpret moral duty differently.

Methods of ethics are rational procedures that enable us to determine what we should voluntarily do (or what it is right for us to do) in a particular situation. Ethics is a study of the principles that govern right action or conduct. It is different from politics, because it is concerned with what is right for each individual, while politics is concerned with what is right for society. It is also a philosophical rather than a scientific inquiry, because it is mainly concerned with what *ought* to be, rather than with what *is*. However, judgments about what *ought* to happen in a particular situation often depend upon judgments about what actually *is* happening in that situation, and thus ethical

judgments often depend upon scientific judgments.

Psychological hedonism should be distinguished from ethical hedonism, says Sidgwick. Psychological hedonism affirms that the motives of human action are to be found in the pursuit of pleasure or in the avoidance of pain. Ethical hedonism, on the other hand, asserts that actions are good insofar as they produce pleasure or prevent pain. Psychological hedonism is a theory of psychological motivation, while ethical hedonism is a theory of ethical conduct. Psychological hedonism and ethical hedonism may be combined or separated as methods of defining the ultimate goal of moral conduct.

Ethical hedonism may be divided into egoistic hedonism (including Epicureanism) and universalistic hedonism (including utilitarianism). While egoistic hedonism affirms that each individual should aim to promote his/her own private happiness, universalistic hedonism affirms that each individual should aim to promote the happiness of all individuals.

Egoistic and universalistic principles may be combined in ethical hedonism, because individuals may rightly or wrongly believe that promoting their own private happiness will promote the general happiness of all individuals. However, the egoistic principle that the private happiness of each individual is more important than the general happiness of all individuals may conflict with the universalistic principle that an individual should sacrifice some of his/her own happiness for the sake of the happiness of other individuals. The egoist may consider his own private happiness to be the ultimate good, but the universalist (or utilitarian) may consider the general happiness of all individuals to be the ultimate good.

Ethical intuitionism affirms that proper conduct is defined by rules or principles that may be known intuitively. It affirms that the rightness or wrongness of actions may be known intuitively, even if the consequences of those actions have not been determined.

Ethical intuitionism, according to Sidgwick, may be divided into three phases: (1) perceptual, (2) dogmatic, and (3) philosophical. Perceptual intuitionism affirms that some ethical truths may be intuitively apprehended. Dogmatic intuitionism affirms that some ethical truths may be accepted without being intuitively apprehended. Philosophical intuitionism affirms that some ethical truths may be intuitively apprehended without being undeniably or absolutely self-evident.

Insofar as some actions may be judged intuitively to be right or wrong, those actions may be judged as right or wrong on the basis of their motives or other intrinsic qualities. Intuitionism affirms that some actions may be intrinsically right or wrong, regardless of their consequences. It also affirms that some actions may be judged as right or wrong, regardless of how those actions compare with actions required by moral duty.

Sidgwick defines a moral duty as a right action for which a moral motive is at least occasionally necessary.<sup>1</sup> A duty is an action that is obligatory and that is owed to someone or something. Types of moral duty include duty to one's family, duty to one's friends, duty to one's community, duty to one's country, duty to those from whom one has received help, duty to those who are in need, and duty to those who are suffering.

Sidgwick defines virtue as a praiseworthy quality that is exhibited in right conduct and that extends beyond the limits of moral duty. Practical wisdom and rational self-control are intellectual virtues,

while benevolence and common humanity are moral virtues. Justice, good faith, veracity, gratitude, generosity, courage, and humility are other moral virtues.

An important question to be considered by any method of ethics is whether some actions are intrinsically good or whether they are merely good as a means to attain an ultimate good. Another important question is whether there is a reliable way of deciding what action should be performed in a particular situation in order to achieve the ultimate goal of moral conduct. Another important question to be considered is how to determine the ultimate goal of moral conduct. Ethical hedonism defines the highest good as the greatest amount of happiness that is attainable by an individual or society. It affirms that the greatest amount of happiness that is attainable by an individual or society is equal to the sum of the greatest amount of pleasure or pain that may be produced by the actions of that individual or society. However, the quantitative method of empirical hedonism may not always be reliable in determining what action is the best means to attain an ultimate good.

Egoistic hedonism and universalistic hedonism may be described as intuitive methods of ethics if they intuitively accept the principle that the enjoyment of pleasure and the avoidance of pain are the only rational aims of human action. They may intuitively rely on psychological hedonism as a theory of motivation, but they do not necessarily have to rely on it, and they may also disagree with the intuitionist principle that the rightness or wrongness of some actions does not depend on the consequences of those actions.

Sidgwick explains that universalistic hedonism should be clearly distinguished from egoistic hedonism. Universalistic hedonism affirms that all individuals have an equal right to be happy and that there is no individual whose happiness is more important than that of any other individual. It also affirms that the rightness or wrongness of actions depends on whether they promote universal happiness. Moral virtues such as benevolence, generosity, and good citizenship may be better promoted by universalistic hedonism than by egoistic hedonism, says Sidgwick.

However, Sidgwick admits that a problem with universalistic hedonism is that an individual may have to decide whether an action is right or wrong by estimating not only how much personal happiness will be produced by that action but also how much general happiness will be produced by that action. An individual may have to be able to compare the pleasures or pains of other individuals with his/her own pleasures or pains. Thus, an individual may have to be able to estimate the total amount of his/her own pleasure or pain, and may have to be able to estimate the total amount of the pleasure or pain that may be experienced by other individuals.

Another problem with utilitarianism is that there may be many ways of determining how the greatest possible amount of happiness should be distributed among the greatest number of individuals. There may be many ways of distributing happiness among all the individuals who are to benefit from a given action.

Sidgwick criticizes Kant's concept of a "categorical imperative" for being ambiguous and misleading. The categorical imperative is to "act only in such a way that you can will that the maxim of your action should become a universal law."<sup>2</sup> Sidgwick argues that the categorical imperative fails to distinguish between subjective and objective moral duty. An individual may subjectively feel that he/she is acting rightly by complying with the categorical imperative, but may objectively be wrong.

Sidgwick also criticizes Kant's concept of free will for failing to distinguish between freedom and rationality. For Kant, the moral freedom of an individual depends on the degree to which the individual is able to act rationally. If an individual is acting rationally, then he/she will act according to the categorical imperative, and the maxim of each of his/her actions will be capable of becoming a universal law of morality. However, Sidgwick argues that moral freedom is the freedom to choose between right and wrong, and that it may be the freedom to act rationally or irrationally. Thus, there may be confusion as to what constitutes "true" freedom. According to Sidgwick, Kant's interpretation of free will is ambiguous in its conclusions as to whether "rational" freedom is the same as, or different from, "moral" freedom, and this ambiguity is also present in Kant's concept of the autonomy and heteronomy of the will.

## **Theories and Kinds of Punishment**

The immediate consequence that follows a criminal act is known as punishment. Thus, punishment is defined as suffering, loss, pain, or any other penalty that is inflicted on a person for the crime by the concerned authority. There are different theories of punishment in law.

## **Theories of Punishment**

## **Theories and Kinds of Punishment**

There are different kinds of punishment that a person can face. In order to understand them, first, we need to understand the theories of the punishment. There are majorly four theories of punishment.

These theories are the deterrent theory, retributive theory, preventive theory, and reformatory theory. We will discuss these theories in length below.

## **Deterrent Theory**

The retributive theory assumes that the punishment is given only for the sake of it. Thus, it suggests that evil should be returned for evil without taking into consideration any consequences. There are two theories in which this theory can be divided further. They are specific deterrence and general deterrence.

In specific deterrence, punishment is designed such that it can educate the criminals. Thus, this can reform the criminals that are subjected to this theory. Also, it is maintained that the

punishment reforms the criminals. This is done by creating a fear that the punishment will be repeated.

While a general deterrence is designed to avoid future crime. So, this is done by making an example of each defendant. Thus, it frightens the citizens to not do what the defendant did.

### **Retributive Theory**

Retribution is the most ancient justification for punishment. This theory insists that a person deserves punishment as he has done a wrongful deed. Also, this theory signifies that no person shall be arrested unless that person has broken the law. Here are the conditions where a person is considered as an offender are:

- The penalty given will be equivalent to the grievance caused by the person.
- Performed a crime of certain culpability.
- That similar persons have been imposed for similar offenses.
- That the action performed was by him and he was only responsible for it. Also, he had full knowledge of the penalty system and possible consequences.

### **Preventive Theory**

This theory has used a restraint that an offender if repeats the criminal act is culpable for death, exile or imprisonment. The theory gets its importance from the notion that society must be protected from criminals. Thus, the punishment here is for solidarity and defense.

The modern criminologists saw the preventive theory from a different view. They first realized that the social and economic forces should be removed from society. Also, one must pay attention to individuals who show anti-social behavior. This is because of psychological and biological handicaps.

### **Reformative Theory**

Deterrence and retributive are examples of classical and non-classical philosophies. The reformative theory was born out of the positive theory that the focal point of crime is positive thinking. Thus, according to this theory, the objective of punishment needs to be reformation by the offender.

So, this is not a punishment virtually but rather a rehabilitative process. Thus, this process helps in making a criminal a good citizen as much as possible. Furthermore, it makes the citizen a meaningful citizen and an upright straight man.

### **Cognitivism**

Cognitivism is the view that ethical sentences express propositions and can therefore be true or false (i.e. they are truth-apt). Thus, moral judgments are capable of being objectively true, because they describe some feature of the world.

A proposition in Epistemology is, roughly speaking, an assertion or a declarative sentence (as opposed to an interrogative, exclamatory or imperative sentence). Thus, an ethical statement which is a valid proposition (e.g. "Mary is a good person") is able to bear truth values, and one can say of it "that is true" or "that is false". Two people may disagree on its truth or falsity, but it

has at least the capacity for truth.

The opposite view is that of Non-Cognitivism, the view that moral statements lack truth-value and do not assert propositions.

### **Types of Cognitivism**

Moral Realist doctrines in Meta-Ethics, such as Ethical Naturalism and Ethical Non-Naturalism, implicitly assume that ethical statements are truth-apt propositions.

However, it is also possible for Moral Anti-Realist theories to accept that ethical sentences can be true or false, even if there are no natural, physical or in any way real entities or objects to make them true or false. Hilary Putnam (1926 - ) argues in his 2004 book *"Ethics without Ontology"* that ethical (and for that matter mathematical) sentences can be true and objective without there being any real world objects to make them so.

Thus, some Moral Anti-Realist theories like Ethical Subjectivism and the Error Theory variant of Moral Nihilism also assume Cognitivism.

### **Non-Cognitivism**

Non-Cognitivism is the meta-ethical view (or family of views) that moral utterances lack truth-value (i.e. they are neither true nor false) and do not assert propositions. Therefore, if moral statements cannot be true, and if one cannot know something that is not true, Non-Cognitivism implies that moral knowledge is impossible, and moral truths are not the kind of truths that can be known.

A proposition in Epistemology is, roughly speaking, an assertion or a declarative sentence (as opposed to an interrogative, exclamatory or imperative sentence). Thus, an ethical statement which is a valid proposition (e.g. "Mary is a good person") is able to bear truth values, and one can say of it "that is true" or "that is false". Two people may disagree on its truth or falsity, but it has at least the capacity for truth.

The opposite view to Non-Cognitivism is that of Cognitivism, that ethical sentences express propositions and can therefore be true or false (i.e. they are truth-apt).

### **Arguments For and Against Non-Cognitivism**

Non-Cognitivism is largely supported by the Argument from Queerness: that ethical properties, if they existed, would be different from any other thing in the universe, since they have no observable effect on the world, and there is no way of discerning (and no actual evidence for) the existence of ethical properties. It focuses on the function of normative statements in practice, arguing that they are more likely to merely express approval or disapproval, or to exhort or persuade in a prescriptive way, than to make definitive assertions of truth or falseness. Non-Cognitivists argue that the burden of evidence is on cognitivists who want to show that in addition to expressing disapproval, for example, the claim "Killing is wrong" is also true.

One argument against Non-Cognitivism is that it ignores the external causes of emotional and prescriptive reactions (e.g. if someone says, "John is a good person," then something about John must have inspired that reaction). It is also argued that, if ethical statements do not represent cognitions (as Non-Cognitivism assumes), then how is it possible to use them as premises in an

argument, in which they follow the same rules of syllogism as true propositions (e.g. "Killing an innocent human is always wrong. All fetuses are innocent humans. Therefore, killing a fetus is always wrong")?

## Types of Non-Cognitivism

The following doctrines can be considered Non-Cognitive:

- **Emotivism:** the view, defended by A.J. Ayer and C. L. Stevenson (1908 -1979) among others, that ethical sentences serve merely to express emotions of approval or disapproval, and ethical judgments are primarily expressions of one's own attitude, although to some extent they are also imperatives meant to influence or change the attitudes and actions of other listeners.
- **Prescriptivism (or Universal Prescriptivism):** the view, propounded by R.M. Hare (1919 - 2002), that moral statements function as imperatives which are universalizable (i.e. applicable to everyone in similar circumstances) e.g. "Killing is wrong" really means "Do not kill!"
- **Expressivism:** the view that the primary function of moral sentences is not to assert any matter of fact, but rather to express an evaluative attitude toward an object of evaluation. Therefore, because the function of moral language is non-descriptive, moral sentences do not have any truth conditions.
- **Quasi-Realism:** the view, developed from Expressivism and defended by Simon Blackburn (1944 - ), that ethical statements behave linguistically like factual claims, and can be appropriately called "true" or "false" even though there are no ethical facts for them to correspond to. Blackburn argues that ethics cannot be entirely realist, for this would not allow for phenomena such as the gradual development of ethical positions over time or in differing cultural traditions.
- **Projectivism:** the view that qualities can be attributed to (or "projected" on) an object as if those qualities actually belong to it. Projectivism in Ethics (originally proposed by David Hume and more recently championed by Simon Blackburn) is associated by many with Moral Relativism, and is considered controversial, even though it was philosophical orthodoxy throughout much of the 20th Century.
- **Moral Fictionalism:** the view that moral statements should not be taken to be literally true, but merely a useful fiction. This has led to charges of individuals claiming to hold attitudes that they do not really have, and therefore are in some way insincere.

## Emotivism

Emotivism is no longer a view of ethics that has many supporters. Like subjectivism it teaches that there are no objective moral facts, and that therefore 'murder is wrong' can't be objectively true.

### Emotivists teach that:

- Moral statements are meaningless.
- This means that the first half of the statement 'it was wrong to murder Fred' adds nothing to the non-moral information that Fred has been murdered.

- Moral statements only express the speaker's feelings about the issue.

**Later emotivists added this idea to Emotivism:**

- By expressing the speaker's feelings about a moral issue moral statements may influence another person's thoughts and conduct.

**Moral statements are meaningless**

In Emotivism a moral statement isn't literally a statement about the speaker's feelings on the topic, but expresses those feelings with emotive force.

When an emotivist says 'murder is wrong' it's like saying 'down with murder' or 'murder, yecch!' or just saying 'murder' while pulling a horrified face, or making a thumbs-down gesture at the same time as saying 'murder is wrong'.

At first sight this seems such a bizarre idea that you might wonder if anyone had ever seriously thought it. One of the great philosophers of the 20th century certainly did:

The presence of an ethical symbol in a proposition adds nothing to its factual content. Thus if I say to someone, 'You acted wrongly in stealing that money,' I am not stating anything more than if I had simply said, 'You stole that money.'

In adding that this action is wrong I am not making any further statement about it. I am simply evincing my moral disapproval of it. It is as if I had said, 'You stole that money,' in a peculiar tone of horror, or written it with the addition of some special exclamation marks.

The tone, or the exclamation marks, adds nothing to the literal meaning of the sentence. It merely serves to show that the expression of it is attended by certain feelings in the speaker.

**A J Ayer, Critique of Ethics and Theology**

The reasons why some philosophers thought this are technical - they thought that ethical statements could not be converted into statements that could be empirically tested, and thus failed the verifiability criterion of meaning - which meant that they were meaningless.

Emotivism pays close attention to the way in which people use language and acknowledges that a moral judgement expresses the attitude that a person takes on a particular issue. It's like shouting "hurray", or pulling a face and going "ugh".

That's why this theory is called Emotivism, because it's based on the emotive effect of moral language.

**Influence**

**Moral statements attempt to influence people**

Later theories of Emotivism taught that it was about more than just an expression of emotion - the speaker is also trying to have an effect on the person they're talking to.

The American philosopher C. L. Stevenson said that the major use of ethical judgements.....is not

to indicate facts, but to create an influence. Instead of merely describing people's interests, they change or intensify them.....For instance: When you tell a man that he oughtn't to steal, your object isn't merely to let him know that people disapprove of stealing. You are attempting, rather, to get him to disapprove of it. Your ethical judgment has a quasi- imperative force which, operating through suggestion, and intensified by your tone of voice, readily permits you to begin to influence, to modify, his interests...

### **Mind, 1937**

So when people disagree about an ethical issue, Emotivism makes it clear that each is trying to persuade the other to adopt their attitude and follow their recommendations as to how to behave, rather than giving information that might be true or false.

### **Emotivism versus Subjectivism**

This version of emotivism gets round one of subjectivism's biggest problems. Consider this example:

When one subjectivist says lying is bad, they're giving the information that they disapprove of lying. If another subjectivist says lying is good, they're giving the information that they approve of lying.

Since, according to the subjectivist view, both are reporting their own personal feelings, there isn't actually anything that they disagree about.

But since people do sincerely disagree about moral issues, there must be more going on than pure subjectivism allows, and this is included in Emotivism: When an Emotivist says lying is bad they're giving the instruction "don't tell lies", while an Emotivist who says lying is good is giving the instruction "do tell lies" - and we can see that there is a clear disagreement between them.

### **Bad points of Emotivism**

Emotivism has become unpopular with philosophers because the theory that led the Emotivists to think that moral statements were *meaningless* has fallen from favour.

Less technically, if expressing moral judgements is really no more than expressing one's personal opinion there doesn't seem any useful basis for arguing about moral judgements. In practical terms, Emotivism falls down because it isn't very satisfying. Even (most) philosophers think moral statements are more than just expressions of feeling.

And it's perfectly possible to imagine an ethical debate in which neither party has an emotion to express.

Non-philosophers also think there is more to ethics than just the expression of an attitude or an attempt to influence behaviour. They want a better explanation and foundation for shared standards of morality than Emotivism can provide.

### **Prescriptivism**

Prescriptivism is the attitude or belief that one variety of a language is superior to others and should be promoted as such. It is also known as linguistic prescriptivism and purism. An ardent promoter of prescriptivism is called a prescriptivist or, informally, a stickler. A key aspect of traditional grammar, prescriptivism is generally characterized by a concern for good, proper, or

correct usage. The term is the antonym (opposite) of descriptivism.

In a paper published in *Historical Linguistics 1995, Volume 2*, Sharon Millar—in an essay title, "Language prescription: a success in failure's clothing?"—defined prescriptivism as "the conscious attempt by language users to control or regulate the language use of others for the purpose of enforcing perceived norms or of promoting innovations." Common examples of prescriptive texts include many (though not all) style and usage guides, dictionaries, writing handbooks, and the like.

## Observations

"[Prescriptivism is the] policy of describing languages as we would like them to be, rather than as we find them. Typical examples of prescriptivist attitudes are the condemnation of preposition stranding and of the split infinitive and a demand for *It's I* in place of the normal *It's me*." – R.L. Trask.

"A prescriptive grammar is essentially a manual that focuses on constructions where usage is divided and lays down rules governing the socially correct use of language. These grammars were a formative influence on language attitudes in Europe and America during the 18th and 19th centuries. Their influence lives on in the handbooks of usage widely found today, such as *A Dictionary of Modern English Usage* (1926) by Henry Watson Fowler (1858-1933), though such books include recommendations about the use of pronunciation, spelling, and vocabulary as well as grammar." – David Crystal,

"I think sensible prescriptivism ought to be part of any education." – Noam Chomsky,

## Verbal Hygiene

"[T]he overt anti-prescriptive stance of linguists is in some respects not unlike the prescriptivism they criticize. The point is that *both* prescriptivism *and* anti-prescriptivism invoke certain norms and circulate particular notions about how language ought to work. Of course, the norms are different (and in the case of linguistics they are often covert). But both sets feed into the more general arguments that influence everyday ideas about language. On that level, 'description' and 'prescription' turn out to be aspects of a single (and normative) activity: a struggle to control language by defining its nature. My use of the term 'verbal hygiene' is intended to capture this idea, whereas to use the term 'prescriptivism' would just recycle the opposition I am trying to deconstruct." – Deborah Cameron

## Language Wars

"The history of prescriptions about English—of grammar texts, manuals of style and '*O tempora o mores*'-type laments—is in part a history of bogus rules, superstitions, half-baked logic, groaningly unhelpful lists, baffling abstract statements, false classifications, contemptuous insiderism, and educational malfeasance. But it is also a history of attempts to make sense of the world and its bazaar of competing ideas and interests. Instinctively, we find the arbitrariness of existence hard to accept. Our desire to impose order on the world, which means inventing the forms of language rather than discovering them, is a creative act. Furthermore, the quarrel between descriptivists and prescriptivists ... is a sort of mad confederacy: each party thrives on lambasting the other." – Henry Hitchings.

## The Problem With Prescriptivists

"[G]eneral ignorance of grammar allows prescriptivists to impose nonsensical mandates and allows test-makers and test-takers to focus primarily on a superficial error in language use."

## Descriptivism

Moral language and descriptive language share the same syntactic structure. "Sam is good" predicates a kind of goodness to Sam just as "Sam is four-legged" predicates having four legs to her. "Being good" as in "being good is being able to bear one's own scrutiny" and "having four legs" as in "having four legs is not required of being a dog" are both noun-like phrases. Again, to say, "If Sam is good, then she will be able to bear her own scrutiny," illustrates that moral predication could be embedded to form a compound sentence just as descriptive predication could. We use both parts of language with an equal ease. Almost all of us are proficient in using moral language. Most of us understand what others express with it; and, we are expected to have understood what moral language means. Few people would apply the term "morally permissible" to an apparent case of wanton cruelty. Furthermore, moral language is governed by the same fundamental rules of logic as descriptive language. For instance, one and the same action cannot be good and bad at the same time. (The philosophical rejection of moral facts remains popular, although this focal reliance on the logico-linguistic aspect of the moral practices is no longer fashionable.

From this, must we then infer that there are entities like "moral goodness" and "obligation" to which moral language refers in the world? Are the three characteristics of structural similarity between moral and descriptive languages, the equal ease with which we employ them, and the logical interplay between them good enough reasons for thinking that there are moral facts? Is it not possible that our ways of influencing others and ourselves are exactly where syntax and semantics of our language betray us and, consequently, that moral language suffers from a lack of referents analogous to terms such as "nothing," the "present king of France," do?

Either moral language describes (or, it is intended to describe accurately) the world or it does not. According to descriptivists, moral language describes the world. The descriptivist position has been thought as the mark of moral realism, while the non-descriptivist position as that of antirealism. This is captured as follows:

(C1) S is a moral realist if and only if S is a moral descriptivist.

So while one may hold that there are no moral facts, according to C1, one may not at the same time hold that moral language describes or is intended to describe the world. Again, one may not hold both that there are moral facts but that our languages about them do not describe the world. For if C1 were true, being a moral realist and being a descriptivist about moral language are logically equivalent. So any non-descriptivist realism and any descriptivist antirealism would show that C1 is false. The possibilities will be discussed shortly in §2 and §3. Descriptivism and, hence, the truth-aptness of moral language, is discussed in more detail in what follows. (Ignored for the moment is what Blackburn calls "quietism" according to which "at some particular point the debate is not a real one, and that we are only offered, for instance, metaphors and images from which we can profit as we please" 1984, 146. One may claim quietism to be present in pretty much any important and interesting philosophical dispute, like "primary versus secondary, fact versus value, description versus expression, or of any other significant kind" 1998, 157. Quietism about whether moral language describes the world, if true, would render the traditional realism/antirealism debate over descriptivism as a dispute over no difference where there is

nothing more than “the celebration of the seamless web of language” 1998, 157.)

Descriptivism in meta-ethics is a cognitivist view, according to which moral language describes (or, is intended to describe) the world. (Cf. Horgan and Timmons 2000, 124. This rough definition, according to them, falls under the dogma of the “[mistaken] semantic assumption: All genuinely cognitive content is descriptive content.” Conflating descriptivism with cognitivism is, according to them, “a largely unquestioned dogma.”) An inevitable corollary of descriptivism is that moral language is apt to truth evaluation; that is, statements express moral judgments that are either true or false. We may say alternatively that moral sentences express propositions without affecting the result of the discussion. As Nicholas Sturgeon puts it, “moral [sentences] typically express [statements] capable of truth and falsity” (1986, 116). Strictly speaking, then, descriptivism says little about, and remains neutral with respect to, the two views in moral epistemology: there are moral statements that are known to be true. Descriptivism does not tell us whether there is any moral statement known to be true. Nor does it tell us anything about the things by virtue of which moral statements are true when they are true. (Cf. Skorupski 1999. He thinks that descriptivism in conjunction without a substantial theory of truth is no descriptivism at all. There is just a terminological difference, and the descriptivism in conjunction with a substantial theory of truth will be discussed in section 2.)

The moral descriptivist believes that moral statements express moral judgments, and that they are either true or false. If every sentence that is capable of truth-value describes the world, then so does every moral statement. Moral language describes the world because every truth-apt sentence describes, or is intended to describe the world. The non-descriptivist denies that. The non-descriptivist believes that moral statements do not express moral judgments. Rather, the non-descriptivist believes that moral judgments are expressed by commands or prescriptions. Neither commands nor prescriptions are truth-apt, and as a result they typically are not meant to describe the world. Moral language does not describe the world, according to the non-descriptivist. That is, it represents our wishes, preferences, emotions, and so on, but it represents nothing over and above them. Figure 1 illustrates the disagreement between the descriptivist and the non-descriptivist. (Definite antirealist positions are marked with the dotted boxes in the figures that follow. An oval box will mark definite realist positions. See figure 5.)

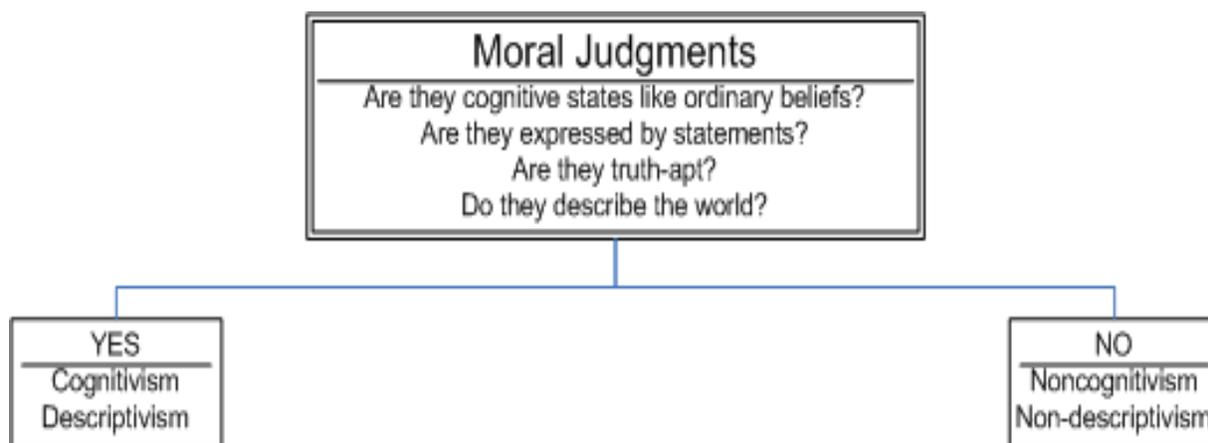

Figure 1

Non-descriptivists disagree about exactly what moral language accomplishes, while they are unanimous about what it does not. G. E. Moore’s open question argument supports emotivism, a

non-descriptivism contrary to his intention in the beginning of the 20th century. A. J. Ayer and C. L. Stevenson argue that moral judgments express feelings of approval or disapproval, or that making moral judgments is equivalent to emoting in reference to behaviors of others and ours. (See Ayer 1952 and Stevenson 1937, 1944, and 1963.) Stevenson says that, "Mr. G. E. Moore's familiar objection about the open question is chiefly pertinent in this regard. No matter what set of scientifically knowable properties a thing may have (says Moore, in effect), you will find, on careful introspection, that it is an open question to ask whether anything having these properties is good," (1937, 18). R. M. Hare's universal prescriptivism, according to which "'ought'-judgments are prescriptive like plain imperatives, but differ from them in being universalizable" (1991, 457) emphasizes that moral language facilitates ways of prescribing actions for all of us. The norm-expressivism of Allen Gibbard has renewed arguments for non-descriptivism recently. Rejecting emotivism, Gibbard, 1990, holds that moral judgments are concerned about rational-to-have or justified moral sentiments, not just about feelings or preferences one has. Apparently, he holds that some moral feelings can be called rational-to-have or justified. It is when "one's acceptance of norms that permit the feeling" (Darwall, Gibbard, and Railton: 1992, 150-51) is expressed, a feeling may be called rational-to-have. So while moral judgments (and moral language) are expressive of what we accept as norms, namely, a state of mind, they are not about describing the world, namely, non-descriptivism about moral judgment and language. Blackburn's projectivism seems difficult to classify one way or another especially when it is considered in conjunction with his quasi-realism (Blackburn: 1984, 1993, and 1998). Moral language according to the projectivist lets us spin our own story onto the world. Non-descriptivists agree, nonetheless, that moral language is the tool of choice when we are panting for help, recommending a course of actions, passing judgments on what others do, and so on, but it is never the tool for describing the world.

The views discussed above can be illustrated with an example. Consider the moral sentence, "Petal ought to avoid eating too much." The utterance of the sentence expresses the speaker's judgment about Petal and perhaps about her tendency to the excessive consumption of food. The cognitivist holds that the speaker's judgment is of the same kind as ordinary beliefs, that is the cognitivist holds that the speaker's moral judgment is a cognitive state. Beliefs are representations of how things are, namely, possible states of affairs; and, language typically expresses beliefs. According to the cognitivist, then, the moral sentence that expresses the moral judgment represents a possible state of affairs. We may say that the descriptivist maintains that the moral sentence describes what ought to be the case about Petal and her tendency toward food. Petal could be instantiating the property of the "oughtness" of avoiding the excessive consumption of food, although this is not the only cognitivist way of maintaining her descriptivism about moral language. Just as the morning star refers to Venus, the linguistic item "ought to avoid eating too much" may refer to a moral property. It might even be maintained that there obtains the referential relation between moral expressions and the things in the world that they are supposed to pick out. Non-cognitivists hold that the speaker's judgment in saying, "Petal ought to avoid eating too much," is not of the same kind as cognitive states. Some noncognitivists go further and deny that the moral sentence represents a possible state of affairs. That is, some noncognitivists are non-descriptivists as well. The non-descriptivists maintain that the surface structure of moral language—and the logical interplay it displays within our use of it—is not a good guide in understanding what moral language does for us (and what we intend to do with it). The word "nothing" picks out no object whatsoever, although it serves as a grammatical subject; the definite description the "present King of France" refers to no one, although its article "the" indicates a unique satisfier of the description, and so on. These are familiar cases (of our language betraying us ontologically). So, part of the non-descriptivist claim is that moral language ontologically

manipulates us just as “nothing” and the “present king of France” do. The merit of the view according to which there lurks a deeper structure (or meaning) to our moral language must be judged on how successful the non-descriptivist construal of the sentence about Petal is.

The non-descriptivist construal of “Petal ought to avoid eating too much” varies. Emotivism construes it as the way of emoting the speaker’s disapproval of Petal’s excessive consumption of food, or the way of informing Petal of her feeling. The expressivist construes it as the speaker’s way of expressing her preference with regard to Petal’s eating habit. The prescriptivist construes it as the way of commanding Petal to not eat excessively. The norm-expressivist construes it as the way of expressing the speaker’s non-acceptance of the norms that allow such a consumption of food. Perhaps the projectivist would construe the statement about Petal as a way of “objectifying” the speaker’s disapproval. However, all reject that there is a dyadic relationship of reference or correspondence, between the moral sentence and how the world is. The dyadic relation has all but been reduced to the monothetic relation of showing/manifesting the speaker’s psychological state. (The truth of this does not entail that people do not believe in moral principles. A. J. Ayer says that “[t]o say...that these moral judgments are merely expressive of certain feelings, feelings of approval or disapproval, is an over simplification” 1954, 238.) Figure 2 diagrams the non-descriptivist positions.

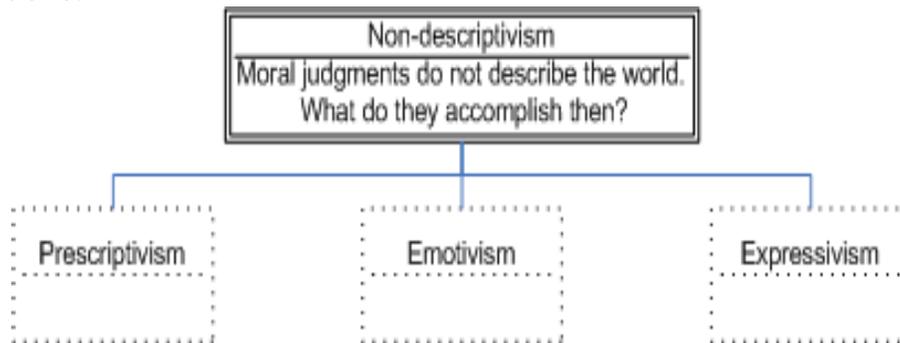

Figure 2

The contrast between descriptivism and non-descriptivism seems inapt for Gilbert Harman’s relativism because his relativism is a definite moral antirealist position. He rejects the objective status of moral facts. (See his 1977, 1986, and 2000; see also Harman and Thomson 1996 in which an interesting discussion of reasons both for and against moral objectivity is presented.) The relativist maintains that there are some ethical questions that can be correctly answered with “yes” for one, and “no” for another. Her claim implies nothing concerning for what moral language is meant. Error theorists maintain that moral judgments systematically err by positing moral facts. (For instance, Mackie says that “[t]he assertion that there are objective values or intrinsically prescriptive entities or features of some kind, which ordinary moral judgments presuppose is, I hold it not meaningless but false” 1977, 40.) That is, moral language aims to get the world right, but it always misses the mark. Mackie’s error theory in this respect occupies an important niche between the sides of the descriptivism divide and the sides of the moral realism divide. Figure 3 incorporates projectivism, relativism, and error theories, into figures 1 and 2.

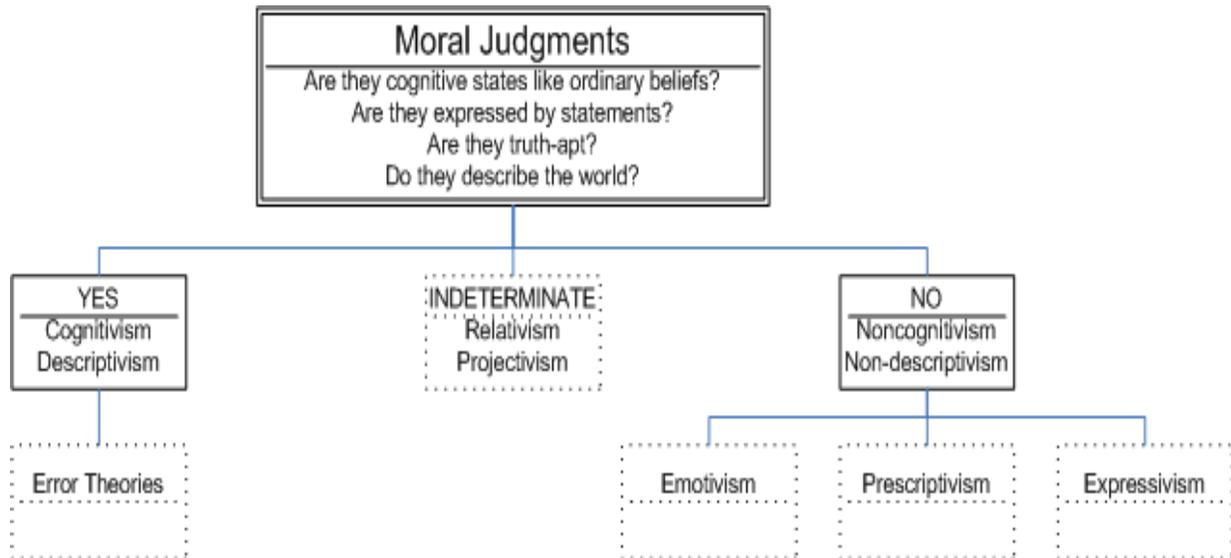

Figure 3

The ontological ramification of accepting descriptivism (or, cognitivism) is not inevitably moral realism. Figure 3 indicates that descriptivism is not sufficient for moral realism. Mackie’s error theory is discussed in §2 in establishing the insufficiency. Blackburn’s projectivism, and John Skorupski’s “irrealist cognitivism” will be very briefly discussed as well. Descriptivism is nonetheless necessary for moral realism. The necessity is argued in §3 when Bruce Waller’s “megaethical level” is considered and rejected. That is, a conjunct of C1 will be shown to be false while the other conjunct of C1 will be shown to be true, thereby making the conjunction C1 false; more specifically, it will be shown that “if S is a moral descriptivist, then S is a moral realist” is false and it will be shown that “S is a moral realist only if S is a moral descriptivist” is true.

# MCQs

1. Ethics is concerned precisely with the \_\_\_\_\_ to decide the right/wrong in human conduct.

- a) will
- b) norms
- c) imagination
- d) laws

Answer: b

2. The \_\_\_\_\_ word 'mores' is the root of the word 'morality'.

- a) Greek
- b) English
- c) French
- d) Latin

Answer: d

3. The term 'ethics' is derived from a/an \_\_\_\_\_ word.

- a) Latin
- b) Greek
- c) Spanish
- d) English

Answer: b

4. Summum Bonum refers to the \_\_\_\_\_ good.

- a) personal
- b) social
- c) supreme
- d) lower

Answer: c

5. \_\_\_\_\_ is not a positive science.

- a) Ethics
- b) Sociology
- c) Physics
- d) Biology

Answer: a

6. Ethics as a normative science deals with the \_\_\_\_\_ of human conduct.

- a) ideas
- b) standards
- c) betterment
- d) None of these

Answer: b

7. A desire that continues to be effective can be termed a \_\_\_\_\_.

- a) will
- b) motive
- c) wish
- d) intention

Answer: c

8. Human desire is \_\_\_\_\_ animal appetite.

- a) different from
- b) similar to
- c) the same as
- d) not distinguishable from

Answer: a

9. A human being may be hungry and yet not \_\_\_ food.

- a) take
- b) provide
- c) like
- d) desire

Answer: d

10. \_\_\_ is a formed habit.

- a) Custom
- b) Desire
- c) Wish
- d) Character

Answer: d

11. The force of will leads to \_\_\_\_\_.

- a) action
- b) inaction
- c) result
- d) wish

Answer: a

12. \_\_\_ may be outer or inner.

- a) Desire
- b) Wish
- c) Intention
- d) All these

Answer: c

13. \_\_\_ induces us to act in a certain way.

- a) Wish
- b) Motive
- c) Will
- d) Desire

Answer: b

14. The motive of an action is a part of the\_\_\_\_\_.

- a) intention
- b) will
- c) wish
- d) none of these

Answer: a

15. \_is a representative ofhedonist ethics.

- a) Bentham
- b) J. S. Mill
- c) Both (a) and (b)
- d) Neither (a) nor (b) 2

Answer: c

16. 'Character' refers to the completesystem constituted by the acts of \_\_\_of a particular kind.

- a) wish
- b) desire
- c) intention
- d) will

Answer: d

17. \_exactly corresponds tocharacter.

- a) Wish
- b) conduct
- c) Will
- d) Desire

Answer: b

18. If human actions are completely determined by\_\_\_\_, it is not free will.

- a) reason
- b) moral imperative
- c) circumstances
- d) All these

Answer: c

19. Find out the items in the List B thatmatch those in the List A.

List A

- 1. Hedonism
- 2. Freewill
- 3. Wish
- 4. Evolutionary morality

List B

- 1.A selected desire
- 2. Herbert Spencer
- 3Pleasure as moral standard
- 4. Higher humanfaculty

- a) 3, 4, 1, 2
- b) 2, 3, 1, 4
- c) 1, 4, 3, 2
- d) 3, 4, 2, 1

Answer: a

20. Pleasure/pain is the norm of moralevaluation in\_\_\_\_.

- a) Intuitionism
- b) Virtue ethics
- c) Hedonism
- d) All these

Answer: c

21. "Men always do seek pleasure". Thisposition is called\_\_\_\_hedonism.

- a) psychological
- b) ethical
- c) egoistic
- d) universalistic

Answer: a

22. Universalistic hedonism is also called \_\_\_\_\_.

- a) ethical
- b) psychological

- d) altruism

Answer: c

23. It is wrong to break a promise becauseas a moral law it cannot be universalized. This illustrates the ethical position of \_\_\_\_\_.

- a) Kant
- b) J. S. Mill
- c) Bentham
- d) Spencer

Answer: a

24. Ethical hedonism is the view that humanbeings\_\_\_\_seek pleasure.

- a) always do
- b) ought to
- c) shall not
- d) ought not

Answer: b

25. \_hedonism refers to thepleasure of each individual.

- a) Egoistic
- b) Psychological
- c) Universalistic
- d) none of these

Answer: a

26. \_hedonism refers to thepleasure of all human beings.

- a) psychological
- b) egoistic
- c) ethical
- d) universalistic

Answer: d

27. The ethics of \_\_\_\_\_ is precisely termed utilitarianism.

- a) Kant
- b) Spencer
- c) J. S. Mill
- d) T. H. Green

Answer: c

28. All conduct either promotes or hinders the organism's adaptation to the environment. This implies the \_\_\_\_\_ theory of morality.

- a) hedonist
- b) evolutionary
- c) intuitionist
- d) none of these

Answer: b

29. Adjustment of internal relations to external relations is the basic postulate of the ethical theory of \_\_\_\_\_.

- a) Bentham
- b) J. S. Mill
- c) Kant
- d) Herbert Spencer

Answer: d

30. According to \_\_\_\_\_, moral life makes the inherent rational/spiritual principle more and more explicit.

- a) J. S. Mill
- b) T. H. Green
- c) Herbert Spencer
- d) Bentham

Answer: b

31. According to Kant, moral imperative is \_\_\_\_\_.

- a) evolutionary
- b) hypothetical
- c) categorical
- d) all these

Answer: c

32. According to \_\_\_\_\_, conscience is

- a) Butler
- b) Bentham
- c) J. S. Mill
- d) Spencer

Answer: a

33. Kant accepted \_\_\_\_\_ as the final authority in moral life.

- a) pleasure
  - b) reason
  - c) freedom
  - d) pain
- Answer: b

34. Find out the items in the List B that match those in the List A.

- | List A            | List B        |
|-------------------|---------------|
| 1. Utilitarianism | 1. Spencer    |
| 2. Evolutionism   | 2. Education  |
| 3. Intuitionism   | 3. Hedonism   |
| 4. Human rights   | 4. Conscience |

- a) 2, 3, 1, 4
  - b) 3, 1, 4, 2
  - c) 4, 3, 1, 2
  - d) 3, 1, 2, 4
- Answer: b

35. Both Bentham and Mill share the the supreme authority in human nature. \_\_\_Principle of morality.

- a) pleasure
  - b) evolutionist
  - c) both (a) and (b)
  - d) neither (a) nor (b)
- Answer: a

36. \_is the author of Methods of Ethics.

- a) Kant
  - b) T. H. Green
  - c) Butler
  - d) Sidgwick
- Answer: d

37. According to hedonists, pleasure is the only thing that is\_\_.

- a) possible
  - b) avoidable
  - c) visible
  - d) desirable
- Answer: d

38. Desire and \_\_\_\_\_are frequently used as synonymous.

- a) pleasure
  - b) intention
  - c) wish
  - d) will
- Answer: c

39. Find out the mismatching pair.

- a) Kant/hedonism
- b) Ethics/normative science
- c) Intuitionism/conscience
- d) Evolutionism/adaptation

Answer: a

40. According to \_\_\_\_\_, conscience is superior to self-love.

- a) Bentham
- b) J. S. Mill
- c) Butler
- d) Spencer

Answer: c

41. Actions are right/wrong according to their intrinsic nature. This is the position of \_\_\_\_\_.

- a) Intuitionists
- b) Hedonists
- c) Utilitarians
- d) None of these

Answer: a

42. According to Kant, an action is good/bad \_\_\_\_\_.

- a) with reference to some external standard
- b) according to the pleasure/pain it produces
- c) in itself
- d) extrinsically

Answer: c

43. 'The moral principle that guides your action should become a universal law'. This is the view of \_\_\_\_\_.

- a) J. S. Mill
- b) Bentham
- c) both (a) and (b)
- d) neither (a) nor (b)

Answer: d

44. The ethical theory of \_\_\_\_\_ shows a close affinity with Darwin's theory of evolution.

- a) J. S. Mill
- b) Herbert Spencer
- c) Immanuel Kant
- d) None of these

Answer: b

- a) pleasure
- b) reason
- c) pain
- d) law

Answer: a

48. According to J. S. Mill, some pleasures are more desirable on account of \_\_\_\_\_.

- a) quantity
- b) quality
- c) appetite
- d) beauty

Answer: b

49. Sidgwick tried a synthesis between \_\_\_\_\_, J. S. Mill and Kant.

- a) Bentham
- b) Spencer
- c) Butler
- d) None of these

Answer: c

50. The author of The Data of Ethics is \_\_\_\_\_.

- a) Kant
- b) Spencer
- c) Bentham
- d) J. S. Mill

Answer: b

51. Perfection or self-realization is the \_\_\_\_\_ of moral evolution.

- a) beginning
- b) content
- c) law
- d) ideal

Answer: d

52. The view that moral development is directed towards a specific goal is \_\_\_\_\_.

- a) universalistic
- b) teleological
- c) legal

d) all these

Answer: b

53. \_is the author of Prolegomena to Ethics.

a) Bentham

b) Aristotle

c) T. H. Green

d) J. S. Mill

Answer: c

54. A\_\_\_action 'tends to bring about what is good'.

a) bad

b) right

c) wrong

d) legal

Answer: b

55. \_argued that if conscience had strength and authority, "it would absolutely govern the world".

a) T. H. Green

b) J. S. Mill

c) Butler

d) Immanuel Kant

Answer: c

56. Avoiding injury either to oneself or to another's physical well-being implies the Respect for\_\_\_.

a) Life

b) Character

c) Freedom

d) Property

Answer: a

57. Respect for life corresponds to the right to\_\_\_.

a) Property

- d) none of these

Answer: a

66. Retributive theory of punishment involves\_\_\_\_\_.

- a) education

- b) reformation
- c) revenge
- d) conversion

Answer: c

67. Capital punishment cannot be justified according to \_\_\_\_\_ theory of punishment.

- a) Retributive
- b) Reformative
- c) both (a) and (b)
- d) neither (a) nor (b)

Answer: b

68. The right to \_\_\_\_\_ is recently included in the fundamental rights in India.

- a) life
- b) freedom
- c) education
- d) property

Answer: c

69. \_\_\_\_\_ is not a proponent of hedonism.

- a) Kant
- b) T. H. Green
- c) both (a) and (b)
- d) neither (a) nor (b)

Answer: c

70. Social Darwinism refers to the position of \_\_\_\_\_.

- a) Kant
- b) J. S. Mill
- c) Bentham
- d) Spencer

Answer: d

71. Those phenomena of conduct in these highest creatures, with which Morality is concerned, also conform to the laws of evolution. \_\_\_\_\_ said this.

- a) Herbert Spencer
- b) Charles Darwin
- c) Bentham
- d) T. H. Green

Answer: a

72. Find out the matching pairs.

1. Bentham/hedonism
2. Reformative view of punishment/the penalty of death
3. T. H. Green/utilitarianism
4. Kant/Critique of Practical reason

- a) Only 4

- b) 1 and 4
- c) 2 and 3
- d) Only 1

Answer: b

73. According to Sidgwick, 'nothing is desirable in itself except\_\_\_\_\_.

- a) pain
- b) pleasure
- c) both (a) and (b)
- d) neither (a) nor (b)

Answer: b

74. Rights and duties are the \_\_\_\_\_ constituents of the citizen's life.

- a) opposite
- b) contradictory
- c) invalid
- d) complementary

Answer: d

75. Right to \_\_\_\_\_ is the most fundamental right.

- a) property
- b) freedom
- c) education
- d) life

Answer: d

76. \_theory of punishment is more humanitarian.

- a) Retributive
- b) Reformative
- c) both (a) and (b)
- d) neither (a) nor (b)

Answer: b

77. Ethics deals with the " \_\_\_\_\_ of human beings living in societies."

- a) conduct
- b) duties
- c) rights
- d) desires

Answer: a

78. Who among the following has identified three types of Justice – Distributive, Retributive, Commutative?

- a) Plato
- b) Aristotle
- c) Hobbes
- d) Locke

Answer: (b)

79. 'Men are not hanged for stealing horse so that horse may not be stolen by others' can be attributed to:

- a) Retributive theory of punishment
- b) Reformatory theory of punishment
- c) Theory of capital punishment
- d) Deterrent theory of punishment

Answer: (d)

80. 'Either freedom of will is a fact or moral judgement a delusion' is a statement of:

- a) Hobbes
- b) Martinie
- c) Kant
- d) Hegel

Answer: (b)

81. Which one of the following statements appropriately represents the position of Nietzsche?

- (a) He equates the will to truth with the will to power.
- (b) The distinction between good and evil is based on the will to power.
- (c) The distinction between good and evil is rooted in objectivity.
- (d) All life and all happiness are governed by the will to power.

Code:

- a) Only (a) and (b) are true
- b) Only (c) and (d) are true
- c) Only (a), (b) and (d) are true
- d) Only (b) and (d) are true

Answer: (c)

82. According to Kant, Moral Laws are:

- a) Apriori based on reason
- b) Apriori not based on reason
- c) Aposteriori not based on reason
- d) Aposteriori based on reason

Answer: (a)

83. 'The goodness of an action is determined by its consequence' is the theory attributed to:

- a) Descriptive
- b) Deontological
- c) Prescriptive
- d) Teleological

Answer: (d)

84. Which among the following is the distinctive feature of ethical judgements, according to Stevenson?

- a) Statement of Command
- b) Approval of the Consequence of an act
- c) Statement of Fact
- d) Disagreement in Attitude

Answer: (d)

85. It has been pointed out that Mill's arguments for Utilitarianism Suffer from the fallacy of:

- a) Illicit major
- b) Illicit Minor

- d) Figure of Speech

Answer: (d)

86. 'Either freedom of will is a fact or moral judgement a delusion' is a statement of:

- a) Hobbes
- b) Martinie
- c) Kant
- d) Hegel

Answer: (b)

87. 'Treating equals equally and unequals unequally' is the view of:

- a) Socrates
- b) Bentham
- c) Aristotle
- d) Mill

Answer: (3)

88. Who among the following has said that "Personality and property go together"?

- a) Kant
- b) Hegel
- c) Ross
- d) Rawls

Answer: (2)

89. Consider the following statements with regard to Bentham and choose the correct code:  
Statements:

1. Bentham dismissed ethics of asceticism as an inverted hedonism.
2. Bentham is an ethical hedonist by virtue of his employment of the pleasure principle as the standard for conduct.
3. Intuitionist ethics was criticized by Bentham for it provides no more than a subjective feeling.

Codes:

- a) Only 1 and 3 are true.
- b) Only 1 and 2 are true
- c) 1, 2 and 3 are true.
- d) Only 2 is true.

Answer: (C)

90. Which of the Philosophers noted below stated? "Utility means the property of any object, whereby it tends to produce benefit, advantage, pleasure, good or happiness or to prevent the happening of mischief, pain, evil, unhappiness to the party whose interest is considered."?

- a) James Mill

- b) J.S. Mill
- c) Hume
- d) Jeremy Bentham

Answer: (D)

91. Which of the philosophers noted below propounded ethical gradation of the springs of action?

- a) Cadworth
- b) Sidgewick
- c) Butler
- d) Martineau

Answer: (D)

92. 'Free-will' in ethics means

- a) The individual is free to do anything
- b) The individual is not free to do anything
- c) The individual is free to act keeping in view of some norms
- d) None of the above

Answer: (C)

93. Who highlighted the problem of personal identity first in modern western philosophy?

- a) Strawson
- b) Locke
- c) Kripke
- d) Descartes

Answer: (B)

94. The four moral sanctions by Bentham are

- a) Natural, Cultural, Political, Social
- b) Natural, Political, Social, Religious
- c) Natural, Economical, Political, Religious
- d) Natural, Economical, Cultural, Religious

Answer: (B)

95. Aristotle identified good as

- a) Happiness
- b) Perfection
- c) Utility
- d) Self-respect

Answer: (A)

96. Consider the statements of J.S. Mill given below and mark the correct code:

1. J.S. Mill's theory is Altruistic hedonism and qualitative utilitarianism.
2. Mill uses pleasure and happiness synonymously.

Answer: (A)

102. "What kind of world we perceive and experience depends upon what kind of beings we are." This is the conclusion of

a) Kant

b) Descartes

c) Aristotle

d) Spinoza

Answer: (A)

103. Truth of reason is justified by

- a) Law of contradiction and principles of sufficient reason
- b) Principles of sufficient reason alone
- c) Law of contradiction alone
- d) Laws of intuitive imagination

Answer: (C)

104. Within a scientific system of propositions

- a) All propositions can be proved and all terms can be defined.
- b) Not all propositions can be proved but all terms can be defined.
- c) All propositions can be proved but not all terms can be defined.
- d) Not all propositions can be proved and not all terms can be defined.

Answer: (D)

105. Human Right presupposed

- a) Dignity of human being
- b) Proper living condition of a human being in a particular setup
- c) Rights of human being in a particular society
- d) Universal Rights of human being in a particular society

Answer: (A)

106. Which one of the options of the followings correctly matches with moral obligation?

- a) Physical compulsion
- b) Self-imposition
- c) External authority
- d) None of these

Answer: (B)

107. According to Kant, moral duty is

- a) A command of God
- b) Given by one's intuition
- c) The imperative of pure reason
- d) Determined by morality

Answer: (C)

108. "We have no right to commit suicide because our life is a joint property of our own and others."

This sentence falls under the domain of

- a) Our duty towards our society
- b) Our duty towards our family
- c) Our duty towards ourselves
- d) Our duty towards all of these

Answer: (D)

109. Which one of the following statements is an incorrect statement?

- a) J.S. Mill does not offer a reasonable explanation of moral obligation.
- b) Sidgwick is a hedonist in his view of the highest good.

- c) Moral judgement depends upon moral sentiments.  
d) According to Aesthetic-Sense- Theory, Beauty is the Ultimate Standard of morality.  
Answer: (C)

110. Emotivism upholds that ethical statements do not express

- a) Truths or falsehoods

Answer: b

224. Kantianism requires us to ask, "Is this action right or wrong, morally speaking, regardless of the consequences?"

a) True  
b) False  
Answer: a

225. According to \_\_\_\_\_ theory there are no universal moral principles Options:

a) Ethical Relativism  
b) Ethical Realism  
c) Ethical Intuitionism  
d) All of these ...  
Answer: A

226. According to \_\_\_\_\_ ethical theory, moral values are intrinsic or an end in-itself

a) Ethical Objectivism  
b) Ethical Realism  
c) Ethical Intuitionism  
d) All of these  
Answer: A

227. \_\_\_\_\_ is also known as Moral Platonism Options:

a) Ethical Relativism  
b) Ethical Realism  
c) Ethical Intuitionism  
d) Plato's ethical theory  
Answer :B

228. \_\_\_\_\_ ethical theory is also known as "God based ethics"

- a) Ethical Supernaturalism
- b) Ethical Naturalism
- c) Ethical Supra-naturalism
- d) None of these

Answer: A

229. Moral Intuitionism is a form of

- a) Cognitivism
- b) Non-cognitivism
- c) Realism
- d) Supernaturalism

Answer: A

230. According to Kant, laws of nature are laws according to which \_\_\_\_, and laws of freedom are laws according to which \_\_\_\_.

- a) everything will happen; everything will happen
- b) everything will happen; everything ought to happen
- c) everything ought to happen; everything will happen
- d) everything ought to happen; everything ought to happen

Answer: b

231. According to Kant, moral laws are:

- a) necessary and apply to all rational beings.
- b) contingent and apply only to human beings.
- c) culturally relative.
- d) grounded in God's commands.

Answer: a

232. According to Kant, the moral worth of an action depends on:

- a) the moral character of the agent who performs it.
- b) the consequences of the action.
- c) the maxim that is acted on.
- d) all of the above.

Answer: c

233. Kant claims that the natural purpose of reason is to:

- a) produce happiness.
- b) produce pleasure.
- c) produce knowledge.
- d) produce a good will.

Answer: d

234. According to Kant, morality requires us to:

- a) perform the action that leads to the greatest total happiness.
- b) act only on maxims that we can will to become universal laws.
- c) behave only in such a way as a perfectly virtuous person would behave.

d) place the interests of others above the interests of ourselves.

Answer: b

235. According to Kant, the supreme principle of morality is:

a) analytic and a priori.

b) analytic and a posteriori.

c) synthetic and a priori.

d) synthetic and a posteriori.

Answer: c

236. Kant claims that the moral law is given to each person by:

a) society.

b) one's own will.

c) God.

d) Nature.

Answer: b

237. According to Kant, the basis of morality is the concept of:

a) charity.

b) fairness.

c) piety.

d) freedom.

Answer: d

238. According to Kant, laws of nature are laws according to which \_\_\_\_, and laws of freedom are laws according to which \_\_\_\_.

a) everything will happen; everything will happen

b) everything will happen; everything ought to happen

c) everything ought to happen; everything will happen

d) everything ought to happen; everything ought to happen

Answer: b

239. Kant claims respect is

a) a feeling

b) a desire.

c) an inclination.

d) all of the above.

Answer: a

240. According to Kant, moral laws are

a) necessary and apply to all rational beings.

b) contingent and apply only to human beings.

c) culturally relative.

d) grounded in God's commands.

Answer: a

241. Kant claims that an action is morally good only if

a) it conforms to the moral law.

- b) it is done for the sake of the moral law.
- c) both a and b.
- d) neither a nor b.

Answer: c

242. According to Kant, perfect duties

- a) prescribe policies.
- b) prescribe goals.
- c) admit of no exceptions.
- d) admit of some exceptions.

Answer: c

243. According to Kant, the only thing that is good without qualification is

- a) pleasure.
- b) character.
- c) wisdom.
- d) a good will.

Answer: d

244. Kant claims that acting (as opposed to having an involuntary spasm) presupposes that one acts

- a) for a reason.
- b) on a desire.
- c) to promote the good.
- d) in accordance with God's will.

Answer: a

245. In Kant's terminology, a maxim is

- a) a principle on which one acts.
- b) a moral duty.
- c) an action that brings about more good than any other available action.
- d) a bit of folk wisdom.

Answer: a

246. According to Kant, morality requires us to

- a) perform the action that leads to the greatest total happiness.
- b) act only on maxims that we can will to become universal laws.
- c) behave only in such a way as a perfectly virtuous person would behave.
- d) place the interests of others above the interests of ourselves.

Answer: b

247. Kant claims that the dictates of morality are

- a) contractarian imperatives.
- b) hypothetical imperatives.
- c) categorical imperatives.
- d) consequentialist imperatives.

Answer: c

248. According to Kant, the supreme principle of morality is

- a) analytic and a priori.
- b) analytic and a posteriori.
- c) synthetic and a priori.
- d) synthetic and a posteriori.

Answer: c

249. According to the humanity formulation of the categorical imperative, we should always act

- a) so as to treat humanity as an end in itself.
- b) so as to treat humanity as a means.
- c) so as to maximize the well-being of humanity.
- d) so as to put the interests of humanity before our own interests.

Answer: a

250. Kant claims that the moral law is given to each person by

- a) society.
- b) one's own will.
- c) God.
- d) nature.

Answer: b

251. Kant refers to a will that is determined by things outside of itself as

- a) compelled.
- b) heteronomous.
- c) contradictory.
- d) debased.

Answer: b

252. According to Kant, the basis of morality is the concept of

- a) charity.
- b) fairness.
- c) piety.
- d) freedom.

Answer: d

253. Mill defines "utility" as:

- a) usefulness for some craft.
- b) usefulness to society.
- c) pleasure and the absence of pain.
- d) it promotes the interests of all and does not harm anyone.

Answer: c

254. When faced with the complaint that utilitarianism is a doctrine worthy of swine, Mill responds that pleasures differ in:

- a) purity.
- b) quality.
- c) species.
- d) weight.

Answer: b

255. Mill claims that a happy life is one of:

- a) tranquility.
- b) excitement.
- c) both a and b.
- d) neither a nor b.

Answer: c

256. Mill claims that in deciding how to act:

- a) we should always calculate the expected consequences of our action.
- b) we should depend on rules of thumb derived from the principle of utility.
- c) we should consult tradition.
- d) we should consult scripture.

Answer: b

257. Mill claims that the principle of utility:

- a) can be proven from self-evident principles.
- b) can be proven from principles that are known empirically.
- c) cannot be proven, and this is a unique problem for the theory.
- d) cannot be proven, but this is common to all first principles.

Answer: d

258. Mill argues that virtue:

- a. is not desirable.
- b. is desirable only as a means to one's own happiness.
- c. is desirable only as a means to the happiness of others.
- d. is desirable as part of one's happiness.

Answer: d

259. Mill claims that one of the strongest objections to utilitarianism is drawn from the idea of:

- a) duty.
- b) justice.
- c) virtue.
- d) supererogation.

Answer: b

260. Mill claims that the distinction between justice and other moral obligations corresponds perfectly to the distinction between:

- a) perfect and imperfect obligations.
- b) positive and negative duties.
- c) strong and weak duties.
- d) absolute and relative obligations.

Answer: a

261. Bentham claims that nature has placed mankind under two sovereign masters:

- a) pain and pleasure.
- b) good and evil.

- c) God and the devil.
- d) duty and self-interest.

Answer: a

262. According to Bentham, the principle of utility is appropriately applied to:

- a) individuals.
- b) governments.
- c) both a and b.
- d) neither a nor b.

Answer: c

263. According to Bentham, considerations of pain and pleasure determine:

- a) what we ought to do.
- b) what we will do.
- c) both a and b.
- d) neither a nor b.

Answer: c

264. Concerning the relationship between morality and theology, Bentham claims that:

- a) we must first know whether something is right before we can know whether it conforms to God's will.
- b) we must first know whether something conforms to God's will before we can know that it is right.
- c) God exists, but does not concern himself with matters of morality.
- d) God does not exist.

Answer: a

265. According to Bentham, a moral sanction is:

- a) pleasure or pain inflicted by chance members of the community.
- b) pleasure or pain inflicted by a judge in accordance with a rule.
- c) pleasure or pain that it is permissible to inflict on someone.
- d) none of the above.

Answer: a

266. Bentham defines the fecundity of a pleasure or pain as:

- a) its chance of occurring.
- b) the degree to which it is felt.
- c) its chance of being followed by sensations of the same kind.
- d) how long it lasts.

Answer: c

267. Bentham claims that actions are right or wrong in virtue of:

- a) the motives behind them.
- b) their consequences.
- c) both a and b.
- d) neither a nor b.

Answer: c

268. Bentham claims that utilitarian calculations:

- a) should be performed prior to each action.
- b) need not be performed before each action, but should always be kept in mind.
- c) are merely a formal device, and do not have practical application.
- d) are fundamentally flawed.

Answer: b

269. Which of the following is not a requirement on the definition of "legal punishment"?

- a) It must be for an offense against legal rules.
- b) It must involve unpleasant consequences.
- c) It must not necessarily be of an actual or supposed offender.
- d) It must be intentionally administered by human beings other than the offender.

Answer: c

270. According to consequentialist theories of punishment, a lawbreaker should be punished only if:

- a) the punishment would likely produce as much overall intrinsic value as would any other alternative punishment
- b) the punishment is consistent with treating the person as an end in himself
- c) the punishment is proportional to the wrongness of the crime
- d) all of the above

Answer: a

271. According to Nathanson, criminals who commit murder forfeit their right to:

- a) life
- b) respect
- c) privacy
- d) humane treatment

Answer: c

272. One message that Nathanson argues we can send by abolishing the death penalty is that:

- a) we respect the dignity of human life
- b) there are some penalties worse than death
- c) there is no punishment that is proportional to murder
- d) none of the above

Answer: a

273. van den Haag thinks that we can't know whether or not a murderer who receives the death penalty:

- a) is justly punished
- b) suffers more than the victim
- c) is morally degraded
- d) is punished excessively

Answer: b

274. Reiman suggests that the refusal to execute criminals teaches:

- a) the wrongfulness of murder
- b) that the death penalty is a better deterrent than life imprisonment
- c) that criminals already face the risk of death
- d) that criminals are usually undeterred by the chance of receiving the death penalty

Answer: a

275. Which of the following is not one of the potentially negative consequences of imposing the death penalty?

- a) the prevention of future murders
- b) great financial cost
- c) the incitement effect
- d) the execution of innocent persons

Answer: a

276. The consequentialist approach to punishment is at odds with:

- a) retributive theories of punishment
  - b) perfectionist theories of punishment
  - c) legal theories of punishment
  - d) preventive theories of punishment
- In response to the argument that the death penalty does not deter murderers,

Answer: a

277. van den Haag claims that:

- a) he is still confident that the threat of the death penalty at least sometimes prevents murder
- b) criminal law is supposed to protect the innocent over murderers
- c) the severity and finality of the death penalty is appropriate to the seriousness and finality of murder
- d) all of the above

Answer: d

278. Nathanson proposes a form of retributivism that requires all of the following except:

- a) a list of crimes ranked according to their seriousness
- b) a scale of punishments that correspond to the seriousness of certain crimes
- c) treating criminals humanely
- d) the death penalty for the most serious crimes

Answer: d

279. One of the messages Nathanson believes we can send by abolishing the death penalty is that:

- a) criminals deserve inhumane treatment
- b) killing in self-defense is never morally justified
- c) we should have respect for the dignity of human beings
- d) murderers should be killed by the state

Answer: c

280. van den Haag responds to the "miscarriages of justice" objection by claiming that:

- a) miscarriages of justice are offset by the moral benefits and usefulness of doing justice
- b) there have been no miscarriages of justice, in the sense used in the objection
- c) miscarriages of justice are inevitable and so irrelevant
- d) none of the above

Answer: a

281. Reiman could be described as:

- a) a consequentialist
- b) a believer in the principle of equality
- c) an abolitionist
- d) a retentionist

Answer: c

282. Which of the following is a common type of error that occurs in capital cases?

- a) suppression of evidence by the defendant
- b) incompetent counsel for the defense
- c) incompetent judges
- d) suppression of evidence by the defense attorney

Answer: b

283. Which of the following is a likely implication of the central findings about the error rates in capital cases?

- a) The costs of reviewing capital cases will increase.
- b) The public's faith and confidence in the courts will decline.
- c) Criminals convicted of a capital offense will remain on death row for 10 years.
- d) The public's support for the death penalty will increase.

Answer: b

284. Which one of the following upholds the view that, 'ought', 'right', 'good' and the like have meaning only when defined in terms of pleasure?

- a) J.S. Mill
- b) C.S. Pierce
- c) Aristotle
- d) Bentham

Answer: (D)

285. Kant's Conception of the 'Kingdom of Ends' approximates to the Gita's Conception of \_\_\_\_\_.

- a) Asceticism
- b) Solidarity of humanity
- c) Humanism
- d) Atheism

Answer: (B)

286. Ontological Dualism is a theory which holds \_

- a) Mind and body are different entities acting together.
- b) Mind and matter are independent of each other.
- c) There are two ultimate realities which act together in a coherent manner.
- d) There are two ultimate realities independent of each other.

**Answer: (D)**

287. "What kind of world we perceive and experience depends upon what kind of beings we are."

This is the conclusion of

- a) Kant
- b) Descartes
- c) Aristotle

- a) Rigorism
  - b) Emotivism
  - c) Intuitionism
  - d) Utilitarianism
- i. Moore
  - ii. Kant
  - iii. Butler
  - iv. Ayer
- Codes:  
a b c d

- a) i ii iii iv
- b) ii iv i iii
- c) ii iv iii i
- d) i iv iii ii

**Answer: (C)**

295. Match List – I with List – II and mark correct answer from given code:

- |                              |                           |
|------------------------------|---------------------------|
| List – I                     | List – II                 |
| a. Self is Real              | i. Justice                |
| b. Respect for World Harmony | ii. Postulate of Morality |
| c. Cardinal Virtue           | iii. Duty                 |
| d. Retributive Theory        | iv. Punishment            |

Codes:

a b c d

- a) ii iv i iii
- b) iii ii iv i
- c) i iii ii iv
- d) ii iii i iv

**Answer: (D)**

296. Emotivism upholds that ethical statements do not express

- a) Truths or falsehoods
- b) Ontological states
- c) Rational states
- d) Effective states

**Answer: (A)**

297. 'Naturalistic fallacy' is

- a) The outcome of naturalism
- b) The outcome of naturalized epistemology
- c) The outcome of natural theology
- d) The outcome of identifying an ethical concept with natural concept

**Answer: (D)**

298. Nominalism is a theory which says

- a) That universals are not real but are only names or words.
- b) The universals are not names.
- c) That universals are established on reason.
- d) That universals are concepts.

**Answer: (A)**

299. Which one of the following is not a statement of value?

- a) Honesty is the best policy.
- b) We believe honesty to be the best policy.
- c) Never indulge in dishonesty.
- d) let us all be honest.

**Answer:** (B)

300. Which one of the following is not a synthetic a priori judgement, according to Kant?

- a) All bodies have weight.
- b) All bodies have specific gravity.
- c)  $9 + 7 = 16$
- d) Every change has a cause.

**Answer:** (Wrong question)

301. In Kantian ethics 'an objective principle of action' is called

- a) A maxim
- b) A rule
- c) A practical law
- d) An imperative

**Answer:** (A)

302. According to Kant, moral duty is

- a) The command of God
- b) Imperative of pure reason
- c) Determined by majority
- d) Given by one's intuition

**Answer:** (B)

303. Which one of the following upholds that, "society must not exist for society's sake" but for "a type of being who is able to raise himself to its higher task and to a higher state of being"?

- a) Hegel
- b) Nietzsche
- c) Sri Aurobindo
- d) Marx

**Answer:** (B)

304. Match List – I with List – II and select the correct answer from the codes given below:

List – I

- a. Subjective Idealism
- b. Commonsense Realism
- c. Absolute Idealism
- d. Critical Idealism

a b c d

List – II

- i. Kant
- ii. Thomas Reid
- iii. Hegel
- iv. Berkeley

Codes:

- a) iv iii ii i
- b) i ii iii iv
- c) iv ii iii i
- d) iii ii iv i

**Answer: (C)**

305. Which of the Philosophers noted below stated? "Utility means the property of any object, whereby it tends to produce benefit, advantage, pleasure, good or happiness or to prevent the happening of mischief, pain, evil, unhappiness to the party whose interest is considered."?

- a) James Mill
- b) J.S. Mill
- c) Hume
- d) Jeremy Bentham

**Answer: (D)**

306. Consider the following statements with regard to Bentham and choose the correct code:  
Statements:

- 1. Bentham dismissed ethics of asceticism as an inverted hedonism.
- 2. Bentham is an ethical hedonist by virtue of his employment of the pleasure principle as the standard for conduct.
- 3. Intuitionist ethics was criticized by Bentham for it provides no more than a subjective feeling.

Codes:

- a) Only 1 and 3 are true.
- b) Only 1 and 2 are true
- c) 1, 2 and 3 are true.
- d) Only 2 is true.

**Answer: (C)**

307. 'Free-will' in ethics means

- a) The individual is free to do anything
- b) The individual is not free to do anything
- c) The individual is free to act keeping in view of some norms
- d) None of the above

**Answer: (C)**

308. Who highlighted the problem of personal identity first in modern western philosophy?

- a) Strawson
- b) Locke
- c) Kripke
- d) Descartes

**Answer: (B)**

309. The four moral sanctions by Bentham are

- a) Natural, Cultural, Political, Social
- b) Natural, Political, Social, Religious
- c) Natural, Economical, Political, Religious
- d) Natural, Economical, Cultural, Religious

**Answer: (B)**

310. Match List – I with List – II and select the correct answer code from below:

List – I

List – II

- |                                |               |
|--------------------------------|---------------|
| a. Rational Utilitarianism     | i. G.E. Moore |
| b. Quantitative Utilitarianism | ii. Sidgwick  |
| c. Ideal Utilitarianism        | iii. Bentham  |
| d. Qualitative Utilitarianism  | iv. J.S. Mill |
- Codes:  
a b c d

- a) i iv ii iii
- b) iii i iv ii
- c) ii iv i iii
- d) ii iii i iv

**Answer:** (D)

311. Consider the statements of J.S. Mill given below and mark the correct code:

1. J.S. Mill's theory is Altruistic hedonism and qualitative utilitarianism.
2. Mill uses pleasure and happiness synonymously.
3. Mill regards virtue, health, love of honour and the like as intrinsic values.

Codes:

- a) 1, 2 and 3 are true.
- b) 1 and 2 are true.
- c) 1 and 3 are true.
- d) Only 2 is true.

**Answer:** (B)

## **UNIT – 5**

### Contemporary Indian Philosophy

## **Vivekananda: Practical Vedanta Introduction**

His philosophy is vedantic based on the beliefs that God alone is real, that man is God his self, and that this realization of divinity in oneself and others is the goal of life. Vivekananda, however, modifies what he considered to be classical Vedanta. He refused to believe that vedantas is theoretical and held that it is practical. He did not agree with the view that Vedanta teaches quietism and renunciation. He did not also reconcile himself the view of individual salvation where the rest of humanity groaned and sighed in misery and held that vedanta could be practiced in this very world. Two points deserve mention in this connection. One is that inspite of the best motive the second point is that Vedanta in the hands of Vivekananda becomes as instrument for revitalizing and regulating India by the masses strong, selfreliant and great. In the philosophy of Vivekananda, contemplation and activity, Nirvakalpa Samadhi and humanitarians work, God and the world run parallel to each other. Neither spirituality is abandoned nor social service is neglected but they are synthesized.

## **Words of Swami Vivekananda**

- It is a tremendous error to feel helpless. Do not seek help from anyone. We are our own help. If we cannot help ourselves, there is none to help us.
- The one theme of the Vedanta philosophy is the search after unity.
- If I do a good action, there is no power in the universe which can stop its being good results.
- Nothing else is necessary but these Love, Sincerity & patience.

## **Vedanta**

The philosophy of Vedanta has been evolved from the Upanishads which occur at the end of the Vedas. Its key-note is strength, and unity in variety its immortal theme. It demonstrates the essential unity of all religions, recognizing them all as so many paths of the same Truth. It accepts all the great prophets, teachers, and sons of God, for it holds that all are manifestations of the one Godhead; and accepting all, it does not attempt to make converts. It does not inculcate dogmas but offers a rational basis for the principles and practices common to religions everywhere. Therefore its teaching appeal to men and women irrespective of race, nationality and religious persuasion. In the light of its teaching the followers of different religions have a better understanding of their respective religions, and of other religions as well. The practice of Vedanta is usually called Yoga, a general name for the practical techniques by which the theoretical knowledge of the philosophy is realized. It is a much more comprehensive scheme of life than the posture and breathing exercises which sometimes pass for yoga. It is concerned not so much with the subnormal and the abnormal, as with the normal and its evolution into the supernormal.

## **Practical Vedanta**

Vivekananda, the person who could perform the colossal feat of finishing the first eleven volume of the Encyclopedia Britannica (out of a total of twenty) had a passionate urge to experience directly the ecstatic absorption with the subject objectless (asamprajanta) beatific supernal state. The late Brajendra Nath seal testifies to the deep and restless passion of Vivekananda to apprehend the highest truth from his early young days. Although the Swami was a revered teacher of the monistic Vedanta, still the devotional mood characteristic of the great Vedantic Acharyas, like Madhava and Vallabha – was also prominent in his person. The world knows him as a gigantic mind who employed his stupendous will power and energy to bring about a regeneration of India. This monk, social energies and humanist philanthropist wanted, as he said, to fall on the society

like an avalanche. He was a pilgrim of the city of god and a warrior for the cause of the suppressed. Hence the Swami's personality was notable for its comprehensiveness and deep sensitiveness to the evils prevalent in the socio- economic and moral structure of the country. He preached both monistic asceticism and social service. His intellectual vision was immensely clear and he could easily penetrate into the currents and cross currents that were manifested in the history of India. Vivekananda advocated the monism of the Upanishads as systematized by Badarayana and Samkara. The ever - conceit blissful reality was to him the supreme extent and the eternal real and could be realized as a result of philosophic thinking and living. The world, according to the view of samkara, is the vivarta of Brahma. But Vivekananda did not wholly deny the reality of the cosmos, although he was bound to do so philosophically. He was inspired by his great teacher who believed in the "motherhood" of the governing principle of universe, a tantric doctrine and formula, which in its incipient forms is also found in the religious systems of the ancient Indus valley and western Asia.

Vivekananda has pointed out in his American lectures that the vedantic metaphysics. Which teaches spiritual equality is the real guarantee of an equal treatment to the vast masses. The French revolution taught liberty and equality, but it degenerated into the despotic imperialisms of Napoleons 1 and 111 and the Russian slogan of the dictatorship of the proletariat is now the slogan of the dictatorship of a manipulating group, 'the vanguard' because these explosive movements were not ethically inspired. After all, genuine ethics and social morality are meant for good behavior and the development of freedom, right, self-consciousness and good in the world. The vedantic metaphysics does not neutralize the subjective disposition to ethical life because of its Mayavada but strengthens moral action by providing to that a rock-like spiritual foundation.

### **Vedanta: Three fundamental truths**

1. That man's real nature is divine.
2. That is the aim of man's life on earth to unfold and manifest his Godhead, which is eternally existent within him, but hidden.
3. That truth is universal.

### **Fundamental Truths of Vedanta According to Swami Vivekananda**

1. The inherent divinity of man.
2. The non-duality of the Ultimate Reality, of Brahman or Atman.
3. The ultimate Reality as Brahman or the Absolute of Philosophy, is also the Intimate Reality as Iswara or God, of religion.
4. The Ultimate Reality as the Atman becomes capable, of not just a belief in Him, but of the realization or experience or anubhava of Him, by man.
5. Such anubhava, and the struggle towards it, constitutes dynamic spirituality, and the true meaning of religion, and not just a belief in His existence and a static piety based on it.
6. Such dynamic spirituality means the steady spiritual growth of man, or his growth in his spiritual dimension, by developing increasing awareness by him of his inborn divine nature.
7. Such spiritual growth is to be achieved by man in the context of his life and work by the comprehensive spiritual technique of Yoga as taught in the Bhagavad Gita, which bridges the gulf between the secular and the sacred, between life and religion.

## **Conclusion**

Swami Vivekananda explored Indian philosophy and drew ethical Systems on the basis of Advaita Vedanta, offering solution for the salvation of humankind. He recognized the energy of individual human as a form of divinity and built a tremendous positive psychology for humankind. He applied philosophy of Advaita Vedanta to build humanity and spirituality. It all reflected his practical Vedanta idealism. Vivekananda was as a great philosopher of Advaita Vedanta and social reformer in colonial India. The spiritual thoughts of Vivekananda have their moorings in the Vedanta philosophy, which is a systematic exposition of the Upanishads. However, he gives a modern interpretation of the ancient ideas to make them practical. He says, The Vedanta, therefore, as a religion must be intensely practical. We must be able to carry it out in every part of our lives.

## **Universality of Religion**

Swami Vivekananda views on universality of religion are one of the finest examples of gallic grace in intellectual culture. The stunning revelation in this digital age is that religion is a matter for the future far more than for the past. "Religion" for Vivekananda, is synonymous with "Universalism" of the spirit. For Vivekananda, religion should be universal in spirit and it should be maintained. Some people say that religion or spiritual ideas are dying out, but it is not true. On the contrary they have just begun to grow. In the past religion was confined into the hands of priests, temples, churches, rituals and dogmas, but that is not true religion. To be true and universal religion it should be free from these shackles. Only that religion is real and living which pervades our nature, our life and our society. Such a religion will always do well to all. All religions must have understanding and should in teach tolerance. On the other hand religion should work as a cementing force to unite the mankind. It can be done by a fair co- ordination of spiritual and materialistic thought, as in the present age science cannot be neglected. The true essence of religion is really coming out, as now people have become more realistic and reasonable. The true and universal religion is in the offering which is very natural, real and living. This will do good not of the individual only but of the whole society. Swami Vivekananda quoted "To devote your life to the good of all and to the happiness of all is religion. Whatever you do for your own sake is not religion." Religion was made to ask people to lead a virtuous life. It is also used to run the society in the right way where people should use their rights and perform their duties. That is why religion had the concepts of praise and punishment. Due to fear of God, people did their duties in the right direction. It went on smoothly for long but then it lost its way. Due to materialist progress people lost faith in religious rituals and dogmas. Now the people have developed better reasoning and they started asking questions about the existence of God and his creation. The paper aims to depict about the universality of religion as preached by Swami Vivekananda and will enlighten the true concept of religion and shed away many cobwebs that have been woven around it by those who misinterpret religion for the narrow, short-term vested interests.

Today we recall with pride and reverence the hallowed memory of Swami Vivekananda who occupies a unique place in the shining galaxy of the illustrious sons of modern India. Swami Vivekananda was an Indian nationalist among nationalists. But his contacts with the West had made him an internationalist with true concept of universality of religion.

Religion is deeply rooted in man and from time immemorial it has been running through his blood. It has been a dominating factor in man and his way of thinking and behaviour. In many ways, religion has been a very intimate matter in man and his life. Indian philosopher Swami Vivekananda has discovered a unique explanation to the concept of religion. He argued for the necessity of a universal religion. For him, religion is not just a talk on doctrines or theories, neither
